APPENDIX II: MANUFACTURERS OF TRADEMARKED PRODUCTS (ALPHABETICAL LIST)	952

Publisher's Preface

With the appearance of the Ninth Edition, "The Condensed Chemical Dictionary" rounds out half a century of continuous service to the chemical and process industries, and to the many thousands of people throughout the world whose work and interests have brought them into contact with chemistry and its commercial products. The First Edition appeared in 1919, when the chemical industry in the United States was just entering on a huge expansion program as a result of World War I. At that time, the urgent need for such a reference book became apparent to Francis M. Turner, then Vice-President of the Chemical Catalog Company, predecessor of Reinhold Publishing Corporation. He remained

Editorial Director of the Dictionary until his death.

The Second and Third Editions were prepared with the assistance of Thomas C. Gregory. The Fourth and following three editions underwent considerable expansion under the capable editorship of Professor and Mrs. Arthur Rose, of State College, Pennsylvania; their competent and effective work improved the Dictionary in many ways. The Eighth Edition was published in 1971, and the Publishers entertain the hope that the Ninth Edition will be equally well received.

VAN NOSTRAND REINHOLD COMPANY

Introduction

The first edition of the *Condensed Chemical Dictionary* appeared in 1919, when the chemical industry in the United States was entering on a huge expansion program as a result of World War I. The urgent need for such a reference book became apparent to Francis M. Turner, President of the Chemical Catalog Company, predecessor of the Reinhold Publishing Corporation. Under his supervision a succession of Editors developed and expanded the *Condensed Chemical Dictionary* to meet the growing needs of the chemical industries. Since his death this development has continued, with the result that the work has achieved world-wide recognition in its field.

The *Condensed Chemical Dictionary* is a unique publication. It is not a dictionary in the usual sense of an assemblage of brief definitions, but rather a compendium of technical data and descriptive information covering many thousand chemicals and chemical phenomena, organized in such a way as to meet the needs of those who have only minutes to devote to any given substance or topic.*

Three distinct types of information are presented: (1) technical descriptions of chemicals, raw materials, and processes; (2) expanded definitions of chemical entities, phenomena, and terminology; and (3) description or identification of a wide range of trademarked products used in the chemical industries. Supplementing these are listings of accepted chemical abbreviations used in the literature, short biographies of chemists of historic importance, and descriptions or notations of the nature and location of many American technical societies and trade associations. In special cases editorial notes have been supplied where it was felt necessary to clarify or amplify a definition or description. A few entries written by specialists are acknowledged by use of the author's name.

In a work of this nature, selection of topics for inclusion can hardly fail to be influenced by

current interests and developing concerns within the topic area. The growing importance to chemists—and to the general public as well—of environmental and health hazards, which came to the forefront so quickly in the 1960's, was reflected in the Eighth Edition, which greatly increased its coverage of this aspect of chemistry. Now, nearly ten years later, the magnitude of the energy problem has been uppermost in the thinking of a broad spectrum of engineers, chemists, and physicists, since it is certainly the No. 1 technical problem confronting this country. Thus the present edition, while retaining its emphasis on environmental considerations, has been expanded in the area of energy and its sources, as far as permitted by presently available information. The effort has been to provide condensed, authoritative, factually oriented statements and descriptions, and to resist prognostications as to the future potential of any particular energy source. At the same time, continuing attention has been devoted to common hazards, such as flammable and explosive materials, poisons, pesticides, carcinogens, corrosive agents, etc., in line with the practice followed in earlier editions, and with the increasing public concern over these matters.

In connection with certain classifications of substances, particularly pesticides and carcinogens, which have occasioned the most controversy in recent years, the statement "Use may be restricted" indicates that a state or local regulation may exist even though the product has not been officially banned, or that a definitive ruling on its use is pending. A number of disputed cases have arisen recently; though some have been definitely settled, others are still being evaluated or are in the process of litigation. Typical is the instance of diethylstilbestrol (DES), use of which in cattle feeds for rapid fattening was first prohibited, later conditionally approved, and finally once again prohibited. Where a spe-

*More detailed and sophisticated treatment is presented in the *Encyclopedia of Chemistry*, Third Edition, edited by C. H. Hampel and G. G. Hawley (Van Nostrand Reinhold, 1973). An elementary volume designed primarily for student use, entitled *Glossary of Chemical Terms*, by the same authors and publisher, is also available (1976).

Introduction

The first edition of the *Condensed Chemical Dictionary* appeared in 1919, when the chemical industry in the United States was entering on a huge expansion program as a result of World War I. The urgent need for such a reference book became apparent to Francis M. Turner, President of the Chemical Catalog Company, predecessor of the Reinhold Publishing Corporation. Under his supervision a succession of Editors developed and expanded the *Condensed Chemical Dictionary* to meet the growing needs of the chemical industries. Since his death this development has continued, with the result that the work has achieved world-wide recognition in its field.

The *Condensed Chemical Dictionary* is a unique publication. It is not a dictionary in the usual sense of an assemblage of brief definitions, but rather a compendium of technical data and descriptive information covering many thousand chemicals and chemical phenomena, organized in such a way as to meet the needs of those who have only minutes to devote to any given substance or topic.*

Three distinct types of information are presented: (1) technical descriptions of chemicals, raw materials, and processes; (2) expanded definitions of chemical entities, phenomena, and terminology; and (3) description or identification of a wide range of trademarked products used in the chemical industries. Supplementing these are listings of accepted chemical abbreviations used in the literature, short biographies of chemists of historic importance, and descriptions or notations of the nature and location of many American technical societies and trade associations. In special cases editorial notes have been supplied where it was felt necessary to clarify or amplify a definition or description. A few entries written by specialists are acknowledged by use of the author's name.

In a work of this nature, selection of topics for inclusion can hardly fail to be influenced by

current interests and developing concerns within the topic area. The growing importance to chemists—and to the general public as well—of environmental and health hazards, which came to the forefront so quickly in the 1960's, was reflected in the Eighth Edition, which greatly increased its coverage of this aspect of chemistry. Now, nearly ten years later, the magnitude of the energy problem has been uppermost in the thinking of a broad spectrum of engineers, chemists, and physicists, since it is certainly the No. 1 technical problem confronting this country. Thus the present edition, while retaining its emphasis on environmental considerations, has been expanded in the area of energy and its sources, as far as permitted by presently available information. The effort has been to provide condensed, authoritative, factually oriented statements and descriptions, and to resist prognostications as to the future potential of any particular energy source. At the same time, continuing attention has been devoted to common hazards, such as flammable and explosive materials, poisons, pesticides, carcinogens, corrosive agents, etc., in line with the practice followed in earlier editions, and with the increasing public concern over these matters.

Introduction

The first edition of the *Condensed Chemical Dictionary* appeared in 1919, when the chemical industry in the United States was entering on a huge expansion program as a result of World War I. The urgent need for such a reference book became apparent to Francis M. Turner, President of the Chemical Catalog Company, predecessor of the Reinhold Publishing Corporation. Under his supervision a succession of Editors developed and expanded the *Condensed Chemical Dictionary* to meet the growing needs of the chemical industries. Since his death this development has continued, with the result that the work has achieved world-wide recognition in its field.

The *Condensed Chemical Dictionary* is a unique publication. It is not a dictionary in the usual sense of an assemblage of brief definitions, but rather a compendium of technical data and descriptive information covering many thousand chemicals and chemical phenomena, organized in such a way as to meet the needs of those who have only minutes to devote to any given substance or topic.*

Three distinct types of information are presented: (1) technical descriptions of chemicals, raw materials, and processes; (2) expanded definitions of chemical entities, phenomena, and terminology; and (3) description or identification of a wide range of trademarked products used in the chemical industries. Supplementing these are listings of accepted chemical abbreviations used in the literature, short biographies of chemists of historic importance, and descriptions or notations of the nature and location of many American technical societies and trade associations. In special cases editorial notes have been supplied where it was felt necessary to clarify or amplify a definition or description. A few entries written by specialists are acknowledged by use of the author's name.

In a work of this nature, selection of topics for inclusion can hardly fail to be influenced by

current interests and developing concerns within the topic area. The growing importance to chemists—and to the general public as well—of environmental and health hazards, which came to the forefront so quickly in the 1960's, was reflected in the Eighth Edition, which greatly increased its coverage of this aspect of chemistry. Now, nearly ten years later, the magnitude of the energy problem has been uppermost in the thinking of a broad spectrum of engineers, chemists, and physicists, since it is certainly the No. 1 technical problem confronting this country. Thus the present edition, while retaining its emphasis on environmental considerations, has been expanded in the area of energy and its sources, as far as permitted by presently available information. The effort has been to provide condensed, authoritative, factually oriented statements and descriptions, and to resist prognostications as to the future potential of any particular energy source. At the same time, continuing attention has been devoted to common hazards, such as flammable and explosive materials, poisons, pesticides, carcinogens, corrosive agents, etc., in line with the practice followed in earlier editions, and with the increasing public concern over these matters.

In connection with certain classifications of substances, particularly pesticides and carcinogens, which have occasioned the most controversy in recent years, the statement "Use may be restricted" indicates that a state or local regulation may exist even though the product has not been officially banned, or that a definitive ruling on its use is pending. A number of disputed cases have arisen recently; though some have been definitely settled, others are still being evaluated or are in the process of litigation. Typical is the instance of diethylstilbestrol (DES), use of which in cattle feeds for rapid fattening was first prohibited, later conditionally approved, and finally once again prohibited. Where a spe-

*More detailed and sophisticated treatment is presented in the *Encyclopedia of Chemistry*, Third Edition, edited by C. H. Hampel and G. G. Hawley (Van Nostrand Reinhold, 1973). An elementary volume designed primarily for student use, entitled *Glossary of Chemical Terms*, by the same authors and publisher, is also available (1976).

cific ruling has been made by a Federal agency limiting the use of a product to certain purposes, this is indicated by the statement "Use has been restricted," e.g., for DDT. When a product has been banned outright, the statement "Use has been prohibited" is used. In such a work as this, in view of the many materials in various stages of evaluative testing, court procedures, appeals, hearings, etc., it is impossible to keep abreast of every development. The user should check the current status of any questionable products before making decisions that involve them. (See also paragraph on Hazards, below.)

Arrangement of Entries

The entries are listed in strict alphabetical order; that is, those comprised of two or more words are alphabetized as if they were a single word, e.g., "acidimetry" precedes "acid value," and "waterproofing agent" precedes "water softener." The many prefixes used in organic chemistry are disregarded in alphabetizing, since they are not considered an integral part of the name; these include ortho-, meta-, para-, alpha-, beta-, gamma-, sec-, tert-, sym-, as-, uns-, cis-, trans-, endo-, exo-, d-, l-l, dl-, n-, N-, O-, as well as all numerals denoting structure. However, there are certain prefixes that are an integral part of the name (iso-, di-, tri-, tetra-, cyclo-, bis-, neo-, pseudo-), and in these cases the name is placed in its normal alphabetical position, e.g., dimethylamine under D and isobutane under I. The same is true of mono- (used as little as possible) and of ortho-, meta-, and para- in inorganic compounds such as sodium orthophosphate.

Chemicals and Raw Materials

The information in the categories listed below is given for each substance in the sequence indicated; where entries are incomplete, it may be presumed that no reliable data were provided by the reference systems utilized.

Name: The commonly accepted name is the key entry. Terminological variations are indicated where necessary. In virtually all cases, the name is given in the singular number. A name having initial caps and enclosed in quotes is a trademark; the superior numbers refer to the name of the manufacturer given in Appendix I.

Synonym: Alternate names (IUPAC and others), as well as trivial names, are indicated. Obsolete and slang names have been eliminated as far as possible. Most synonyms are entered independently and cross-referenced, but space limitation has not permitted complete consistency in this regard.

Formula: The molecular (or atomic) formula is regularly given; structural formulas are used in special cases of unusual importance or interest.

Properties: The properties typically given are: physical state; atomic number; atomic weight; valence; isotopes; odor; taste; specific gravity; boiling point (at 760 mm Hg unless otherwise stated); melting point (freezing point); refractive index; solubility; or miscibility. Various other properties are given where pertinent: flash point; autoignition point; electrical properties; tensile strength; hardness; or expansion coefficient.

Source or Occurrence: Geographical origin of metals, ores, essential oils, vegetable oils, and other natural products.

Derivation: The chemical reactions or other means of obtaining the product; current industrial methods are emphasized; obsolete and "curiosity" methods have been largely eliminated.

Grades: Recognized grades as reported in the industrial literature, including technical, C.P., U.S.P., refined, reactor, semiconductor, and the like.

Containers: Unit types; tank cars; tank trucks; carlots; bulk; barges; pipelines.

Hazard: This category includes flammability, toxicity, tissue irritation, explosion risks, etc., based on authoritative data. Also given are the tolerance ratings (Threshold Limit Values) for workroom exposures established by the American Conference of Government Industrial Hygienists; various rulings of the Food and Drug Administration; as well as reference to chemical safety data sheets prepared by and available from the Manufacturing Chemists Association, 1825 Connecticut Ave., N.W., Washington, D.C., 20009. It was not considered practicable

to include exposure standards established by the Federal regulatory bodies NIOSH and OSHA; those that have been determined have been published periodically in the *Federal Register* over the last few years.

The toxicity ratings are intended to be used only as indications of the industrial hazard presented by a given material; qualified toxicologists or physicians should be consulted for specific evaluations, dosages, exposure times and concentrations. For further information regarding these hazards, the reader is referred to the following entries: combustible material; flammable material; dust, industrial; corrosive material; oxidizing material; poison (1); toxicity; toxic materials; carcinogen.

Uses: These are primarily large-scale applications. Because of the rapidity of change in the chemical industries and the difficulty of obtaining reliable current data, no attempt has been made to list uses in the order of their tonnage consumption. The patent literature is not specifically represented.

Shipping Regulations: The requirements for transportation labelling for both rail and air are given under this heading; they are based on those established by the official regulatory agencies at the time this book was in preparation. These agencies are the Department of Transportation (Graziano's Tariff No. 25), Washington, D.C., for rail and water transport, and the Federal Aviation Authority, which observes the regulations of the International Air Transport Association, Geneva, Switzerland (P.O. Box 160). These schedules are periodically updated—indeed the latter issues a revised tariff annually.

In view of the frequent and numerous changes in labelling specifications, the designations "Rail" and "Air" are used in the Shipping Regulations entry, rather than the initials of the agencies (DOT and IATA), as in previous editions. This has been done to avoid the impression that such regulations are currently definitive. It should not be assumed that any given label specification in this book is ipso facto the latest ruling of either agency. For this reason, **this Dictionary is not to be cited as a final authority for any transportation label.** All

manufacturers and shippers should obtain the official revised tariffs on a regular basis to ensure proper compliance, not only in respect to labeling but to the many other shipping specifications for hazardous materials contained therein.

General Entries

It is likely that no two editors would completely agree about what general subjects should be included in a dictionary of this kind. The major subdivisions of matter directly involved with chemical reactions, the various states of matter, and the more important groups of compounds would almost certainly be regarded as essential; but beyond these, the area of selectivity widens rapidly. The topics either added or expanded by the present Editor were chosen chiefly because of their interest and importance, both industrial and biochemical, and secondarily because of the terminological confusion evidenced in the literature and in industrial practice. Regarding the latter, the reader is referred to the entries on gum, resin, pigment, dye, filler, extender, reinforcing agent, homogeneous, and combustible materials. In some cases a position has been taken which may not be accepted by all, but which is defensible and certainly not arbitrary. Even editors must acknowledge that the meanings and uses of terms often change illogically, and that such changes are usually irreversible.

Among the general entries are: important subdivisions of chemistry; short biographies of outstanding chemists of the past; numerous group definitions (barbiturate, peroxide); major chemical and physicochemical phenomena (polymerization, catalysis); functional names (anti-freeze, heat-exchange agent, sequestrant); terms describing special material forms (aerosol, foam, fiber); energy sources (solar cell, fuel cell, fusion); and the more important chemical processes. No general entry is intended to be encyclopedic or definitive, but rather a condensation of essential information, to be supplemented by reference to specialized sources. To present all this in useful and acceptably complete form has been a challenging, though often frustrating task, which the Editor leaves with the uneasy feeling that, like the breadcrumbs in the Mad Hatter's butter, some mistakes may have got in as well.

Trademarks

Continuing the policy of previous editions, an essential component of the Dictionary comprises descriptions of several thousand proprietary industrial products. The information was either provided by the manufacturers of these materials or taken from announcements or advertisements appearing in the technical press. Each proprietary name is enclosed in quotation marks, is stated to be a trademark (or brand name), and is followed by a superscript number referring to the Numerical List of Manufacturers on page 948. From this, the address of the manufacturer can easily be found in the Alphabetical List of Manufacturers. We wish to thank the owners of these trademarks for making the information available. The space devoted to these is necessarily limited, as the constant proliferation of trademarked products makes it impossible to list more than a small fraction of them in a volume such as this.

The absence of a specific trademark designation does not mean that proprietary rights may not exist in a particular name. No listing, de-

scription, or designation in this book is to be construed as affecting the scope, validity, or ownership of any trademark rights that may exist therein. Neither the Editor nor the Publisher assumes any responsibility for the accuracy of any such description, or for the validity or ownership of any trademark.

A Request

Many corrections and suggestions have been received from readers during the long history of the earlier editions; the Editors have always tried to acknowledge these to the best of their ability, and they have welcomed this correspondence, for it has been an important source of information about the acceptance of the Dictionary by its market. The present Editor and Publisher wish to encourage this reaction from the field, not only to permit corrections to be made in reprinted issues, but also as a basis for preparing future editions. All letters addressed to the Publisher will be forwarded.

The
Condensed Chemical
Dictionary

A

A (1) Abbreviation for absolute temperature; (2) abbreviation for Angstrom (q.v.); (3) symbol for mass number (AEC).

abaca (Manila hemp). The strongest vegetable fiber, obtained from the leaves of a tree of the banana family. The fibers are 4-8 ft long, light in weight, soft, lustrous, nearly white, and do not swell or lose strength when wet. Denier ranges from 300 to 500. Combustible, but self-extinguishing.

Sources: Philippines, Central America, Sumatra.

Grades: Available in 18 grades based on color and length.

Uses: Heavy cordage and twine, especially for marine use; manila paper.

See also *hemp*.

ABC salt. Abbreviation for 4',4'' azobis-4-biphenyl-carboxylic acid, disodium salt used as a chemical intermediate.

abherent. Any substance that prevents adhesion of a material to itself or to another material. It may be in the form of a dry powder (talc, starch); a suspension (bentonite-water); a solution (soap-water); or a soft solid (stearic acid, tallow). Abherents are used as dusting agents and mold washes in the adhesives, rubber and plastics industries. Fats and oils are used as abherents in the baking industry. Fluorocarbon-resin coatings on metals are widely used on cooking utensils.

Abies Siberica oil. See *fir needle oil*.

abietic acid (abietinic acid; sylvic acid) $C_{19}H_{29}COOH$ (having a phenanthrene ring system). A major active ingredient of rosin, where it occurs with other resin acids. The term is often applied to these mixtures, separation of which is not achieved in technical grade material.

Properties: Yellowish resinous powder; m.p. 172-175°C; optical rotation -106°; soluble in alcohol, ether, chloroform, and benzene; insoluble in water. Combustible. Low toxicity.

Derivation: Rosin, pine resin; tall oil.

Method of purification: Crystallization.

Grades: Technical.

Containers: Kegs; drums; multiwall paper bags.

Uses: Abietates (resinates) of heavy metals as varnish driers; esters in lacquers and varnishes; fermentation industries; soaps.

"Abitol."²⁶⁶ Trademark for a colorless, tacky, very viscous liquid; mixture of tetra-, di-, and dehydroabietyl alcohols made from rosin.

Uses: Plasticizers, tackifiers, adhesive modifiers.

ablation. The rapid removal of heat (5000 to 10,000°F) from a metallic substrate by pyrolysis of a material of low thermal conductivity, which is able to absorb or dissipate the heat while being decomposed to gases and porous char. Ablative materials applied to the exterior of temperature-sensitive structures isolate them from hyperthermal effects of the environment.

Interaction of a high-energy environment with the exposed ablative material results in a small amount of sacrificial erosion of the surface material. The attendant energy-absorption processes control the surface temperature and greatly restrict the flow of heat into the substrate. Ablative materials are usually composed of a ceramic or glass-reinforced plastic.

abrasive. A finely divided, hard, refractory material, ranging from 6 to 10 on the Mohs scale, used to reduce, smooth, clean, or polish the surfaces of other, less hard substances, such as glass, plastic, stone, wood, etc. Natural abrasive materials include diamond dust, garnet, sand (silica), corundum (aluminum oxide, emery), pumice, rouge (iron oxide), and feldspar; the more important synthetic types are silicon carbide, boron carbide, cerium oxide, and fused alumina. Abrasives in powder form are used in several ways: (1) applied directly to the surface to be treated by mechanical pressure or compressed-air blast, as in cleaning building stone; (2) affixed to a paper or textile backing after the particles have been coated with an adhesive; or (3) mixed with a bonding agent such as sodium silicate or clay, the particles being compressed into a wheel rotated by a power-driven shaft.

abrasive, coated. See *abrasive* (2).

ABS. Abbreviation for (1) alkyl benzene sulfonate (detergent); (2) acrylonitrile-butadiene-styrene copolymer. See *ABS resin*.

"Absafil."³³⁹ Trademark for an acrylonitrile-butadiene-styrene copolymer reinforced with glass fiber. See also *reinforced plastic*.

abscisin. A plant hormone which promotes the aging process in plants, by inducing the dropping of leaves and fruit. Occurs naturally in many plants; the synthetic product is commercially available as abscisic acid. See also *plant growth regulator*.

absolute. (1) Free from admixture of other substances; pure. Example: absolute alcohol is dehydrated ethyl alcohol, 99% pure.

(2) The pure essential oil obtained by double solvent extraction of flowers in the manufacture of perfumes. See *concrete* (2).

(3) Absolute temperature (q.v.).

absolute temperature. The fundamental temperature scale used in theoretical physics and chemistry, and in certain engineering calculations such as the change in volume of a gas with temperature. Absolute temperatures are expressed either in degrees Kelvin or in degrees Rankine, corresponding respectively to the centigrade and Fahrenheit scales. Degrees Kelvin are obtained by adding 273 to the centigrade temperature, while degrees Rankine are obtained by adding 460 to the Fahrenheit temperature. The nearest practical approach to absolute zero is about -272°C.

absorbent. (1) Any substance exhibiting the property of absorption, e.g., absorbent cotton, so made by removal of the natural waxes present. See absorption (1). (2) A material that does not transmit certain wavelengths of incident radiation. See absorption (2).

absorption. (1) In chemical terminology, the penetration of one substance into the inner structure of another, as distinguished from adsorption, in which one substance is attracted to and held on the surface of another. Physicochemical absorption occurs between a liquid and a gas or vapor, as in the operation known as scrubbing (q.v.) in which the liquid is called an absorption oil; sulfuric acid, glycerol, and some other liquids absorb water vapor from the air under certain conditions. Physiological absorption takes place through porous tissues such as the skin and intestinal walls, which permit passage of liquids and gases into the bloodstream. See also adsorption; hygroscopic.

(2) In physical terminology, retention by a substance of certain wavelengths of radiation incident upon it, followed by either an increase in temperature of the substance or by a compensatory change in the energy state of its molecules. The ultraviolet component of sunlight is absorbed as the light passes through glass and some organic compounds, the radiant energy being transformed into thermal energy. The radiation-absorptive capacity of matter is utilized in analytical chemistry in various types of absorption spectroscopy (q.v.).

(3) In physical chemistry, the ability of some elements to pick up or "capture" thermal neutrons produced in nuclear reactors as a result of fission. This is due to the large capture cross section of their atoms, which is measured in units called barns; elements of particularly high neutron absorption capability are cadmium and boron.

absorption band. The range of wavelengths absorbed by a molecule; for example, absorption in the infrared band of 2.3 to 3.2 μ indicates the presence of OH and NH groups, while the 3.3 to 3.5 band indicates aliphatic structure. Atoms absorb only a single wavelength, producing lines, such as the sodium D line. See also spectroscopy; resonance (2); ultraviolet absorber; excited state.

absorption oil. See absorption (1).

absorption spectroscopy. An important technique of instrumental analysis involving measurement of the absorption of radiant energy by a substance as a function of the energy incident upon it. Absorption processes occur throughout the electromagnetic spectrum, ranging from the gamma region (nuclear resonance absorption or the Mossbauer effect) to the radio region (nuclear magnetic resonance). In practice they are limited to those processes that are followed by the emission of radiant energy of greater intensity than that which was absorbed. All absorption processes involve absorption of a photon by the substance being analyzed. If it gives off the excess energy by emitting a photon of less energy than that absorbed, fluorescence or phosphorescence occurs, depending on the lifetime of the excited state.

The emitted energy is normally studied. If the source of radiant energy and the absorbing species are in identical energy states, i.e., in resonance, the excess energy is often given up by the nondirectional emission of a photon whose energy is identical with that absorbed.

Either absorption or emission may be studied,

depending upon the chemical and instrumental circumstances. If the emitted energy is studied, the term "resonant fluorescence" is often used. However, if the absorbing species releases the excess energy in small steps by the process of inter-molecular collision or some other mode, it is commonly understood that this phenomenon falls within the realm of absorption spectroscopy. (The terms absorption spectroscopy, spectrophotometry, and absorptimetry are often used synonymously.)

Most absorption spectroscopy is done in the ultraviolet, visible, and infrared regions of the electromagnetic spectrum. See also emission spectroscopy; infrared spectroscopy.

ABS resin. Any of a group of tough, rigid thermoplastics deriving their name from the three letters of the monomers which produce them; Acrylonitrile-Butadiene-Styrene. Most contemporary ABS resins are true graft polymers consisting of an elastomeric polybutadiene or rubber phase, grafted with styrene and acrylonitrile monomers for compatibility, dispersed in a rigid styrene-acrylonitrile (SAN) matrix. Mechanical polyblends of elastomeric and rigid copolymers, e.g., butadiene-acrylonitrile rubber and SAN, historically the first ABS resins, are also marketed.

Varying the composition of the polymer by changing the ratios of the three monomers and use of other comonomers and additives results in ABS resins with a wide range of properties.

Properties: Dimensional stability over temperature range from -40 to +160°F. Attacked by nitric and sulfuric acids, and by aldehydes, ketones, esters, and chlorinated hydrocarbons. Insoluble in alcohols, aliphatic hydrocarbons, mineral and vegetable oils. Processed by conventional molding and extrusion methods. Sp. gr. 1.04; tensile strength about 6500 psi; flexural strength 10,000 psi; good electrical resistance; water absorption 0.3-0.4%. Nontoxic. Combustible, but slow-burning; flame retardants may be added. Can be vacuum-metallized or electroplated. **Grades:** High-, medium-, and low-impact; molding and extrusion.

Uses: Automobile body parts and fittings; telephones; bottles; heels; luggage; packaging; refrigerator door liners; plastic pipe (subject to local building codes); building panels (ditto); shower stalls; boats; radiator grills; machinery housings; business machines.

Note: Several trademarked types are "Cyclocac," "Abson," "Kralastic," "Lustran." For further information refer to Society of Plastics Industry, 250 Park Ave., New York.

abundance. The relative amount (% by weight) of a substance in the earth's crust, including the atmosphere and the oceans.

(a) The abundance of the elements in the earth's crust is:

Rank	Element	% by wt.
1	Oxygen	49.2
2	Silicon	25.7
3	Aluminum	7.5
4	Iron	4.7
5	Calcium	3.4
6	Sodium	2.6
7	Potassium	2.4
8	Magnesium	1.9
9	Hydrogen	0.9
10	Titanium	0.6
11	Chlorine	0.2
12	Phosphorus	0.1

Rank	Element	% by wt.
13	Manganese	0.1
14	Carbon	0.09
15	Sulfur	0.05
16	Barium	0.05
	all others	0.51

(b) The percentages of inorganic compounds in the earth's crust, exclusive of water, are:

(1) SiO ₂ 55	(2) Al ₂ O ₃ 15	(3) CaCO ₃ 8.8
(4) MgO 1.6	(5) Na ₂ O 1.6	(6) K ₂ O 1.9

(c) The most abundant organic materials are cellulose and its derivatives, and proteins.

Note: On the universal scale, the most abundant element is hydrogen.

Ac Symbol for actinium; abbreviation of acetate.

AC. Abbreviation for allyl chloride.

acacia gum. See arabic gum.

acaricide. A type of pesticide effective on mites and ticks (acarides).

"Accel."¹²³ Trademark for a lactic acid starter culture for use in food processing.

accelerator. (1) A compound, usually organic, that greatly reduces the time required for vulcanization of natural and synthetic rubbers, at the same time improving the ageing and other physical properties. Organic accelerators invariably contain nitrogen, and in some cases both nitrogen and sulfur. The latter type are called ultra-accelerators because of their greater activity. The major types include amines, guanidines, thiazoles, thiuram sulfides, and dithiocarbamates. The amines and guanidines are basic, the others acidic. The introduction of organic accelerators in the early twenties was largely responsible for the successful development of automobile tires and mechanical products for engineering uses. A few inorganic accelerators are still used in low-grade products, e.g., lime, magnesium oxide, and lead oxide. See also vulcanization, rubber.

(2) A compound added to a photographic developer to increase its activity, such as certain quaternary ammonium compounds and alkaline substances.

(3) A particle accelerator (q.v.).

acceptor. See donor.

"Acele."²⁸ Trademark for a cellulose acetate fiber.

Properties: Sp. gr. 1.32; tensile strength (psi), 18,000–24,000; break elongation 28%; moisture regain 6%; soluble in glacial acetic acid, acetone, acetonitrile, butyrolactone, dimethyl formamide, dioxane-1,4. Combustible.

Containers: Tubes and cones in cases; beams.

Uses: Textiles.

See also acetate fiber.

acenaphthene (1,8-dihydroacenaphthalene; ethylenenaphthalene) C₁₀H₈(CH₂)₂, a tricyclic compound.

Properties: White needles; sp. gr. 1.024 (99/4°C); freezing point 93.6°C; b.p. 277.5°C; refractive index (100°C) 1.6048. Soluble in hot alcohol; insoluble in water. Combustible.

Derivation: From coal tar.

Grades: Technical; 98%.

Containers: Fiber drums.

Hazard: Irritating to eyes and skin.

Uses: Dye intermediate; pharmaceuticals; insecticide; fungicide; plastics.

acenaphthenequinone (1,2-acenaphthenedione)

C₁₀H₆(CO)₂, a tricyclic compound.

Properties: Yellow needles; m.p. 261–263°C; insoluble in water; soluble in alcohol.

Derivation: By oxidizing acenaphthene, using glacial acetic acid and sodium or potassium dichromate.

Grades: Technical.

Uses: Dye synthesis.

acenocoumarin (3-(alpha-acetonyl-4-nitrobenzyl)-4-hydroxycoumarin) C₁₉H₁₅NO₆.

Properties: White crystalline powder, tasteless and odorless; m.p. 197°C. Slightly soluble in water and organic solvents. Low toxicity.

Use: Medicine (anticoagulant).

acetal (diethylacetal; 1,1-diethoxyethane; ethylenediethyl ether) CH₃CH(OC₂H₅)₂.

Properties: Colorless, volatile liquid; agreeable odor; nutty after-taste. Stable to alkalis but readily decomposed by dilute acids. Forms a constant-boiling mixture with ethyl alcohol. Soluble in alcohol, ether, and water. Sp. gr. 0.831; b.p. 103–104°C; vapor pressure 20.0 mm (20°C); flash point (closed cup) –5°F; specific heat 0.520; refractive index 1.38193 (20°C); wt (lb/gal) 6.89; autoignition temp. 446°F.

Derivation: Partial oxidation of ethyl alcohol, the acetaldehyde first formed condensing with the alcohol.

Grades: Technical.

Containers: Cans; carboys.

Hazard: Highly flammable. Dangerous fire risk. Explosive limits in air 1.65 to 10.4%. Moderately toxic and narcotic in high concentrations.

Uses: Solvent; cosmetics; organic synthesis; perfumes; flavors.

Shipping regulations. (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

See also acetal resin.

acetaldehyde (acetic aldehyde; aldehyde; ethanal; ethyl aldehyde) CH₃CHO.

Properties: Colorless liquid; pungent, fruity odor. Sp. gr. 0.783 (18/4°C); b.p. 20.2°C; m.p. –123.5°C; vapor pressure 740.0 mm (20°C); flash point –40°F (open cup); specific heat 0.650; refractive index 1.3316 (20°C); wt. 6.50 lb/gal (20°C); miscible with water, alcohol, ether, benzene, gasoline, solvent naphtha, toluene, xylene, turpentine and acetone.

Derivation: (a) oxidation of ethylene; (b) vapor-phase oxidation of ethanol; (c) vapor-phase oxidation of propane and butane; (d) direct conversion of ethylene.

Grades: Technical 99%.

Containers: 5-, 10-, 55-, and 110-gal steel drums; tank cars.

Hazard: Highly flammable and toxic. Dangerous fire and explosion risk. Explosive limits in air 4 to 57%.

Tolerance, 100 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of acetic acid and acetic anhydride, *n*-butanol, 2-ethylhexanol, peracetic acid, pentaerythritol, pyridines, chloral, 1,3-butylene glycol, and trimethylpropane; also as intermediate.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.)

acetaldehyde ammonia. See aldehyde ammonia.

acetaldehyde cyanohydrin. See lactonitrile.

acetal. See aldol.

acetal resin (polyacetal). A polyoxymethylene thermoplastic polymer obtained by ionically initiated polymerization of formaldehyde (CH_2O) to obtain a linear molecule of the type $-\text{O}-\text{CH}_2-\text{O}-\text{CH}_2-\text{O}-\text{CH}_2-$. Single molecules may have over 1500 $-\text{CH}_2\text{O}-$ units. As the molecule has no side chains, dense crystals are formed. Acetal resins are hard, rigid, strong, tough and resilient; dielectric constant 3.7; dielectric strength 1200 volts/mil (20-mil), 600 volts/mil (80-mil); dimensionally stable under exposure to moisture and heat, resistant to chemicals, solvents, flexing and creep, and have a high gloss and low friction surface. Can be chromium-plated, injection-molded, extruded, and blow-molded. Not recommended for use in strong acids or alkalis. They may be homopolymers or copolymers.

Properties: Sp. gr. 1.425; thermal conductivity 0.13 Btu/hr/sq ft/°F/ft; coefficient of thermal expansion 4.5×10^{-5} per °F; specific heat 0.35 Btu/lb/°F; water absorption 0.41%/24 hr; tensile strength 10,000 psi; elongation 15%; hardness (Rockwell) R120; impact strength (notched) 1.4 ft-lb/in.; flexural strength 14,100 psi; shear strength 9500 psi. Combustible, but slow burning.

Uses: An engineering plastic, often used as substitute for metals, as oil and gas pipes; automotive and appliance parts; industrial parts; hardware; communication equipment; aerosol containers for cosmetics.

See also "Delrin"; "Celcon."

acetamide (acetic acid amine, ethanamide) CH_3CONH_2 .

Properties: Colorless deliquescent crystals. Mousy odor. Soluble in water and alcohol; slightly soluble in ether. Sp. gr. 1.159; m.p. 82°C; b.p. 223°C; refractive index 1.4274 (78.3°C). Low toxicity. Combustible.

Derivation: Interaction of ethyl acetate and ammonium hydroxide.

Method of purification: Crystallization.

Grades: Technical; C.P. (odorless); intermediate; reagent.

Containers: Fiber cartons.

Uses: Organic synthesis (reactant, solvent, peroxide stabilizer); general solvent; lacquers; explosives; soldering flux; hygroscopic agent; wetting agent; penetrating agent.

acetamido-. Prefix indicating the group $\text{CH}_3\text{CONH}-$. Also called acetamino- or acetylaminio-.

5-acetamido-8-amino-2-naphthalenesulfonic acid (acetyl-1,4-naphthalenediamine-7-sulfonic acid; acetylaminio-1,6-Cleve's acid)

$\text{C}_{10}\text{H}_5(\text{NHCOCH}_3)(\text{NH}_2)(\text{SO}_3\text{H})$. A reddish brown paste.

Hazard: May be toxic.

Use: Chemical intermediate.

8-acetamido-5-amino-2-naphthalenesulfonic acid (acetyl-1,4-naphthalenediamine-6-sulfonic acid; acetylaminio-1,7-Cleve's acid)

$\text{C}_{10}\text{H}_5(\text{NHCOCH}_3)(\text{NH}_2)(\text{SO}_3\text{H})$. A paste.

Hazard: May be toxic.

Use: Chemical intermediate.

para-acetamidobenzenesulfonyl chloride. See N-acetylsulfanilyl chloride.

acetamidocynoacetic ester. See ethyl acetamidocynoacetate.

8-acetamido-2-naphthalenesulfonic acid magnesium salt (acetyl-1,7-Cleve's acid)
 $[\text{C}_{10}\text{H}_6(\text{CH}_3\text{CONH})(\text{SO}_3)]_2\text{Mg}$.

Properties: Brownish-gray paste containing approximately 80% solids.

Use: Intermediate.

para-acetamidophenol. See para-acetylaminophenol.

"Acetamine."²⁸ Trademark for a group of azo dyes and developers made for application to acetate yarn, and especially suited to nylon.

acetamino-. See acetamido-.

acetaminophen. See para-acetylaminophenol.

acetanilide (N-phenylacetamide) $\text{C}_6\text{H}_5\text{NH}(\text{COCH}_3)$.

Properties: White, shining crystalline leaflets or white, crystalline powder; odorless; stable in air; slightly burning taste; sp. gr. 1.2105; m.p. 114–116°C; b.p. 303.8°C; soluble in hot water, alcohol, ether, chloroform, acetone, glycerol and benzene. Flash point 345°F; combustible; autoignition temp. 1015°F.

Derivation: Acetylation of aniline with glacial acetic acid.

Grades: Technical; C.P.

Containers: 1-lb cartons; bottles; fiber drums; multi-wall paper bags.

Hazard: Moderately toxic by ingestion.

Use: Rubber accelerator; inhibitor in hydrogen peroxide; stabilizer for cellulose ester coatings; manufacture of intermediates (para-nitroaniline, para-nitroacetanilide; para-phenylenediamine); synthetic camphor; pharmaceutical chemicals; dyestuffs; precursor in penicillin manufacture; medicine (antiseptic).

acetanisole. See para-methoxyacetophenone.

acetate. (1) A salt of acetic acid in which the terminal H atom is replaced by a metal, as in copper acetate, $\text{Cu}(\text{CH}_3\text{COO})_2$.

(2) An ester of acetic acid where the substitution is by a radical as in ethyl acetate, $\text{CH}_3\text{COOC}_2\text{H}_5$. In cellulose acetate the hydroxyl radicals of the cellulose are involved in the esterification. See also cellulose acetate; vinyl acetate.

acetate dye. One group comprises water-insoluble azo or anthraquinone dyes that have been highly dispersed to make them capable of penetrating and dyeing acetate fibers. A second class consists of water-insoluble amino azo dyes that are made water-soluble by treatment with formaldehyde and bisulfite. After absorption by the fiber the resulting sulfonic acids hydrolyze and regenerate the insoluble dyes.

acetate fiber. Generic name for a manufactured fiber in which the fiber-forming substance is cellulose acetate. Where not less than 92% of the hydroxyl groups are acetylated, the term triacetate may be used as a generic description of the fiber (Federal Trade Commission). This fiber was formerly called "acetate rayon" or "acetate silk." The term "rayon" is no longer permissible for this type.

Properties: Thermoplastic; becomes tacky at 350°F. Soluble in acetone and glacial acetic acid; decomposed by concentrated solutions of strong acids and alkalis. Moisture absorption 6%. Tenacity (dry) 1.4 g/denier; (wet) about 1 g/denier. Elongation 50% dry, 40% wet. Combustible.

Uses: Wearing apparel; industrial fabrics.

See also "Acele" (acetate); "Arnel" (triacetate); and following entry.

acetate fiber, saponified. Regenerated cellulose fibers obtained by complete saponification of highly oriented cellulose acetate fibers. Available in continuous filament form having a high degree of crystallinity and great strength.

Properties: Tensile strength (psi) 136,000–155,000; elongation 6%; sp. gr. 1.5–1.6; moisture regain 9.6–10.7%; decomposes about 300°F. Similar to cotton in chemical resistance, dyeing, and resistance to insects and mildew. Combustible.

Uses: Cargo-parachutes; typewriter ribbons; belts; webbing; tapes; carpet backing.

acetate film. A durable, highly transparent film with nondeforming characteristics, produced from cellulose acetate resin. It is grease-, oil-, dust-, and air-proof and hygienic. Combustible.

Available forms: Rolls and cut-to-size sheets.

Uses: Laminates; support for photographic film; document preservation; pressure-sensitive tape; magnetic sound recording tape; window cartons and envelopes; packaging.

acetate of lime. Commercial term for calcium acetate made from pyroligneous acid and milk of lime. There are brown and gray acetates of lime. For further data see calcium acetate.

acetate process. See cellulose acetate.

acethydrazidepyridinium chloride. See Girard's "P" reagent.

acetic acid (ethanoic acid, vinegar acid, methanecarboxylic acid) CH_3COOH . Glacial acetic acid is the pure compound (99.8% min.), as distinguished from the usual water solutions known as acetic acid. It is the end-product of oxidation of fermentation alcohols, as in vinegar (q.v.). 36th highest-volume chemical produced in U.S. (1975).

Properties: Clear, colorless liquid; pungent odor. M.p. 16.63°C; b.p. 118°C (765 mm), 80°C (202 mm); sp. gr. 1.0492 (20/4°C); wt/gal (20°C) 8.64 lb; viscosity (20°C) 1.22 cps; flash point (open cup) 110°F; refractive index 1.3715 (20°C). Miscible with water, alcohol, glycerin, and ether; insoluble in carbon disulfide; autoignition temp. 800°F. Combustible.

Derivation: (a) liquid- and vapor-phase oxidation of petroleum gases (with catalyst); (b) oxidation of acetaldehyde; (c) reaction of methanol and carbon monoxide; (d) directly from naphtha.

Grades: U.S.P. (glacial, 99.4 wt %, and dilute, 36–37 wt %), C.P.; technical (80; 99.5%); commercial (6, 28, 30, 36, 56, 60, 70, 80 and 99.5%); N.F. (diluted; 6.0 g/100 ml).

Containers: 5-lb bottles; 6-, 13-gal carboys; 8.5-, 13-, 55-, 100-gal barrels and drums; tank cars.

Hazard: Moderate fire risk. Pure acetic acid is toxic by ingestion and inhalation, but dilute material is approved by FDA for food use. Strong irritant to skin and tissue. Tolerance, 10 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of acetic anhydride, cellulose acetate, and vinyl acetate monomer; acetic esters; chloroacetic acid; production of plastics, pharmaceuticals, dyes, insecticides, photographic chemicals, etc.; food additive (acidulant); latex coagulant; oil-well acidizer; textile printing.

Shipping Regulations: Glacial or over 80% acid solution: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

See also vinegar.

acetic acid amine. See acetamide.

acetic acid, glacial. See acetic acid.

acetic aldehyde. See acetaldehyde.

acetic anhydride (acetyl oxide; acetic oxide) $(\text{CH}_3\text{CO})_2\text{O}$.

Properties: Colorless, mobile, strongly refractive liquid; strong odor; sp. gr. 1.0830 (20/20°C); b.p. 139.9°C; f.p. -73.1°C; flash point 121°F (C.C.). Autoignition temp. 732°F; wt/gal (20°C) 9.01 lbs. Miscible with alcohol, ether, and acetic acid; soluble in cold water; decomposes in hot water to form acetic acid. Combustible.

Derivation: (a) oxidation of acetaldehyde with air or oxygen with catalyst; (b) by catalyzed thermal decomposition of acetic acid to ketone.

Grades: C.P., technical (75, 85, 90–95%).

Containers: Bottles; carboys; aluminum drums; tank cars.

Hazards: Strongly irritating and corrosive; may cause burns and eye damage. Tolerance, 5 ppm in air. Moderate fire risk. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Cellulose acetate fibers and plastics; vinyl acetate; dehydrating and acetylating agent in production of pharmaceuticals, dyes, perfumes, explosives, etc.; aspirin. Esterifying agent for food starch (5% max.).

Shipping Regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

acetic ester. See ethyl acetate.

acetic ether. See ethyl acetate.

acetic oxide. See acetic anhydride.

acetin (monoacetin; glyceryl monoacetate)

$\text{C}_3\text{H}_5(\text{OH})_2\text{OOCCH}_3$. Acetin may also refer to glyceryl di- or triacetate, also known as diacetin and triacetin (q.v.).

Properties: Colorless, thick liquid; hygroscopic; sp. gr. 1.206 (20/4°C); b.p. 158°C (165 mm); 130°C (3 mm); soluble in water, alcohol; slightly soluble in ether; insoluble in benzene; combustible.

Derivation: By heating glycerol and strong acetic acid, distilling off the weak acetic acid formed and again heating with strong acetic acid and distilling. Method of purification: Rectification.

Hazard: Moderately toxic; irritant.

Uses: Tanning; solvent for dyes; food additive; gelatinizing agent in explosives.

acetoacetanilide (acetylacetanilide)

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_5$.

Properties: White, crystalline solid; m.p. 85°C. Resembles ethyl acetoacetate in chemical reactivity. Slightly soluble in water, soluble in dilute sodium hydroxide, alcohol, ether, acids, chloroform, and hot benzene; density 25 lb/cu ft. Flash point 325°F; combustible.

Derivation: By reacting ethyl acetoacetate with aniline, eliminating ethyl alcohol. Acetoacetanilide may also be prepared from aniline and diketene.

Grades: Technical.

Containers: Fiber drums.

Uses: Organic synthesis; dyestuffs (intermediate in the manufacture of the dry colors generally referred to as Hansa and benzidine yellows).

acetoacet-ortho-anisidide

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{OCH}_3$.

Properties: White crystalline powder; m.p. 86.6°C; sp. gr. 1.1320 (86.6/20°C); flash point (open cup) 325°F. Combustible.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Intermediate for azo pigments.

acetoacet-ortho-chloranilide

Properties: White crystalline powder; m.p. 107°C; b.p. decomposes; sp. gr. 1.1920 (107/20°C); flash point (open cup) 350°F. Almost insoluble in water. Combustible.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Moderately toxic, by ingestion.

Use: Intermediate for azo pigments.

acetoacet-para-chloranilide $\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{Cl}$

Properties: White crystalline powder; m.p. 133°C; b.p. decomposes; flash point (open cup) 320°F. Combustible. Very slightly soluble in water.

Containers: 200-lb drums.

Hazard: Moderately toxic by ingestion.

Use: Intermediate for azo pigments.

acetoacetic acid (acetylacetic acid; diacetic acid; acetone carboxylic acid) $\text{CH}_3\text{COCH}_2\text{COOH}$

Properties: Colorless oily liquid; soluble in water, alcohol, and ether; decomposes below 100°C into acetone and carbon dioxide.

Hazard: Irritant to eyes and skin.

Uses: Organic synthesis.

acetoacetic ester. See ethyl acetoacetate.

acetoacet-para-phenetide

Properties: Crystalline powder; m.p. 108.5°C; b.p. decomposes; sp. gr. 1.0378 (108.5/20°C); flash point (open cup) 325°F. Combustible.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Moderately toxic by ingestion.

Use: Intermediate for azo pigments.

acetoacet-ortho-toluidide $\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$

Properties: Fine, white granular powder; m.p. 106°C; b.p. decomposes; density 1.062 g/ml (106°C); slightly soluble in water. Flash point 320°F; combustible.

Grades: Technical.

Hazard: Moderately toxic.

Uses: Intermediate in the manufacture of Hansa and benzidine yellows.

acetoacet-para-toluidide $\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{CH}_3$

Properties: White crystalline powder; m.p. 93.0–96.0°C; purity, 99% min.

Hazard: Moderately toxic.

Uses: Light-fast yellow pigment intermediate; diazo coupler.

acetoacet-meta-xylylide (AAMX)

Properties: White to light yellow crystalline solid; m.p. 89–90°C; sp. gr. (20°C) 1.238; solubility in water (25°C) 0.5%; flash point 340°F; combustible.

Use: Intermediate for yellow pigments.

acetoaminofluorene. A pesticide. May not be used in food products or beverages (FDA).

Hazard: Toxic by ingestion.

para-acetoanisole. See para-methoxyacetophenone.

acetoglyceride. Usually an acetylated monoglyceride although commercial acetoglycerides will contain di- and triglycerides. See acetostearin.

acetoin. See acetylmethylcarbinol.

acetol. See hydroxy-2-propanone.

acetomerocetol

Properties: White solid; m.p. 155–157°C; freely soluble in alcohol; soluble in ether or chloroform; sparingly soluble in benzene; insoluble in water.

Hazard: Toxic by ingestion.

Use: Medicine (antiseptic, solution 1:1000)

Shipping regulations: (Rail, Air) Mercury compounds, solid, n.o.s., Poison label.

acetone (dimethylketone; 2-propanone) CH_3COCH_3 . 40th highest-volume chemical produced in U.S. (1975).

Properties: Colorless volatile liquid; sweetish odor. M.p. –94.3°C; b.p. 56.2°C; refractive index (20°C) 1.3591; sp. gr. (20/20°C) 0.792; wt/gal (15°C) 6.64 lb; flash point (open cup) 15°F. Autoignition temp. 1000°F. Miscible with water, alcohol, ether, chloroform and most oils.

Derivation: (a) Oxidation of cumene (q.v.); (b) dehydrogenation or oxidation of isopropyl alcohol with metallic catalyst (c) vapor-phase oxidation of butane; (d) by-product of synthetic glycerol production.

Grades: Technical; C.P.; N.F.; electronic; spectrophotometric.

Containers: Cans; drums; tank cars; tank trucks.

Hazard: Flammable; dangerous fire risk. Explosive limits in air 2.6 to 12.8%. Tolerance, 1000 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemicals (methyl isobutyl ketone, methyl isobutyl carbinol; methyl methacrylate; bisphenol-A); paint, varnish and lacquer solvent; cellulose acetate, especially as spinning solvent; to clean and dry parts of precision equipment; solvent for potassium iodide and permanganate; delusterant for cellulose acetate fibers; specification testing of vulcanized rubber products.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

acetone bromoform. See tribromo-*tert*-butyl alcohol.

acetonecarboxylic acid. See acetoacetic acid.

acetone chloroform. See chlorobutanol.

acetone cyanohydrin (alpha-hydroxyisobutyronitrile; 2-methylactonitrile) $(\text{CH}_3)_2\text{COHCN}$

Properties: Colorless liquid; b.p. 82°C (23 mm); m.p. –20°C; density 0.932 (19°C); refractive index n_D^{20} 1.3996; flash point 165°F; soluble in water, alcohol, and ether. Combustible; autoignition temp. 1270°F.

Derivation: Condensing acetone with hydrocyanic acid.

Grades: Technical (97–98% pure).

Containers: 6-gal carboys; 380-lb drums.

Hazard: Toxic. Readily decomposes to hydrocyanic acid and acetone.

Uses: Insecticides; intermediate for organic synthesis, especially methyl methacrylate.

Shipping regulations: (Rail, Air) Poison label.

acetonedicarboxylic acid. See beta-ketoglutaric acid.

acetone oxime. See acetoxime.

acetone semicarbazone $(\text{CH}_3)_2\text{CNNHCONH}_2$. White powder; m.p. 188°C. A chemical intermediate.

acetone sodium bisulfite. See sodium acetone bisulfite.

acetonitrile (methyl cyanide) $\text{CH}_3\text{C}\equiv\text{N}$

Properties: Colorless, limpid liquid; aromatic odor; sp. gr. 0.783; m.p. –41°C; b.p. 82°C; flash point 42°F. Soluble in water and alcohol; high dielectric constant; high polarity; strongly reactive.

Derivation: By-product of propylene-ammonia process for acrylonitrile.

Grades: Technical; nanograde; spectrophotometric.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic. Flammable, dangerous fire risk. Tolerance, 40 ppm in air.

Uses: Solvent in hydrocarbon extraction processes, especially for butadiene; specialty solvent; intermediate; separation of fatty acids from vegetable oils; manufacture of synthetic pharmaceuticals.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

acetonylacetone (1,2-diacetylene; hexanedione-2,5; 2,5-diketohexane) $\text{CH}_3\text{COCH}_2\text{CH}_2\text{COCH}_3$.

Properties: Colorless liquid. Soluble in water; sp. gr. 0.9734 (20/20°C); b.p. 192.2°C; vapor pressure 0.43 mm at 20°C; freezing point -5.4°C; flash point 185°F; wt 8.1 lb/gal (20°C). Combustible; autoignition temp. 920°F.

Derivation: By-product in the production of acetaldehyde from acetylene.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Hazard: Irritant to eyes and skin.

Uses: Solvent for cellulose acetate, roll-coating inks, lacquers, stains; intermediate for pharmaceuticals and photographic chemicals; electroplating.

acetonyl alcohol. See hydroxy-2-propanone.

3-(alpha-acetonylbenzyl)-4-hydroxycoumarin. See warfarin.

3-(alpha-acetonylfurfuryl)-4-hydroxycoumarin (sodium salt also used). A rodenticide.

Hazard: Toxic by ingestion and inhalation.

3-(alpha-acetonyl-4-nitrobenzyl)-4-hydroxycoumarin. See acenocoumarin.

acetophenetidin (para-acetylphenetidin; acetophenetidine; phenacetin; para-ethoxyacetanilide) $\text{CH}_3\text{CONHC}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: White crystals or powder; odorless and stable in air. Soluble in alcohol, chloroform and ether; slightly soluble in water; has slightly bitter taste. M.p. 135°C.

Derivation: By the interaction of para-phenetidin and glacial acetic acid, or of ethyl bromide and para-acetaminophenol.

Method of purification: Crystallization.

Grades: Technical; U.S.P., as phenacetin.

Containers: 100-, 200-, 1000-lb drums.

Hazard: Moderately toxic by ingestion.

Uses: Medicine (analgesic); veterinary medicine.

acetophenone (phenyl methyl ketone; hypnone; acetylbenzene) $\text{C}_6\text{H}_5\text{COCH}_3$.

Properties: Colorless liquid with sweet, pungent odor and taste. B.p. 201.7°C; f.p. 19.7°C; sp. gr. (20/20°C) 1.030; wt/gal (20°C) 8.56 lb; refractive index (20°C) 1.5363; flash point (COC) 180°F. Slightly soluble in water; soluble in organic solvents. Combustible. Low toxicity.

Derivation: (a) Friedel-Crafts process with benzene and acetic anhydride or acetyl chloride; (b) by-product from the oxidation of cumene (c) oxidation of ethylbenzene.

Method of purification: Distillation and crystallization.

Grades: Technical; refined; perfumery.

Containers: Glass bottles; cans; drums; tank cars; tank trucks.

Hazard: Narcotic in high concentrations.

Uses: Perfumery; solvent; intermediate for pharmaceuticals, resins, etc.; flavoring.

"Acetoquat."⁴⁰⁰ Trademark for a series of quaternary ammonium salts.

"Aceto-Slip."⁴⁰⁰ Trademark for a refined oleamide (q.v.).

acetostearin.

$\text{CH}_3(\text{CH}_2)_{16}\text{COOCH}_2\text{CHOHCH}_2\text{OOCCH}_3$. Acetylated glyceryl monostearate. Solid with peculiar combination of flexibility and nongreasiness. Derived from glyceryl monostearate or mixed glycerides by acetylation with acetic anhydride. Used as a protective coating for food and as a plasticizer. Nontoxic.

acetotoluidide. See acetyl-ortho- or -para-toluidine.

acetoxime (acetone oxime; 2-propanone oxime) $(\text{CH}_3)_2\text{CNOH}$.

Properties: Colorless crystals; both basic and acidic in properties. Volatilizes in air. Chloral-like odor. Sp. gr. 0.97 (20/20°C); b.p. 136.3°C; m.p. 61°C. Fairly readily hydrolyzed by dilute acids. Soluble in alcohols, ethers, and water. Combustible.

Grades: Technical.

Uses: Organic synthesis (intermediate); solvent for cellulose ethers; primer for diesel fuels.

ortho-acetoxybenzoic acid. See aspirin.

acetoxylation. A recently developed method of synthesizing ethylene glycol in which ethylene is reacted with acetic acid in the presence of a catalyst such as tellurium-bromine, resulting in formation of mixed mono- and diacetates; this is followed by hydrolysis to ethylene glycol and acetic acid, with up to 95% yield of the glycol. It is thus considerably more efficient than the ethylene oxide method.

4-(para-acetoxyphenyl)-2-butanone. See Q-lure.

acetozone. See acetylbenzoyl peroxide.

"Acetulan."⁴⁹³ Trademark for a special fraction of acetylated lanolin alcohols.

Properties: Anhydrous, pale straw color, practically odorless, low-viscosity liquid. Miscible with ethanol, mineral oil, and other common formulating materials; insoluble in water. Combustible, nontoxic.

Uses: Hydrophobic penetrant; emollient; plasticizer; cosolvent; pigment dispersant; cosmetics.

acetic acid (N-acetylglucine; acetylaminooacetic acid). $\text{CH}_3\text{CONHCH}_2\text{COOH}$.

Properties: Long needles; m.p. 206-208°C; soluble in water and alcohol; slightly soluble in acetone, chloroform; glacial acetic acid; practically insoluble in ether, benzene. Forms stable salts with organic bases.

Use: Medicine.

acetylacetanilide. See acetoacetanilide.

acetylacetic acid. See acetoacetic acid.

acetylacetone $\text{CH}_3\text{COCH}_2\text{OCCH}_3$ (diacetylmethane; pentanedione-2,4).

Properties: Mobile, colorless liquid. Unpleasant odor. When cooled, solidifies to lustrous, pearly spangles. The liquid is affected by light, turning brown and forming resins. B.p. 140.5°C sp. gr. (20/20°C) 0.9753; wt 8.1 lb/gal; freezing point -23.5°C; flash point 105°F (TOC). Soluble in water (acidified by hydrochloric acid); fairly soluble in neutral water; soluble in alcohol, chloroform, ether, benzene, acetone, and glacial acetic. Combustible.

Derivation: By condensing ethyl acetate with acetone.

Containers: 5-gal cans; 55-gal drums.

Hazard: Moderate fire risk; moderately toxic.

Uses: Solvent for cellulose acetate; intermediate; metal chelates; paint driers; lubricant additives; pesticides.

N-acetyl-L(+)-alanine. See alanine.

acetylamino-. See acetamido-.

acetylaminooacetic acid. See aceturic acid.

para-acetylaminobenzenesulfonyl chloride. See N-acetylsulfanilyl chloride.

ortho-acetylaminobenzoic acid. See acetylanthranilic acid.

para-acetylaminophenol (APAP; N-acetyl-para-aminophenol; acetaminophen; para-acetamidophenol; para-hydroxyacetanilide) $\text{CH}_3\text{CONHC}_6\text{H}_4\text{OH}$.

Properties: Crystals; odorless; slightly bitter taste; sp. gr. 1.293 (21/4°C); m.p. 168°C; slightly soluble in water and ether; soluble in alcohol; pH saturated aqueous solution 5.5–6.5.

Derivation: Interaction of para-aminophenol and an aqueous solution of acetic anhydride.

Grade: N.F.

Containers: Drums.

Uses: Intermediate in making pharmaceuticals; stabilizer for hydrogen peroxide.

para-acetylaminophenyl salicylate (phenetsal)

$\text{C}_6\text{H}_4(\text{NHCOCH}_3)\text{OOCCH}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Fine, white, crystalline scales; odorless, tasteless. Soluble in alcohol, ether, and hot water; insoluble in light hydrocarbon solvents; decomposed by strong alkalis. M.p. 187–188°C.

Derivation: By reducing para-nitrophenol salicylate to para-aminophenol salicylate and acetylating the latter.

Containers: Tins; glass bottles.

Hazard: See aspirin.

Use: Medicine (analgesic).

para-acetylanisole. See para-methoxyacetophenone.

N-acetylanthranilic acid (ortho-acetylaminobenzoic acid) $\text{CH}_3\text{CONHC}_6\text{H}_4\text{COOH}$.

Properties: Needles, plates, rhombic crystals (crystallized in glacial acetic acid); m.p. 185°C; slightly soluble in water; soluble in hot alcohol, ether and benzene. Combustible.

Derivation: Oxidation of ortho-acetyltoluidine with potassium permanganate in the presence of magnesium sulfate or potassium chloride.

Grades: Technical.

Uses: Chemical (organic synthesis, anthranilic acid).

acetylation. Introduction of an acetyl radical (CH_3CO) into the molecule of an organic compound having OH or NH_2 groups. The usual reagents for this purpose are acetic anhydride or acetyl chloride. Thus ethyl alcohol $\text{C}_2\text{H}_5\text{OH}$ may be converted to ethyl acetate ($\text{C}_2\text{H}_5\text{OCOCH}_3$). Cellulose is similarly converted to cellulose acetate by treatment with a mixture containing acetic anhydride. Acetylation is commonly used to determine the number of hydroxyl groups in fats and oils (see acetyl value).

acetylbenzene. See acetophenone.

acetyl benzoyl peroxide (acetozone; benzozone)

$\text{C}_6\text{H}_5\text{CO} \cdot \text{O}_2 \cdot \text{OCCH}_3$.

Properties: White crystals; decomposed by water, alkaloids, organic matter and some organic solvents; decomposes slowly and evaporates when gently heated, and instantaneously (possibly explosively) if quickly heated, ground or compressed. M.p. 36.6°C; b.p. 130°C (19 mm); moderately soluble in

ether, chloroform, carbon tetrachloride and water; slightly soluble in mineral oils and alcohol. The commercial product is mixed with a neutral drying powder and contains 50% acetyl benzoyl peroxide.

Hazard: Moderately toxic by ingestion. Strong irritant to skin and mucous membranes. Strong oxidizing agent; dangerous in contact with organic materials. Moderate explosion risk when shocked or heated.

Uses: Medicine (active germicide); disinfectant.

Shipping regulations: (Rail) Solid, not accepted; solution, Yellow label. (Air) Solid, or solutions containing more than 40% by weight of peroxide. Not acceptable. Solutions containing not more than 40% by weight of peroxide in a nonvolatile solvent, Organic Peroxide label. Not acceptable on passenger planes.

acetyl bromide CH_3COBr .

Properties: Colorless, fuming liquid; turns yellow in air; reacts violently with water or alcohol; soluble in ether, chloroform and benzene. B.p. 81°C; m.p. -96°C; sp. gr. 1.663 (16/4°C).

Derivation: Interaction of acetic acid and phosphorus pentabromide.

Grades: Technical.

Containers: Metal bottles; iron drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin.

Uses: Organic synthesis; manufacture of dyes.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

N-acetyl-N-bromodiethylacetyl urea. See acetylcarbromal.

alpha-acetylbutyrolactone (gamma-lactone)

$\text{CH}_3\text{CH}_2\text{CH}(\text{OCCH}_3)\text{C}(\text{O})$.

Properties: Liquid with ester-like odor. Sp. gr. 1.18–1.19 (20°C); b.p. (30 mm) 142–144°C; soluble in water. Combustible.

Derivation: Sodium acetoacetate and ethylene oxide in absolute alcohol.

Use: Intermediate.

acetyl carbinol. See hydroxy-2-propanone.

acetylcarbromal (N-acetyl-N-bromodiethylacetylurea) $(\text{C}_2\text{H}_5)_2\text{CBrCONHCONHCOCH}_3$.

Properties: Crystals, slightly bitter taste; m.p. 109°C. Slightly soluble in water; freely soluble in alcohol, and ethyl acetate.

Hazard: Overdoses may be fatal.

Use: Medicine (sedative).

acetyl chloride (ethanoyl chloride) CH_3COCl .

Properties: Colorless, highly refractive, fuming liquid; strong odor; sp. gr. 1.1051; m.p. -112°C; b.p. 51–52°C; flash point 40°F (closed cup); soluble in ether, acetone, acetic acid.

Derivation: By mixing glacial acetic acid and phosphorus trichloride in the cold and heating a short time to drive off hydrochloric acid. The acetylchloride is then distilled.

Containers: Iron drums; 110-lb carboys. Protect from moisture.

Hazard: Toxic; strong irritant to eyes; flammable, dangerous fire risk. Reacts violently with water and alcohol.

Uses: Organic preparations (acetylating agent); dye-stuffs; pharmaceuticals.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

acetylcholine (acetyl ethanol trimethylammonium hydroxide) $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{N}(\text{CH}_3)_3\text{OH}$. A derivative

of choline important because it acts as the chemical transmitter of nerve impulses in the autonomic system. It has been isolated and identified in brain tissue. The enzyme cholinesterase (q.v.) hydrolyzes acetylcholine into choline and acetic acid, and is necessary in the body to prevent acetylcholine poisoning. See nerve gas.

Uses: Medicine (as bromide and chloride); biochemical research.

See also cholinesterase inhibitor.

acetylcholinesterase. See cholinesterase.

N-acetyl-L-cysteine (USAN)

$\text{HSCH}_2\text{CH}(\text{NHCOCH}_3)\text{COOH}$. The N-acetyl derivative of the naturally occurring amino acid, L-cysteine. Used in medicine.

Grade: N.D.

alpha-acetyldigitoxin (anhydrous) $\text{C}_{43}\text{H}_{66}\text{O}_{14}$.

Properties: Crystals; sparingly soluble in water, ether, petroleum ether; soluble in most organic solvents.

Derivation: Obtained by enzymatic hydrolysis of a digitalis extract.

Hazard: Moderately toxic.

Use: Medicine (heart disease).

acetylene (ethyne) $\text{HC} \equiv \text{CH}$.

Properties: Colorless gas; ethereal odor; sp. gr. 0.91 (air = 1); m.p. -81.8°C (890 mm); b.p. -84°C ; soluble in alcohol, acetone; slightly soluble in water; flash point (closed cup) 0°F ; autoignition temp. 635°F . An asphyxiant gas.

Derivation: (a) by the action of water on calcium carbide; (b) By cracking petroleum hydrocarbons with steam (Wulff process), or natural gas by partial oxidation (BASF process); (c) from fuel oil by modified arc process; (d) from coal by ARC-Coal process (experimental).

Grades: Technical, containing 98% acetylene and not more than 0.05% by volume of phosphine or hydrogen sulfide; 99.5%.

Containers: Steel cylinders; pipeline (see Hazard).

Hazard: Highly flammable; dangerous fire risk; burns with intensely hot flame. Explosive limits in air 2.5 to 80%. Forms explosive compounds with silver, mercury, and copper, which should be excluded from contact with acetylene in transmission systems. Copper alloys may be used with caution. Piping used should be electrically bonded and grounded. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Vinyl chloride and vinylidene chloride; vinyl acetate; welding and cutting metals; acrylonitrile; acrylates; per- and trichloroethylene, cyclooctatetraene; 1,4-butanediol; carbon black.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

acetylene black. The carbon black resulting from incomplete combustion or thermal decomposition of acetylene. See also carbon black.

Properties: High liquid adsorption, retention of high bulk volume; high electrical conductivity.

Containers: Bags; cases.

Uses: Dry cell batteries; component of explosives; reinforcing agent in rubber and in thermal and sound insulation; gloss suppressor in paints; carburizing agent in hardening of steel; pigment in printing inks; filler in electroconductive polymers.

acetylene dichloride. See sym-dichloroethylene.

acetylene hydrocarbon (alkyne). One of a class of unsaturated hydrocarbons of the homologous series having the generic formula $\text{C}_n\text{H}_{2n-2}$ and a structural formula containing a triple bond.

acetylene polymer. The best known polymer of acetylene is cyclooctatetraene, developed by Reppe in Germany during World War II. Another is made with a Ziegler catalyst. Both conjugated and unconjugated types have been synthesized, but no use for them on an industrial scale has yet been found.

acetylene tetrabromide (sym-tetrabromoethane)

$\text{CHBr}_2\text{CHBr}_2$.

Properties: Yellowish liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 2.98 to 3.00; b.p. $239-242^\circ\text{C}$ with decomposition; 151°C (54 mm); m.p. 0.1°C ; refractive index 1.638. Combustible.

Derivation: Interaction of acetylene and bromine, and subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Container: Steel drums.

Hazard: Toxic and irritant by inhalation. Tolerance, 1 ppm in air.

Uses: Separating minerals by specific gravity; solvent for fats, oils, and waxes; fluid in liquid gauges; solvent in microscopy.

acetylene tetrachloride. See sym-tetrachloroethane.

acetylenogen. See calcium carbide.

N-acetyethanolamine (hydroxyethylacetamide)

$\text{CH}_3\text{CONHC}_2\text{H}_4\text{OH}$.

Properties: Brown viscous liquid, soluble in alcohol, ether, and water; sp. gr. 1.122 (20/20°C); boiling range $150-152^\circ\text{C}$ (5 mm), decomposes (10 mm); lb/gal 9.34 (20°C); refractive index $n_{20/D}$ 1.4730; flash point 350°F ; f.p. 15.8°C . Combustible; low toxicity.

Grades: Technical (75% solution in water).

Uses: Plasticizer for polyvinyl alcohol and for cellulosic and proteinaceous materials; humectant for paper products, glues, cork and inks; high-boiling solvent for fountain-pen inks; textile conditioner.

acetyethanoltrimethylammonium hydroxide. See acetylcholine.

acetylugenol. See eugenol acetate.

acetylferrocene (ferrocenyl methyl ketone)

$\text{C}_5\text{H}_5\text{FeC}_5\text{H}_4\text{COCH}_3$. Orange crystalline solid; m.p. $85-86^\circ\text{C}$. Used as an intermediate. See also ferrocene.

acetylformic acid. See pyruvic acid.

N-acetylglycine. See aceturic acid.

acetylide. A salt-like carbide formed by the reaction of acetylene and an alkali or alkaline-earth metal in liquid ammonia, or with silver, copper and mercury salts in aqueous solution. The latter are explosive when shocked or heated. See also carbide; calcium carbide.

acetyl iodide CH_3COI .

Properties: Colorless, transparent, fuming liquid, turning brown on exposure to air or moisture; soluble in ether and benzene; decomposed by water and alcohol. Sp. gr. 1.98; b.p. $105-108^\circ\text{C}$.

Derivation: Interaction of acetic acid, iodine, and phosphorus.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles.

Hazard: Toxic; strong irritant to eyes and skin.

Uses: Organic synthesis.

Shipping regulations: (Rail) Corrosive liquid (n.o.s.).

White label. (Air) Corrosive label.

acetylisoegenol (isoegenol acetate)

$C_6H_3(CHCH_3)(OCH_3)(OCOCH_3)$.

Properties: White crystals; spicy clove-like odor; congealing point 77°C ; soluble 1 part in 27 parts of 95% alcohol. Combustible. Low toxicity.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tin cans.

Uses: Perfumery, particularly for carnation-type odors; flavoring.

acetyl ketene. See diketene.

acetylmethylcarbinol (acetoin; 3-hydroxy-2-butanone; dimethylketol) $CH_3COCHOHCH_3$.

Properties: Slightly yellow liquid or crystalline solid (dimer); oxidizes gradually to diacetyl on exposure to air; sp. gr. 1.016; b.p. $140\text{--}148^\circ\text{C}$; m.p. 15°C ; soluble in alcohol; miscible with water in all proportions; slightly soluble in ether. Combustible. Low toxicity.

Derivation: Reduction of diacetyl.

Grades: Technical; F.C.C. (as acetoin).

Containers: Polyethylene-lined cartons.

Uses: Aroma carrier; preparation of flavors and essences.

acetyl oxide. See acetic anhydride.

acetyl peroxide (diacetyl peroxide) $(CH_3CO)_2O_2$.

Properties: Colorless crystals; m.p. 30°C ; slightly soluble in cold water; soluble in alcohol and ether. Marketed as a 25% solution in dimethyl phthalate; flash point (open cup) 113°F ; f.p. (approx.) -8°C ; sp. gr. (20°C) 1.18. Combustible.

Containers: 65-lb carboys.

Hazard (25% solution): Moderate fire risk. Strong oxidizing agent. Moderately toxic and irritant. The pure (100%) material is a severe explosion hazard; should not be stored after preparation, nor heated above 30°C .

Uses: Initiator and catalyst for resins.

Shipping regulations: (Rail) (Solid) Not accepted. (Solution) Yellow label. (Air) Solid, or solutions containing more than 25% by weight of peroxide, Not acceptable. Solutions containing not more than 25% by weight of peroxide in a nonvolatile solvent, Organic Peroxide label. Not acceptable on passenger planes.

acetylphenetidin. See acetophenetidin.

acetylphenol. See phenyl acetate.

N-acetyl-para-phenylenediamine. See para-aminoacetanilide.

acetylpropionic acid. See levulinic acid.

acetyl propionyl (2,3-pentanedione; methyl ethyl glyoxal; methyl ethyl diketone) $CH_3COCOCH_2CH_3$.

Properties: Yellow liquid; m.p. -52°C ; b.p. $106\text{--}110^\circ\text{C}$; sp. gr. ($15/4^\circ\text{C}$) 0.955–0.959; partly soluble in water. Combustible. Nontoxic.

Grade: 99%.

Use: Flavors of butterscotch and chocolate type.

4-acetylresorcinol (2,4-dihydroxyacetophenone)

$C_6H_3(OH)_2COCH_3$.

Properties: Light tan crystals; m.p. $146\text{--}148^\circ\text{C}$. High absorptivity in ultraviolet light region. Slightly soluble in water; soluble in most organic solvents except benzene and chloroform.

Uses: UV absorber in plastics; dye intermediate; fungicide; plant growth promoter.

acetylsalicylic acid. See aspirin.

N-acetylsulfanilyl chloride (para-acetamidobenzenesulfonyl chloride; para-acetylamino benzenesulfonyl chloride) $(CH_3CONH)C_6H_4(SO_2Cl)$.

Properties: Light tan to brownish powder or fine crystals. M.p. 149°C ; soluble in benzene, chloroform, and ether.

Containers: 150-lb steel drums.

Hazard: May be toxic.

Use: Intermediate in the manufacture of sulfa drugs.

2-acetylthiophene (methyl 2-thienyl ketone)

$CH_3COC_4H_3S$.

Properties: Yellowish oily liquid; m.p. $10\text{--}11^\circ\text{C}$; b.p. 213.5°C ; $88\text{--}90^\circ\text{C}$ (10 mm); very slightly soluble in ether.

Use: Organic intermediate.

acetyl-ortho-toluidine (ortho-acetotoluidide)

$CH_3CONHC_6H_4CH_3$.

Properties: Colorless crystals; m.p. 110°C ; b.p. 296°C ; sp. gr. 1.168 (15°C); soluble in alcohol, ether, benzene, chloroform, glacial acetic acid; slightly soluble in cold water; insoluble in hot water.

Derivation: By boiling glacial acetic acid with ortho-toluidine and distilling the product.

Grade: Technical.

Use: Organic synthesis.

acetyl-para-toluidine (para-acetotoluidide)

$CH_3CONHC_6H_4CH_3$.

Properties: Colorless needles; m.p. 153°C ; b.p. 307°C ; density 1.212 ($15/4^\circ\text{C}$); slightly soluble in water; soluble in alcohol, ether, ethyl acetate, glacial acetic acid.

Grades: Technical.

Containers: Wooden barrels or fiber drums.

Uses: Dyes.

acetyl triallyl citrate

$CH_3COOC_3H_4(COOCH_2CH:CH_2)_3$.

Properties: Liquid; boiling range $142\text{--}143^\circ\text{C}$ (0.2 mm); sp. gr. 1.140 (20°C); refractive index $n_{25/D}$ 1.4665; flash point 365°F . Combustible.

Use: Cross-linking agent for polyesters; monomer for polymerization.

acetyl tributyl citrate $CH_3COOC_3H_4(COOC_4H_9)_3$.

Properties: Colorless, odorless liquid. Distillation range (1 mm) $172\text{--}174^\circ\text{C}$; pour point -75°F ; sp. gr. (25°C) 1.046; wt/gal (25°C) 8.74 lb; refractive index (25°C) 1.4408; viscosity (25°C) 42.7 cps. Insoluble in water. Flash point 400°F . Combustible; low toxicity.

Derivation: Esterification and acetylation of citric acid.

Grade: Technical.

Containers: Metal drums; tanks.

Uses: Plasticizer for vinyl resins.

acetyl triethyl citrate $CH_3COOC_3H_4(COOC_2H_5)_3$.

Properties: Colorless, odorless liquid. Distillation range (1 mm) $131\text{--}132^\circ\text{C}$; pour point -45°F ; sp. gr. (25°C) 1.135; wt/gal (25°C) 9.47 lb; refractive index (25°C) 1.4386; viscosity (25°C) 53.7 cps. Slightly

soluble in water. Flash point 370°F; combustible; low toxicity.

Derivation: Esterification and acetylation of citric acid.

Grades: Technical.

Containers: Metal drums; cans.

Uses: Plasticizer for cellulose, particularly ethyl cellulose.

acetyl tri-2-ethylhexyl citrate

Properties: Liquid; b.p. 225°C (1 mm); insoluble in water. Flash point 430°F. Combustible; low toxicity.

Grades: Technical.

Use: Low-volatility plasticizer for vinyl resins.

N-acetyltryptophan. Available commercially as N-acetyl-L-tryptophan; m.p. 185–186°C; N-acetyl-DL-tryptophan, m.p. 205°C.

Use: Nutrition and biochemical research; medicine.

acetyl valeryl (heptadione-2,3) $\text{CH}_3\text{COCOC}_4\text{H}_9$. Yellow liquid, 92% pure. Combustible. Nontoxic.

Uses: Cheese, butter, and miscellaneous flavors.

acetyl value. The number of milligrams of potassium hydroxide required for neutralization of acetic acid obtained by the saponification of one gram of acetylated fat or oil sample. Acetylation is carried out by boiling the sample with an equal amount of acetic anhydride, washing and drying. Saponification values on the acetylated and on untreated fat are determined. From the results the acetyl value is calculated. It is a measure of the number of free hydroxyl groups in the fat or oil.

ACGIH. Abbreviation for American Conference of Governmental Industrial Hygienists. See threshold limit values.

"Achromycin."³¹⁵ Trademark for tetracycline hydrochloride.

acicular. Needle-shaped; used in describing crystals or the particles in powders.

acid. One of a large class of chemical substances whose water solutions have one or more of the following properties: sour taste, ability to make litmus dye turn red and to cause other indicator dyes to change to characteristic colors, ability to react with and dissolve certain metals to form salts, and ability to react with bases or alkalis to form salts. All acids contain hydrogen. In water, ionization or splitting of the molecule occurs, so that some or most of this hydrogen forms H_3O^+ ions (hydronium ions), usually written more simply as hydrogen ions, H^+ .

Acids are referred to as strong or weak according to the concentration of hydrogen ion that results from ionization. Hydrochloric acid (HCl), nitric acid (HNO_3), and sulfuric acid (H_2SO_4), are strong or highly ionized acids; acetic acid (CH_3COOH) and carbonic acid (H_2CO_3) are weak acids. Tenth normal HCl is 100 times as acid ($\text{pH} = 1$) as tenth normal acetic acid ($\text{pH} = 3$). pH range of acids is from 6.9 to 1. See also pH .

When dealing with chemical reactions in solvents other than water it is sometimes convenient to define an acid as a substance that ionizes to give the positive ion of the solvent. The common definitions of acid have been extended as more detailed studies of

chemical reactions were made. The Lowry-Bronsted definition of an acid as a substance that can give up a proton is more useful in connection with an understanding of bases (see base). Perhaps the most significant contribution to the theory of acids was the electron-pair concept introduced by G. N. Lewis about 1915. See Lewis electron theory.

A brief outline of the major groups of acids is as follows:

Inorganic

Mineral acids: sulfuric, nitric, hydrochloric, phosphoric.

Hazard: All mineral acids are highly irritating and corrosive to human tissue.

Organic

Carboxylic (contain $-\text{COOH}$ group)

aliphatic: acetic, formic

aromatic: benzoic, salicylic

Dicarboxylic (contain 2 $-\text{COOH}$ groups)

oxalic, phthalic, sebacic, adipic

Fatty acids (contain $-\text{COOH}$ group)

aliphatic: oleic, palmitic, stearic

aromatic: phenylstearic

Amino acids: nitrogen-containing protein components

For further details see Lewis acid, carboxylic acid, fatty acid, amino acid, and specific compounds.

1, 2, 4 acid. See 1-amino-2-naphthol-4-sulfonic acid.

acid amide. See amide.

acid ammonium tartrate. See ammonium bitartrate.

acid anhydride. An oxide of a nonmetallic element of an organic radical which is capable of forming an acid when united with water, or which can be formed by the abstraction of water from the acid molecule, or which can unite with basic oxides to form salts.

acid butyl phosphate. See *n*-butyl acid phosphate.

acid calcium phosphate. See calcium phosphate, monobasic.

acid dye. An azo, triarylmethane or anthraquinone dye with acid substituents such as nitro-, carboxy-, or sulfonic acid. They are most frequently applied in acid solution to wool and silk, and no doubt combine with the basic groups of the proteins of those animal fibers. Orange II (C.I. 15510), black 10B and acid alizarine blue B are examples.

acid ethylsulfate. See ethylsulfuric acid.

"Acidex."²⁰⁵ Trademark for an epoxy coating.

acid fungal protease (fungal protease enzyme). Highly off-white powder. Used as replacement for pepsin; chill-proofing agent for beer; in cereal treatment; feed supplement for baby pigs; rennet extender.

acid glaucine blue. See peacock blue.

acid, hard. See Lewis electron theory.

acidic oxide. An oxide of a nonmetal, e.g., SO_2 , CO_2 , P_2O_5 , SO_3 , which forms acids when combined with water. See also acid anhydride.

acidimetry. The determination of the concentration of acid solutions or of the quantity of acid in a sample or mixture. This is usually done by titration with a solution of base of known strength (standard solution) and an indicator is used to establish the end point. See also pH .

acid lining. Silica brick lining used in steel-making furnaces.

acid magnesium citrate. See magnesium citrate, dibasic.

acid magnesium phosphate. See magnesium phosphate, monobasic.

acid methyl sulfate. See methylsulfuric acid.

acid mine drainage (AMD). Water from both active and inactive coal mines which has become contaminated with sulfuric acid as a result of hydrolysis of ferric sulfate, the oxidation product of pyrite. This is a factor in water and stream pollution, which can be corrected by use of appropriate ion-exchange resins. See also "Amberlite."

"Acidol."¹⁶² Trademark for betaine hydrochloride. (q.v.)

"Acidolene."²⁴⁴ Trademark for a series of sulfonated oils made from neatsfoot, sperm, cod, fish and coconut oil.

Uses: Leather industry, as fatliquor. Also used wherever an oil emulsifiable in water is needed for plasticizing or softening.

acid phosphatase. An enzyme found in blood serum which catalyzes the liberation of inorganic phosphate from phosphate esters. Optimum pH 5; is less active than alkaline phosphatase.

Uses: Biochemical research.

acid phosphate. An acid salt of phosphoric acid such as NaH_2PO_4 , CaHPO_4 , etc. Also used to refer specifically to calcium phosphate monobasic, $\text{Ca}(\text{H}_2\text{PO}_4)_2$, or superphosphate of lime.

acid potassium oxalate. See potassium binoxalate.

acid potassium sulfate. See potassium bisulfate.

acid, soft. See Lewis electron theory.

acidulant. Any of a number of acids (mostly organic) used in food processing as flavor intensifiers, preservatives, buffers, meat-curing agents, viscosity modifiers, etc. Those most commonly used are citric, fumaric, propionic, sorbic, lactic, succinic, adipic, malic, and tartaric acids.

"Acidulin."¹⁰⁰ Trademark for glutamic acid hydrochloride (q.v.).

acid value. The number of milligrams of potassium hydroxide neutralized by the free acids present in one gram of oil, fat, or wax. The determination is made by titrating the sample in hot 95% ethyl alcohol, using phenolphthalein as indicator.

Acid Yellow 9. See 4-aminoazobenzene-3,4'-disulfonic acid.

"Acitene."²⁵² Trademark for a group of terpene products from tall oil.

"Acintol."²⁵² Trademark for a series of tall oils, crude and distilled, and tall oil derivatives, such as fatty acids, rosins, tall oil heads, pitch. The derivatives are usually obtained by fractional distillation. Combustible.

Uses: Adhesives; cement; intermediates; degreasing compounds; emulsifiers; flotation agents; ink vehicles; leather chemicals; lubricants; metallic soaps; oil-well drilling muds; paints and varnishes; rubber chemicals; soaps and cleaners.

"Acitrol."³²⁰ Trademark for a series of pickling inhibitors for acid baths.

"ACL."⁵⁵ Trademark for a series of solid, organic chlorine-liberating compounds; used in bleaches, cleansers, sanitizers, etc.

"Aclar."⁵⁰ Trademark for a series of fluorohalocarbon films. Retail useful properties from -320°F to $+390^\circ\text{F}$. Used in packaging applications, where a transparent, vapor and/or gas barrier is required, as in packaging of foods for astronauts. Used in electronic and electrical applications because of insulating and heat-resistant properties. Extreme chemical resistance and ability to seal make it useful as a tank lining, etc.

"A-C-M."²⁹⁹ Trademark for a balanced mixture of ascorbic acid (vitamin C) and citric acid, used as an antioxidant that protects flavor and prevents browning of fruits exposed to air. Used in home freezing and canning of fresh fruits.

"Acofor."⁷⁹ Trademark for distilled tall oil fatty acids. Properties: Sp. gr. 0.907 ($25/25^\circ\text{C}$); refractive index (20°C) 1.471; flash point (open cup) 380°F ; acid number 192; saponification number 194; unsaponifiable matter 2.5%; rosin acids 4.5%. Combustible. Uses: Paint and varnish; inks; soaps; disinfectants; textile oils; core oils, etc. See also "Aconew."

acoin. See di-para-anisyl-para-phenetylguanidine hydrochloride.

"Aconew."⁷⁹ Trademark for pale distilled tall oil fatty acids. See also "Acofor."

aconite (monkshood; wolfsbane; friar's cowl).

Derivation: Dried tuberous root or leaves of the perennial herbaceous plant *Aconitum napellus*.

Occurrence: Mountainous regions of Europe, Asia and North America.

Grades: Technical.

Containers: Burlap bags and bales.

Hazard: Toxic by ingestion and skin absorption.

Uses: Medicine and veterinary medicine.

aconitic acid (propene-1,2,3-tricarboxylic acid)

$\text{H}(\text{COOH})\text{C}:\text{C}(\text{COOH})\text{CH}_2(\text{COOH})$.

Properties: White to yellowish crystalline solid; m.p. (about) 195°C with decomposition; soluble in water and alcohol. Nontoxic. Combustible.

Derivation: (a) By dehydration of citric acid with sulfuric acid; (b) extraction from sugar cane bagasse, *Aconitum napellus* and other natural sources.

Uses: Preparation of plasticizers and wetting agents; antioxidant; organic syntheses; making itaconic acid.

"Acousti-Celotex."³⁵¹ Trademark for sound-absorbing tile or panels made from cellulose fibers or mineral wool fibers with an organic binder.

"A-C" Polyethylene.¹⁷⁵ Trademark for a series of low molecular weight polyethylenes. Available in both emulsifiable and nonemulsifiable grades.

Containers: 50-lb multiwall paper bags.

Uses: Coating containers and paper; printing inks, paints and paste polishes; rubber lubricants and mold release agents; emulsifiable grades in various liquid polishes, textile finishes, paper sizes.

acraldehyde. See acrolein.

"Acrawax."⁷³ Trademark for a series of synthetic waxes supplied in solid and powdered forms. Melting range from 83 to 143°C . Used as antitack agents; flattening agents in paint; lubricant and mold release agents for butyl and neoprene elastomers; adhesives; rubber; plastics.

acridine $\text{C}_{13}\text{H}_9\text{N}$ (tricyclic).

Properties: Small colorless needles. Soluble in alco-

hol, ether or carbon disulfide, sparingly soluble in hot water. Sublimes at 100°C; m.p. 111°C; b.p. above 360°C.

Derivation: (a) By extraction with dilute sulfuric acid from the anthracene fraction from coal tar and adding potassium dichromate. The acridine chromate precipitated is recrystallized, treated with ammonia and recrystallized. (b) Synthetically.

Hazard: Carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Uses: Manufacture of dyes; derivatives, especially acriflavine, proflavine; analytical reagent.

acriflavine C₁₄H₁₄N₃Cl. A mixture of 3,6-diamino-10-methylacridinium chloride and 3,6-diaminoacridine.

Properties: Brownish or orange, odorless, granular powder. Soluble in 3 parts of water; incompletely soluble in alcohol; nearly insoluble in ether and chloroform; the aqueous solutions fluoresce green on dilution. Also available as the hydrochloride.

Uses: Antiseptic and bacteriostat.

"Acrilan."⁷⁵⁸ Trademark for a synthetic acrylic fiber.

Properties: Tenacity (wet and dry) 3 g/denier; softened by heat at 455°F; resistant to common solvents, mineral acids and weak alkalis. Can be satisfactorily wet-laundered. Ignites readily; not self-extinguishing.

Derivation: A solution of polymerized acrylonitrile is forced through minute holes of a spinneret, the solvent is removed, and the resulting fiber is stretched.

Uses: Woven and knitted clothing fabrics; carpets; drapes; upholstery; electrical insulation; laminates.

"Acrilex" 100.¹²⁵ Trademark for a durable, non-nitrogenous textile reactant; a cross-linking agent for cellulose.

Containers: 55-gal drums.

Hazard: Strong irritant to eyes and skin.

"Acricol."⁷⁴⁹⁶ Trademark for an aqueous acrylic emulsion. Used as a fabric finish, hand modifier, anticrock agent for pigment prints, non-woven binder, and upholstery backing.

"Acriviolet."⁷²⁴³ Trademark for dye mixture used as oral antiseptic.

acroleic acid. See acrylic acid.

acrolein (2-propenal; acrylaldehyde; allyl aldehyde; acraldehyde) CH₂CHCHO.

Properties: Colorless or yellowish liquid; disagreeable choking odor. Soluble in water, alcohol and ether. Polymerizes readily unless inhibitor (hydroquinone) is added. Very reactive. B.p. 52.7°C; m.p. -87.0°C; sp. gr. (20/20°C) 0.8427; wt/gal (20°C) 7.03 lb; flash point (COC) below 0°F. Autoignition temp. 532°F.

Derivation: (a) Oxidation of allyl alcohol or propylene; (b) by heating glycerol with magnesium sulfate; (c) from propylene with bismuth-phosphorus-molybdenum catalyst.

Method of purification: Rectification.

Grades: Technical.

Containers: Up to tanks.

Hazard: Toxic by inhalation and ingestion; strong irritant to eyes and skin. Tolerance, 0.1 ppm in air. Flammable, dangerous fire risk. Explosive limits in air 2.8 to 31%. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Intermediate for synthetic glycerol, polyurethane, and polyester resins, methionine, pharmaceuticals; herbicide; tear gas.

Shipping regulations: (inhibited) (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes. (uninhibited) Not acceptable.

acrolein dimer (2-formyl-3,4-dihydro-2H-pyran)

ÖCH:CHCH₂CH₂CHCHO.

Properties: Liquid; sp. gr. 1.0775 (20°C); b.p. 151.3°C; freezing point -100°C; flash point (open cup) 118°F; wt/gal (20/20°C) 8.96 lb; soluble in water. Combustible.

Containers: 55-gal drums.

Hazard: Moderate fire risk.

Uses: Intermediate for resins, pharmaceuticals, dyes-stuffs.

"Acronal."⁷⁴⁴⁰ Trademark for dispersions, solutions, and solids of acrylate homo- and copolymers.

"Acrylafil."⁷⁵³⁹ Trademark for styrene-acrylonitrile polymer with glass fiber reinforcement. Available with 35 and 40% glass fiber content.

acrylaldehyde. See acrolein.

acrylamide CH₂CHCONH₂.

Properties: Colorless, odorless crystals; m.p. 84.5°C; b.p. (25 mm) 125°C; sp. gr. 1.122 (30°C); soluble in water, alcohol, acetone; insoluble in benzene, heptane. The solid is stable at room temperature but may polymerize violently on melting.

Derivation: Hydration of acrylonitrile with sulfuric acid (84.5%) and neutralization.

Grade: Technical (approximately 97% pure).

Containers: Fiber drums.

Hazard: Toxic by skin absorption. Tolerance, 0.3 mg per cubic meter of air.

Uses: Synthesis of dyes, etc.; cross-linking agent; adhesives, paper and textile sizes, soil conditioning agents; flocculants; sewage and waste treatment; ore processing; permanent press fabrics.

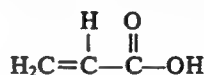

acrylate. (1) Any of several monomers used for the manufacture of thermosetting acrylic surface coating resins, e.g., 2-hydroxyethyl acrylate (HEA) and hydroxypropyl acrylate (HPA).

(2) Polymer of acrylic acid or its esters, used in surface coatings, emulsion paints, paper and leather finishes, etc.

See also acrylic acid; acrylic resin.

"Acrylene."⁷²⁶⁵ Trademark for a modified acrylic latex particularly useful as an exterior paint vehicle.

acrylic acid (acroleic acid; propenoic acid)

Properties: Colorless liquid; acrid odor. Polymerizes readily. Miscible with water, alcohol and ether. B.p. 140.9°C; m.p. 12.1°C; sp. gr. (20/20°C) 1.052; vapor pressure (20°C) 3.1 mm; wt/gal (20°C) 8.6 lb; refractive index (20°C) 1.4224; flash point (open cup) 130°F. Combustible.

Derivation: (a) Condensation of ethylene oxide with hydrocyanic acid followed by reaction with sulfuric acid at 320°F; (b) acetylene, carbon monoxide and water, with nickel catalyst; (c) propylene is vapor-oxidized to acrolein, which is oxidized to acrylic acid at 300°C with molybdenum-vanadium catalyst.

Grades: Technical (esterification and polymerization grades); glacial (97%).

Containers: Bottles; drums; tank cars.

Hazard: Irritant and corrosive to skin. May polymerize with explosive violence. Moderate fire risk.
Use: Monomer for polyacrylic and polymethacrylic acids and other acrylic polymers. See acrylic resin.
Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) (inhibited) Corrosive label; (uninhibited) Not acceptable.

acrylic fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85% by weight of acrylonitrile units $-\text{CH}_2\text{CH}(\text{CN})-$ (Federal Trade Commission).

Properties: Tensile strength, 2 to 3 g/denier; water absorption 1.5 to 2.5%; sp. gr. about 1.17.

Hazard: Readily combustible; fumes may be toxic.

Uses: Modacrylic fibers; blankets; carpets.

See also modacrylic fiber; acrylic resin.

acrylic resin. Thermoplastic polymers or copolymers of acrylic acid, methacrylic acid, esters of these acids, or acrylonitrile. The monomers are colorless liquids that polymerize readily in the presence of light, heat, or catalysts such as benzoyl peroxide; they must be stored or shipped with inhibitors present to avoid spontaneous and explosive polymerization. See also acrylic acid, acrylonitrile, methyl methacrylate; acrylic fiber, nitrile rubber.

Properties: Acrylic resins vary from hard, brittle solids to fibrous, elastomeric structures to viscous liquids, depending on the monomer used and the method of polymerization. A distinctive property of cast sheet and extruded rods of acrylic resin is ability to transfer light through the solid material as exemplified in "Lucite" and "Plexiglas."

Uses: Bulk-polymerized: Hard, shatterproof transparent or colored material (glass substitute, decorative illuminated signs, contact lenses, dentures, medical instruments, specimen preservation, furniture components). Suspension-polymerized: beads and molding powders (headlight lenses, adsorbents in chromatography, ion-exchange resins). Solution polymers: coatings for paper, textiles, wood, etc. Aqueous emulsions: adhesives, laminated structures, fabric coatings, nonwoven fabrics. Compounded prepolymers: exterior auto paints, applied by spray and baked. Acrylonitrile-derived acrylics are extruded into synthetic fibers and are also the basis of the nitrile family of synthetic elastomers.

"Acryloid" Coating Resins.²³ Trademark for acrylic ester polymers in organic solvent solutions or 100% solids form, water-white and transparent. Films range from very hard to very soft.

Use: Exceptionally resistant surface coatings, such as heat-resistant and fumeproof enamels, vinyl and plastic printing, fluorescent coatings, clear and pigmented coatings on metals.

"Acryloid" Modifiers.²³ Trademark for thermoplastic acrylic polymers in powder form. Various grades facilitate processing or improve physical properties of rigid or semi-rigid poly (vinyl chloride) formulations.

"Acryloid" Oil Additives.²³ Trademark for acrylic polymers supplied in special oil solution or in diester lubricant.

Use: Viscosity-index improvement, pour-point depression of lubricating oils and hydraulic fluids, sludge dispersancy in lubricating and fuel oils

"Acrylon."⁶⁵ Trademark for a group of acrylic rubbers outstanding in resistance to oil, grease, ozone, and oxidation.

Uses: Gaskets and rubber parts for contact with oils and diester lubricants.

acrylonitrile (propenenitrile; vinyl cyanide) $\text{H}_2\text{C}=\text{CHCN}$.
Properties: Colorless, mobile liquid; mild odor; freezing range -83° to -84°C ; b.p. $77.3-77.4^\circ\text{C}$; sp. gr. 0.8004 (25°C); flash point (TOC) 32°F . Soluble in all common organic solvents; partially miscible with water.

Derivation: (a) From propylene, oxygen, and ammonia with either bismuth phosphomolybdate or a uranium-based compound as catalyst; (b) addition of hydrogen cyanide to acetylene with cuprous chloride catalyst; (c) dehydration of ethylene cyanohydrin.

Containers: Tank cars; tank trucks.

Hazard: Toxic by inhalation and skin absorption. Flammable, dangerous fire risk. Explosive limits in air 3 to 17%. Tolerance, 20 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Monomer for acrylic and modacrylic fibers and high-strength whiskers; ABS and acrylonitrile-styrene copolymers; nitrile rubber; cyanoethylation of cotton; synthetic soil blocks (acrylonitrile polymerized in wood pulp); organic synthesis; grain fumigant; monomer for a semiconductive polymer that can be used like inorganic oxide catalysts in dehydrogenation of *tert*-butyl alcohol to isobutylene and water; bottles for soft drinks.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

acrylonitrile-butadiene rubber. See nitrile rubber.

acrylonitrile-butadiene-styrene resin. See ABS resin.

acrylonitrile dimer. See methylene glutaronitrile.

acrylonitrile-styrene copolymer. A thermoplastic blend of acrylonitrile and styrene monomers having good dimensional stability and suitable for use in contact with foods. Among its numerous applications is that of bottles for soft drinks (trademarked "Cyclesafe"). FDA regulations limit the amount of acrylonitrile monomer that can migrate from the container to the contents to 0.3 ppm.

acryloyl chloride (acrylyl chloride) $\text{H}_2\text{CCHCOCl}$.
 Liquid; b.p. 75°C .

Containers: Glass containers, up to 55 gal.

Uses: Monomer; intermediate.

"Acrysol."²³ (1) Trademark for aqueous solutions of sodium polyacrylate or other polymeric acrylic salts.
Use: Thickeners in paints, fabric coatings and backings; adhesives.

(2) Trademark for polyacrylic acid and copolymer products in aqueous solutions or dispersions. Some grades are solutions of sodium polyacrylate.

Use: Warp size for synthetic fibers, cotton and rayon; modifier of starch sizes.

A.C.S. Abbreviation for American Chemical Society (q.v.)

"Actafoam."⁵¹¹ Trademark for an activator-stabilizer for vinyl foams containing azodicarbonamide. Lead-free.

"Actane."¹⁴² Trademark for fluoride-containing additive supplied in powder form for acid pickling solutions to dissolve siliceous films on metals as well as to assist in etching aluminum and other metals.

ACTH (adrenocorticotrophic hormone; corticotropin). One of the hormones secreted by the anterior lobe of the pituitary gland. It stimulates an increase in the secretion of the adrenal cortical steroid hormones. It is a polypeptide consisting of a 39-unit chain of amino acids, the sequence varying in certain positions with the biological species. ACTH was synthesized in 1960.

Properties: White powder; freely soluble in water; soluble in 60–70% alcohol or acetone. Solutions are stable to heat. Molecular weight is approximately 3500.

Source: Extracted from whole pituitary glands of swine, sheep and ox. Normally isolated from swine.

Grades: Pure; U.S.P., as corticotropin injections.

Units: Based on comparison with U.S.P. Corticotropin Reference Standard.

Hazard: May have damaging side effects.

Uses: Medicine; biochemical research; veterinary medicine.

"Acti-dione."⁵¹⁹ Trademark for antibiotic cycloheximide, an agricultural fungicide.

"Actidip."²⁰⁴ Trademark for a mildly alkaline powder having the property of refining crystal size in phosphate baths when used just prior to the phosphate. Commercially available in 100-lb fiber drums.

"actif • 8."⁷¹ Trademark for a phosphate leavening system consisting of sodium aluminum phosphate and anhydrous monocalcium phosphate. (F.C.C.)

actinide series (actinoid series). The group of radioactive elements starting with actinium (q.v.) and ending with Element 105. All are classed as metals. Those with atomic number higher than 92 are called transuranic elements. The series includes the following elements: actinium, 89; thorium, 90; protoactinium, 91; uranium, 92; neptunium, 93; plutonium, 94; americium, 95; curium, 96; berkelium, 97; californium, 98; einsteinium, 99; fermium, 100; mendelevium, 101; nobelium, 102; lawrencium, 103; rutherfordium, 104; and hahnium, 105. The isotopes of several of these elements are under study for possible uses in such fields as radiography, neutron activation analysis, hydrology, and geophysics.

actinium Ac A radioactive metallic element; first member of the actinide series (q.v.)

Properties: Atomic number 89; atomic weight 227 (most stable isotope); silvery white metal; m.p. 1050°C; b.p. (est) 3200°C; oxidation state +3. Eleven radioactive isotopes; 227 has half-life of 21.8 years.

Derivation: Uranium ores; neutron bombardment of radium. Several compounds have been prepared. Available commercially at 98% minimum purity.

Hazard: Radioactive poison, radiation being of the bone-seeking type.

Uses: Radioactive tracer (225 isotope).

See also lanthanum, to which actinium is closely similar.

actinomycin. A family of antibiotics produced by Streptomyces; reported to be active against *E. coli*, other bacteria, fungi and to have cytostatic and radiomimetic activity. There are many forms of actinomycin; two of commercial importance are actinomycin and dactinomycin.

activated alumina. See alumina, activated.

activated carbon. See carbon, activated.

activated sludge. See sewage sludge.

activation. The process of treating a substance or a molecule or atom by heat or radiation or the presence of another substance so that the first mentioned substance, atom or molecule will undergo chemical or physical change more rapidly or completely. Common types of activation are:

(1) Processing of carbon black, alumina and other materials to impart improved adsorbent qualities. Subjecting the material to steam or carbon dioxide at high temperatures is the method usually used. See alumina, activated; carbon, activated.

(2) Heating or otherwise supplying energy to a substance (for example, ultraviolet or infrared radiation) to attain the necessary level of energy for the occurrence of a chemical reaction, or for emission of desired light waves, as in fluorescence or chemical lasers. The term excitation is also used.

(3) An important variation of (2) is the process of making a material radioactive by bombardment with neutrons, protons, or other nuclear particles. See also activation analysis.

(4) Catalysis (q.v.), basically a process by which energy of activation for occurrence of a reaction is lowered by the presence of a non-reacting substance.

activation analysis. An extremely sensitive technique for identifying and measuring very small amounts of various elements. A sample is exposed to neutron bombardment in a nuclear reactor, for the purpose of producing radioisotopes from the stable elements. The characteristics of the induced radiations are sufficiently distinct that different elements in the sample can be accurately identified. The technique is particularly useful when concentrations of the elements are too small to be measured by ordinary means. Trace elements have thus been determined in drugs, fertilizers, foods, fuels, glass, minerals, dusts, water, toxicants, etc.

activator. (1) A metallic oxide that makes possible the cross-linking of sulfur in rubber vulcanization. By far the most widely used is zinc oxide; in rubber mixes where no organic accelerator is used, oxides of magnesium, calcium or lead are effective.

(2) A fatty acid that increases the effectiveness of acidic organic accelerators; stearic acid is generally used, especially with thiazoles.

(3) A substance necessary in trace quantities to induce luminescence in certain crystals. Silver and copper are activators for zinc sulfide and cadmium sulfide.

See also initiator.

active amyl alcohol. See 2-methyl-1-butanol.

active carbon. See carbon, activated.

activity. (1) Chemical activity (thermodynamic activity):

A quantity replacing actual molar concentration in mathematical expressions for the equilibrium constant so as to eliminate the effect of concentration on equilibrium constant. (2) Activity coefficient: A fractional number which when multiplied by the molar concentration of a substance in solution, yields the chemical activity. This term gives an idea of how much interaction exists between molecules at higher concentrations. (3) Activity of metals or elements: An active element will react with a compound of a less active element, to produce the latter as the free element, and the active element ends up in a new compound. Thus, magnesium, an active metal, will displace copper from copper sulfate to form magnesium sulfate and free metallic copper; chlorine will liberate iodine from sodium iodide, and sodium chloride is formed. See electromotive series. (4) Activity product: The number resulting from the multiplication of the activities of slightly soluble substances. This is frequently called the solubility product. (5) Catalytic activity: See catalysis. (6) Optical activity: The

existence of optical rotation (q.v.) in a substance. (7)
Radioactivity (q.v.).

activity coefficient. See activity (2).

activity series (displacement series; electromotive series).

An arrangement of the metals in the order of their tendency to react with water and acids, so that each metal displaces from solution those below it in the series and is displaced by those above it. The arrangement of the more common metals is: potassium, sodium, magnesium, aluminum, zinc, iron, tin, lead, hydrogen, copper, mercury, silver, platinum, gold.

"Acto."⁵¹ Trademark for refined petroleum sodium sulfonate. Used as an oil-soluble emulsifier and surface-active agent.

"Actol."²⁴³ Trademark for a series of polyoxypropylene diols, triols, and polyols. These vary in molecular weight from about 1,000 to 3,600; the diols and triols are almost insoluble in water, but the polyols are completely miscible with it.

Containers: 55-gal drums.

Uses: Urethane foams, elastomers, and coatings.

acyl. An organic acid group in which the OH of the carboxyl group is replaced by some other substituent (RCO—). Examples: acetyl, $\text{CH}_3\text{CO—}$; benzoyl, $\text{C}_6\text{H}_5\text{CO—}$.

ADA. Abbreviation for acetonedicarboxylic acid. See beta-ketoglutaric acid.

"Adalin."¹⁶² Trademark for carbromal or bromo-diethylacetylurea (q.v.).

1-adamantanamine hydrochloride. See amantadine hydrochloride.

adamantane (diamantane; sym-tricyclodecane) $\text{C}_{10}\text{H}_{16}$. Has unique molecular structure consisting of four fused cyclohexane rings. White crystals; m.p. 205–210°C (subl); about 99% pure. Derivatives recently developed (alkyl adamantanes) have potential uses in imparting heat-, solvent-, and chemical resistance to many basic types of plastics. Synthetic lubricants and pharmaceuticals are also based on adamantane derivatives. See also "Symmetrel."

Adams, Roger (1889–1971). American chemist, born in Boston; graduated from Harvard, where he taught chemistry for some years. After studying in Germany he moved to the University of Illinois in 1916, where he later became Chairman of the Dept. of Chemistry (1926–1954). During his prolific career he made this department one of the best in the country, and strongly influenced the development of industrial chemical research in the U.S. His executive and creative ability made him an outstanding figure as a teacher, innovator and administrator. Among his research contributions were development of platinum hydrogenation catalysts, and structural determinations of chaulmoogric acid, gossypol, alkaloids, and marijuana. He held many important offices, including presidency of the ACS and AAAS, and was a recipient of the Priestley medal.

adamsite. See diphenylamine chloroarsine.

addition polymer. A polymer formed by the direct addition or combination of the monomer molecules with one another. An example is the formation of polystyrene by stepwise combination of styrene monomer units (about 1000 per macromolecule). See also polymerization.

additive. This general term is conventionally defined as any substance incorporated into a base material,

usually in low concentrations, to perform a specific function, e.g., antioxidants, stabilizers, colorants, inhibitors, preservatives, thickeners, softeners, driers, dispersing agents, plasticizers, viscosity-index improvers, pour-point depressants, biodegrading agents, and numerous others. They are used in many fields (petroleum products, foods, paints, plastics, rubber, textiles, and cosmetics).

Note: This definition does not make a necessary distinction between ingredients that are essential to the existence of the end product and those that are merely helpful and thus of secondary importance. It is questionable whether ingredients without which the end product could not exist should be considered additives. For example, leavening agents are essential to the existence of bread and other bakery products, as are blowing agents to cellular plastics; emulsifiers are essential to mayonnaise; and sulfur or its equivalent is essential to vulcanized rubber. These are in fact base materials rather than additives, since they are essential to a satisfactory end product.

See also food additive.

additive, unintentional. See food additive.

adduct. See inclusion complex.

adenine (6-aminopurine) $\text{C}_5\text{H}_5\text{N}_5$.

Properties: White, odorless microcrystalline powder with sharp salty taste. M.p. 360–5°C (dec.). Very slightly soluble in cold water; soluble in boiling water, acids and alkalies; slightly soluble in alcohol; insoluble in ether and chloroform. Aqueous solutions are neutral.

Occurrence: Ribonucleic acids and deoxyribonucleic acids, nucleosides, nucleotides, and many important coenzymes.

Derivation: By extraction from tea; by synthesis from uric acid; prepared from yeast ribonucleic acid.

Use: Medicine and biochemical research.

adenosine (adenine riboside; 9-beta-D-ribofuranosyladenine) $\text{C}_5\text{H}_4\text{N}_5\text{C}_5\text{H}_9\text{O}_4$. The nucleoside composed of adenine and ribose.

Properties: White, crystalline, odorless powder with mild, saline or bitter taste. M.p. 229°C. Quite soluble in hot water; practically insoluble in alcohol.

Derivation: Isolation following hydrolysis of yeast nucleic acid.

Use: Biochemical research.

adenosine diphosphate (5'-adenylphosphoric acid; ADP; adenosine 5'-pyrophosphate; adenosine diphosphoric acid) $\text{C}_{10}\text{H}_{15}\text{N}_5\text{O}_{10}\text{P}_2$. A nucleotide found in all living cells and important in the storage of energy for chemical reactions.

Derivation: (a) From adenosine triphosphate by hydrolysis with the enzyme adenosinetriphosphatase from lobster or rabbit muscle; (b) by yeast phosphorylation of adenosine.

Use: Biochemical research.

Commercially available as the sodium or barium salt.

adenosinediphosphoric acid. See adenosine diphosphate.

adenosine monophosphate. See adenylic acid.

adenosine phosphate. USAN for 5'-adenylic acid.

adenosine triphosphate (5'-adenyldiphosphoric acid; ATP) $\text{C}_{10}\text{H}_{16}\text{N}_5\text{O}_{13}\text{P}_3$. A nucleotide which serves as a source of energy for biochemical transformations in plants (photosynthesis) and also for many chemical reactions in the body, especially those associated with muscular activity, and with replication of cell components.

Properties: White amorphous powder; odorless; faint

sour taste. Soluble in water; insoluble in alcohol, ether, and organic solvents; stable in acidic solutions; decomposes in alkaline solution.

Derivation: Isolation from muscle tissue; yeast phosphorylation of adenosine.

Use: Biochemical research.

Commercially available as the disodium, dipotassium, and dibarium salts.

adenylic acid (adenosine monophosphate; AA; adenosine phosphate; adenosinephosphoric acid; AMP) $C_{10}H_{14}N_5O_7P$. The monophosphoric ester of adenosine; i.e., the nucleotide containing adenine, D-ribose and phosphoric acid. Adenylic acid is a constituent of many important coenzymes. Cyclic adenosine-3',5',-monophosphate is designated by biochemists as cAMP (q.v.).

Properties (muscle adenylic acid): Crystalline solid; m.p. 196–200°C. Readily soluble in boiling water. Gives only traces of furfural when boiled with 20% hydrochloric acid.

(yeast adenylic acid monohydrate): Long crystalline rods. Decomposes 195°C. Anhydrous form decomposes at 208°C. Almost insoluble in cold water; slightly soluble in boiling water. Gives quantitative yield of furfural when distilled with 20% HCl.

Derivation: Yeast adenylic acid by precipitation from yeast nucleic acid. Muscle adenylic acid by precipitation from tissues; by hydrolysis of ATP with barium hydroxide; by enzymatic phosphorylation of adenosine.

Uses: Medicine and biochemical research.

adhesion. The state in which two surfaces are held together by interfacial forces, which may consist of valence forces or interlocking action, or both. (ASTM)

adhesive. Any substance, inorganic or organic, natural or synthetic, that is capable of bonding other substances together by surface attachment. A brief classification by type is as follows:

I. Inorganic

1. Soluble silicates (water glass)
2. Phosphate cements
3. Portland cement (calcium oxide-silica)
4. Other hydraulic cements (mortar, gypsum)
5. Ceramic (silica-boric acid)
6. Thermosetting powdered glasses ("Pyroceram")

II. Organic

1. Natural
 - (a) Animal
 - Hide and bone glue; fish glue
 - Blood and casein glues
 - (b) Vegetable
 - Soybean, starch, celluloses, rubber latex and rubber-solvent (pressure-sensitive).
 - Gums, terpene resins (rosin), mucilages
 - (c) Mineral
 - Asphalt, pitches, hydrocarbon resins
2. Synthetic
 - (a) Elastomer-solvent cements
 - (b) Polysulfide sealants
 - (c) Thermoplastic resins (for hot-melts)
 - Polyethylene, isobutylene, polyamides, polyvinyl acetate
 - (d) Thermosetting resins
 - Epoxy, phenolformaldehyde, polyvinyl butyral, cyanoacrylates.
 - (e) Silicone polymers and cements

See also following entries. For further information refer

to Adhesives Manufacturers Association, 441 Lexington Ave., New York.

adhesive, high-temperature. (1) Organic polymers, e.g., polybenzimidazoles, that retain bonding strength up to 500°F for a relatively long time (500–1000 hours); above 500°F, strength drops rapidly, 80% being lost after 10 minutes at 1000°F.

(2) Inorganic (ceramic), e.g., silica-boric acid mixtures or cermets produce bonds having high strength above 2000°F; adhesive lap-bond strengths can be over 2000 psi at 1000°F. These adhesives are used largely for aerospace service, and metal/metal and glass/metal seals.

adhesive, hot-melt. A solid, thermoplastic material which quickly melts upon heating, and then sets to a firm bond on cooling. Most other types of adhesives set by evaporation of solvent. Hot-melt types offer the possibility of almost instantaneous bonding, making them well-suited to automated operation. In general, they are low-cost, low-strength products, but are entirely adequate for bonding cellulosic materials. Ingredients of hot-melts are polyethylene, polyvinyl acetate, polyamides, hydrocarbon resins, as well as natural asphalts, bitumens, resinous materials, and waxes. Uses: Rapid and efficient bonding of low-strength materials, e.g., bookbinding, food cartons, side-seaming of cans, miscellaneous packaging applications.

See also sealant.

adhesive, rubber-based (cement, rubber). (1) A solution of natural or synthetic rubber in a suitable organic solvent, without sulfur or other curing agent; (2) a mixture of rubber (often reclaimed), filler, and tackifier (pine tar, liquid asphalt) applied to fabric backing (pressure-sensitive friction tape); (3) a room-temperature curing rubber-solvent-curable mixture, often made up in two parts, which are blended just before use; (4) rubber latex, especially for on-the-job repairing, such as conveyor belts; (5) silicone rubber cement (see "RTV" and silicone (uses)).

Hazard: Those containing organic solvents, (1) and (3) above, are flammable.

Shipping Regulations: Cement, liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

adiabatic. A process, condition, or operation during which there is no gain or loss of heat from the environment.

adipic acid (hexanedioic acid; 1,4-butanedicarboxylic acid) $COOH(CH_2)_4COOH$.

Properties: White, crystalline solid. M.p. 152°C; b.p. (100 mm) 265°C; sp. gr. (20/4°C) 1.360; flash point (closed cup) 385°F. Slightly soluble in water; soluble in alcohol and acetone. Relatively stable. Combustible; low toxicity.

Derivation: Oxidation of cyclohexane, cyclohexanol, or cyclohexanone with air or nitric acid.

Grades: Technical; F.C.C.

Containers: Glass bottles; tins; 50-lb multiwall paper bags; drums.

Uses: Manufacture of nylon and of polyurethane foams; preparation of esters for use as plasticizers and lubricants; food additive (neutralizer and flavoring agent); adhesives.

"Adipol."TM Trademark for a series of adipate plasticizers.

adiponitrile (1,4-dicyanobutane) $\text{NC}(\text{CH}_2)_4\text{CN}$.

Properties: Water-white, odorless liquid; m.p. $1\text{--}3^\circ\text{C}$; n (20/D) 1.4369; b.p. 295°C ; flash point 200°F (open cup); combustible. Slightly soluble in water; soluble in alcohol and chloroform.

Derivation: Chlorination of butadiene to dichlorobutylene, which is reacted with 35% sodium cyanide solution to yield 1,4-dicyanobutylene; this is hydrogenated to adiponitrile. Also by electroorganic synthesis from acrylonitrile.

Hazard: Toxic by ingestion.

Uses: Intermediate in the manufacture of nylon; organic synthesis.

"Adiprene."²⁸ Trademark for a polyurethane rubber, the reaction product of diisocyanate and polyalkylene ether glycol. In its raw polymer form it is a liquid of honey-like color and consistency which is compounded chemically (to polymerize it further) and converted into products by casting and other techniques. See also polyurethane rubber.

"Admerol."²²¹ Trademark for a long oil, oxidizing copolymer for zinc- and lead-free stains and blister-resistant paints; binder for aluminum paints and varnish oils.

"Admex."²²¹ Trademark for a series of plasticizers consisting variously of epoxidized soybean oil, tallate esters, monomeric esters and polyesters. Used in vinyl plastics.

admiralty metal. A nonferrous alloy containing 70–73% copper, 0.75–1.20% tin, remainder zinc. It offers good resistance to dilute acids and alkalis, sea water, and moist sulfurous atmospheres. Sp. gr. (20°C) 8.53; liquidus temperature 935°C ; solidus temperature 900°C .

Uses: Condenser, evaporator, and heat exchanger tubes, plates, and ferrules.

"Adofoam."⁵⁴⁴ Trademark for oil-field additive used specifically in air-drilling and hydraulic fracturing to produce stable foam in fresh water, salt water, acid/water solutions, sulfur/water, and oil/water mixtures.

"Adogen."²²¹ Trademark for a series of fatty nitrogen chemicals including amines, amides, amine acetates and quaternary ammonium compounds. Available in various grades for specific applications in fabric softeners, ore separation, detergents, petroleum additives, corrosion inhibitors, bactericides, printing inks, antiblock and slip agents, water-proofing formulations and chemical intermediates.

"Adol."²²¹ Trademark for a series of industrial fatty alcohols, specifically cetyl, stearyl, and oleyl, available in a variety of grades for specific applications.

"Adomall."⁵⁴⁴ Trademark for multi-value water-fracturing additive in oil-field operations; kills bacteria, inhibits corrosion, lowers surface tension, reduces permeability damage, removes drilling mud from bore and fracture areas, and produces stable foam to return fracturing water from wells.

"Adomite."⁵⁴⁴ Trademark for oil-field additives to reduce fluid loss during hydraulic fracturing. "Adomite Mark II" functions in oil-based fracturing fluids; "Adomite Aqua" in water-based fracture fluids.

"Adoquat."⁵⁴⁴ Trademark for a quaternary ammonium salt used in waterflooding operations for secondary recovery of petroleum. It increases efficiency by inhibiting bacterial growth and reducing microbial plugging.

"Adoxal."²²⁷ Trademark for 2,6,10-trimethyl-9-undecen-1-al. (q.v.)

ADP. Abbreviation for (1)adenosine diphosphate (q.v.); (2) ammonium dihydrogen phosphate. See ammonium phosphate, monobasic.

"Adrenalin."³³⁰ Trademark for epinephrine (q.v.).

adrenaline. A hormone having a benzenoid structure with the formula $\text{C}_9\text{H}_{13}\text{O}_3\text{N}$ (also called epinephrine). It is obtained by extraction from the adrenal glands of cattle, and is also made synthetically. Its effect on body metabolism is pronounced, causing an increase in blood pressure and rate of heart beat. Under normal conditions its rate of release into the system is constant, but emotional stresses such as fear or anger rapidly increase the output and result in temporarily heightened metabolic activity.

adrenocorticotrophic hormone. See ACTH; corticoid hormone.

adriamycin (doxorubicin). An antibiotic drug reported to be effective against such types of cancer as leukemia and cancers of the breast and bladder. It is made by fermentation of a soil fungus. Approved by FDA for clinical research, but is said to have deleterious side effects. Synthetic routes to adriamycin and its analogs have been developed.

adsorbent. A substance which has the ability to condense or hold molecules of other substances on its surface. Activated carbon, activated alumina, and silica gel are examples.

"Adsorbosil."⁴²⁵ Trademark for adsorbents for use in chromatography. "Adsorbosil"-I is a mixture of specially purified silica gel and 10% calcium sulfate designed as a thin-layer chromatography powder; "Adsorbosil" CAB is designed for column chromatography.

adsorption. Adherence of the atoms, ions or molecules of a gas or liquid to the surface of another substance, called the adsorbent (q.v.) The best-known examples are gas/solid and liquid/solid systems. Finely divided or microporous materials presenting a large area of active surface are strong adsorbents, and are used for removing colors, odors, and water vapor (activated carbon, activated alumina, silica gel). The attractive force of adsorption is relatively small, of the order of van der Waal's forces (q.v.). When molecules of two or more substances are present, those of one substance may be adsorbed more readily than those of the others. This is called preferential adsorption. See also absorption, chemisorption.

adsorption indicator. A substance used in analytical chemistry to detect the presence of a slight excess of another substance or ion in solution as the result of a color produced by adsorption of the indicator on a precipitate present in the solution. Thus a precipitate of silver chloride will turn red in a solution containing even a minute excess of silver ion (silver nitrate solution), if fluorescein is present. In this example, fluorescein is the adsorption indicator.

"Advabrite."²³⁰ Trademark for a series of optical brighteners giving a bright, blue-white fluorescence in very dilute solutions either in daylight or ultraviolet light.

"Advacar."²³⁰ Trademark for a series of water-dispersible paint driers. Supplied in high metal concentrations (calcium 4%, cobalt 6%, lead 24%, manganese 6%).

"Advacide."²³⁰ Trademark for a series of fungicides and mildewcides for paints, etc., wood and fabric preserva-

tives. "Advacide" TPLA is a free-flowing powder of triphenyl lead acetate containing 10% of a liquid aromatic hydrocarbon mixture, and used in antifouling paints.

"**Advalite.**"²³⁰ Trademark for a series of organic and organometallic compounds, specifically designed for the stabilization of vinyl coatings systems against heat and light degradation.

"**Advawax.**"²³⁰ Trademark for a series of wax modifiers. P. High molecular weight polybutene and paraffin wax.

M. High molecular weight polybutene and amber-colored microcrystalline wax.

280. A hard, high-melting point synthetic wax for use in lacquers, varnishes, as a plastic lubricant and anti-blocking agent, as an extender or substitute for carnauba wax.

"**Advawet.**"²³⁰ Trademark for a series of wetting agents for emulsion paints, latex paints and vinyl plastisols.

AEC. Abbreviation of Atomic Energy Commission, now replaced by Energy Research and Development Agency (q.v.).

AEH. Abbreviation for anhydroenneaheptitol.

AEPD. Abbreviation for 2-amino-2-ethyl-1,3-propanediol.

aerate. To impregnate or saturate a material (usually a liquid) with air, or some similar gas. This is usually achieved by bubbling the air through the liquid, or by spraying the liquid into air.

aerobic. Requiring air or oxygen. See bacteria.

"**Aerocarb.**"⁵⁷ Trademark for mixtures containing salts of sodium, potassium, and barium used as a molten bath for case-hardening and heat treatment of steel.

Containers: Steel drums.

Hazard: Toxic by ingestion.

"**Aerocat.**"⁵⁷ Trademark for a series of synthetic silica-alumina catalysts used for refining of petroleum in fluid catalytic cracking units.

"**Aero**" Cyanamid.⁵⁷ Trademark for an agricultural chemical.

Properties: Gray to black dry material of various finenesses.

Containers: 50- and 100-lb bags.

Uses: For direct application to soil; formulating complete fertilizers and special uses such as leaf removal, vine killing, wood control and disease control.

"**Aerofloat.**"⁵⁷ Trademark for aryl dithiophosphoric acids (liquids) and alkyl dithiophosphoric acid salts (solids) used as mining flotation reagents to promote frothing properties.

"**Aerofloc.**"⁵⁷ Trademark for a group of synthetic water-soluble polymers used as flocculating agents to improve solid-liquid separations by thickening and filtration.

"**Aerofroth**" Frothers.⁵⁷ Trademark for a group of surface-active agents used primarily as foaming agents or frothers in flotation processing of ores and minerals.

aerogel. Dispersion of a gas in a solid or a liquid. The reverse of an aerosol; flexible and rigid plastic foams are examples. See foam; aerosol.

"**Aeroheat**" Heat Treating Salts.⁵⁷ Trademark for various mixtures containing alkaline chlorides, carbonates,

nitrites and nitrites. Used in the form of molten baths in the hardening, quenching, annealing and tempering of ferrous and non-ferrous metals.

See also salt bath.

"**Aeromet.**"⁵⁷ Trademark for metallurgical additive in steel making where nitrogen content is desired; also applied to iron and steel for desulfurization.

Containers: Bulk freight cars, moisture-resistant paper bags in fiber drums.

"**Aeromine.**"⁵⁷ Trademark for a group of cationic flotation reagents used in froth flotation processing of ores and minerals, primarily silica and silicates.

"**Aeroprills.**"⁵⁷ Trademark for an ammonium nitrate fertilizer containing 33.5% nitrogen (16.75% nitrate nitrogen; 16.75% ammonia nitrogen).

Properties: Light cream-colored pellets.

Containers: 80 or 100 lb bags.

Hazard: See ammonium nitrate.

Uses: For direct application and in fertilizer mixtures.

"**Aerosil.**"⁵⁶² Trademark for submicroscopic pyrogenic silica made at 1100°C; high surface area.

Uses: Reinforcing and dispersing agent in rubber and plastics; thickening agent in lacquers; anticaking agent.

"**Aerosize.**"⁵⁷ Trademark for a series of aqueous high free-rosin emulsions used for treatment of paper and paper board to impart water, ink, and lactic acid resistance. May be used to give a surface sizing effect as on floor coverings.

aerosol. A suspension of liquid or solid particles in a gas, the particles often being in the colloidal size range. Fog and smoke are common examples of natural aerosols; fine sprays (perfumes, insecticides, inhalants, antiperspirants, paints, etc.) are man-made aerosols. Suspensions of various kinds may be formed by placing the components, together with a compressed gas, in a container (bomb). The pressure of the gas causes the mixture to be released as a fine spray (aerosol) or foam (aerogel) when a valve is opened. This technique is used on an industrial scale to spray paints and pesticides. It is also used in consumer items such as perfumes, deodorants, shaving cream, whipped cream, and the like. The propellant gas may be a hydrocarbon (propane, isobutane), a chlorofluorocarbon, carbon dioxide, or nitrous oxide. About half of the propellants are chlorofluorocarbons, 45% are hydrocarbons, the other 5% being nitrous oxide and carbon dioxide. Most paint sprays utilize hydrocarbons, which have an excellent safety record in spite of their flammability, and are not environmentally damaging. See also chlorofluorocarbon.

Note: The use of chlorofluorocarbons for aerosol propellants is under extensive investigation because of their possible deleterious effect on atmospheric ozone; as a result such propellants are being discontinued by some aerosol manufacturers until positive determinations are completed. See also propellant, and ozone (note).

"**Aerosol**" Wetting Agent.⁵⁷ Trademark for neutral wetting agents obtainable in various types. They do not decompose on heating and are soluble in practically all nonaqueous media as well as in water.

Uses: Antiseptics; cosmetics; detergents; inks; cleaning, degreasing metals; case-hardening processes for

metals; paints, varnishes, and lacquers; paper; shampoos; toilet preparations; acid treatment of oil wells; embalming fluids; settling operations; breaking mineral oil emulsions; shoe cleaners and polishes.

"Aerosporin."³⁰¹ Trademark for polymyxin B sulfate.

"Aerotex"⁵⁷ Trademark for a group of synthetic resins used in finishing textile fabrics.

"Aerotex" Water Repellent S.⁵⁷ Trademark for a silicone emulsion for producing water repellency on textile fabrics.

"Aerothene."²³³ Trademark for a group of chlorinated solvents used as vapor-pressure depressants, or with compressed gases to replace fluorocarbon propellant systems.

aerозine. A 50-50 mixture of hydrazine and unsymmetricalhydrazine (UDMH); one of most used of bipropellant rocket fuels.

Hazard: Flammable and explosive. See also hydrazine.

AET. See aminoethylisothiourea dihydrobromide.

"Afaxin."¹⁶² Trademark for synthetic oleo-vitamin A.

affinity. The tendency of an atom or compound to react or combine with atoms or compounds of different chemical constitution. For example, paraffin hydrocarbons were so named because they are quite unreactive, the word "paraffin" meaning "very little affinity." The hemoglobin molecule has a much greater affinity for carbon monoxide than for oxygen. The free energy decrease is a quantitative measure of chemical affinity.

afatoxin. $C_{17}H_{10}O_6$. A polynuclear substance derived from molds; a known carcinogen (q.v.). Produced by a fungus occurring on many vegetables, especially those with high moisture content. It is highly toxic.

after-chromed dye. A dye that is improved in color or fastness by treatment with sodium dichromate, copper sulfate or similar materials, after the fabrics are dyed.

Ag Symbol for silver.

agar (agar-agar). A phycocolloid derived from red algae such as Gelidium and Gracilaria; it is a polysaccharide mixture of agarose and agarpectin.

Properties: Thin, translucent, membranous pieces, or pale buff powder. Strongly hydrophilic, it absorbs 20 times its weight of cold water with swelling; forms strong gels at about 40°C. Nontoxic.

Grades: Technical; U.S.P.; F.C.C.

Containers: Bales (strip); fiber drums (powder).

Uses: Microbiology and bacteriology (culture medium); antistaling agent in bakery products; confectionery, meats, and poultry; gelation agent; desserts and beverages; protective colloid in ice cream; pet foods; health foods; laxative; pharmaceuticals; dental impressions; laboratory reagent; photographic emulsions.

See also algae; alginic acid.

age-resister. See antioxidant.

"Agerite."¹¹⁹ Trademark for a series of antioxidants for rubber.

Alba, para-Benzoyloxyphenol.

DPPD. N,N'-Diphenyl-para-phenylenediamine.

Gel. A mixture of alkylated diphenylamines with selected petroleum wax.

Geltrol. Phosphited polyalkyl polyphenol.

Hipar. Mixture of phenyl-beta-naphthylamine, isopropoxydiphenylamine, and diphenyl-para-phenylenediamine.

HP. A blend of phenyl-beta-naphthylamine and N,N'-diphenyl-para-phenylenediamine.

Iso. para-Isopropoxydiphenylamine.

Powder. Phenyl-beta-naphthylamine.

Resin. Aldol-alpha-naphthylamine.

Resin D. A polymerized 1,2-dihydro-2,2,4-trimethyl-quinoline.

Spar. Mixed mono-, di-, and tristyrenated phenols.

Stalite and Stalite S. Mixture of alkylated diphenylamines.

Superflex. Diphenylamine-acetone reaction product.

Superlite. A mixture of polybutylated bisphenol A.

White. syn-Di-beta-naphthyl-para-phenylenediamine.

agglomeration. See aggregation.

agglutination. The combination or aggregation of particles of matter under the influence of a specific protein. The term is usually restricted to antigen-antibody reactions characterized by a clumping together of visible cells, such as bacteria or erythrocytes. The antigen is called an agglutinin and the antibody an agglutinin, because of an apparent gluing or sticking action. See also aggregation.

aggregation. A general term describing the tendency of large molecules or colloidal particles to combine (coalesce) in clumps, especially in solution. When this occurs, usually as a result of removal of the electric charges by addition of an appropriate electrolyte, by the action of heat, or by mechanical agitation, the aggregates precipitate or separate from the dissolved state. Included in this term are the more specific terms agglutination, coagulation, flocculation, and peptization. See also these entries.

aglucone. The nonsugar-like portion of a glucoside molecule. See glycoside.

aglycone. A nonsugar hydrolytic product of a glycoside. See glycoside.

agricultural chemical (agrichemical). A chemical compound or mixture used to increase the productivity and quality of farm crops. They include fertilizers, soil conditioners, fungicides, insecticides, herbicides, nematocides, and plant hormones. For further information, refer to National Agricultural Chemicals Association, Washington, D.C.

A.I.Ch.E. Abbreviation for American Institute of Chemical Engineers (q.v.).

"Al Polymer."²¹⁶ Trademark for an aromatic polymer that can be cured at moderate temperatures to produce a poly(amide-imide). It is a single polymer system based on trimellitic anhydride (q.v.). Supplied as a completely solid resin.

Uses: As a complete 220° insulation system in wire enamels, dipping varnishes, impregnated cloth, glass and asbestos laminates, film and sleeving.

air. A mixture (or solution) of gases, the composition of which varies with altitude and other conditions at the collection point. The composition of dry air at sea level is:

Substance	% by Wt.	% by Vol.
Nitrogen	75.53	78.00
Oxygen	23.16	20.95
Argon		0.93
Carbon dioxide		0.03
Neon		0.0018
Helium		0.0005
Methane		0.0002
Krypton		0.0001
Nitrous oxide		0.000,05

Substance	% by Vol.
Hydrogen	0.000,05
Xenon	0.000,008
Ozone	0.000,001

The density of dry air is 1.29 g/liter (at 0°C and 760 mm Hg). It is noncombustible, but will support combustion.

Liquid air is air which has been subjected to a series of compression, expansion and cooling operations until it liquefies.

Containers: Steel cylinders or tanks, under high pressure.

Uses: Source of oxygen, nitrogen, and rare gases; coolant; power source (compressed); cryogenic agent (liquid); particle classification; blowing agent (asphalt, soap, ice-cream mixes, whipped cream, etc.); floatation.

Shipping regulations: Air, compressed: (Rail) Green label. (Air) Nonflammable compressed gas label. Air, liquid: Not acceptable on passenger planes; (non-pressured) Not acceptable.

See also air pollution.

air classification. The separation of solid particles according to weight and/or size, by suspension in and settling from an air stream of appropriate velocity, as in air-floated clays and other particulate products.

air floatation. See air classification.

"Air Floate."¹⁷⁷ Trademark for a technical grade of barium carbonate with improved flow properties.

Hazard: Toxic by ingestion.

Use: Ceramic industry.

"Air-Flo Green."¹⁴⁷ Trademark for a mosquito larvicide containing copper meta-arsenite.

Hazard: Highly toxic by ingestion.

"Aiocel PK Foam Liquid."²⁷⁰ Trademark for a protein-based liquid concentrate used to produce lightweight concrete, low density refractories, foamed ceramics and other rigid inorganic foams. Also used as an air entraining agent to facilitate the pumping of concrete through pipe and flexible hose.

air pollution (atmospheric pollution). Introduction into the atmosphere of substances that are not normally present therein, and that have a harmful effect on man, animals, or plant life. Important among these are sulfur dioxide, which forms sulfuric acid on contact with water vapor; automotive exhaust emission products (carbon monoxide, lead compounds, polynuclear hydrocarbons, nitrogen oxides); toxic metal dusts from smelters, coal smoke, and other particulates; formaldehyde and acrolein; and radioactive emanations. Control of these is exercised by the Environmental Protection Agency. As conventionally used, the term does not apply to interior air spaces such as industrial workrooms. Tolerances for the latter are established by the American Conference of Governmental and Industrial Hygienists (ACGIH). See threshold limit values.

Note: EPA requirements for automotive exhaust emission standards have been postponed until 1980, since it has been found that the present catalytic converters cause formation of sulfuric acid and sulfates from the sulfur in the gasoline, and are also inefficient in other respects.

"Akineton."⁹ Trademark for biperiden, employed in medicine as the hydrochloride and lactate salts.

"Akon."¹¹⁶ Trademark for a colloidal iron product used for removing oxygen from boiler feed water to reduce corrosion.

"Akroflex" C.²⁸ Trademark for a rubber antioxidant containing 35% diphenyl-para-phenylenediamine $C_6H_4(NHC_6H_5)_2$, and 65% phenyl-alpha-naphthylamine ("Neozone" A).

Uses: To improve the aging and service life of rubbers; anticrosslinking agent for SBR (styrene-butadiene rubber).

"Aktoflo-S"²³⁶ Trademark for a mixed oxyethylated phenol derivative with an optimum proportion of defoamant added. Added to emulsified-surfactant drilling muds, to reduce clay dispersion, and viscosity.

"Aktone."²⁸⁵ Trademark for a rubber accelerator; density 1.39. Used as a secondary accelerator, defoamant and secondary blowing agent in sponge compounds.

"Akweons."¹⁵² Trademark for metal-processing oils. 674 and 700. Wetting agents and corrosion inhibitors for use in acids; also exhibit fume-depressant properties.

250. An acid fume depressant and pickling activator.

"Akwilox."¹⁵² Trademark for high specific gravity, brominated vegetable oils manufactured for use in the soft drink industry.

Al Symbol for aluminum.

alabaster. A fine-grained, compact gypsum.

"Alacsan."⁵⁴² Trademark for a series of quaternary ammonium compounds. Used in cosmetics, germicides, algacides, disinfectants, deodorants, and sanitizers.

"Alacstat" C-2.⁵⁴² Trademark for N,N-bis(2-hydroxyethyl alkylamine); used as antistatic agent for polyolefins.

"Alamac."²⁵⁹ Trademark for acetate salts of primary amines. Water-soluble or dispersible.

Uses: Non-metallic ore flotation; corrosion inhibition.

"Alamide."²⁵⁹ Trademark for a series of high molecular weight, aliphatic amides, such as palmitamide and stearamide, produced by reacting ammonia with fatty acids.

Uses: Intermediates for durable water repellents and finishes for textiles and paper; mold release and anti-blocking agents.

"Alamine."²⁵⁹ Trademark for a series of primary, secondary, and tertiary aliphatic amines, organic substituted ammonia derivatives. Soluble in variety of organic solvents. Not appreciably soluble in water. Chain length from C_{12} - C_{18} with varying degrees of unsaturation.

Uses: Corrosion inhibitors, ore flotation agents, textile finishing agents, asphalt antistripping agents, rubber compounding, color particle dispersion, petroleum product additives, chemical intermediates.

"Alanap."²⁴⁸ Trademark for N-1-naphthylphthalamic acid; used as a herbicide.

alanine (alpha-alanine; alpha-aminopropionic acid; 2-aminopropanoic acid) $CH_3CH(NH_2)COOH$. A nonessential amino acid.

Properties: Colorless crystals; soluble in water; slightly

soluble in alcohol; insoluble in ether; optically active; nontoxic.

DL-alanine, m.p. 295°C with decomposition; sublimes at 200°C.

L(+)-alanine, m.p. 297°C with decomposition.

D(-)-alanine, m.p. 295°C with decomposition.

L(+)-alanine hydrochloride: prisms; m.p. 204°C with decomposition.

L(+)-alanine, N-acetyl; crystals; m.p. 116°C.

L(+)-alanine, N-benzoyl; crystals; m.p. 152-154°C.

Derivation: Hydrolysis of protein (silk, gelatin, zein); organic synthesis.

Grades: Reagent; technical.

Containers: Drums (DL-form).

Uses: Microbiological research; biochemical research; dietary supplement.

beta-alanine (3-aminopropanoic acid; beta-aminopropionic acid). $\text{NH}_2\text{CH}_2\text{CH}_2\text{COOH}$. A naturally occurring amino acid not found in protein.

Properties: White prisms; m.p. 198°C with decomposition. Soluble in water; pH (50% solution) 6.0-7.3, slightly soluble in alcohol; insoluble in ether. Hydrochloride: plates and leaflets; m.p. 122.5°C; platinum chloride: yellow leaflets; m.p. 210°C (dec). Nontoxic.

Derivation: Addition of ammonia to beta-propiolactone; other processes based on the reaction of ammonia with acrylonitrile, etc.

Containers: Fiber drums.

Uses: Biochemical research; organic synthesis; production of calcium pantothenate (q.v.); buffer in electroplating.

beta-alanylhistidine. See carnosine.

"Alar."²⁴⁸ Trademark for a plant growth regulator (succinic acid 2,2-dimethylhydrazide) which improves the color and texture of apples, grapes, and tomatoes, and prevents premature dropping.

"Alathon."²⁸ Trademark for a polyethylene resin. "Alathon" G-0530, designated as a reinforced polyethylene, contains 30% by weight of glass-fiber treated with a proprietary coupling agent that optimizes its reinforcing properties.

"Albacer."⁷³ Trademark for a hard, white synthetic wax; m.p. 99-104°C; soluble in some organic solvents; compatible with a range of synthetic resins, mineral and vegetable oils, and other waxes.

Uses: Coatings for paper; mold lubricant; polishes.

"Albamycin."³²⁷ Trademark for novobiocin. (q.v.). Hazard: May have damaging side effects.

"Albaoil."²⁴⁴ Trademark for series of sulfonated castor oils varying in percentage of oil.

Uses: Fatliquor and plasticizer in leather; also in textile and other industries.

"Alberene Stone."⁴²⁷ Trademark for a natural soapstone (magnesium silicate) for chemical laboratory benches, sinks, fume hoods, etc. Highly resistant to acids and alkalis.

"Albigen."⁴⁴⁰ Trademark for a water-soluble polymer used in the textile industry for stripping vat and other dyestuffs. Has no affinity for the fiber; promotes the stripping effect of alkaline hydrosulfite solutions.

"Albone."²⁸ Trademark for a series of hydrogen peroxide solutions, which vary in hydrogen peroxide content from 35% to 90% by weight.

Hazard: See hydrogen peroxide.

albumin. Any of a group of water-soluble proteins of wide occurrence in such natural products as milk (lactalbumin), blood serum, and eggs (ovalbumin).

They are readily coagulated by heat and hydrolyze to alpha-amino acids or their derivatives. See following entries.

albumin, blood.

Properties: Brown amorphous lumps soluble in water and alcohol.

Derivation: Ox-blood is allowed to coagulate and the serum separated by centrifuging. The decanted liquor is filtered, decolorized and subsequently evaporated at low pressure. Nontoxic.

Grades: Technical, light and dark.

Containers: 100-, 332-lb drums; 300-lb barrels.

Uses: Photographic papers; textile printing; dye preparations; clarifying agent; adhesive; pesticides.

albumin, egg (ovalbumin). Principal protein found in egg white.

Preparation: Fresh white separated from the yolk, diluted with water, beaten to froth and subsequently filtered and evaporated. Nontoxic. Molecular weight 43,000.

Grades: Technical; edible.

Containers: Cases; barrels.

Uses: Leather industry; foodstuffs; clarifying agent; photography; adhesives; sugar refining.

albumin, milk. See lactalbumin.

albumin, serum (normal human).

Properties: Light yellow to cream colored lumps; practically odorless. About 96% of the total protein is albumin. Molecular weight 66,000.

Derivation: Fractionation of human blood and careful drying.

Grades: U.S.P., as sterile solution.

Use: Medicine.

A.L.C.A. Abbreviation for American Leather Chemists' Association.

alchemy. The predecessor of chemistry, practiced from as early as 500 B.C. through the 16th century. Its two principal goals were transmutation of the baser metals into gold and discovery of a universal remedy. Modern chemistry grew out of alchemy by gradual stages, but a few of the old ideas persisted almost into the 19th century, e.g., phlogiston theory.

Alcoa smelting process. A new and more efficient method for production of aluminum metal from bauxite announced in 1973 by the Aluminum Co. of America. It requires about one-third less electric power than the Hall technology, the only large-scale process now in use. In the new method, alumina made in the usual manner (Bayer process) is reacted with chlorine, the resulting aluminum chloride yielding the metal and chlorine on electrolysis. Pilot-plant production is under way.

alcohol. A broad class of hydroxyl-containing organic compounds occurring naturally in plants and made synthetically from petroleum derivatives such as ethylene. Many are manufactured in tonnage quantities; their major uses are in organic synthesis, as solvents, detergents, beverages, pharmaceuticals, plasticizers, and fuels. The many types may be summarized as follows:

I. Monohydric (1 OH group)

1. Aliphatic

(a) paraffinic (ethyl alcohol)

(b) olefinic (allyl alcohol)

2. Alicyclic (cyclohexanol)

3. Aromatic (phenol, benzyl alcohol)

4. Heterocyclic (furfuryl alcohol)

5. Polycyclic (sterols)

II. Dihydric (2 OH groups): glycols and derivatives (diols)

III. Trihydric (3 OH groups): glycerol and derivatives

IV. Polyhydric (polyols) (3 or more OH groups)
For further information see monohydric, dihydric, trihydric, polyol, and specific alcohol.

alcohol, absolute. See ethyl alcohol.

alcohol dehydrogenase. An enzyme found in animal and plant tissue which acts upon ethyl alcohol and other alcohols producing acetaldehyde and other aldehydes.

Use: Biochemical research.

alcohol, denatured. Ethyl alcohol to which another liquid has been added to make it unfit to use as a beverage (chiefly for tax reasons). In the U.S. it may be either Completely Denatured (CDA), usually by the use of the toxic methyl alcohol, or Specially Denatured (SDA). The number of formulations authorized officially for making SDA have been reduced to four (Nos. 40, 40A, 40B and 40C). They include the following denaturants: SDA 40B must contain brucine, brucine sulfate, or quassin, plus tert-butyl alcohol; SDA 40A must contain sucrose octa-acetate plus tert-butyl alcohol; SDA 40B must contain Bitrex and tert-butyl alcohol; SDA 40C must contain only tert-butyl alcohol. For exact formulas consult the Alcohol and Tobacco Tax Division of IRS, Washington, D.C.

Properties: See ethyl alcohol.

Hazard: Flammable, dangerous fire risk; may be toxic by ingestion.

Uses: Manufacture of acetaldehyde and other chemicals; solvents; antifreeze and brake fluids; fuel.

Shipping Regulations: (Rail) Red label. (Air) Flammable Liquid label.

alcohol, grain. Synonym for ethyl alcohol, applying to that made from grain.

alcohol, industrial. A mixture of 95% ethyl alcohol and 5% water, plus additives for denaturing or special solvent purposes. See also alcohol, denatured.

alcoholysis. A chemical reaction between an alcohol and another organic compound, analogous to hydrolysis. The alcohol molecule decomposes to form a new compound with the reacting substance, the other reaction product being water. Both hydrolysis and alcoholysis may be considered as forms of solvolysis. See also solvolysis.

alcohol, wood. See methyl alcohol.

"Aldactone."⁷⁰ Trademark for spironolactone (q.v.).

"Aldaromes."¹⁸⁸ Trademark for compositions of aromatic chemicals and essential oils used in embalming fluids and sprays to mask or cover the unpleasant odor of formaldehyde. Will not decompose when in contact with formaldehyde; give clear solutions in 40% formaldehyde. Not water-soluble.

aldehyde. A broad class of organic compounds having the generic formula $RCHO$, and characterized by an unsaturated carbonyl group ($C=O$). They are formed from alcohols by either dehydrogenation or oxidation, and thus occupy an intermediate position between primary alcohols and the acids obtained from them by further oxidation. Their chemical derivation is indicated by the name: *al*(cohol) + *dehyd*(rogena-

tion). Aldehydes are reactive compounds, participating in oxidation, reduction, addition, and polymerization reactions. For specific properties, see individual compound.

aldehyde ammonia (acetaldehyde ammonia; 1-aminoethanol) $CH_3CHOHNH_2$.

Properties: White crystalline solid; stable in closed containers, resinifies on long exposure to air. Very soluble in water and alcohol.

Constants: M.p. 97°C (partly decomposed).

Derivation: Action of acetaldehyde on ammonia.

Hazard: Moderately toxic by ingestion and inhalation, strong irritant. Moderate fire and explosion risk.

Uses: Accelerator for vulcanization of thread rubber; organic synthesis; source of acetaldehyde and ammonia.

aldehyde collidine. See 2-methyl-5-ethylpyridine.

aldehydine. See 2-methyl-5-ethylpyridine.

"Aldo."⁷³ Trademark for a series of waxes, glyceryl monofatty acid esters, in technical, water-dispersible, and edible grades.

Uses: Foods; plastics and rubber; cosmetics; lubricants; plasticizers; emulsion stabilizers.

aldol (acetaldol; beta-hydroxybutyraldehyde)
 $CH_3CHOHCH_2CHO$.

Properties: Water-white to pale yellow syrupy liquid.

Decomposes into crotonaldehyde and water on distillation under atmospheric pressure. Miscible with water, alcohol, ether, organic solvents. Sp. gr. 1.1098 (15.6/4°C); b.p. 83°C (20 mm); vapor pressure < 0.1 mm (20°C); specific heat 0.737; weight 9.17 lb/gal (20°C). Flash point 150°F (open cup); freezing point below 0°C. Autoignition temp. 530°F. Combustible.

Derivation: By condensation of acetaldehyde.

Grades: Technical (98%).

Hazard: Moderately toxic and irritant. Moderate fire risk.

Containers: Cans; drums; tank cars.

Uses: Synthesis of rubber accelerators and age resisters; perfumery; engraving; ore flotation; solvent; solvent mixtures for cellulose acetate; fungicides; organic synthesis; printer's rollers; cadmium plating; dyes; drugs; dyeing assistant; synthetic polymers.

aldolase (zymohexase). An enzyme present in muscle involved in glycogenolysis and anaerobic glycolysis. It catalyzes production of dihydroxyacetone phosphate and phosphoglyceric aldehyde from fructose 1,6-diphosphate.

Use: Biochemical research.

aldol condensation. A reaction between two aldehyde or two ketone molecules in which the position of one of the hydrogen atoms is changed in such a way as to form a single molecule having one hydroxyl and one carbonyl group. Since such a molecule is partly an alcohol (OH group) and partly an aldehyde (CO group) and represents a union of two smaller molecules, the reaction is called an ald-ol condensation. It can be repeated to form molecules of increasing molecular weight. The condensation of formaldehyde to sugars in plants, which on repetition builds up the more complex carbohydrate structures such as starch and cellulose, is thought to be a reaction of this type. It occurs most effectively in an alkaline medium.

aldo-alpha-naphthylamine condensate.

Properties: Orange to dark red solid with characteristic odor; softens at 64°C min; sp. gr. 1.16; insoluble in water, gasoline; slightly soluble in alcohol and petroleum hydrocarbons; soluble in acetone, benzene, chloroform and carbon disulfide.

Uses: Antioxidant in tire carcasses, tubes, insulating tape, black soles.

aldose. Any of a group of sugars whose molecule contains an aldehyde group and one or more alcohol groups. An example is glyceraldehyde ($\text{HOCH}_2 \cdot \text{CHOH} \cdot \text{CHO}$), specifically called an aldotriose because it contains three carbon atoms.

"Aldisperse."⁷³ Trademark for a series of polyethylene glycol monofatty acid esters.

Properties: yellow liquids to soft white solids (S-9); sp. gr. about 1.0; m.p. < 2°C (O-9) to 24–29°C (S-9). Soluble in most organic solvents. Combustible; non-toxic.

Uses: Antistatic agents; emulsifiers and detergents; wetting agents; dye assistants; thickening agents; viscosity stabilizers.

aldosterone (electrocortin) $\text{C}_{21}\text{H}_{38}\text{O}_5$. An adrenal cortical steroid hormone which is the most powerful mineralocorticoid. Probably the chief regulator of sodium, potassium, and chloride metabolism, approximately 30 times as active as deoxycorticosterone. Properties: Crystals; m.p. 108–112°C.

Derivation: Isolated from adrenals; has been synthesized.

Use: Medicine.

"Aldox."²⁰⁴ Trademark for an acidic powdered compound used to deoxidize aluminum prior to spot welding or to desmut aluminum subsequent to etching. Commercially available in 400-lb fiber drums.

aldrin (HHDN) $\text{C}_{12}\text{H}_8\text{Cl}_6$. The assigned common name for an insecticidal product containing 95% or more of 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-endo-exodimethanonaphthalene. See also dieldrin and endrin.

Properties: Brown to white crystalline solid; m.p. 104–105.5°C; insoluble in water; soluble in most organic solvents. Not affected by alkalis or dilute acids; compatible with most fertilizers, herbicides, fungicides, and insecticides.

Grade: Technical.

Containers: Fiber drums.

Uses: Insecticide.

Hazard: Highly toxic by ingestion and inhalation; absorbed by skin. Tolerance, 0.25 mg per cubic meter of air. Said to be carcinogenic. Use restricted to nonagricultural applications.

Shipping regulations: (Rail, Air) Liquid mixtures with more than 60% aldrin, Poison label; dry mixtures with more than 65% aldrin, Poison label. See regulations for further details.

"Aldyl."²⁸ Trademark for plastic pipe made of "Delrin" acetal resin clad in a jacket of yellow "Alathon" polyethylene resin.

ale. See brewing.

"Alert"¹⁵¹ Trademark for a series of mercaptan type gas odorants, recommended for warning odorization of natural gas.

"Alfane."⁴¹ Trademark for an acid-, solvent-resistant, synthetic-resin cement of the epoxy type used as a mortar cement up to 212°F.

alfin. A catalyst obtained from alkali alcoholates derived from a secondary alcohol which is a methyl

carbinol and olefins possessing the grouping $-\text{CH}=\text{CH}-\text{CH}_2$, which may be part of a ring, as in toluene. The interaction of the alkali alcoholate (sodium isopropoxide) with the olefin halide (allyl chloride) gives a slurry of sodium chloride on which sodium isopropoxide and allyl sodium are adsorbed. This slurry is a typical alfin catalyst used to convert olefins into polyolefins. The elastomers produced are called alfin rubbers, and are now in commercial production.

"Alfol."⁵⁴⁴ Trademark for synthetic primary straight-chain alcohols made by Ziegler-type reaction of aluminum alkyls, ethane, and hydrogen. Lower alcohols (C_6 to C_{12}) are chiefly used in phthalate and other esters for use as vinyl plasticizers. Higher alcohols (C_{12} to C_{18}) are intermediates producing biodegradable surfactants, alcohol sulfates, alcohol ethoxylate nonionics, alcohol ether sulfate anionics, and amine-derived cationics.

"Alfonic."⁵⁴⁴ Trademark for ethoxylate primary straight-chain alcohols and alcohol ether sulfate salts for use as active components in biodegradable detergent compounds.

"Alfracx."²⁸⁰ Trademark for a series of refractory products composed principally of electrically fused aluminum oxide grain. Available as bonded refractories and refractory cements. Used as furnace linings.

algae. Chlorophyll-bearing organisms occurring in both salt and fresh water; they have no flowers or seeds, but reproduce by unicellular spores. They range in size from single cells to giant kelp over 100 ft long, and include most kinds of seaweed. There are four kinds of algae: brown, red, green, and blue-green. Their photosynthetic activity accounts for the fact that over two-thirds of the world total of photosynthesis takes place in the oceans. Algae are harvested and used as food supplements (see carrageenan, agar), soil conditioners, animal feeds, and as a source of iodine; they also contain numerous minerals, vitamins, proteins, lipids, and essential amino acids. Alginic acid (q.v.) is another important derivative. Blue-green algae are water contaminants and are toxic to fish and other aquatic life. Phosphorus compounds in detergent wastes stimulate the growth of algae to such an extent that overpopulation at the water surface prevents light from reaching many of the plants; these decompose, removing oxygen and releasing carbon dioxide, thus making the water unsuitable for fish. Algae are being used in treatment of sewage and plant effluent in a proprietary flocculation process. See also: eutrophication; agar.

"Algepon."³⁰⁰ Trademark for series of dyeing, stripping and discharge printing assistants for various applications in textile processing. Several types are each formulated for a specific function.

algicide. Chemical agent added to water to destroy algae. Copper sulfate is commonly employed for large water systems.

"Algimaster."⁴²⁶ Trademark for a composition containing the active ingredients alkyl quaternary ammonium bromides, organic polyamine, amine hydrobromides.

Containers: 1-qt polyethylene bottles.

Uses: Control of algae in swimming pool water.

algin. A hydrophilic polysaccharide (phycocolloid or hydrocolloid) found exclusively in the brown algae. It is analogous to agar (q.v.). The seaweed (giant

kelp) is sea-harvested, water-extracted and refined. U.S. (California) and Great Britain are the chief producers. See also alginic acid; alginate.

alginate. Any of several derivatives of alginic acid (e.g., calcium, sodium or potassium salts or propylene glycol alginate). They are hydrophilic colloids (hydrocolloids) obtained from seaweed. Sodium alginate is water-soluble but reacts with calcium salts to form insoluble calcium alginate.

Uses: Food additive (thickener, stabilizer); yarns and fibers; medicine (first-aid dressings); meat substitute; high-protein food analogs.

alginic acid ($C_6H_8O_6$)_n, a polysaccharide composed of beta-D-mannuronic acid residues linked so that the carboxyl group of each unit is free, while the aldehyde group is shielded by a glycosidic linkage. It is a linear polymer of the mannuronic acid in the pyranose ring form.

Properties: White to yellow powder, possessing marked hydrophilic colloidal properties for suspending, thickening, emulsifying and stabilizing. Insoluble in organic solvents; slowly soluble in alkaline solutions. Nontoxic.

Grades: Refined (food); technical (commercial); N.F. (sodium alginate); F.C.C.

Containers: Drums; fiber containers; bottles; multi-wall paper bags.

Uses: Food industry as thickener and emulsifier; protective colloid; tooth paste; cosmetics; pharmaceuticals; textile sizing; coatings; waterproofing agent for concrete; boiler water treatment; oil-well drilling muds; storage of gasoline as a solid.

alicyclic. A group of organic compounds characterized by arrangement of the carbon atoms in closed ring structures sometimes resembling boats, chairs, or even birdcages. These compounds have properties resembling those of aliphatics, and should not be confused with aromatic compounds (q.v.) having the hexagonal benzene ring. Alicyclics are comprised of three subgroups: (1) cycloparaffins (saturated), (2) cycloolefins (unsaturated, with two or more double bonds), and (3) cycloacetylenes (cyclynes) with a triple bond. The best-known cycloparaffins (sometimes called naphthenes) are cyclopropane, cyclohexane, and cyclopentane; typical of the cycloolefins are cyclopentadiene and cyclooctatetraene. Most alicyclics are derived from petroleum or coal tar. Many can be synthesized by various methods. See also subgroups referred to above.

"Alidase."⁷⁰ Trademark for hyaluronidase. See hyaluronic acid.

"Alipal."³⁰⁷ Trademark for a series of anionic surfactants. CO-433. Sodium salt of sulfated nonylphenoxypoly(ethyleneoxy)ethanol; 28% active.

Uses: Detergents, shampoos, scrub soaps, lime soap dispersant; emulsifier; antistatic agent.

aliphatic. One of the major groups of organic compounds characterized by straight- or branched-chain arrangement of the constituent carbon atoms. Aliphatic hydrocarbons are comprised of three subgroups: (1) paraffins (alkanes), all of which are saturated and comparatively unreactive, the branched-chain types being much more suitable for gasoline than the straight-chain; (2) olefins (alkenes or alkenes), which are unsaturated and quite reactive; (3) acetylenes (alkynes), which contain a triple bond

and are highly reactive. In complex structures the chains may be branched or cross-linked. See also alicyclic; aromatic; chain.

"Aliquat."²⁵⁹ Trademark for a group of fatty quaternary ammonium chlorides, stable in both acidic and alkaline media.

Uses: Cationic textile softeners, corrosion inhibitors, and flow control agents.

aliquot. A part which is a definite fraction of a whole; as, aliquot samples for testing or analysis.

"Alite."³²⁶ Trademark for a series of sintered metallic oxides.

"Alitrite."²⁵⁹ Trademark for a series of high molecular weight, aliphatic nitriles produced from fatty acids from tallow, hydrogenated tallow, coconut and soybean oils, and palmitic and stearic acids.

Uses: Lubricating oil additives; plasticizers.

"Alizachrome."¹³⁴ Trademark for a series of mordant acid dyes.

alizarin (1,2-dihydroxyanthraquinone)

$C_6H_4(CO)_2C_6H_2(OH)_2$. Parent form of many dyes and pigments, including mordants.

Properties: Orange-red crystals; brownish-yellow powder. Soluble in alcohol and ether; sparingly soluble in water. C.I. No. 58000. M.p. 289°C; b.p. 430°C (sublimable). Low toxicity. Combustible.

Derivation: Anthracene is oxidized to anthraquinone, the sulfonic acid of which is then fused with caustic soda and potassium chlorate; the melt is run into hot water and the alizarin precipitated with hydrochloric acid. Occurs naturally in madder root.

Grades: Technical.

Containers: Barrels; kegs; fiber drums.

Uses: Manufacture of dyes; production of lakes; both dye and intermediate.

alizarin oil. Turkey red oil (q.v.).

alizarin yellow R (para-nitrophenylazosalicylate sodium) $O_2NC_6H_4NNC_6H_3OHCOONa$. C.I. 14030.

Properties: Yellow brown powder; soluble in water.

Use: Acid-base indicator in pH range 10.1 (yellow) to 12.0 (violet); biological stain.

"Alizarol."²⁴³ Trademark for a group of acid mordant dyes.

alkadiene. See diolefin.

"Alkalate."²⁴⁴ Trademark for a compound consisting of sodium sesquisilicate base intimately combined with sodium phosphate. Total Na_2O content 38.2%; per cent of total Na_2O in active form 32.4%; per cent of total Na_2O in inactive form 5.8%; compounded to balance the effect of bicarbonates and soil conditions. Uses: General free-rinse cleaning in high bicarbonate areas, such as laundries and dairies.

alkali. Any substance which in water solution is bitter, more or less irritating or caustic to the skin, turns litmus blue, and has a pH value greater than 7.0. See also base; pH; alkali metal.

The alkali industry produces sodium hydroxide, sodium carbonate (soda ash), sodium chloride, salt cake, sodium bicarbonate, and corresponding potassium compounds.

Hazard: Strong alkalis in solution are corrosive to the skin and mucous membranes.

alkali blue. Class name for a group of pigment dry powders prepared by the phenylation of pararosaniline or fuchsine, followed by drowning in hydrochloric acid, washing and sulfonating. Alkali blue, on a weight basis, has the highest tinting strength of all blue pigments. The presscake may be "flushed" with vehicle to replace the water in the pulp.

Uses: Printing inks; interior paints.

alkali cellulose. The product formed by steeping wood pulp with sodium hydroxide, the first step in the manufacture of viscose rayon and other cellulose derivatives. See also carboxymethylcellulose.

alkali metal. A metal in Group 1A of the periodic system; lithium, sodium, potassium, rubidium, cesium, and francium. Except for francium (q.v.), the alkali metals are all soft, silvery metals, which may be readily fused and volatilized, the melting and boiling points becoming lower with increasing atomic weight. The specific gravity increases with, but less rapidly than, the atomic weight, the atomic volume therefore becoming greater as the series is ascended. They are the most strongly electropositive of the metals. They react vigorously, at times violently with water; within the group itself the basicity increases with atomic weight, that of cesium being the greatest.

Hazard: Dangerous fire risks, especially in contact with moisture, acids, or oxidizing materials.

alkalimetry. The measurement of the concentration of bases or of the amount of free base present in a solution by titration or some other means of analysis.

alkaline earth. An oxide of an alkaline earth metal (lime).

alkaline-earth metals. Calcium, barium, strontium, and radium (Group II A of Periodic Table). In general they are white, and differ by shades of color or casts, malleable, extrudable, and machinable, and may be made into rods, wire, or plate; less reactive than sodium and potassium, and have higher melting and boiling points. See also specific entry.

alkaloid. A basic nitrogenous organic compound of vegetable origin. Usually derived from the nitrogen ring compounds: pyridine, quinoline, isoquinoline, pyrrole; designated by the ending -ine. Though some are liquids, they are usually colorless, crystalline solids, having a bitter taste, which combine with acids without elimination of water. They are soluble in alcohol; insoluble, or sparingly soluble in water. Examples are atropine, morphine, nicotine, quinine, codeine, caffeine, cocaine and strychnine.

Hazard: Most alkaloids are toxic by ingestion.

Uses: Medicine.

See specific entry.

"Alkamortar H-W."⁷⁴⁶ Trademark for a ceramic air-setting mortar, resistant to caustic solutions of moderate concentrations at atmospheric temperatures.

Uses: Bonding acid-resistant brick and in limited installations under alkaline conditions.

"Alkam" 4T.⁵⁰⁵ Trademark for a polyaliphatic amine. Properties: Clear pale yellow liquid; b.p. 211.1°C (160 mm Hg); refractive index (n_D²⁰); 1.453; heat of vaporization, 66.8 cal/g; completely miscible with methanol, benzene and hexane.

Uses: Curing agent for epoxy resins; also as an acid gas absorber and as an antiozonant synergist, dispersant and emulsifier.

alkane. See paraffin.

alkanesulfonic acid, mixed RSO₃H (R is methyl, ethyl, propyl, mixed). Trade designation for a mixture of

methane-, ethane-, and propanesulfonic acids. A strong nonoxidizing, nonsulfonating liquid acid which is thermally stable at moderately high temperatures. Properties: Light amber liquid with sour odor; very corrosive; miscible with water, and saturated fatty acids. M.p. below -40°C; b.p. 120-140° (1 mm); sp. gr. 1.38 (20°C); pH (1% solution) 1.15.

Containers: 5-, 25-, 70-lb carboys.

Hazard: Strong irritant to eyes and skin.

Uses: Catalyst; intermediate; reaction medium.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

"Alkanol."⁷²⁸ Trademark for a series of fatty alcohol-ethylene oxide condensation products used as non-ionic surface-active agents in detergents, dispersing and emulsifying agents in paper, leather, and textiles. These include grades OA, OE, OJ, OP, and HC. 189-S is a saturated hydrocarbon sodium sulfonate. B and BG are sodium alkylnaphthalene sulfonates. S is tetrahydronaphthalene sodium sulfonate.

alkanolamine (alkylolamine). A compound such as ethanolamine, HOCH₂CH₂NH₂, or triethanolamine, (HOCH₂CH₂)₃N, in which nitrogen is attached directly to the carbon of an alkyl alcohol. See specific compound.

"Alkaterge."³¹⁹ Trademark for a group of oil-soluble surface-active agents.

Containers: Up to 55-gal drums.

Uses: Corrosion inhibitor; salts and soap; paper, textiles, metal cleaners; emulsion stabilizer; acid acceptor; pigment grinding and dispersion; antifoam agent; antioxidant.

"Alkazene" 42.²³³ Trademark for dibromoethylbenzene. (C₆H₃C₂H₂Br₂). Colorless liquid, f.p. -40°C; b.p. 262°C; sp. gr. 1.744; refractive index 1.587 at 25°C; 14.51 lb/gal at 25°C. Insoluble in water; soluble in methanol and ether. Used in the synthesis of pharmaceuticals, dyes, quaternary ammonium compounds and other organic compounds.

alkene. See olefin.

"Alkeran."³⁰¹ Trademark for melphalan (q.v.).

"Alkolene."⁷⁴⁴ Trademark for series of slightly alkaline oils emulsified with soap; used in the leather industry.

"Alkophos."⁵⁸ Trademark for aluminum acid phosphates in liquid form.

Uses: High-temperature water-insoluble binder, coating, or adhesive.

"Alkor."⁷⁴¹ Trademark for a synthetic, furan-type resin cement which is acid- and alkali-proof and used as a mortar cement where temperatures do not exceed 380°F.

alkoxyaluminum hydrides (H_nAlOR_{3-n}). A group of reducing agents especially useful in converting epoxides to alcohols. Derived by reaction of aluminum hydride with the corresponding alcohol in tetrahydrofuran.

"Alkyd Molding Compound."¹⁷⁵ Trademark for a thermosetting plastic comprised of an unsaturated polyester (usually formulated with a diallyl phthalate cross-linking monomer), inorganic mineral fillers (clay, glass fiber, asbestos, etc.), and other modifiers. Properties: High dimensional stability, good electrical resistivity, ease of molding at low pressures. Glass-reinforced type has high mechanical strength and impact resistance.

Forms available: Granular, putty (soft), glass-reinforced.

Uses: Components of electrical systems, encapsulating compounds, vacuum tube bases; electrical insulation.

See also alkyl resin.

alkyl resin. The thermosetting reaction product of a dihydric or polyhydric alcohol (ethylene glycol or glycerol) and a polybasic acid (phthalic anhydride) in the presence of a drying oil (linseed, soybean) which acts as a modifier. Alkyls are actually a type of polyester resin, which has a similar derivation, but is not oil-modified. Alkyl resins may be produced by direct fusion of glycerol, phthalic anhydride and drying oil at from 410–450°F. Solvents are then added to adjust the solids content. The amount of drying oil varies depending on the intended use. The solutions are used as vehicles in exterior house paints, marine paints and baking enamels. Molded alkyl resins are used for electrical components, distributor caps, encapsulation, and a variety of similar applications. See also "Alkyl Molding Compound."

alkyl. A paraffinic hydrocarbon group which may be derived from an alkane by dropping one hydrogen from the formula. Examples are methyl, CH_3 -, ethyl, C_2H_5 -, propyl, $\text{CH}_3\text{CH}_2\text{CH}_2$ -, isopropyl, $(\text{CH}_3)_2\text{CH}$ -, etc. Corresponding aromatic groups are known as aryl.

alkylaryl polyethyleneglycol ether. See isooctylphenoxypolyoxyethylene ethanol for a typical example of this class of compound. Used as surface-active agents, as in detergents.

alkylaryl sulfonate. An organic sulfonate of combined aliphatic and aromatic structure, e.g., alkylbenzene sulfonate (q.v.).

alkylate. (1) A product of alkylation (q.v.). (2) A term used in the petroleum industry to designate a branched chain paraffin derived from an isoparaffin and an olefin, e.g., isobutane reacts with ethylene (with catalyst) to form 2,2-dimethylbutane (neohexane). The product is used as a high-octane blending component of aviation and civilian gasolines.

(3) In the detergent industry, the term is applied to the reaction product of benzene or its homologs with a long-chain olefin to form an intermediate, e.g., dodecylbenzene, used in the manufacture of detergents. It also designates a product made from a long-chain normal paraffin, which is chlorinated to permit combination with benzene to yield a biodegradable alkylate. The adjectives "hard" and "soft" applied to detergents refer to their ease of decomposition by microorganisms. See biodegradability; detergent.

alkylation. (1) The introduction of an alkyl (q.v.) radical into an organic molecule. This was one of the early chemical processes used in Germany to furnish intermediates for improved dyes, e.g., dimethylaniline. Other alkylation products are cumene, dodecylbenzene, ethylbenzene, and nonylphenol.

(2) A process whereby a high-octane blending component for gasolines is derived from catalytic combination of an isoparaffin and an olefin. See also alkylate (2); neohexane.

alkylbenzene sulfonate (ABS). A branched-chain sulfonate type of synthetic detergent, usually a dodecylbenzene or tridecylbenzene sulfonate. Such compounds are known as "hard" detergents because of their resistance to breakdown by microorganisms.

They are being replaced by linear sulfonates. See alkyl sulfonate, linear; detergent. See also sodium dodecylbenzene sulfonate.

alkyldimethylbenzylammonium chloride. General name for a quaternary detergent. See, for example, benzalkonium chloride.

alkyl fluorophosphate. See diisopropyl fluorophosphate.

alkylolamine. See alkanolamine.

alkyl sulfonate, linear (linear alkylate sulfonate; LAS). A straight-chain alkylbenzene sulfonate; a detergent specially tailored for biodegradability (q.v.). The linear alkylates may be normal or iso (branched at the end only), but are C_{10} or longer. See sodium dodecylbenzene sulfonate.

alkyne. See acetylene hydrocarbon.

allantoin (glyoxyldiureide; 5-ureidohydantoin) $\text{C}_4\text{H}_6\text{N}_4\text{O}_3$. The end product of purine metabolism in mammals other than man and other primates; it results from the oxidation of uric acid.

Properties: White to colorless, odorless, tasteless powder or crystals; m.p. 230°C (dec.). One gram is soluble in 190 cc water or 500 cc alcohol; readily soluble in alkalies. Optically active forms are known.

Preparation: Produced by oxidation of uric acid. Also present in tobacco seeds, sugar beets, wheat sprouts. Uses: Biochemical research; medicine.

allene (propadiene; dimethylenemethane) $\text{H}_2\text{C}:\text{C}:\text{CH}_2$. Properties: Colorless gas; unstable; m.p. -136.5°C; b.p. -34.5°C. Can be readily liquefied.

Derivation: (a) Action of zinc dust on 2,3-dichloropropene; (b) pyrolysis of isobutylene; (c) electrolysis of potassium itaconate.

Containers: Cylinders.

Hazard: Flammable; dangerous fire risk.

Use: Organic intermediate.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

allergen. Any substance that acts in the manner of an antigen on coming into contact with body tissues by inhalation, ingestion or skin adsorption. The allergen causes a specific reagin to be formed in the bloodstream; the ability to produce reagins in response to a given allergen is an inherited characteristic that differentiates an allergic from a non-allergic person. A reagin is actually an antibody. The specificity of the allergen-reagin reaction and its dependence on molecular configuration is similar to the antigen-antibody reaction (q.v.).

The allergen molecule (often a protein such as pollen or wool) may be regarded as a key which precisely fits the corresponding structural shape of the reagin molecule. Allergies in the form of contact dermatitis can result from exposure to a wide range of plant products, some metals, and a few organic chemicals. Though they are alike in some ways, antigen-antibody reactions protect the individual, whereas allergen-reagin reactions are harmful. See also antigen-antibody.

allethrin $\text{C}_{19}\text{H}_{26}\text{O}_3$. Generic name for 2-allyl-4-hydroxy-3-methyl-2-cyclopenten-1-one ester of chrysanthemum monocarboxylic acid. A synthetic insecticide structurally similar to pyrethrin and used in the same manner. For other synthetic analogs see barth-

rin, cyclothrin, ethythrln, furethrin. Pyrethrin I differs in having a 2,4-pentadienyl group in place of the allyl of allethrin.

Properties: Clear, amber-colored, viscous liquid. Sp. gr. (20/20°C) 1.005-1.015; refractive index (20°C) 1.5040. Insoluble in water; incompatible with alkalis; soluble in alcohol, carbon tetrachloride, kerosine, and nitromethane. Low toxicity. Combustible.

Derivation: Synthetically (glycerine, acetylene, and ethyl acetoacetate are the major raw materials).

Grades: 90% technical (about 90% pure, with 10% of isomers or related compounds); 20% technical, 2.5% technical.

Containers: Drums.

Uses: Insecticides; synergist.

"Allexcel."³⁴² Trademark for allethrin-containing insecticidal concentrates.

allicin (C₆H₁₀OS₂). An antibacterial substance extracted from garlic (allium).

Properties: Colorless oily liquid; sharp garlic odor; unstable, decomposing rapidly when heated; slightly soluble in water; very soluble in alcohol, benzene and ether.

Hazard: Skin and eye irritant.

Use: Medicine.

"Allmul."⁴⁵⁵ Trademark for a firebrick having a melting point of 3335°F, and a chemical analysis of 76% alumina, 20% silica. Recommended for most severe furnace applications.

allo-. A prefix designating the more stable of two geometrical isomers (Chemical Abstracts).

allomaleic acid. See fumaric acid.

allomerism. A constancy of crystalline form or structure with a variation in chemical composition. See also polyallomer.

alloocimene (2,6-dimethyl-2,4,6-octatriene) (CH₃)₂C(CH)₃CCH₃CHCH₃.

Properties: Clear, almost colorless liquid. Boiling range (5-95%) 89-91°C (20 mm); sp. gr. (15/15°C) 0.824; refractive index (20°C) 1.5278. Polymerizes and oxidizes readily. Combustible; low toxicity.

Derivation: Pyrolysis of alpha-pinene.

Uses: Component of varnishes and a variety of polymers; fragrance.

allophanamide. See biuret.

allophanate. An unsaturated nitrogenous product made by reaction of an alcohol with two moles of isocyanic acid (a gas). Usually crystalline, high-melting products that are easily isolated. Acid-sensitive and tertiary alcohols can be converted into allophanates.

"Alloprene."^{206a} Trademark for a type of chlorinated rubber.

allothreonine. See threonine.

allotrope. One of several possible forms of a substance. See allotropy.

allotropy (polymorphism). The existence of a substance in two or more forms, which are significantly different in physical or chemical properties. The difference between the forms involves either (1) crystal structure, (2) the number of atoms in the molecule of a gas, or (3) the molecular structure of a liquid. Carbon is a common example of (1), occurring in several crystal forms (diamond, carbon black, graphite) as well as several amorphous forms. Diatomic oxygen and ozone (O₃) are instances of (2); and liquid sulfur and helium of (3). Uranium has 3 crystalline

forms, manganese 4, and plutonium no less than 6. A number of other metals also have several allotropic forms, which are often designated by Greek letters, e.g., alpha-, gamma- and delta-iron.

alloxan (mesoxalylurea) C₄H₂O₄N₂ · H₂O and 4H₂O.

Properties: White crystals, become pink on exposure to air; colorless, aqueous solution imparts pink color to skin; m.p. 170°C (dec.) (various m.p. in literature); soluble in water and alcohol.

Derivation: Oxidation of uric acid in acid solution.

Uses: Biochemical research; cosmetics; organic synthesis.

alloy. A solid or liquid mixture of two or more metals; or of one or more metals with certain nonmetallic elements, as in carbon steels. The properties of alloys are often greatly different from those of the components. The purpose of an alloy is to improve the specific usefulness of the primary component—not to adulterate or degrade it. Gold is too soft to use without a small percentage of copper; the corrosion and oxidation resistance of steel is markedly increased by incorporation of from 15 to 18% of chromium and often a few percent of nickel (stainless steel). The presence of up to 1.5% carbon profoundly affects the properties of steels. Similarly, a low percentage of molybdenum improves the toughness and wear resistance of steel. The hundreds of special alloys available are instances of the tailor-made nature of alloys to meet specific operating conditions. See alloy, fusible; amalgam; superalloy.

alloy, fusible (low-melting alloy; fusible metal). An alloy melting in the range of about 125-500°F, usually containing bismuth, lead, tin, cadmium, or indium. Eutectic alloys are the particular compositions that have definite and minimum melting points, compared with other mixtures of the same metals. The compositions of a few fusible alloys are given below:

System	Composition	Eutectic Temperature
Cd—Bi	60 Bi 40 Cd	144
In—Bi	33.7 Bi 66.3 In	72
	67.0 Bi 33 In	109
Pb—Bi	56.5 Bi 43.5 Pb	125
Sn—Bi	58 Bi 42 Sn	139
Pb—Sn—Bi	52 Bi-16 Sn-32 Pb	96
Pb—Cd—Bi	52 Bi-8 Cd-40 Pb	92
Sn—Cd—Bi	54 Bi-20 Cd-26 Sn	102
In—Sn—Bi	58 Bi-17 Sn-25 In	79
Pb—Sn—Cd—Bi	*50Bi-10 Cd-13.3 Sn-26.7 Pb	70
In—Pb—Sn—Bi	49.4 Bi-11.6 Sn-18 Pb-21 In	57
In—Cd—Pb—Sn—Bi	44.7 Bi-5.3 Cd-8.3 Sn-22.6 Pb-19.1 In	47

*Wood's metal.

alloy steel. A steel containing up to 10% of elements such as chromium, molybdenum, nickel, etc., usually with a low percentage of carbon. These added elements improve hardenability, wear resistance, toughness, and other properties. This term includes low-alloy steels, in which the alloy content does not exceed 5%, but does not include stainless steel. See also steel.

allylacetone (5-hexene-2-one) CH₂CHCH₂CH₂COCH₃.

Properties: Colorless liquid; sp. gr. (20/4°C) 0.846; wt/gal (20°C) 6.99 lb; 5% to 95% distills between 127-129°C; soluble in water and organic solvents.

Containers: 5-gal steel drums; 55-gal resin steel drums.
Hazard: Probably highly toxic by ingestion and inhalation.

Uses: Intermediate in pharmaceutical synthesis; perfumes, fungicides; insecticides; fine chemicals.

allyl acrylate $\text{CH}_2\text{CHCOOCH}_2\text{CHCH}_2$. Liquid; b.p. 122–124°C. Used as monomer for resins.

Hazard: Probably highly toxic by ingestion and inhalation.

allyl alcohol (2-propen-1-ol; propenyl alcohol)

$\text{CH}_2=\text{CHCH}_2\text{OH}$.

Properties: Colorless liquid with pungent mustardlike odor. B.p. 96.9°C; m.p. –129°C; sp. gr. (20/4°C) 0.8520; wt/gal (20°C) 7.11 lb; refractive index n_{D}^{20} 1.4131; flash point (TOC) 90°F. Miscible with water, alcohol, chloroform, ether, petroleum ether.

Derivation: (a) Hydrolysis of allyl chloride (from propylene) with dilute caustic; (b) isomerization of propylene oxide over lithium phosphate catalyst at 230–270°C; (c) dehydration of propylene glycol.

Containers: 55-gal drums; tank cars.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin. Flammable, moderate fire risk. Tolerance, 2 ppm in air.

Uses: Esters for use in resins and plasticizers; intermediate for pharmaceuticals and other organic chemicals; manufacture of glycerol and acrolein; military poison gas; herbicide.

Shipping regulations: (Rail, Air) Poison label.

allylamine (2-propenylamine) $\text{C}_3\text{H}_5\text{NH}_2$.

Properties: Colorless to light yellow liquid; strong ammoniacal odor; attacks rubber and cork; b.p. 55–58°C; sp. gr. 0.759–0.761 (20/20°C); refractive index n_{D}^{22} 1.4194. Soluble in water, alcohol, ether, and chloroform. Combustible.

Grades: C.P.; technical.

Containers: 55-gal drums; tank cars.

Hazard: Fumes are strongly irritant to eyes and skin.

Uses: Pharmaceutical intermediate; organic synthesis.

allyl bromide (3-bromopropene; bromoallylene)

$\text{C}_3\text{H}_5\text{Br}$.

Properties: Colorless to light yellow liquid; irritating, unpleasant odor. Sp. gr. 1.398 (20/4°C); m.p. –199°C; b.p. 71.3°C; refractive index 1.4654; soluble in alcohol, ether, chloroform, carbon tetrachloride, carbon disulfide; insoluble in water. Flash point 30°F; autoignition temp. 563°F.

Grades: Technically pure (95% minimum purity by bromine titration).

Containers: 5-gal carboys.

Hazard: Strong irritant to skin and eyes. Flammable, dangerous fire risk.

Uses: Organic synthesis; preparation of resins and perfume intermediates.

Shipping regulations: (Rail) Red label. (Air) Flammable. Liquid label. Not acceptable on passenger planes.

allyl caproate (allyl hexanoate; 2-propenyl hexanoate) $\text{CH}_3(\text{CH}_2)_4\text{COOCH}_2\text{CHCH}_2$.

Properties: Colorless to pale yellow liquid; pineapple odor. Insoluble in water; soluble in 1 volume of 80% alcohol. Sp. gr. 0.885–0.888; refractive index 1.424–1.426; b.p. 186–188°C.

Hazard: May be toxic.

Uses: Perfumery; flavors.

allyl chloride (3-chloropropene; alpha-chloropropylene) $\text{CH}_2\text{CHCH}_2\text{Cl}$.

Properties: Colorless liquid with unpleasant pungent odor; b.p. 45.0°C; f.p. –134.5°C; sp. gr. (20/4°C) 0.9382; wt/gal (20°C) 7.83 lb; refractive index 1.416; flash point (TOC) –20°F. Autoignition temp. 737°F. Insoluble in water; miscible with alcohol, chloroform, ether, and naphtha.

Derivation: By gas-phase direct chlorination of propylene at 15 psi and 400–500°C.

Method of purification: Distillation.

Containers: 55-gal drums; tank cars.

Hazard: Strong irritant to tissue. Toxic by inhalation. Highly flammable, dangerous fire risk. Explosive limits in air 3.3 to 11.2%. Tolerance, 1 ppm in air.

Uses: Preparation of allyl alcohol and other allyl derivatives; thermosetting resins for varnishes, plastics, adhesives; synthesis of pharmaceuticals, glycerol, and insecticides; precursor of epichlorohydrin.

Shipping regulations: (Rail) Flammable liquid, n.o.s. Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

allyl chlorocarbonate (allyl chloroformate)

$\text{C}_3\text{H}_5\text{OOCCL}$.

Properties: Colorless liquid; pungent odor. B.p. 106°C; sp. gr. 1.14; flash point 88°F (closed cup).

Hazard: Toxic; strong irritant to tissue. Flammable, moderate fire risk.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

allyl chloroformate. See allyl chlorocarbonate.

allyl cyanide (3-butenenitrile; vinylacetonitrile.)

$\text{CH}_2=\text{CHCH}_2\text{CN}$.

Properties: Liquid; agreeable onion-like odor; sp. gr. 0.8341; m.p. –87°C; b.p. 119°C. Slightly soluble in water.

Derivation: Treating dry cuprous cyanide with allyl bromide.

Hazard: Toxic; absorbed by skin. Tolerance (as CN): 5 mg per cubic meter of air.

Uses: Crosslinking agent in polymerization.

allyl diglycol carbonate. See diethylene glycol bis (allyl carbonate).

4-allyl-1,2-dimethoxybenzene. See methyl eugenol.

allylene. See methylacetylene.

2-allyl-2-ethyl-1,3-propanediol

$\text{C}_3\text{H}_5\text{C}(\text{CH}_2\text{OH})_2\text{CH}_2\text{CH}_3$. Off-white solid; f.p. 31°C; density (35°C) 0.976 g/cc. Suggested as polymer additive and chemical intermediate.

allyl hexanoate. See allyl caproate.

1-allyl-4-hydroxybenzene. See chavicol.

L-N-allyl-3-hydroxymorphinan bitartrate. See levallorphan tartrate.

allyl-alpha-ionone. $\text{C}_{16}\text{H}_{24}\text{O}$. Yellow liquid with fruity odor; sp. gr. (25/25°C) 0.928–0.935. Stable; soluble in 70% alcohol. Made synthetically. Used as perfume and flavoring. Combustible; low toxicity.

5-allyl-5-isobutylbarbituric acid $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White crystalline powder; odorless; slightly bitter taste; soluble in alcohol, ether and chloroform; almost insoluble in water; m.p. 138–139°C.

Hazard: Toxic by ingestion.

Use: Medicine (sedative).
See also barbiturate.

allyl isocyanate C_3H_5NCO .

Properties: Colorless liquid that turns yellow on standing; sp. gr. 0.935–0.945 (20°C); flash point 110°F; b.p. 85.5–86°C; f.p. < -80°C. Combustible.

Grades: Purity, 98% min.

Hazard: Probably toxic. Moderate fire risk.

Uses: Organic intermediate; cross-linking agent; polymer modifier.

allyl isothiocyanate (allyl isosulfocyanate; mustard oil; 2-propenyl isothiocyanate) CH_2CHCH_2NCS .

Properties: Colorless to pale yellow, oily liquid; pungent, irritating odor; sharp, biting taste. Sp. gr. 1.013–1.016 (25°C); b.p. 152°C; flash point 115°F; refractive index 1.527; optically inactive. Soluble in alcohol, ether, carbon disulfide; slightly soluble in water. Combustible.

Derivation: Distillation of sodium thiocyanate and allyl chloride, or of seed of black mustard.

Grades: Technical; F.C.C.

Containers: 5-lb bottles.

Hazard: Toxic by ingestion, inhalation and skin contact. Moderate fire risk.

Uses: Fumigant; ointments and mustard plasters.

Shipping regulations: (Air) Poison label. Not acceptable on passenger planes.

allyl mercaptan. See allyl thiol.

allyl methacrylate $CH_2C(CH_3)COOC_3H_5$. Used as monomer and intermediate.

4-allyl-2-methoxyphenol. See eugenol.

5-allyl-5-(1-methylbutyl) barbituric acid. See secobarbital.

4-allyl-1,2-methylenedioxybenzene. See safrole.

allyl pelargonate $C_3H_5OOC(CH_2)_3CH_3$. Liquid; fruity odor; b.p. (3 mm) 87–91°C; refractive index 1.4332 (20.5°C). Used in flavors and perfumes; polymers. Combustible.

para-allylphenol. See chavicol.

allyl resin. A special class of polyester resins derived from esters of allyl alcohol and dibasic acids. Common monomers are allyl diglycol carbonate, also known as diethylene glycol bis(allyl carbonate), diallyl chloredate, diallyl phthalate, diallyl isophthalate, and diallyl maleate. Polymerization occurs through the unsaturated allyl double bond to form thermosetting resins which are highly resistant to chemicals, moisture, abrasion, and heat. They have low shrinkage and good electrical resistivity.

Uses: As laminating adhesives and coatings, especially by impregnation of layered materials with prepolymers (called prepresses); allylic glass cloth; varnishes; applications requiring microwave transparency; encapsulation of electronic parts; vacuum impregnation of metal castings of ceramics; molding compositions; heat-resistant furniture finishes.

allyl sulfide (diallyl sulfide; thioallyl ether) $(CH_2CHCH_2)_2S$.

Properties: Colorless liquid with garlic odor. Combustible. B.p. 139°C; sp. gr. (27/4°C) 0.888; refractive index n_D 27/D 1.4877. Insoluble in water; miscible with alcohol, ether, chloroform, and carbon tetrachloride.

Hazard: Strong irritant to eyes and skin.

Uses: Component of artificial oil of garlic.

allyl thiol (allyl mercaptan; 2-propene-1-thiol). CH_2CHCH_2SH .

Properties: Water-white liquid (darkens on standing); strong garlic odor; sp. gr. 0.925 (23/4°C); b.p. 67–68° (90°C); insoluble in water; soluble in ether and alcohol. Combustible.

Containers: Bottles.

Hazard: May be toxic.

Uses: Pharmaceutical intermediate; rubber accelerator intermediate.

allylthiourea (allylsulfocarbamide; thiosinamine; allyl sulfourea). $C_3H_7NHCSNH_2$.

Properties: White crystalline solid; slight garlic odor; bitter taste; sp. gr. 1.22; m.p. 78°C. Soluble in water, ether, and solutions of borax, benzoates, urethane; insoluble in benzene; slightly soluble in 70% alcohol.

Derivation: Warming a mixture of equal parts of allyl isothiocyanate and absolute alcohol with an equal amount of 30% ammonia.

Hazard: May be toxic. A strong allergen.

Uses: Medicine; corrosion inhibitor; organic synthesis.

allyltrichlorosilane $CH_2CHCH_2SiCl_3$.

Properties: Colorless liquid; pungent, irritating odor; b.p. 117.5°C; sp. gr. 1.217 (27°C); refractive index n_D 20/D 1.487; flash point (COC) 95°F. Readily hydrolyzed by moisture, with the liberation by hydrochloric acid; polymerizes easily.

Derivation: Reaction of allyl chloride with silicon (copper catalyst).

Hazard: Toxic; strong irritant to tissue. Flammable, moderate fire risk.

Use: Intermediate for silicones; glass fiber finishes.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

4-allyl veratrole. See methyl eugenol.

almond oil, bitter. See oil of bitter almond.

almond oil, sweet. See oil of sweet almond.

"Alnico." Trademark for an alloy containing chiefly aluminum, nickel, and cobalt; it has outstanding properties as a permanent magnet.

aloin (barbaloin). A mixture of active principles obtained from aloe. Varies in properties according to variety used.

Properties: Yellow crystals with bitter taste; darkens on exposure to air; odorless or slight odor of aloe; soluble in acetone, alkalies, water, and alcohol; slightly soluble in ether.

Grades: Technical.

Containers: Barrels; drums; kegs.

Uses: Medicine; proprietary laxatives; electroplating baths; fermentation.

"Alon."²⁷⁵ Trademark for a fumed alumina.

Properties: Powder with surface area of 100 square meters per gram. Isoelectric point at pH 9.1.

Derivation: Flame hydrolysis of aluminum chloride.

Uses: Spinning aid for textiles, especially wool; paper making; antistatic agent; armature cores; hair sprays; reinforcement of elastomers; hydrophilic and thickening agent.

"Alox."¹¹⁷ Trademark for a series of oxygenated hydrocarbons derived from the controlled, liquid phase, partial oxidation of petroleum fractions. Each consists of mixtures of organic acids and hydroxy acids, lactones, esters, and unsaponifiable matter. Esters, amines, amides and metal soap derivatives are also available.

Containers: Up to tank car lots.

Uses: Corrosion inhibitors; film-forming rust preventives; lubricity agents; emulsifiers.

"Aloxite."²⁸⁰ Trademark for aluminum oxide made by fusing materials high in alumina, such as bauxite, and for articles made therefrom.

Containers: Multiwall paper sacks.

Uses: Abrasive grains and powders; grinding wheels; stones; razor hones; refractory cements; filter plates and tubes; diffuser plates and tubes; porous undergrain plates and coated abrasive products.

alpaca. A natural fiber obtained from a South American animal similar to the llama. Properties resemble those of wool. Used for specialty clothing and also blended with rayon. Combustible.

"Alpco."²⁷¹ Trademark for a series of high-melting mineral waxes and resins, used for carbon paper, inks, polishes, paper, plasticizers, surfactants, dispersants, casting waxes and surface coatings.

"Alperox" C.¹⁵⁴ Trademark for lauroyl peroxide (96.5% min.).

alpha (α) (1) A prefix denoting the position of a substituting atom or group in an organic compound. The Greek letters alpha, beta, gamma, etc., are usually not identical with the IUPAC numbering system, 1, 2, 3, etc., since they do not start from the same carbon atom. However, alpha and beta are used with naphthalene ring compounds to show the 1 and 2 positions, respectively. Alpha, beta, etc. are also used to designate attachment to the side chain of a ring compound.

(2) Both a symbol and a term used for relative volatility in distillation.

(3) Symbol for optical rotation (q.v.).

(4) A form of radiation consisting of helium nuclei. See alpha particle.

(5) The major allotropic form of a substance, especially of metals, e.g., alpha-iron.

alpha particle. A helium nucleus emitted spontaneously from radioactive elements, both natural and man-made. Its energy is in the range of 4 to 8 MeV, and is dissipated in a very short path, i.e., in a few centimeters of air or less than 0.005 mm of aluminum. It has the same mass (4) and positive charge (2) as the helium nucleus. Accelerated in a cyclotron, alpha particles can be used to bombard the nuclei of other elements. See also helium; decay, radioactive.

"Alphazurine."²⁴³ Trademark for triphenylmethane acid blues.

"Alsilox."⁴⁶⁸ Trademark for a fusion product of 1% alumina, 65% litharge, and 34% silica; used in ceramics. Available in various particle sizes.

"Altax."²⁶⁵ Trademark for benzothiazyl disulfide.

Properties: Cream to light yellow powder; sp. gr. $1.51 \pm .03$; moderately soluble in benzene, carbon disulfide, chloroform; insoluble in water, dilute caustic, gasoline.

Uses: Primary accelerator in natural and nitrile rubber and SBR; plasticizer and vulcanization retarder in neoprene Type G; cure modifier in neoprene Type W; oxidation cure activator in butyl. For extruded and molded goods, tire and tubes, wire and cable, sponge.

altheine. See asparagine.

"Aludur-11."¹²⁶ Trademark for an alumina ceramic of comparable chemical resistance to porcelain, but with superior mechanical properties.

alum. See aluminum ammonium sulfate, aluminum potassium sulfate, aluminum sulfate.

"Alumalith."²⁵⁰ Trademark for amblygonite (q.v.).

alum, burnt (alum, dried) $\text{AlNH}_4(\text{SO}_4)_2$ or $\text{AlK}(\text{SO}_4)_2$. Aluminum ammonium sulfate or aluminum potassium sulfate heated just sufficiently to drive off the water of crystallization.

Properties: White, odorless powder; sweetish taste. Absorbs moisture on exposure to air. Soluble in hot and slowly soluble in cold water; insoluble in alcohol. Grades: N.F.

Use: Medicine (astringent).

alum, chrome. See chromium-potassium sulfate.

alum, chrome ammonium. See chromium-ammonium sulfate.

"Alumel."¹⁶⁶ Trademark for an alloy consisting of about 94% nickel, with small, carefully controlled amounts of silicon, aluminum and manganese. It is chiefly used in thermocouples and lead wire.

"Alumex."²⁸⁵ Trademark for a china clay; particle size 55–60% minus 2 microns, 20–25% plus 5 microns; oil absorption 30 cc/100 g clay; pH 4.5–5.5

alumina. See aluminum oxide.

alumina, activated. A highly porous, granular form of aluminum oxide having preferential adsorptive capacity for moisture and odor contained in gases and some liquids. When saturated, it can be regenerated by heat (350–600°F). The cycle of adsorption and reactivation can be repeated many times. Granules range in size from powder to pieces about $1\frac{1}{2}$ " diam. Average weight about 50 lb/cu ft. An effective desiccant (q.v.) for gases and vapors in the petroleum industry. It is also used as a catalyst or catalyst carrier; in chromatography; and in water purification.

alumina, fused. See aluminum oxide; "Alundum."

alumina gel. See aluminum hydroxide gel.

alumina-silica fiber.

Properties: Amorphous structure; excellent resistance to all chemicals except hydrofluoric and phosphoric acids and concentrated alkalis. Available in both short and long staple. Low heat conductivity; high thermal shock resistance. Tensile strength 400,000 psi; elastic modulus 16 million psi; upper temperature limit in oxidizing atmosphere 800°C. Noncombustible.

Derivation: The short fiber type is made by blasting a stream of molten alumina and silica with a steam jet. Long staple is spun from a molten mixture of alumina and silica modified with zirconium.

Forms: Fibers; sheets; blankets.

Uses: Nonwoven fabrics (short staple); woven fabric structures; cordage; thermal insulation; repair of furnace linings; piping molten metals; welding insulation (re-usable); insulation for rocket and space applications.

Note: In finely divided form, alumina-silica is also used as a catalyst (q.v.).

alumina trihydrate (aluminum hydroxide; aluminum hydrate; hydrated alumina; hydrated aluminum oxide) $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ or $\text{Al}(\text{OH})_3$.

Properties: White crystalline powder, balls or granules; sp. gr. 2.42; insoluble in water; soluble in mineral acids and caustic soda. Noncombustible.

Derivation: From bauxite; the ore is dissolved in strong caustic and aluminum hydroxide precipitated from the sodium aluminate solution by neutralization (as with carbon dioxide) or by autprecipitation (Bayer process, q.v.).

Grades: Technical; C.P.

Containers: Bags; drums; tonnage lots.

Uses: Glass, ceramics, iron-free aluminum and aluminum salts; manufacture of activated alumina; base for organic lakes; flame retardant. Finely divided form (0.1–0.6 microns) used for rubber reinforcing agent, paper coating, filler, cosmetics.

aluminium. British spelling of aluminum.

aluminosilicate. A compound of aluminum silicate with metal oxides or other radicals. Used as catalyst in the refining of petroleum; to soften water. See also zeolite.

aluminum (aluminium). Al Metallic element of atomic number 13; Group IIIA of the Periodic Table. Atomic weight 26.9815. Valence 3; no stable isotopes; monovalent in high-temperature compounds $AlCl$ and AlF . Most abundant metal in earth's crust; third most abundant of all elements. Does not occur free in nature. Nontoxic.

Properties: Silvery white, crystalline solid. Tensile strength (annealed) 6800 psi, cold-rolled 16,000 psi. Sp. gr. 2.708; m.p. 660°C; b.p. 2450°C. Forms protective coating of Al_2O_3 about 50 Å thick, which makes it highly resistant to ordinary corrosion. Attacked by conc. and dilute solutions of HCl , hot, conc. H_2SO_4 and perchloric acid, also violently by strong alkalis. Rapidly oxidized by water at 180°C. Unattacked by dilute or cold conc. H_2SO_4 and conc. nitric acid. Nontoxic and noncombustible except in powder form. Electrical conductivity about 2/3 that of copper. Aluminum qualifies as both a light metal and a heavy metal, according to their respective definitions.

Derivation: From bauxite by Bayer process (q.v.) and subsequent electrolytic reduction by Hall process (q.v.). There are several processes for obtaining ultrapure aluminum: (a) electrolytic (three-layer); (b) zone refining (q.v.); and (c) chemical refining. Purities up to 0.2 ppm are possible.

Two new and more efficient processes in the advanced experimental stage are the Alcoa and Toth processes (q.v.).

Forms available: Structural shapes of all types, plates, rods, wire, foil, flakes, powder (technical and U.S.P.). Aluminum can be electrolytically coated and dyed by the anodizing process (see anodic coating); it can be foamed by incorporating zirconium hydride in molten aluminum; and it is often alloyed with other metals, or mechanically combined (fused or bonded) with boron and sapphire fibers or whiskers. Strengths up to 55,000 psi at 500°C have been obtained in such composites. A vapor-deposition technique is used to form a tightly adherent coating from 0.2 to 1 mil thick on titanium and steel.

Hazard: Fine powder forms flammable and explosive mixtures in air. Tolerance, 50 million particles per cubic foot of air.

Uses: Building and construction; corrosion-resistant chemical equipment (desalination plants); die-cast auto parts; electrical industry (power transmission lines); photoengraving plates; permanent magnets; cryogenic technology; machinery and accessory equipment; containers for fissionable reactor fuels; tubes for ointments, tooth paste, shaving cream, etc. As powder, in paints and protective coatings, as rocket fuel, ingredient of incendiary mixtures

(thermite); as a catalyst; foamed concrete; vacuum metallizing and coating. As foil, in packaging, cooking, decorative stamping. As flakes, for insulation of liquid fuels.

Shipping regulations (powder): (Rail) Flammable solid, n.o.s. Yellow label. (Air) Flammable Solid label.

See also aluminum alloy. For further information refer to Aluminum Association, New York, N.Y.

aluminum acetate. (a) Normal $Al(C_2H_3O_2)_3$; (b) basic $Al(C_2H_3O_2)_2OH$.

Properties: (a) Known only in solution; (b) white powder; insoluble in water; decomposed by heat.

Derivation: Interaction of aluminum hydroxide and acetic acid. The product is recovered by crystallization.

Grades: Technical; C.P.; also sold in solution (U.S.P.).

Containers: Boxes; drums; carboys (solutions).

Uses: Waterproofing cloth; mordant in textile-dyeing; preparation of lakes; embalming fluids; calico printing; treatment of dermatitis.

See also mordant rouge.

aluminum acetylacetonate $Al(C_5H_7O_2)_3$.

Properties: Solid; m.p. 189°C; b.p. 315°C. Soluble in benzene and alcohol.

Uses: Deposition of aluminum; catalyst.

aluminum acetylsalicylate (aluminum aspirin)

$[C_6H_4(OCOCH_3)(COO)]_2AlOH$.

Properties: White to off-white granules or powder; odorless or slight odor; m.p., decomposes. Insoluble in water and organic solvents; soluble with decomposition in alkali hydroxides and carbonates.

Derivation: Reaction of aluminum hydroxide with acetylsalicylic acid.

Grade: N.F.

Uses: Medicine.

aluminum alkyl (aluminum trialkyl). Catalyst used in the Ziegler process.

Hazard: Pyrophoric liquid.

Shipping regulations: (Rail) Red label. (Air) Not acceptable.

See triethylaluminum and triisobutylaluminum.

aluminum alloy. Aluminum containing variable amounts of manganese, silicon, copper, magnesium, lead, bismuth, nickel, chromium, zinc, or tin. A wide range of uses and properties is possible. Alloys may be obtained for casting or working, heat-treatable or non-heat-treatable, with a wide range of strength, corrosion resistance, machinability and weldability. See also duralumin.

aluminum ammonium chloride (ammonium aluminum chloride) $AlCl_3 \cdot NH_4Cl$.

Properties: White crystals; soluble in water. M.p. 304°C.

Uses: Fur treatment.

aluminum ammonium sulfate (ammonium alum; alum N.F.) $Al_2(SO_4)_3(NH_4)_2SO_4 \cdot 24H_2O$ or $AlNH_4(SO_4)_2 \cdot 12H_2O$.

Properties: Colorless crystals; odorless; strong astringent taste. Soluble in water, glycerine; insoluble in alcohol. Sp. gr. 1.645; m.p. 94.5°C; b.p., loses $20H_2O$ at 120°C.

Derivation: By crystallization from a mixture of ammonium and aluminum sulfates.

Method of purification: Recrystallization.

Grades: Technical, lump, ground, powdered; C.P.; N.F.; F.C.C.

Containers: Bags; drums.

Hazard: Moderately toxic by ingestion.

Uses: Medicine; mordant in dyeing; water and sew-

- age purification; sizing paper; retanning leather; clarifying agent; ingredient in baking powder; food additive.
- aluminum, anodized.** See anodic coating.
- aluminum arsenide AlAs .** A semiconductor used in rectifiers, transistors, thermistors.
Hazard: Highly toxic by ingestion.
(Rail, Air) Arsenical compounds, solid. Poison label.
- aluminum borate $2\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ (approx.)**
Properties: White, granular powder; decomposed by water.
Derivation: Interaction of aluminum hydroxide and boric acid.
Grades: Technical; C.P.
Use: Glass and ceramic industries
- aluminum boride**
Properties: Powder; apparent bulk density (fully settled): light, 0.6–0.8 g/cc; dense, 1.2–1.4 g/cc; high neutron absorption.
Uses: Nuclear shielding.
- aluminum borohydride $\text{Al}(\text{BH}_4)_3$.**
Properties: Volatile pyrophoric liquid; b.p. 44.5°C; m.p. -64.5°C.
Derivation: (1) By reaction of sodium borohydride and aluminum chloride in the presence of a small amount of tributyl phosphate; (2) by reaction of trimethylaluminum and diborane.
Hazard: Ignites spontaneously in air; reacts violently with water.
Uses: Intermediate in organic synthesis; jet fuel additive.
Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Pyrophoric liquid n.o.s. Not acceptable.
- aluminum brass.** An alloy containing 76% copper, 21.5 to 22.25% zinc, 1.75 to 2.50% aluminum.
Uses: Condenser, evaporator and heat exchanger tubes and ferrules.
- aluminum bromide (a) AlBr_3 ; (b) $\text{AlBr}_3 \cdot 6\text{H}_2\text{O}$.**
Properties: White to yellowish, deliquescent crystals; exists as double molecules Al_2Br_6 in the vapor; soluble in water, alcohol, carbon disulfide or ether. (a) Sp. gr. 3.01; m.p. 97.5°C; b.p. 265°C; (b) sp. gr. 2.54; m.p. 93°C (decomposes).
Derivation: (a) By passing bromine over heated aluminum; (b) reaction of hydrobromic acid with aluminum hydroxide.
Containers: Glass jars; air-tight drums.
Hazard: The anhydrous form reacts violently with water and is corrosive to skin.
Uses: Bromination, alkylation, and isomerization catalyst in organic synthesis.
Shipping regulations: (anhydrous) (Air) Corrosive label.
- aluminum bronze.** An alloy containing 88–96.1% copper, 2.3–10.5% aluminum, and small amounts of iron and tin. Characterized by high strength, ductility, hardness and resistance to shock, fatigue, most chemicals, and sea water.
Powder: Also called gold bronze powder. An alloy of 90% copper and 10% aluminum reduced from leaf form to powder, polished mechanically, and coated with stearic acid. Available in the following grades: litho, molding, printing-ink, and radiator. Used as a pigment in paints and inks.
- aluminum n-butoxide $\text{Al}(\text{OC}_4\text{H}_9)_3$.**
Properties: Yellow to white crystalline solid; m.p. 101.5°C (pure) and 88–96°C (commercial); density 1.0251 (20°C); b.p. 290–310°C (30 mm). Soluble in aromatic, aliphatic and chlorinated hydrocarbons.
Uses: Ester exchange catalyst; defoamer ingredient; hydrophobic agent intermediate.
- aluminum carbide Al_4C_3 .**
Properties: Yellow crystals or powder; decomposes in water with liberation of methane. Sp. gr. 2.36. Stable to 1400°C.
Derivation: By heating aluminum oxide and coke in an electric furnace.
Grades: Technical.
Containers: Iron drums.
Uses: Generating methane; catalyst; metallurgy; drying agent.
Hazard: Dangerous fire risk. Keep dry.
Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.
- aluminum carbonate.** A basic carbonate of variable composition; formula sometimes given as $\text{Al}_2\text{O}_3 \cdot \text{CO}_2$. White lumps or powder, insoluble in water, dissolves in hot hydrochloric acid or sulfuric acid. Formerly used as mild astringent, styptic. Normal aluminum carbonate $\text{Al}_2(\text{CO}_3)_3$ is not known as an individual compound.
- "Aluminum Chelate."**¹³⁴ Trademark for a group of compounds based on aluminum.
BEA-1: Chemically modified aluminum secondary butoxide.
Properties: Pale yellow liquid; sp. gr. 1.030 (21°C); aluminum content 8.9–9.1%.
PEA-1: Chemically modified aluminum isopropylate.
Properties: Pale yellow liquid; sp. gr. 1.035 (25°C); aluminum content 9.3–10.0%.
PEA-2: Chemically modified aluminum isopropylate.
Properties: Pale yellow; soluble in aromatic, aliphatic and chlorinated hydrocarbons; aluminum content 7.8–7.9%.
Uses: Curing of epoxy, phenolic, castor oil alkyds and high molecular weight polymers which are hydroxyl or carboxyl bearing; textile hydrophobing, in solvent based systems; adhesion promotion.
- aluminum chloride, anhydrous AlCl_3 .**
Properties: White or yellowish crystals; sp. gr. (25°C) 2.44; m.p. 190°C (2.5 atm); sublimes readily at 178°C; the vapor consists of double molecules, Al_2Cl_6 . Soluble in water.
Derivation: (a) By reaction of purified gaseous chlorine with molten aluminum; (b) by reaction of bauxite with coke and chlorine at about 1600°F. This product is used to make the hydrate.
Impurities: (a) Ferric chloride; free aluminum; insolubles.
Grades: Technical; reagent.
Containers: Drums; car lots.
Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue. Reacts violently with water, evolving HCl. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.
Uses: Ethylbenzene catalyst; dyestuff intermediate; detergent alkylate; ethyl chloride; pharmaceuticals and organics (Friedel-Crafts catalyst); butyl rubber; petroleum refining; hydrocarbon resins; nucleating agent for titanium dioxide pigments.
Shipping regulations: (Rail) Not listed. (Air) Corrosive label.

aluminum chloride hydrate $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White or yellowish deliquescent crystalline powder; nearly odorless; sweet, astringent taste; sp. gr. 2.4; m.p., decomposes. Soluble in water and alcohol. The water solution is acid.

Derivation: By crystallizing the anhydrous form from hydrochloric acid solution.

Grades: Technical; C.P.; N.F. See also aluminum chloride solution.

Hazard: May be toxic.

Uses: Pharmaceuticals and cosmetics; pigments; roofing granules; special papers; photography; textile (wool).

aluminum chloride solution 32° Bé. Special grade of a solution containing only 0.005% iron as impurity, and having an acid reaction but containing no free acid.

Containers: Carboys; tank cars; tank trucks.

Uses: Antiperspirants; roofing granules.

aluminum chlorohydrate, $[\text{Al}_2(\text{OH})_2\text{Cl}]_x$. An ingredient of commercial antiperspirant and deodorant preparations. Also used for water purification and treatment of sewage and plant effluent.**aluminum diethyl monochloride**. See diethylaluminum chloride.**aluminum diformate** (aluminum formate, basic)

Properties: White or gray powder. Soluble in water. Low toxicity.

Derivation: Aluminum hydroxide is dissolved in formic acid and spray-dried. Solutions are also prepared by treating aluminum sulfate with formic acid, followed by lime.

Grades: Technical solutions (12–20° Bé).

Containers: Carboys; carlots.

Uses: Waterproofing; mordanting; antiperspirants; tanning leather; improving wet strength of paper.

aluminum distearate $\text{Al}(\text{OH})(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White powder; m.p. 145°C; sp. gr. 1.009.

Insoluble in water, alcohol, ether. Forms gel with aliphatic and aromatic hydrocarbons. Low toxicity.

Uses: Thickener in paints, inks, and greases; water repellent; lubricant in plastics and ropes; in cement production.

aluminum ethylhexoate (aluminum octoate). A metallic salt of 2-ethylhexoic acid, used as a gelling agent for liquid hydrocarbons as gasoline and common petroleum fractions used in coating thinners.**aluminum fluoride, anhydrous** AlF_3 .

Properties: White crystals. Sublimes about 1260°C without melting; sp. gr. 2.882. Slightly soluble in water; insoluble in most organic solvents.

Derivation: (1) Action of hydrogen fluoride gas on alumina trihydrate; (2) reaction of hydrofluoric acid on a suspension of aluminum trihydrate, followed by calcining the hydrate formed; (3) reaction of fluosilicic acid on aluminum hydrate.

Grades: Technical

Containers: Multiwall paper sacks; fiber drums.

Hazard: Moderately toxic; strong irritant to tissue. Tolerance (as F): 2.5 mg per cubic meter of air.

Uses: Production of aluminum to lower the melting point and increase the conductivity of the electrolyte; flux in ceramic glazes and enamels; manufacture of aluminum silicate.

aluminum fluoride hydrate $\text{AlF}_3 \cdot 3\frac{1}{2}\text{H}_2\text{O}$.

Properties: White crystalline powder. Slightly soluble in water.

Derivation: Action of hydrofluoric acid on alumina hydrate and subsequent recovery by crystallization.

Grades: Technical; C.P.

Containers: Bags; drums.

Hazard: Moderately toxic.

Uses: Ceramics (production of white enamel).

aluminum fluosilicate (aluminum silicofluoride)

Properties: White powder. Slightly soluble in cold water; readily soluble in hot water.

Grades: Technical.

Hazard: Moderately toxic.

Uses: Artificial gems, enamels, glass.

aluminum formate. See aluminum triformate, and aluminum diformate.**aluminum formate, basic**. See aluminum diformate.**aluminum formate, normal**. See aluminum triformate.**aluminum formoacetate** $\text{Al}(\text{OH})(\text{OOC})(\text{OOCCH}_3)$.

White powder; soluble in water and alcohol; used in textile water repellents.

aluminum hydrate. See alumina trihydrate.**aluminum hydride** AlH_3 .

Properties: White to gray powder; decomp. 160°C (100°C if catalyzed). Evolves hydrogen on contact with water.

Hazard: Dangerous fire and explosion risk.

Uses: Electroless coatings on plastics, textiles, fibers, other metals; possible rocket fuel.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

aluminum hydroxide. See alumina trihydrate.**aluminum hydroxide, anhydrous**. See alumina trihydrate.**aluminum hydroxide gel** (hydrous aluminum oxide; alumina gel) $\text{Al}_2\text{O}_3 \cdot x\text{H}_2\text{O}$.

Properties: White, gelatinous precipitate. Constants variable with the composition; sp. gr. about 2.4. Insoluble in water and alcohol; soluble in acid and alkali. Nontoxic; noncombustible.

Derivation: By treating a solution of aluminum sulfate or chloride with caustic soda, sodium carbonate or ammonia; by precipitation from sodium aluminate solution by seeding or acidifying (carbon dioxide is commonly used).

Grades: Technical; C.P.; U.S.P. (containing 4% Al_2O_3); N.F. (dried, containing 50% Al_2O_3).

Containers: Fiber drums.

Uses: Dyeing mordant; water purification; waterproofing fabrics; manufacture of lakes; filtering medium; chemicals (aluminum salts); lubricating compositions; manufacture of glass; sizing paper; ceramic glaze; medicine.

aluminum hydroxystearate

Properties: White powder; m.p. 155°C; sp. gr. 1.045.

Less soluble in nonpolar compounds than other aluminum stearates, and more soluble in polar compounds.

Uses: Waterproofing of leather and cements; lubricant for plastics and ropes; paints and inks.

aluminum iodide AlI_3 (anhydrous).

Properties: Brown-black crystalline pieces (white when pure); m.p. 191°C; b.p. 385°C; sp. gr. 3.9825.

Soluble in water, alcohol, ether, carbon disulfide.

Derivation: Heating aluminum and iodine in a sealed tube.

Method of purification: Crystallization.

Grades: Technical.

Containers: Bottles.

Hazard: Moderately toxic. Reacts violently with water.

Uses: Organic synthesis.

aluminum isopropoxide. See aluminum isopropylate.

aluminum isopropylate (aluminum isopropoxide)

$\text{Al}(\text{OC}_3\text{H}_7)_3$.

Properties: White solid; sp. gr. 1.035 (20°C); m.p. 128–132°C; b.p. 138–148°C (10 mm). Soluble in alcohol, benzene; decomposes in water.

Derivation: From isopropanol and aluminum.

Grades: Distilled (purity approximately 100%).

Containers: Waterproof drums.

Uses: Dehydrating agent; catalyst; waterproofing textiles.

aluminum metaphosphate $\text{Al}(\text{PO}_3)_3$.

Properties: White powder; insoluble in water; m.p. approx. 1537°C.

Uses: As a constituent of glazes, enamels and glasses, and as a high temperature insulating cement.

aluminum monobasic stearate. See aluminum monostearate.

aluminum monopalmitate. See aluminum palmitate.

aluminum monostearate (aluminum monobasic stearate) $\text{Al}(\text{OH})_2[\text{OOC}(\text{CH}_2)_{16}\text{CH}_3]$.

Properties: Fine, white to yellowish white powder; faint characteristic odor; m.p. 155°C; sp. gr. 1.020. Insoluble in water, alcohol and ether. Forms a gel with aliphatic and aromatic hydrocarbons. Low toxicity.

Derivation: Mixing solutions of a soluble aluminum salt and sodium stearate.

Grades: U.S.P., which describes it as a mixture of the monostearate and monopalmitate containing 14.5–16.0% Al_2O_3 .

Uses: Medicine; manufacture of paints, inks, greases, waxes; thickening lubricating oils; waterproofing; gloss producer; stabilizer for plastics.

aluminum naphthenate.

Properties: Yellow substance of rubbery consistency with high thickening power. Combustible.

Derivation: Reaction of an aluminum salt with an alkali naphthenate in aqueous solution.

Uses: Paint and varnish drier and bodying agent; detergent in lube oils; the solution in organic solvents has been proposed for insecticides and siccatives.

See also soap (2).

aluminum nitrate $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White crystals. Soluble in cold water; decomposes in hot water. Soluble in alcohol and acetone. M.p. 73°C; decomposes at 150°C.

Derivation: Formed by the action of nitric acid on aluminum and crystallization.

Grades: Technical; C.P.; 99.75%.

Containers: Multiwall paper sacks; drums.

Hazard: Strong oxidizing agent. Do not store near combustible materials.

Uses: Textiles (mordant); leather tanning; manufacture of incandescent filaments; catalyst in petroleum refining; nucleonics.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

aluminum oleate $\text{Al}(\text{C}_{18}\text{H}_{33}\text{O}_2)_3$.

Properties: Yellowish-white viscous mass. Insoluble in water; soluble in alcohol, benzene, ether, oil and turpentine. Combustible. Nontoxic.

Derivation: By heating aluminum hydroxide, water and oleic acid. The resultant mixture is filtered and dried.

Uses: Waterproofing; drier for paints, etc.; thickener for lubricating oils; medicine; as lacquer for metals; lubricant for plastics; food additive.

aluminum orthophosphate. See aluminum phosphate.

aluminum oxide (alumina) Al_2O_3 . The mineral corundum (q.v.) is natural aluminum oxide, and emery, ruby, and sapphire are impure crystalline varieties. The mixed mineral bauxite is a hydrated aluminum oxide.

Properties: Vary according to the method of preparation. White powder, balls or lumps of various mesh. Sp. gr. 3.4–4.0; m.p. 2030°C; insoluble in water; difficultly soluble in mineral acids and strong alkali. *Noncombustible; nontoxic.* See also *alumina trihydrate*; *aluminum hydroxide gel*.

Derivation: (a) Leaching of bauxite with caustic soda followed by precipitation of a hydrated aluminum oxide by hydrolysis and seeding of the solution. The alumina hydrate is then washed, filtered and calcined to remove water and obtain the anhydrous oxide. See Derivation under *alumina trihydrate*. (b) Coal mine waste waters are used to obtain aluminum sulfate, which is then reduced to alumina.

Grades: Technical; C.P.; fibers; high purity; fused; calcined.

Containers: Multiwall paper sacks; drums; barrels.

Uses: Production of aluminum; manufacture of abrasives, refractories, ceramics, electrical insulators, catalyst and catalyst supports; paper; spark plugs; crucibles and laboratory wares; absorbing gases and water vapors (see *alumina activated*); chromatographic analysis; fluxes; light bulbs; artificial gems; heat-resistant fibers.

aluminum oxide, hydrated. See *alumina trihydrate*.

aluminum oxide, hydrous. See *aluminum hydroxide gel*.

aluminum palmitate (aluminum monopalmitate)

$\text{Al}(\text{OH})_2(\text{C}_{16}\text{H}_{31}\text{O}_2)$.

Properties: White powder; m.p. 200°C; sp. gr. 1.072. Insoluble in alcohol and acetone; forms gel with hydrocarbons. Combustible; nontoxic.

Derivation: By heating aluminum hydroxide and palmitic acid and water. The resultant mixture is filtered and dried.

Uses: Waterproofing leather, paper, textiles; thickening for lubricating oils; thickening or suspending agent in paints and inks; production of high gloss on leather and paper; ingredient of varnishes; lubricant for plastics; food additive.

aluminum paste. Aluminum powder ground in oil; used for aluminum paints.

aluminum phenolsulfonate (aluminum sulfocarbolate) $\text{Al}_2(\text{C}_6\text{H}_4\text{OHSO}_3)_6$.

Properties: Reddish-white powder with slight phenol odor. Strongly astringent taste. Soluble in water and alcohol, glycerin.

Containers: Drums.

Use: Medicine.

aluminum phosphate (aluminum orthophosphate)AlPO₄.

Properties: White crystals. Insoluble in water and alcohol, soluble in acids and alkalis. Sp. gr. 2.566; m.p. 1500°C.

Derivation: Interaction of solutions of aluminum sulfate and sodium phosphate.

Containers: Bags, drums.

Hazard: Solutions are corrosive to tissue.

Uses: Ceramics, dental cements; cosmetics; paints and varnishes; pharmaceuticals; pulp and paper.

Shipping regulations: (solution) (Air) Corrosive label.

aluminum phosphide AlP.

Properties: Dark gray or dark yellow crystals; sp. gr. 2.85. Evolves phosphine.

Hazard: Toxic; flammable, dangerous fire risk.

Uses: Insecticide; fumigant.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Corrosive label.

aluminum picrate Al[(NO₂)₃C₆H₂O]₃.

Properties: Strong oxidizing agent.

Hazard: Toxic by ingestion and inhalation. Dangerous fire risk in contact with combustible materials; severe explosion risk when shocked or heated.

Uses: Explosive compositions.

Shipping regulations: (Rail) Consult regulations (explosive compositions); (Air) Compositions, explosive, n.o.s. Not acceptable.

aluminum potassium sulfate (potash alum; alum, N.F.; potassium alum) Al₂(SO₄)₃ • K₂SO₄ • 24H₂O, sometimes written AlK(SO₄)₂ • 12H₂O.

Properties: White odorless crystals having an astringent taste; sp. gr. 1.75; m.p. 92°C; b.p., loses 18H₂O at 64.5°C; anhydrous at 200°C; soluble in water; insoluble in alcohol. Solutions in water are acid. Noncombustible; nontoxic.

Derivation: (a) From alunite, leucite or similar mineral. (b) Also derived by crystallization from a solution made by dissolving aluminum sulfate and potassium sulfate.

Grades: Technical; lump; ground; powdered; N.F.; F.C.C.

Containers: Bags and drums.

Uses: Dyeing (mordant); paper; matches; paints; tanning agent; waterproofing agent; purification of water; aluminum salts; food additive; medicine.

aluminum resinate.

Properties: Brown solid. Insoluble in water; soluble in oils.

Derivation: Heating soluble aluminum salts and rosin.

Grades: Technical (fused, precipitated).

Uses: Drier for varnishes.

Hazard: Flammable; dangerous fire risk.

Shipping regulations: (Powder) (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

aluminum rubidium sulfate (rubidium alum)AlRb(SO₄)₂ • 12H₂O.

Properties: Colorless crystals. Soluble in water (hot); insoluble in alcohol. Sp. gr. 1.867; m.p. 99°C.

aluminum salicylate Al(C₆H₄OHCOO)₃.

Properties: Reddish-white powder. Odorless. Soluble in dilute alkalis; insoluble in water, alcohol. Decomposed by acid.

Use: Medicine.

aluminum silicate. Any of the numerous types of clay (q.v.), which contain varying proportions of Al₂O₃ and SiO₂. Made synthetically by heating aluminum

fluoride at 1000–1200°C with silica and water vapor; the crystals or whiskers obtained are up to 1 cm long, have high strength, and are used in reinforced plastics. See also mullite; kaolin.

Uses: Same as for clay.

aluminum silicofluoride. See aluminum fluosilicate.

aluminum silicon. Ingots and powder.

Hazard (powder): Flammable, dangerous fire risk.

Shipping regulations: (Powder): (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

aluminum soaps. See aluminum oleate, aluminum palmitate, aluminum resinate, aluminum stearate. See also soap (2).

aluminum sodium sulfate (SAS; sodium aluminum sulfate; soda alum; alum; porous)

Al₂(SO₄)₃ • Na₂SO₄ • 24H₂O, or AlNa(SO₄)₂ • 12H₂O.

Properties: Colorless crystals; saline, astringent taste; effloresces in air. Soluble in water; insoluble in alcohol. Sp. gr. 1.675; m.p. 61°C. Nontoxic; noncombustible.

Derivation: By heating a solution of aluminum sulfate and adding sodium chloride. The solution is allowed to cool, with constant stirring. The alum meal deposited is washed with water and centrifuged.

Method of purification: Recrystallization.

Grades: Pure crystals; technical; C.P.; F.C.C.

Containers: Bulk in cars; bags; barrels.

Uses: Textiles (mordant, waterproofing); dry colors; ceramics; tanning; paper size precipitant; matches; inks; engraving; sugar refining; water purification; medicine; confectionery; baking powders; food additive.

aluminum stearate (aluminum tristearate)

Al(C₁₈H₃₅O₂)₃ (approx.).

Properties: White powder; sp. gr. 1.070; m.p. 115°C. Insoluble in water, alcohol, ether; soluble in alkali, petroleum, turpentine oil. Forms gel with aliphatic and aromatic hydrocarbons. Nontoxic.

Derivation: Reaction of aluminum salts with stearic acid.

Grade: Technical.

Containers: 25-, 50-lb bags; cartons; drums.

Uses: Paint and varnish drier; greases; waterproofing agent; cement additive; lubricants; cutting compounds; flattening agent; cosmetics and pharmaceuticals; additive for chewing gums.

aluminum sulfate (trade term for alum; pearl alum; pickle alum; cake alum; filter alum; paper makers' alum; patent alum). (a) Al₂(SO₄)₃; (b) Al₂(SO₄)₃ • 18H₂O. Noncombustible; nontoxic.

Properties: White crystals; soluble in water (has a sweet taste); insoluble in alcohol. Stable in air. Sp. gr. (a) 2.71, (b) 1.62 m.p. (a) decomposes at 770°C, (b) decomposes at 86.5°C.

Derivation: (1) By treating pure kaolin or aluminum hydroxide or bauxite with sulfuric acid. The insoluble silicic acid is removed by filtration and the sulfate is obtained by crystallization; (2) similarly from waste coal-mining shale and sulfuric acid.

Grades: Iron-free; technical; C.P.; U.S.P.; F.C.C. A liquid form (49.7 H₂O) is also available.

Containers: Bags; fiber drums; multiwall paper sacks; bulk in carloads; solution in rubberlined tank cars or trucks.

Uses: Sizing paper; lakes; alums; mordant for dyeing; foaming agent in fire foams; fireproofing cloth; tannage of white leather; catalyst in manufacture of ethane; pH control in paper industry; waterproof-

ing agent for concrete; clarifying agent for fats and oils; lubricating compositions; deodorizer and decolorizer in petroleum refinery processes; precipitating agent in sewage treatment and water purification; food additive.

aluminum sulfide Al_2S_3 .

Properties: Yellowish-gray lumps. Odor of hydrogen sulfide gas. In moist air, decomposes and forms a gray powder; decomposed by water to evolve hydrogen sulfide. Sp. gr. 2.02; m.p. 1100°C .

Hazard: Moderately toxic by ingestion. Irritant to skin and tissue.

Uses: Preparation of hydrogen sulfide.

aluminum sulfocarbolate. See aluminum phenolsulfonate.

aluminum thiocyanate (aluminum sulfocyanate)

$\text{Al}(\text{SCN})_3$.

Properties: Yellowish powder. Soluble in water; insoluble in alcohol and ether. Probably low toxicity.

Uses: Textile industry; manufacturing pottery.

aluminum trialkyl. See triethylaluminum and triisobutylaluminum.

aluminum tributyl. See tributyl aluminum.

aluminum triformate (aluminum formate, normal)

$\text{Al}(\text{HCOO})_3 \cdot 3\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in hot water; slightly soluble in cold water.

Uses: Textile (delustering rayon, mordanting, waterproofing, after-treatment of dyeings); paper (sizing); fur dyeing (mordant); and medicine.

aluminum trimethyl. See trimethyl aluminum.

aluminum triricinoleate $\text{Al}(\text{C}_{17}\text{H}_{32}\text{OHCOO})_3$.

Properties: Yellowish to brown plastic mass. Limited solubility in most organic solvents. M.p. 95°C . Combustible. Low toxicity.

Derivation: Castor oil.

Uses: Gelling agent; waterproofing; solvent-resistant lubricants.

aluminum tristearate. See aluminum stearate.

alum, N.F. May be either aluminum ammonium sulfate or aluminum potassium sulfate.

alum, papermakers'. See aluminum sulfate.

alum, pearl. Specially prepared aluminum sulfate for the paper making industry.

alum, pickle. Aluminum sulfate prepared to meet specifications of packers and preservers.

alum, porous. See aluminum sodium sulfate.

alum, potash. See aluminum potassium sulfate.

alum, rubidium. See aluminum rubidium sulfate.

alum, soda. See aluminum sodium sulfate.

"Alundum."²⁴⁹ Trademark for a series of fused-alumina refractory and abrasive products. Fusion point $2000\text{--}2050^\circ\text{C}$.

Grades: Grains, cements and refractory shapes.

Uses: (grains) Electrical insulation in radio and television tubes; (cements) embedding electrical resistors, metal melting applications, refractory brick setting; (refractory shapes) high-temperature work, as in furnaces, bricks, plates, muffles, tunnel kilns, tubes, laboratory ware.

alunite (alum stone) $\text{KAl}_3(\text{OH})_6(\text{SO}_4)_3$. A naturally occurring basic potassium aluminum sulfate, usually found with volcanic and other igneous rocks.

Occurrence: Utah, Arizona, California, Colorado, Nevada, Washington; Italy; Australia.

Uses: Production of alum potassium compounds, millstones; substitute for bauxite in aluminum manufacture; decolorizing and deodorizing agent; fertilizer.

"Alusite" D.⁴⁴⁶ Trademark for a 70% alumina brick with relatively low porosity, good resistance to mechanical abrasion and penetration by molten slags. Used in rotary lime, lime sludge and dolomite kilns, soaking pit curb walls, gas regenerators, non-ferrous metallurgical refining furnaces, in reverberatory and brass melting furnaces, and various lead furnaces.

"Alwax" Sizes.⁵⁷ Trademark for series of aqueous emulsions of paraffin and microcrystalline waxes.

Uses: Coating paper to resist water, lactic acid, blood serum, and other organic liquids. Improves paper pliability, gives smoother surface, added scuff resistance to container board, and improved printing qualities.

Am Symbol for americium.

"AM."⁴³³ Trademark for brands of selenium dioxide, tellurium dioxide, and germanium dioxide.

amalgam. A mixture or alloy of mercury with any of a number of metals or alloys, including cesium, sodium, tin, zinc, lithium, potassium, gold and silver, as well as with some nonmetals. Dental amalgams are mixtures of mercury with a silver-tin alloy. A sodium amalgam is formed in the preparation of pure sodium hydroxide by electrolysis of brine.

Uses: Dental fillings; silvering mirrors; catalysis; analytical separation of metals; to facilitate application of active metals such as sodium, aluminum, and zinc in the preparation of titanium, etc., or in reduction of organic compounds. See also sodium amalgam.

amantadine hydrochloride (1-adamantanamine hydrochloride) $\text{C}_{10}\text{H}_{17}\text{N} \cdot \text{HCl}$. A derivative of adamantane (q.v.). An anti-viral drug. Also used in treatment of Parkinson's disease. See "Symmetrel."

amaranth (FDC Red No. 2; Red Dye No. 2).

$\text{NaSO}_3\text{C}_{10}\text{H}_5\text{N}=\text{NC}_{10}\text{H}_4(\text{SO}_3\text{Na})_2\text{OH}$. An azo dye derived from naphthionic and R acids.

Properties: Dark red to purple powder; sp. gr. about 1.50; soluble in water, glycerin, propylene glycol; insoluble in most organic solvents.

Hazard: A suspected carcinogen. Use in foods, drugs and cosmetics restricted.

Uses: Formerly a certified food and drug colorant. Replaced for some applications by FDC Red No. 40.

amatol. An explosive mixture of ammonium nitrate and T.N.T. The 50-50 mixture can be melted and poured for filling small shells; the 80% ammonium nitrate mixture is granular.

Hazard: A high explosive. Moderately toxic by ingestion, inhalation, and skin absorption. Strong irritant. Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

"Amax."^{40,265} Trademark for N-oxydiethylene benzothiazole-2-sulfenamide.

Uses: Accelerator for natural rubber and SBR.

amber. A polymerized fossil resin derived from an extinct variety of pine. Readily accumulates static electrical charge by friction; good electrical insulator.

ambergris.

Properties: Irregular, gray, waxy, opaque masses; peculiar odor. Insoluble in water; soluble in alcohol, chloroform, ether, fats, and oils. M.p. about 60°C; sp. gr. 0.80–0.92.

Chief constituents: Cholesterol, ambrein, benzoic acid.

Derivation: Intestinal tract of the sperm whale. Found on beaches and afloat in the ocean.

Uses: Fixative in perfumes; also provides animal note to cosmetics. Its popularity has increased in recent years.

"Amberlac."⁷²³ Trademark for modified alkyd-type resins for quick-drying lacquers. Some grades are resin-modified; some oxidizing and baking grades. Uses: Metal primers; bottle cap coatings; food can coatings; appliance coatings.

"Amberlac" 165. Trademark for synthetic water-soluble polymer. Colorless additive for film formers; improves scuff resistance; prevents sticking of thermoplastic coatings.

Uses: High gloss paper coatings; coating of book covers, decorative papers, paperboard.

"Amberlite."⁷²³ Trademark for several types of ion-exchange resins. Insoluble crosslinked polymers of various types in minute bead form. Strong acid, weak acid, strong base, and weak base forms, each having various grades differing in exchange capacity and porosity, for removing simple and complex cations and anions from aqueous and non-aqueous solutions. Reversible in action, can be regenerated.

Grades: Laboratory; liquid; nuclear, mixed bed; pharmaceutical.

Uses: Water conditioning (softening and complete deionization); recovery and concentration of metals, antibiotics, vitamins, organic bases; catalysis; decolorization of sugar; manufacture of chemicals; neutralization of acid mine water drainage; analytical chemistry; water treatment in nuclear reactors; pharmaceuticals.

"Amberol."⁷²³ Trademark for maleic-resin and resin-modified and unmodified phenolformaldehyde-type polymers in solid form. They react with various oils to produce fast drying, high gloss protective coatings and vehicles for printing inks.

Uses: Varnishes; enamels; can liners; nitrocellulose sanding sealers; printing inks; tackifying and vulcanization of butyl rubber.

"Ambidex."⁷⁴⁸ Trademark for a dark-colored oil-soluble, cationic surface-active agent, containing both an amide group and an amine salt. Used to make oil-in-water and water-in-oil emulsions.

ambient temperature. The temperature of the environment in which an experiment is conducted or in which any physical or chemical event occurs. See also room temperature.

"Ambiflo."⁷²³ Trademark for polyglycol lubricants. Used in brake fluids, rubber mold release formulations, metalworking, compressor and textile fiber lubricants.

"Ambitrol."⁷²³ Trademark for coolants used in stationary industrial engines.

amblygonite $\text{Li}(\text{AlF})\text{PO}_4$ or $\text{AlPO}_4 \cdot \text{LiF}$. A natural fluorophosphate of aluminum and lithium.

Properties: White to grayish-white. Contains up to

10.1% lithia, sometimes with partial replacement by sodium. Sp. gr. 3.01–3.09 Mohs hardness 6.

Occurrence: California, Maine, Connecticut, South Dakota; Germany; Norway; France.

Use: A source of lithium; used in glazes and coatings.

"Ambodryl."⁷³⁰ Trademark for bromodiphenhydramine hydrochloride [beta-(para-bromobenzhydryloxy) ethyl dimethylamine hydrochloride]
 $\text{C}_{17}\text{H}_{21}\text{BrNO} \cdot \text{HCl}$

Properties: White to off-white odorless amorphous or crystalline powder possessing a bitter taste; melting range 148–150°C. Soluble in water and alcohol; insoluble in ether.

Use: Medicine.

ambomycin (USAN). An antibiotic produced by *Streptomyces ambofaciens*.

"Ambraloy-687."⁷³⁴ Trademark for an aluminum-brass alloy containing arsenic as an inhibitor to increase its resistance to dezincification. Its nominal composition is copper 77%, zinc 20.96%, aluminum 2%, arsenic 0.04%. Used principally as a condenser tube alloy where cooling water is salt or brackish, and where it is resistant to the impinging action of turbulently flowing sea water containing air bubbles.

ambrettolide (omega-6-hexadecenolactone; 6-hexadecenolide; 16-hydroxy-6-hexadecenoic acid, omega lactone) $\text{C}_{16}\text{H}_{28}\text{O}_2$. Colorless liquid, having powerful musk-like odor. Found in ambrette-seed oil.

Uses: Flavoring; perfume fixative.

"Amcrom."⁷⁴³ Trademark for copper-chromium alloys.

"Amerchol."⁷⁴⁹ Trademark for a series of surface-active lanolin derivatives; most are soft solids.

Uses: Emulsifiers and stabilizers for water and oil systems; emollients in pharmaceuticals and cosmetics.

American Carbon Society. The present name of the American Carbon Committee, a group incorporated in 1964 to operate the Biennial American Carbon Conferences. The committee also has sponsored the international journal *Carbon*.

American Chemical Society (ACS). The nationally chartered professional society for chemists in the United States. One of the largest scientific organizations in the world, it was started in 1876, and now has over 110,000 members. Its publications include the world-famous *Chemical Abstracts*, *Journal of the American Chemical Society*, a number of high-level journals devoted to major subdivisions of chemistry, as well as technical books, including the ACS Monograph Series. It has 28 Divisions and many regional Sections. The Priestley Medal, considered the highest award in chemistry, was established by the ACS in 1923. The Society celebrated its 100th anniversary at its Centennial Meeting in New York City, April 5–8, 1976. Its offices are at 1155 16th St., N.W., Washington, D.C.
See also Chemical Abstracts Service.

American Conference of Governmental Industrial Hygienists (ACGIH). An official group of scientists established for the purpose of determining standards of exposure to toxic and otherwise harmful materials in workroom air. The standards are revised periodically and are available from the Secretary, Box 1937, Cincinnati, Ohio. See also threshold limit value.

American Institute of Chemical Engineers (AIChE). Founded in 1908, the AIChE is the largest society

in the world devoted exclusively to the advancement and development of chemical engineering. Its official publication is *Chemical Engineering Progress*. It has over 50 local sections and many committees working in a wide range of activities. Its offices are located at 345 East 47th Street, N.Y.

American Institute of Chemists. Founded in 1923, the AIC is primarily concerned with chemists and chemical engineers as professional people, rather than with chemistry as a science. Special emphasis is placed on the scientific integrity of the individual and on a code of ethics adhered to by all its members. It publishes a monthly journal, *The Chemist*. Its offices are at 60 East 42nd Street, N.Y.

American Petroleum Institute (API) Incorporated in 1919 under the laws of the District of Columbia; membership about 15,000. The objects of the Institute as stated in its charter, are: (1) to afford a means of cooperation with the government in all matters of national concern; (2) to foster foreign and domestic trade in American petroleum products; (3) to promote, in general, the interests of the petroleum industry in all its branches; (4) to promote the mutual improvement of its members and the study of the arts and sciences connected with the petroleum industry.

The activities of the Institute include the fields of standardization, design, care, and correct practice in the use of equipment; engineering and technology; fundamental research; safety and fire protection; industrial health; product labeling; waste disposal; testing methods and specifications; measuring, sampling, and testing; nomenclature; metallurgy; corrosion prevention; pipeline, highway, waterway, and railroad transportation; radio facilities; fuels and lubricants; agriculture; highways; aviation; vocational and personnel training; education and public relations; finance and accounting; statistics; petroleum reserves; taxation, legislation, and regulation. Its offices are located at 1271 Avenue of the Americas, New York, N.Y. 10020.

American Society for Metals (ASM). Formally organized in 1935, this society actually had been active under other names since 1913, when the need for standards of metal quality and performance in the automobile became generally recognized. ASM publishes *Metals Review* and the famous "Metals Handbook," as well as research monographs on metals. It is active in all phases of metallurgical activity, metal research, education and information retrieval. Its headquarters is at Metals Park, Ohio 44073.

American Society for Testing and Materials (ASTM). This society, organized in 1898, and chartered in 1902, is a scientific and technical organization formed for "the development of standards on characteristics and performance of materials, products, systems, and services; and the promotion of related knowledge." It is the world's largest source of voluntary consensus standards. The society operates through more than 125 main technical committees which function in prescribed fields under regulations that ensure balanced representation among producers, users, and general interest participants. Headquarters of the society is at 1916 Race St., Philadelphia, Pa. 19103.

americium Am A synthetic radioactive element of atomic number 95; a member of the actinide series

(q.v.). Atomic weight 241; 14 isotopes of widely varying half-life.

Properties: Normal valence +3, but divalent, tetravalent and higher valencies exist. Alpha and gamma emitter; forms compounds with oxygen, halides, lithium, etc. Metallic americium is silver-white, crystalline, sp. gr. 13.6, m.p. about 100°C. Half-life of Am 241 is 458 years.

Derivation: Multiple neutron capture in plutonium in nuclear reactor; Pu isotopes yield Am 241 and Am 243 on beta decay. The 241 isotope is available in 100-gram quantities, the 243 isotope only in milligram quantities. The metal is obtained by reduction of Am trifluoride with barium in a vacuum at 1200°C.

Hazard: A radioactive poison.

Uses: Gamma radiography; radiochemical research; electronic devices.

Shipping regulations: (Rail, Air) Consult regulations.

"Ameripol" CB.⁵⁶¹ Trademark for synthetic cis-polybutadiene rubber.

"Ameripol" SN.⁵⁶¹ Trademark for a synthetic natural rubber (cis-polyisoprene).

"Ameripol" 4502 and 4503.⁵⁶¹ Adhesive polymers based on SBR and produced in free-flowing crumb form to reduce dissolving time and eliminate need for milling equipment.

"Amerlate" P.⁴⁹³ Trademark for the isopropyl ester of hydroxy, normal and branched chain acids of lanolin. A light yellow soft solid that liquefies on contact with skin. A hydrophilic emollient; moisturizer; conditioning agent; lubricant; pigment dispersant; nonionic auxiliary w/o emulsifier.

"Amersol."³¹⁹ Trademark for denatured alcohols for all industrial uses.

amethopterin. See methotrexate.

amiben. Generic name for 3-amino-2,5-dichlorobenzoic acid; $C_6H_3NH_2Cl_2COOH$.

Use: Herbicide or plant growth regulator.

Hazard: May be toxic.

amide. A nitrogenous compound related to or derived from ammonia. Reaction of an alkali metal with ammonia yields inorganic amides, e.g., sodium amide ($NaNH_2$). Organic amides are characterized by an acyl group ($-CONH_2$), usually attached to an organic group ($R=CONH_2$). They are closely related to organic acids. Acetamide (CH_3CONH_2) and formamide ($HCONH_2$) are common examples. Carbamide (urea) is $CO(NH_2)_2$. See also polyamide.

4-amidino-1-(nitrosamino-amidino)-1-tetrazene. See tetrazene.

amidol. See 2,4-diaminophenol hydrochloride.

aminacrine hydrochloride. USAN name for 9-amino-acridine hydrochloride.

amination. The process of making an amine (RNH_2). The methods commonly used are (a) reduction of a nitro compound and (b) action of ammonia on a chloro-, hydroxy-, or sulfonic acid compound.

amine. A class of organic compounds of nitrogen that may be considered as derived from ammonia (NH_3) by replacing one or more of the hydrogen atoms with alkyl groups. The amine is primary, secondary, or tertiary depending on whether one, two, or three of

the hydrogen atoms are replaced. All amines are basic in nature, and usually combine readily with hydrochloric or other strong acids to form salts. See also fatty amine.

amine 220. 2-(8-Heptadecenyl)-2-imidazoline-1-eth-

anol, $C_{17}H_{33}C:NC_2H_4NC_2H_4OH$.

Properties: Sp. gr. 0.9330 (20/20°C); lb/gal 7.76 (20°C); b.p. 235°C (1 mm); flash point 465°F. Combustible.

Containers: 1-gal can; 5- and 55-gal drums.

Uses: Demulsifier used particularly in the recovery of tar from water-gas process emulsions. A powerful cationic wetting agent. Useful in flotation processes involving siliceous minerals and the formation of emulsions and dispersions under acidic conditions.

amine 248 Dark-colored liquid or paste consisting of a non-volatile amine mixture with bis-(hexamethylene)tri-amine and its homologs as principal components. Disperses readily in water.

Containers: Up to tank cars.

Uses: Coagulant and flocculating agent; ingredient of antistripping agents for asphalt; corrosion inhibitor; anchoring agent; for making cationic amine salts.

"Amine 750."²⁶⁶ Trademark for technical grade dehydroabietylamine with low secondary amine content.

amine absorption process. See Girbotol absorption process.

"Amine C, O and S."²¹⁹

$CH_3(CH_2)_nCNC_2NC_2N_4OH$. Trademarks for high molecular weight imidazolines soluble in organic solvents but sparingly soluble in water at alkaline pHs. React with acids such as hydrochloric to form water-soluble positively charged colloids with unusual tolerance for electrolyte.

Uses: Fungicides; antistatic treatment for upholstery; water-repellent treatment for plaster; detergents; rust-preventive oils.

"Amine D."²⁶⁶ Trademark for a technical grade of dehydroabietylamine.

Properties: Pale yellow viscous liquid; oil soluble.

Uses: Production of bactericides; fungicides; corrosion inhibitors; asphalt additives; flotation agents.

"Amine D Acetate."²⁶⁶ Trademark for acetic acid salt of "Amine D."

aminimide. Any of a group of nitrogenous compounds derived by reaction of 1,1-dimethylhydrazine with an epoxide in the presence of an ester of a carboxylic acid. A number of types of epoxides and esters may be used, providing a wide variety of products, including short- and long-chain aliphatics and aromatics. This family of compounds was announced in 1973; their major uses are considered to be in tire-cord dips to increase adhesion of cord to rubber, in soil-removing detergents (nonionic), in coatings formulations, and in cosmetic creams and shampoos. They are stated to be biodegradable and without toxic hazard. They also have elastomer and cross-linking applications from adhesives, caulks and sealants, to foams and mechanical goods. As isocyanate precursors, aminimides can be prepared in a large number of structural variations. Bis-aminimides are especially valuable for producing stable, single-package prepolymer compositions for *in situ* generation of isocyanates in polyurethane applications.

para-aminoacetanilide (4'-aminoacetanilide; N-acetyl-para-phenylenediamine) $NH_2C_6H_4NHCOCH_3$.

Properties: Colorless or reddish crystals; soluble in alcohol and ether, slightly soluble in water. M.p. 162°C; b.p. 267°C. Combustible.

Derivation: Acetylation of para-phenylenediamine.

Containers: Drums.

Hazard: Probably moderately toxic by ingestion.

Uses: Intermediates; azo dyes.

aminoacetic acid. See glycine.

aminoacetophenetide hydrochloride. See phenocoll hydrochloride.

amino acid. An organic acid containing both a basic amino group (NH_2) and an acidic carboxyl group ($COOH$); thus they are amphoteric and exist in aqueous solution as dipolar ions. The 25 amino acids that have been established as protein constituents are alpha-amino acids (i.e., the $-NH_2$ group is attached to the carbon atom next to the $-COOH$ group). Many other amino acids occur in the free state in plant or animal tissue. 22 amino acids with structures identical with those that exist today have been identified in pre-Cambrian sedimentary rock, indicating an age of at least 3 million years.

Amino acids can be obtained by hydrolysis of a protein; or they can be synthesized in various ways, especially by fermentation of glucose. An essential amino acid is one which cannot be synthesized by the body and is necessary for survival, namely, isoleucine, phenylalanine, leucine, lysine, methionine, threonine, tryptophan, and valine. Non-essential amino acids (alanine, glycine, and about a dozen others) can be synthesized by the body in adequate quantities. Arginine and histidine are essential during periods of intensive growth.

All the essential and most of the non-essential amino acids have one or more asymmetric carbon atoms and are optically active.

Research in molecular biology has established the fact that heredity characteristics are to a large extent determined by the sequence of amino acids in the genes, which is programmed by deoxyribonucleic acid. This substance is composed of four amino acids, and is itself a protein. (See genetic code, deoxyribonucleic acid, chromatin, protein.)

Note: Use of amino acids as fortification additives to foods restricted by FDA to foods containing proteins.

amino acid oxidase. See amino oxidase.

5-aminoacridine. See 9-aminoacridine.

9-aminoacridine (5-aminoacridine) $C_{13}H_{10}N_2$.

Properties: Sulfur-yellow crystals; m.p. 241°C; moderately strong base. Freely soluble in alcohol.

Use: Medicine (also as hydrochloride).

aminoamylene glycol. See 2-amino-2-ethyl-1,3-propanediol.

5-amino-2-anilobenzenesulfonic acid. See 4-amino-diphenylamine-2-sulfonic acid.

ortho-aminoaniline. See ortho-anisidine.

para-aminoaniline. See para-anisidine.

aminoanthraquinone $C_6H_4(CO)_2C_6H_3NH_2$ (tricyclic) (a) 1-amino; (b) 2-amino.

Properties: (a) Red, iridescent needles. (b) Red or orange-brown needles. Soluble in alcohol, chloroform, benzene, and acetone; insoluble in water. M.p. (a) 252°C; (b) 302°C; b.p. sublime (both a and b).

Derivation: By reduction of nitroanthraquinones, or by the substitution of the amino radical direct for the sulfonic acid.

Hazard: May be toxic.

Use: Dye intermediates.

4-aminoantipyrine (4-amino-1,5-dimethyl-2-phenyl-3-pyrazolone; 1,5-dimethyl-2-phenyl-4-aminopyrazolone) $C_{11}H_{13}N_3O$.

Properties: M.p. 107–109°C.

Uses: Medicine; analytical reagent.

para-aminoazobenzene (aniline yellow; phenylazoaniline) $C_6H_5NNC_6H_4NH_2$.

Properties: Yellow to tan crystals. Soluble in alcohol and ether; slightly soluble in water. M.p. 126–128°C; b.p. above 360°C.

Derivation: (a) Heating diazoaminobenzene with aniline hydrochloride as catalyst. (b) Diazotization of a solution of aniline and aniline hydrochloride with hydrochloric acid and sodium nitrite.

Uses: Dyes (chrysoidine, induline, solid yellow and acid yellow); insecticide.

4-aminoazobenzene-3,4'-disulfonic acid (Acid Yellow 9) $C_6H_4(SO_3H)NNC_6H_3NH_2(SO_3H)$. Bright, violet needles. Used for synthesizing dyes; for dyeing wool.

para-aminoazobenzene hydrochloride (aminoazobenzene salt) $C_6H_5NNC_6H_4NH_2 \cdot HCl$.

Properties: Steel-blue crystals. Soluble in alcohol; slightly soluble in water.

Derivation: By passing dry hydrogen chloride gas into a solution of aminoazobenzene.

Uses: Dyes; coloring lacquers; intermediate.

aminoazobenzenemonosulfonic acid

$NH_2C_6H_4NNC_6H_4SO_3H$.

Properties: Yellowish-white, microscopic needles. Barely soluble in water; almost insoluble in alcohol, ether and chloroform.

Derivation: By sulfonating aminoazobenzene.

Use: Dyestuff manufacture.

ortho-aminoazotoluene (Solvent Yellow 3; 2-amino-5-azotoluene; tolazotoluidine)

$CH_3C_6H_4N_2C_6H_3NH_2CH_3$.

Properties: Reddish-brown to yellow crystals; soluble in alcohol, ether, oils, and fats; slightly soluble in water; m.p. 100–117°C.

Derivation: From ortho-toluidine by treatment with nitrite and hydrochloric acid.

Uses: Dyes; medicine.

6-para-(para-aminobenzamido)benzamido-1-naphthol-3-sulfonic acid

$H_2NC_6H_4CONHC_6H_4CONHC_{10}H_5(OH)(SO_3H)$.

Gray paste containing approx. 35% solids. Used as an intermediate.

aminobenzene. See aniline.

para-aminobenzenearsonic acid. See arsanilic acid.

2-amino-para-benzenedisulfonic acid (aniline-2,5-disulfonic acid) $C_6H_4NH_2(SO_3H)_2 \cdot 4H_2O$.

Properties: Crystals; very soluble in water and alcohol. Derivation: Boiling sodium salt of 4-chloro-3-nitrobenzene sulfonate with sodium sulfite, resulting in formation of sodium 2-nitrobenzene disulfonate, which is reduced with iron and acetic acid to aniline-2,5-disulfonic acid.

Uses: Intermediate.

4-amino-meta-benzenedisulfonic acid (aniline-2,4-disulfonic acid) $C_6H_4NH_2(SO_3H)_2 \cdot 2H_2O$.

Properties: Needles decomposing when heated over 120°C; very soluble in water and alcohol.

Derivation: By heating sulfanilic acid with fuming sulfuric acid at 170–180°C.

Use: Dye intermediate.

meta-aminobenzenesulfonic acid. See metanilic acid.

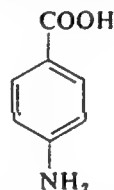

para-aminobenzenesulfonic acid. See sulfanilic acid.

meta-aminobenzoic acid $C_6H_4NH_2CO_2H$. Yellowish or reddish crystals; sublimes easily; sweet taste. Slightly soluble in water, alcohol, and ether; m.p. 173°C to 174°C.

Use: Dye intermediate.

ortho-aminobenzoic acid. See anthranilic acid.

para-aminobenzoic acid (PABA) $NH_2C_6H_4CO_2H$. Required by many organisms as a vitamin for growth; active in neutralizing the antibacteriostatic effect of some sulfonamide drugs.

Properties: Light buff odorless crystals; white when pure; discolors on exposure to light and air; m.p. 186–187°C. Sparingly soluble in cold water; soluble in hot water, solutions of alkali hydroxides or carbonates. Unstable to ferric salts and oxidizing agents. Derivation: Reduction of para-nitrobenzoic acid. Commercially available as the calcium, potassium, and sodium salts.

Food source: Widely distributed, especially in yeast.

Grades: Technical; N.F.

Containers: Bottles; drums.

Uses: Dye intermediate; pharmaceuticals; nutrition; UV absorber in suntan lotions.

2-aminobenzothiazole $C_6H_4NC(NH_2)S$ (bicyclic). Used for chemical intermediates; photographic chemicals.

meta-aminobenzotrifluoride $CF_3C_6H_4NH_2$.

Properties: Colorless to oily yellow liquid.

Grade: Technical (88% min); purified (98% min).

Use: Pharmaceutical intermediate.

ortho-aminobenzoylformic anhydride. See isatin.

N-(para-aminobenzoyl)glycine. See para-aminohippuric acid.

ortho-aminobiphenyl (ortho-phenylaniline; ortho-biphenylamine) $C_6H_5C_6H_4NH_2$.

Properties: Colorless or purplish crystals; m.p. 49.3°C; b.p. 299°C; insoluble in water.

Derivation: Reduction of ortho-nitrobiphenyl.

Containers: Drums; tank cars.

Hazard: May be toxic.

Uses: Intermediate for organic synthesis (carbazole); resins; synthetic rubbers.

1-aminobutane. See n-butylamine.

2-aminobutane. See sec-butylamine.

2-amino-1-butanol $CH_3CH_2CHNH_2CH_2OH$.

Properties: Colorless liquid; sp. gr. 0.944 at 20°C; m.p. -2°C; b.p. 178°C; (10 mm) 79–80°C; flash point 164°F; wt 7.85 lb/gal (20°C); pH (0.1M aqueous solution) 11.11; refractive index 1.453 at 20°C. Completely miscible in water at 20°C; soluble

in alcohols; corrosive to copper, brass, aluminum. Combustible. Low toxicity.
Containers: 1-gal cans; 5- and 55-gal drums.
Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis.

aminobutyric acid. $\text{CH}_3\text{CH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A rare amino acid, having three major modifications; optically active; soluble in water.

alpha-aminocaproic acid. See norleucine.

aminocaproic lactam. See caprolactam.

aminochlorobenzene. See chloroaniline.

2-amino-4-chlorophenol (para-chloro-ortho-aminophenol) $\text{C}_6\text{H}_3\text{OHNH}_2\text{Cl}$.

Properties: Light brown crystals; m.p. 138°C (dec.).

Derivation: Reduction of para-chloro-ortho-nitrophenol.

Use: Intermediate.

2-amino-4-chlorotoluene [5-chloro-2-methylaniline ($\text{NH}_2 = 1$); 4-chloro-ortho-toluidine ($\text{CH}_3 = 1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$. Off-white solid or light brown oil which tends to darken on storage; m.p. $20\text{--}22^\circ\text{C}$.

Use: Intermediate.

2-amino-5-chlorotoluene $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$. Crystalline solid; m.p. $26\text{--}27^\circ\text{C}$; sparingly soluble in water; soluble in dilute acids. Used as an intermediate.

2-amino-6-chlorotoluene [6-chloro-ortho-toluidine ($\text{CH}_3 = 1$); 3-chloro-2-methylaniline ($\text{NH}_2 = 1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$. Liquid; m.p. $0\text{--}2^\circ\text{C}$.

Use: Intermediate.

4-amino-2-chlorotoluene [2-chloro-para-toluidine ($\text{CH}_3 = 1$); 3-chloro-4-methylaniline ($\text{NH}_2 = 1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$. Liquid; m.p. $21\text{--}24^\circ\text{C}$.

Use: Intermediate.

4-amino-2-chlorotoluene-5-sulfonic acid (Brilliant Toning Red Amine; Permanent Red 2B Amine) $\text{ClNH}_2\text{CH}_3\text{C}_6\text{H}_2\text{SO}_3\text{H}$.

Properties: White to buff powder; essentially insoluble as free acid; soluble as sodium or ammonium salt.

Grades: 98.5% min purity.

Containers: Fiber drums.

Uses: Intermediate for azo pigments.

5-amino-2-chlorotoluene-4-sulfonic acid (Lake Red C Amine). $\text{ClNH}_2\text{CH}_3\text{C}_6\text{H}_2\text{SO}_3\text{H}$.

Properties: White to pink powder; essentially insoluble as free acid; soluble as sodium or ammonium salt.

Grades: 98.5% min purity.

Containers: Fiber drums.

Uses: Intermediate for azo pigments.

meta-amino-para-cresol methyl ether. See 5-methyl-ortho-anisidine.

aminocyclohexane. See cyclohexylamine.

L-amino-dehydrogenase. See amino oxidase.

3-amino-2,5-dichlorobenzoic acid. See amiben.

para-aminodiethylaniline (N,N-diethyl-para-phenylenediamine; diethylaminoaniline) $(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid; b.p. $260\text{--}2^\circ\text{C}$; insoluble in water; soluble in alcohol and ether.

Derivation: Treatment of diethylaniline with nitrous acid and subsequent reduction.

Hazard: Probably toxic. See aniline.

Uses: Dye intermediate; source of diazonium compounds in diazo copying process.

para-aminodiethylaniline hydrochloride $\text{C}_{10}\text{H}_{16}\text{N}_2 \cdot \text{HCl}$. Properties: Colorless needles; soluble in water, alcohol; insoluble in ether.

Hazard: Probably toxic. See aniline.

Use: Color photography.

2-amino-4,6-dihydroxypteridine. See xanthopterin.

para-aminodimethylaniline (dimethylaminoaniline; dimethyl-para-phenylenediamine) $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Colorless, asbestos-like, needles; stable in air when pure. If impure, the crystals liquefy. Soluble in water, alcohol and benzene. M.p. 41°C ; b.p. 257°C . Derivation: By reduction of para-nitrosodimethylaniline with zinc dust and hydrochloric acid.

Method of purification: Recrystallization from mixture of benzene and ligroin.

Hazard: Toxic by ingestion or inhalation of vapor; irritant to skin and eyes.

Uses: Base for production of methylene blue; photo-developer; reagent for detection of hydrogen sulfide; reagent for cellulose; organic synthesis; reagent for certain bacteria.

aminodimethylbenzene. See xylidine.

1-amino-2,3-dimethylbenzene. See 2,3-xylidine.

1-amino-2,4-dimethylbenzene. See 2,4-xylidine.

1-amino-2,5-dimethylbenzene. See 2,5-xylidine.

1-amino-2,6-dimethylbenzene. See 2,6-xylidine.

4-amino-1,5-dimethyl-2-phenyl-3-pyrazolone. See 4-aminoantipyrene.

2-amino-4,6-dimethylpyridine $(\text{CH}_3)_2\text{C}_5\text{H}_2\text{NNH}_2$.

Properties: Solid; m.p. $65.2\text{--}68.5^\circ\text{C}$; b.p. 235°C . Water-soluble.

Derivation: Prepared from 2-aminopyridine.

Use: Organic intermediate.

2-amino-4,6-dinitrophenol. See picramic acid.

para-aminodiphenyl. $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless crystals. M.p. 53°C ; b.p. 302°C .

Hazard: Toxic by ingestion, inhalation, skin absorption. A carcinogenic agent.

Uses: Organic research.

para-aminodiphenylamine (N-phenyl-para-phenylenediamine) $\text{NH}_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Purple powder; m.p. 75°C ; insoluble in water; soluble in alcohol and acetone.

Derivation: Reduction of the coupling product of diazotized sulfanilic acid and diphenylamine.

Uses: Dye intermediate; pharmaceuticals; photographic chemicals.

4-aminodiphenylamine-2-sulfonic acid (5-amino-2-anilino benzenesulfonic acid) $\text{C}_6\text{H}_5\text{NHC}_6\text{H}_3\text{NH}_2\text{SO}_3\text{H}$.

Properties: Needle-like crystals. Barely soluble in water.

Derivation: From para-nitrodiphenylamine-ortho-sulfonic acid by reduction with iron and hydrochloric acid.

Use: Synthesis of dyestuffs.

aminodithioformic acid. See dithiocarbamic acid.

aminoethane. See ethylamine.

2-aminoethanesulfonic acid. See taurine.

2-aminoethanethiol (cysteamine; mercaptamine; thioethanolamine) $\text{HSCH}_2\text{CH}_2\text{NH}_2$.

Properties: Crystals with unpleasant odor; oxidizes on contact with air; m.p. 97°C ; soluble in water. Combustible.

Uses: Medicine (believed to offer protection against radiation).

1-aminoethanol. See aldehyde ammonia.

2-aminoethanol. See ethanolamine.

2-(2-aminoethoxy)ethanol ("Diglycolamine"; DGA). $\text{NH}_2\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless, slightly viscous liquid with a mild amine odor. Miscible with water and alcohols; b.p. 221°C; sp. gr. (20/20°C) 1.0572; flash point 260°F; f.p. -12.5°C. Combustible.

Hazard: Strong irritant to tissue.

Uses: Removal of acid components from gases, especially CO_2 and H_2S from natural gas; intermediate. Shipping regulations: (Air) Corrosive label.

aminoethylethanolamine. See hydroxyethyl-ethylenediamine.

4-aminoethylglyoxaline. See histamine.

alpha-(1-aminoethyl)-meta-hydroxybenzyl alcohol bitartrate. See metaraminol bitartrate.

4-(2-aminoethyl)imidazole. See histamine.

beta-aminoethylisothiurea dihydrobromide (2-(2-aminoethyl)-2-thiopseudourea dihydrobromide; AET) $\text{C}_3\text{H}_9\text{N}_3\text{S} \cdot 2\text{HBr}$.

Properties: Crystals; hygroscopic; m.p. 194-195°C.

Derivation: Thiourea is refluxed with 2-bromoethylamine hydrobromide in isopropanol.

Use: Enzyme activator; free radical detoxifier (believed to offer protection against radiation).

para-beta-aminoethylphenol. See tyramine.

N-aminoethylpiperazine

$\text{H}_2\text{NC}_2\text{H}_4\text{NCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$. High boiling tri-

amine combining a primary, secondary and tertiary amine in one molecule.

Properties: Liquid; sp. gr. 0.9837; b.p. 222.0°C; flash point 200°F; freezing point 17.6°. Soluble in water. Combustible.

Containers: 55-gal drums; tank cars.

Hazard: Strong irritant to tissue.

Uses: Epoxy curing agent; intermediate for pharmaceuticals; anthelmintics, surface-active agents, synthetic fibers.

Shipping regulations: (Air) Corrosive label.

2-amino-2-ethyl-1,3-propanediol (AEPD; aminoamyleneglycol) $\text{CH}_2\text{OH}(\text{C}_2\text{H}_5)\text{NH}_2\text{CH}_2\text{OH}$.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis; paints and other coatings.

3-(2-aminoethyl)pyrazole dihydrochloride. See betazole hydrochloride.

2-aminoethylsulfuric acid $\text{NH}_2\text{CH}_2\text{CH}_2\text{OSO}_3\text{H}$.

Properties: White, noncorrosive crystalline powder; m.p. 274-280°C; sinters at 274°C and darkens without complete melting at 280°C; sp. gr. 1.782; bulk density 1.007 g/cc. Soluble in water; insoluble in most organic solvents; pH of 1% aqueous solution 4.0 (20°C), 5% aqueous solution 3.3 (39°C).

Use: Organic synthesis of ethyleneimine and various other compounds; amination of cotton.

2-(2-aminoethyl)-2-thiopseudourea dihydrobromide. See beta-aminoethylisothiurea dihydrobromide.

3-amino-alpha-ethyl-2,4,6-triiodohydrocinnamic acid. See iopanoic acid.

4-aminofolic acid. See aminopterin.

aminoform. See hexamethylenetetramine.

amino-G acid. See 2-naphthylamine-6,8-disulfonic acid.

alpha-aminoglutaric acid. See glutamic acid.

amino-4-guanidovaleric acid. See arginine.

aminohexamethyleneimine.

$\text{NH}_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2$.

Properties: Liquid; b.p. 170°C; soluble in water and most organic solvents. Combustible.

Uses: Intermediate for dyes, pharmaceuticals and photographic chemicals.

2-aminohexanoic acid. See norleucine.

6-aminohexanoic acid. See aminocaproic acid.

para-aminohippuric acid [N-(para-aminobenzoyl)glycine; PAHA] $\text{NH}_2\text{C}_6\text{H}_4\text{CONHCH}_2\text{COOH}$.

Properties: White, crystalline powder. Discolors on exposure to light. Slightly soluble in water, alcohol, and most organic solvents. Very soluble in dilute hydrochloric acid and alkalis. Forms a water-soluble sodium salt. M.p. 197-199°C.

Grade: U.S.P.

Uses: Medical diagnostic reagent; intermediate.

aminohydroxybenzoic acids. See aminosalicyclic acids.

alpha-amino-beta-hydroxybutyric acid. See threonine.

2-amino-2-hydroxymethyl-1,3-propanediol. See tris(hydroxymethyl)aminomethane.

alpha-amino-beta-hydroxypropionic acid. See serine.

alpha-amino-beta-imidazolepropionic acid. See histidine.

alpha-aminoisocaproic acid. See leucine.

alpha-aminoisovaleric acid. See valine.

amino-J acid. See 2-naphthylamine-5,7-disulfonic acid.

aminomercuric chloride. See mercury, ammoniated.

aminomethane. See methylamine.

3-amino-4-methoxybenzanilide

$\text{CH}_3\text{OC}_6\text{H}_3(\text{NH}_2)\text{CONHC}_6\text{H}_5$. Gray powder.

Hazard: May be toxic.

Uses: Dyes, pharmaceuticals and other organic chemicals.

1-amino-2-methoxy-5-methylbenzene. See 5-methyl-orthoanisidine.

meta-(4-amino-3-methoxyphenylazo) benzenesulfonic acid $\text{H}_2\text{NC}_6\text{H}_3(\text{OCH}_3)\text{NNC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: Maroon paste containing approximately 38% solids.

Use: Intermediate.

para-aminomethylbenzenesulfonamide hydrochloride. See mafenide hydrochloride.

1-alpha-(aminomethyl)-3,4-dihydroxybenzyl alcohol. See lavarterenol.

4-amino-4'-methyldiphenylamine-2-sulfonic acid (aminotoluidinobenzenesulfonic acid)

$\text{CH}_3\text{C}_6\text{H}_4\text{NHC}_6\text{H}_3\text{NH}_2\text{SO}_3\text{H}$.

Properties: Light to dark gray paste with characteristic odor.

Use: Intermediate.

4-amino-10-methylfolic acid. See methotrexate.

4-amino-2-methyl-1-naphthol. See "Synkamin."

2-amino-3-methylpentanoic acid. See isoleucine.

2-amino-2-methyl-1,3-propanediol (AMPD; aminobutylene glycol; butanediolamine)
 $\text{CH}_2\text{OCH}(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$. Corrosive to copper, brass, aluminum.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis; cosmetics.

2-amino-2-methyl-1-propanol (isobutanolamine; AMP)
 $\text{CH}_3\text{C}(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis.

2-amino-3-methylpyridine (2-amino-3-picoline)
 $\text{N}:\text{C}(\text{NH}_2)\text{C}(\text{CH}_3):\text{CHCH}:\text{CH}$.

Properties: Liquid. B.p. 221°C; freezing point 29.5–33.3°C; soluble in water.

Derivation: From 2-aminopyridine.

Hazard: May be toxic. See 2-aminopyridine.

Use: Intermediate.

2-amino-4-methylpyridine (2-amino-4-picoline)
 $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{C}(\text{CH}_3)\text{CH}:\text{CH}$.

Properties: Crystals; b.p. 230.9°C; 115–117°C (11 mm); melting point 96–99.0°C. Sublimes on slow heating; soluble in water, lower alcohols.

Derivation: Prepared from 2-aminopyridine.

Hazard: May be toxic. See 2-aminopyridine.

Use: Intermediate; medicine.

2-amino-5-methylpyridine (2-amino-5-picoline)
 $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{CHC}(\text{CH}_3):\text{CH}$.

Properties: Crystals. B.p. 227.1°C; melting point 76.6°C; soluble in water.

Derivation: Prepared from 2-aminopyridine.

Hazard: May be toxic. See 2-aminopyridine.

Uses: Intermediate.

2-amino-6-methylpyridine (2-amino-6-picoline)
 $\text{N}:\text{C}(\text{NH}_2)\text{CH}:\text{CHCH}:\text{C}(\text{CH}_3)$.

Properties: Crystals. B.p. 214.4°C; melting point 43.7°C; soluble in water.

Derivation: Prepared from 2-aminopyridine.

Hazard: May be toxic. See 2-aminopyridine.

Use: Intermediate.

2-amino-4-(methylthio)butyric acid. See methionine.

alpha-amino-beta-methylvaleric acid. See isoleucine.

alpha-amino-gamma-methylvaleric acid. See leucine.

3-amino-1,5-naphthalenedisulfonic acid. See 2-naphthylamine-4,8-disulfonic acid.

6-amino-1,3-naphthalenedisulfonic acid. See 2-naphthylamine-5,7-disulfonic acid.

7-amino-1,3-naphthalenedisulfonic acid. See 2-naphthylamine-6,8-disulfonic acid.

1-aminonaphthalene-4-sulfonic acid. See naphthionic acid.

2-amino-1-naphthalenesulfonic acid. See 2-naphthylamine-1-sulfonic acid.

4-amino-1-naphthalenesulfonic acid. See naphthionic acid.

5-amino-1-naphthalenesulfonic acid. See 1-naphthylamine-5-sulfonic acid.

5-amino-2-naphthalenesulfonic acid. See 1-naphthylamine-6-sulfonic acid.

6-amino-2-naphthalenesulfonic acid. See 2-naphthylamine-6-sulfonic acid.

8-amino-1-naphthalenesulfonic acid. See 1-naphthylamine-8-sulfonic acid.

8-amino-2-naphthalenesulfonic acid. See 1-naphthylamine-7-sulfonic acid.

8-amino-1,3,6-naphthalenetrisulfonic acid. See 1-naphthylamine-3,6,8-trisulfonic acid.

1-amino-8-naphthol-2,4-disulfonic acid. See 8-amino-1-naphthol-5,7-disulfonic acid.

1-amino-8-naphthol-3,5-disulfonic acid. (B acid; 8-amino-1-naphthol-4,6-disulfonic acid)
 $\text{C}_{10}\text{H}_4\text{NH}_2\text{OH}(\text{SO}_3\text{H})_2$.

Derivation: By sulfonating 1-amino-8-naphthol-3-sulfonic acid.

Use: Dye intermediate.

1-amino-8-naphthol-3,6-disulfonic acid (H acid; 8-amino-1-naphthol-3,6-disulfonic acid)
 $\text{C}_{10}\text{H}_4\text{NH}_2\text{OH}(\text{SO}_3\text{H})_2$.

Properties: Gray powder. Soluble in water, alcohol and ether.

Derivation: From alpha-naphthylamine trisulfonic acid by soda fusion.

Use: Dye intermediate.

1-amino-8-naphthol-4,6-disulfonic acid (K acid; 8-amino-1-naphthol-3,5-disulfonic acid)
 $\text{C}_{10}\text{H}_4\text{NH}_2\text{OH}(\text{SO}_3\text{H})_2$.

Derivation: By soda fusion of a naphthylamine trisulfonic acid.

Use: Dye intermediate.

2-amino-8-naphthol-3,6-disulfonic acid (2R acid; RR acid; 7-amino-1-naphthol-3,6-disulfonic acid)
 $\text{C}_{10}\text{H}_4\text{NH}_2\text{OH}(\text{SO}_3\text{H})_2$.

Derivation: By soda fusion of a naphthylamine trisulfonic acid.

Use: Dye intermediate.

7-amino-1-naphthol-3,6-disulfonic acid. See 2-amino-8-naphthol-3,6-disulfonic acid.

8-amino-1-naphthol-3,5-disulfonic acid. See 1-amino-8-naphthol-4,6-disulfonic acid.

8-amino-1-naphthol-3,6-disulfonic acid. See 1-amino-8-naphthol-3,6-disulfonic acid.

8-amino-1-naphthol-4,6-disulfonic acid. See 1-amino-8-naphthol-3,5-disulfonic acid.

8-amino-1-naphthol-5,7-disulfonic acid. Chicago acid; SS acid, 1-amino-8-naphthol-2,4-disulfonic acid)
 $\text{C}_{10}\text{H}_4\text{NH}_2\text{OH}(\text{SO}_3\text{H})_2$.

Properties: Gray paste; white when pure. Soluble in water and sodium hydroxide solution.

Derivation: Fusion of 1,8-naphthosultam-2,4-disulfonic acid with caustic potash.

Uses: Dye intermediate.

1-amino-2-naphthol-4-sulfonic acid (1,2,4 acid)
 $\text{C}_{10}\text{H}_5\text{NH}_2\text{OHSO}_3\text{H}$.

Properties: Pinkish-white to gray needles. Soluble in hot water; almost insoluble in cold water.

Derivation: Beta-naphthol is changed to the 1-nitroso-beta-naphthol which is treated with sodium bisulfite.

Upon acidification the free sulfurous acid effects simultaneous reduction and sulfonation.
Uses: Aniline dyes.

1-amino-2-naphthol-6-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: Needles or prisms. Slightly soluble in hot water, alcohol; insoluble in ether.

Derivation: By reducing 1,2,6-nitrosonephtholsulfonic acid.

Uses: Dye intermediate and chemical intermediate.

1-amino-5-naphthol-7-sulfonic acid (M acid; 5-amino-1-naphthol-3-sulfonic acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Gray needles. Slightly soluble in cold water; soluble in hot water and alcohol.

Use: Dye intermediate.

1-amino-8-naphthol-4-sulfonic acid (S acid; 8-amino-1-naphthol-5-sulfonic acid)

Properties: Gray needles; white when pure. Slightly soluble in water; insoluble in alcohol and ether.

Derivation: Fusion of 1-naphthylamine-4,8-disulfonic acid with caustic soda.

Use: Dye intermediate.

1-amino-8-naphthol-5-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: Small needles; slightly soluble in water.

Derivation: Fusion of 1-naphthylamine-5,8-disulfonic acid with caustic soda.

Use: Dye intermediate.

2-amino-1-naphthol-4-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: White needles; insoluble in water, alcohol, ether, benzene.

Derivation: By heating 2-nitroso-1-naphthol with sodium sulfite.

Use: Dye intermediate.

2-amino-3-naphthol-6-sulfonic acid (R acid)

$C_{10}H_7NH_2OHSO_3H$.

Properties: Needles; slightly soluble in water.

Derivation: Fusion of 2-naphthylamine-3,6-disulfonic acid with caustic soda.

Uses: Dyes.

2-amino-5-naphthol-7-sulfonic acid (J acid; 6-amino-1-naphthol-3-sulfonic acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Gray needles, white when pure. Soluble in hot water; sparingly soluble in cold water.

Derivation: Fusion of beta-naphthylamine-5,7-disulfonic acid with caustic.

Hazard: May be toxic.

Use: Dyes.

2-amino-8-naphthol-6-sulfonic acid. See 7-amino-1-naphthol-3-sulfonic acid.

5-amino-1-naphthol-3-sulfonic acid. See 1-amino-5-naphthol-7-sulfonic acid.

6-amino-1-naphthol-3-sulfonic acid. See 2-amino-5-naphthol-7-sulfonic acid.

7-amino-1-naphthol-3-sulfonic acid (gamma acid; 2-amino-8-naphthol-6-sulfonic acid)

$C_{10}H_7NH_2OHSO_3H$.

Properties: White crystals. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: By heating caustic soda and 2-naphthylamine-6,8-disulfonic acid in an autoclave.

Use: Azo dye intermediate.

8-amino-1-naphthol-5-sulfonic acid. See 1-amino-8-naphthol-4-sulfonic acid.

2-amino-5-nitrothiazole $C_3H_3N_3O_2S$.

Properties: Greenish yellow to orange-yellow fluffy powder; slightly bitter taste. Decomposes $202^\circ C$; very sparingly soluble in water; soluble in dilute acids.

Use: Veterinary medicine.

amino oxidase (L-amino acid oxidase; D-amino acid oxidase; L-amino dehydrogenase). An enzyme which catalyzes the deamination of alpha-amino acids by dehydrogenation to keto acids and ammonia. Two types are recognized, acting on the D- and L-amino acids. Recent emphasis has been on characterization of the D-amino oxidase, which is known to contain the flavin isoalloxazine as coenzyme. Both types are found in animal tissue, especially in liver and kidney, as well as in snake venom and certain bacteria.

2-amino-6-oxypurine. See guanine.

1-aminopentane. See n-amylamine.

2-aminophenetole. See ortho-phenetidine.

4-aminophenetole. See para-phenetidine.

meta-aminophenol (meta-hydroxyaniline) $C_6H_4NH_2OH$.

Properties: White crystals; m.p. $122^\circ C$; soluble in water, alcohol, and ether.

Derivation: Fusion of meta-sulfanilic acid with caustic soda and subsequent extraction of the melt with ether.

Hazard: Moderately toxic; an allergen and skin irritant.

Uses: Dye intermediate; intermediate for para-amino-salicylic acid.

ortho-aminophenol (ortho-hydroxyaniline)

$C_6H_4NH_2OH$.

Properties: White crystals; turn brown with age; m.p. $172-173^\circ C$; sublimes on further heating. Soluble in cold water, alcohol, benzene; freely soluble in ether.

Derivation: By reduction of ortho-nitrophenol mixed with aqueous ammonia by means of a stream of hydrogen sulfide. Also available as the hydrochloride.

Grades: Technical; 99% min.

Containers: Fiber cans and drums.

Hazard: Moderately toxic by ingestion.

Uses: Dyeing furs and hair; dye intermediate for azo and sulfur dyes; pharmaceuticals.

para-aminophenol (para-hydroxyaniline) $C_6H_4NH_2OH$.

Properties: White or reddish yellow crystals; turn violet on exposure to light; m.p. $184^\circ C$, with decomposition; soluble in water and alcohol.

Derivation: (a) By reduction of para-nitrophenol with iron filings and hydrochloric acid. (b) By electrolytic reduction of nitrobenzene in concentrated sulfuric acid and treatment with an alkali to free the base. Also available as the hydrochloride.

Grades: Technical; photographic.

Containers: Glass bottles; fiber drums.

Hazard: Moderately toxic by ingestion.

Uses: Dyeing textiles, hair, furs, feathers; photographic developer; pharmaceuticals; antioxidants, oil additives.

4-amino-1-phenol-2,6-disulfonic acid

$C_6H_4OHNH_2(SO_3H)_2$.

Properties: Fine needles. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: Action of sulfur dioxide on paranitrophenol.

Uses: Dyes.

2-amino-1-phenol-4-sulfonic acid (ortho-aminophenol-para-sulfonic acid) $C_6H_3OHNH_2SO_3H$.

Properties: Brown crystals. Fairly soluble in hot water; very soluble in alkaline solution. No melting point. Decomposes on heating.

Derivation: (a) Sulfonation and nitration of chlorobenzene followed by hydrolysis to phenol with caustic soda with subsequent reduction by sodium sulfide. (b) Sulfonation of ortho-aminophenol. (c) Sulfonation of phenol followed by nitration and reduction.

Containers: 100-lb kegs; 250-lb wooden barrels.

Use: Intermediate for dyes.

ortho-aminophenol-para-sulfonic acid. See 2-amino-1-phenol-4-sulfonic acid.

6-(D-alpha-aminophenylacetamido)penicillanic acid.
See ampicillin.

para-aminophenylarsonic acid. See arsanilic acid.

1-amino-2-phenylethane. See beta-phenylethylamine.

ortho-aminophenylglyoxalic lactim. See isatin.

para-aminophenylmercaptoacetic acid

$NH_2C_6H_4SCH_2CO_2H$.

Properties: M.p. 186–187°C; insoluble in water, alcohol, benzene, chloroform; soluble in aqueous acid or alkali solutions.

Uses: Synthetic intermediate for dyes and pharmaceuticals.

2-(para-aminophenyl)-6-methylbenzothiazole. See dehydrothio-para-toluidine.

meta-aminophenyl methyl carbinol

$NH_2C_6H_4CH(OH)CH_3$.

Properties: Solid; sp. gr. 1.12; b.p. 217.3°C (100 min); melting point 66.4°C; soluble in water; flash point 315°F; combustible.

Uses: Carrier for dyeing synthetic fibers; intermediate for perfume chemicals and pharmaceuticals.

1-(meta-aminophenyl)-3-methyl-5-pyrazolone

$NH_2C_6H_4NNC(CH_3)CH_2CO$.

Properties: Light tan paste containing approximately 45% solids.

Uses: Intermediate.

alpha-amino-beta-phenylpropionic acid. See phenylalanine.

aminophylline (theophylline ethylenediamine)

$C_{16}H_{24}N_{10}O_4 \cdot xH_2O$. Contains 84–86% anhydrous theophylline; 14–15% ethylenediamine.

Properties: White or slightly yellowish granules or powder with slight ammoniacal odor and a bitter taste. Soluble in water; insoluble in alcohol and ether. Deteriorates slowly on exposure to air. Solutions are alkaline to litmus.

Grade: U.S.P.

Containers: Bottles; 25-, 100-lb drums.

Use: Medicine; veterinary medicine.

aminopicolines. See aminomethylpyridines.

aminoplast resin (amino resin). A class of thermosetting resins made by the reaction of an amine with an aldehyde. The only aldehyde in commercial use is formaldehyde, and the most important amines are urea and melamine.

Uses: Molding, adhesives, laminating, textile finishes,

permanent-press fabrics, wash-and-wear apparel fabrics, protective coatings, paper manufacture; leather treatment, binders for fabrics, foundry sands, graphite resistors, plaster of paris fortification, foam structures and ion-exchange resins.

See dimethylol urea; methylol urea; melamine resins; urea-formaldehyde resins.

2-aminopropane. See isopropylamine.

2-aminopropanoic acid. See alanine.

3-aminopropanoic acid. See beta-alanine.

1-amino-2-propanol. See isopropanolamine.

2-amino-1-propanol (2-aminopropyl alcohol; beta-propanolamine) $CH_3CH(NH_2)CH_2OH$.

Properties: Colorless to pale yellow liquid. Both *l* and *dl* forms are available. *dl*-form: fishy odor; boils at 173–176°C; freely soluble in water, alcohol, ether. *l*-form: refractive index 1.4480–1.4495 at 25°C; distillation range about 114°C at 100 mm. Combustible.

Uses: Organic synthesis and chemical intermediate.

3-amino-1-propanol (propanolamine)

$H_2NCH_2CH_2CH_2OH$.

Properties: Colorless liquid; m.p. 12.4°C; b.p. 184–186°C, 168°C (500 mm); flash point 175°F; sp. gr. 0.9786 (30°C). Miscible with alcohol, water, acetone and chloroform. Combustible.

Grade: 99% pure.

Hazard: Moderately toxic by ingestion; moderate irritant to tissue.

Uses: Organic intermediate.

2-aminopropyl alcohol. See 2-amino-1-propanol.

4-(3-aminopropyl)morpholine. See N-aminopropylmorpholine.

N-aminopropylmorpholine (4-(3-aminopropyl)morpholine) $CH_2CH_2OCH_2CH_2NC_3H_6NH_2$.

Properties: Colorless liquid; sp. gr. 0.9872 (20/20°C); b.p. 224.5°C; flash point 220°F (O.C.). f.p., –15°C; soluble in water and alcohol. Combustible.

Hazard: Strong irritant to tissue.

Use: Fiber synthesis; chemical intermediate.

Shipping regulations: (Air) Corrosive label.

para-(2-aminopropyl) phenol. See hydroxyamphetamin.

gamma-aminopropyltriethoxysilane.

$NH_2(CH_2)_3Si(OC_2H_5)_3$.

Properties: Liquid; b.p. 217°C; sp. gr. 0.94 (25°C).

Uses: Sizing of glass fibers for making laminates.

gamma-aminopropyltrimethoxysilane

$NH_2(CH_2)_3Si(OCH_3)_3$. 100% active; water-white liquid; sp. gr. 1.01; refractive index 1.42

Uses: Glass fabric sizing; binder; adhesion promoter.

aminopterin (4-aminofolic acid; aminopteroylglutamic acid) $C_{19}H_{20}N_8O_4 \cdot 2H_2O$. Differs slightly in structure from folic acid (q.v.) and antagonizes the utilization of folic acid by the body; an antimetabolite.

Properties: Occurs as clusters of yellow needles which are soluble in aqueous sodium hydroxide solutions.

Hazard: Toxic by ingestion.

Uses: Medicine; rodenticide.

aminopteroylglutamic acid. See aminopterin.

6-aminopurine. See adenine.

2-aminopyridine (alpha-pyridylamine) $C_5H_4NNH_2$.

Properties: White leaflets or large, colorless crystals; freezing point 58.1°C; b.p. 210.6°C; soluble in water, alcohol, benzene, ether.

Hazard: Toxic by ingestion and inhalation. Tolerance, 0.5 ppm in air.

Use: Intermediate for antihistamines, and other pharmaceuticals.

3-aminopyridine (beta-pyridylamine) $C_5H_4NNH_2$.

Properties: White crystals; m.p. $64^\circ C$; b.p. $250-252^\circ C$; soluble in water, alcohol, benzene, ether.

Hazard: May be toxic.

Use: Intermediate in preparation of drugs and dye-stuffs.

4-aminopyridine $C_5H_4NNH_2$.

Properties: Crystals; m.p. $158.9^\circ C$; b.p. $273.5^\circ C$; soluble in water.

Derivation: From 2-aminopyridine.

Grade: 95% (minimum).

Hazard: May be toxic.

Used: Intermediate.

amino R acid. See 2-naphthylamine-3,6-disulfonic acid.

4-aminosalicylic acid (PASA; PAS; para-aminosalicylic acid; 4-amino-2-hydroxybenzoic acid)
 $NH_2C_6H_3(OH)COOH$.

Properties: White or nearly white bulky powder. Odorless or has slight acetous odor. M.p. $150-151^\circ C$ (decomp.). Affected by light and air. Darkened solutions should not be used. Soluble in sodium bicarbonate and phosphoric acid; somewhat soluble in alcohol; slightly soluble in ether or acetone; practically insoluble in benzene and water; pH (saturated aqueous solution) 3.0-3.7. Low toxicity.

Derivation: From meta-aminophenol and potassium bicarbonate solution under pressure.

Grade: U.S.P.

Use: Medicine; industrial preservative.

5-aminosalicylic acid (meta-aminosalicylic acid; 5-amino-2-hydroxybenzoic acid) $NH_2C_6H_3(OH)COOH$.

Properties: White crystals; sometimes pinkish; m.p. $260-280^\circ C$ with decomposition; soluble in hot water or alcohol.

Derivation: From the corresponding nitrosalicylic acid by reduction.

Uses: Dyes; intermediate.

alpha-aminosuccinamic acid. See asparagine.

aminosuccinic acid. See aspartic acid.

2-aminothiazole (2-thiazylamine) $\overline{SCHCHNCNH_2}$.

Properties: Light yellow crystals; m.p. $90^\circ C$; distills at 3 mm without decomposition. Slightly soluble in cold water, alcohol and ether; soluble in hot water and dilute mineral acids. Low toxicity.

Derivation: Chlorination of vinyl acetate and condensation with thiourea.

Use: Intermediate in synthesis of sulfathiazole.

alpha-amino-beta-thiolpropionic acid. See cysteine.

aminothiourea. See thiosemicarbazide.

aminotoluene. See meta-, ortho-, or para-toluidine. See also benzylamine.

6-amino-s-triazine-2,4-diol. See ammelide.

3-amino-1,2,4-triazole (amitrole) $\overline{NHNC(NH_2)NCH}$.

Properties: White crystalline solid; m.p. $156-159^\circ C$; soluble in water; slightly soluble in alcohol.

Hazard: Use on food crops restricted; a carcinogen.

Uses: Herbicide and plant growth regulator.

4-amino-3,5,6-trichloropicolinic acid ("Tordon").

$C_5NCl_3(COOH)(NH_2)$. Herbicide and defoliant, especially for perennials, broad-leaf weeds, etc.; considered relatively nontoxic to animals and humans.

3-(3-amino-2,4,6-triiodophenyl)-2-ethylpropanoic acid. See iopanoic acid.

aminourea hydrochloride. See semicarbazide hydrochloride.

"Aminox."²⁴⁸ Trademark for a low-temperature reaction product of diphenylamine and acetone.

Properties: Light-tan powder; sp. gr. 1.13; m.p. $85-95^\circ C$; soluble in acetone, benzene, and ethylene dichloride; insoluble in water and gasoline.

Use: Antioxidant for nylon and light-colored rubber products.

aminoxylene. See xylidine.

amitrole. Generic name for 3-amino-1,2,4-triazole (q.v.).

"Amizyme."¹¹⁴ Trademark for a series of enzyme preparations, high in dextrinizing or starch-liquefying properties. Available in tablet, powdered or liquid form.

Derivation: Produced by growing pure microbial cultures on select media.

Uses: Conversion of starch; used in paper coatings, adhesives, and textile sizes.

"Ammate."²⁸ Trademark for ammonium sulfamate in various grades.

Hazard: See ammonium sulfamate.

Use: Non-selective herbicide.

ammelide (6-amino-s-triazine-2,4-diol; cyanuramide)
 $NC(OH)NC(OH)NC(NH_2)$. Crystalline solid; m.p.,

decomposes; insoluble in alcohol; slightly soluble in hot water. Similar to melamine and suggested for melamine-type (amino) resins.

ammeline (4,6-diamino-s-triazine-2-ol; cyanurdiamide)
 $NC(OH)NC(NH_2)NC(NH_2)$. Crystalline solid; m.p.,

decomposes; insoluble in water and alcohol. A compound similar to melamine and used in melamine-type resins and in special high temperature lubricants.

ammine. A coordination compound formed by the union of ammonia with a metallic substance, in such a way that the nitrogen atoms are linked directly to the metal. See cobaltamine and coordination compound. Note the distinction from amines, in which the nitrogen is attached directly to the carbon atom.

ammonia, anhydrous. NH_3 . Third highest-volume chemical produced in U.S. (1975).

Properties: Colorless gas (or liquid); sharp, intensely irritating odor; lighter than air; easily liquefied by pressure; b.p. $-33.5^\circ C$ freezing point $-77.7^\circ C$; vapor pressure of liquid 8.5 atm ($20^\circ C$); sp. volume 22.7 cu ft lb ($70^\circ C$); sp. gr. of liquid 0.77 at $0^\circ C$; 0.6819 at b.p.; very soluble in water, alcohol, and ether. Autoignition temp. $1204^\circ F$. Combustible.

Note: Ammonia is the first complex molecule to be identified in interstellar space; it has been observed in galactic dust clouds in the Milky Way, and is believed to constitute the rings of the planet Saturn.

Derivation: Natural gas is the basic raw material for most of the ammonia made in the U.S.; it can also be made from coal. A mixture of natural gas, air, and

steam is converted to CO_2 , H_2 , and N_2 ; the CO_2 is absorbed and the mixture is adjusted to a composition of 1 part nitrogen (from the air) to 3 parts hydrogen. See also synthesis gas. Synthesis is carried out at 1000 atm or less and at temperatures up to 700°C . A number of different catalysts have been used, the most effective being produced by fusion of iron oxide (Fe_3O_4) containing aluminum oxide and potassium oxide as promoters, followed by reduction of the oxide. Chemisorption of the nitrogen on the catalyst surface is the rate-controlling step. Ammonia is formed as the end-product of animal metabolism by decomposition of uric acid.

Grades: Commercial 99.5%; refrigerant 99.97%. See also ammonium hydroxide.

Containers: Steel cylinders; barges; unit trains; ocean tankers; special tank cars at -28°F ; pressurized tank cars; pipelines.

Hazard: Toxic and irritant by inhalation; tolerance, 25 ppm in air. Inhalation of concentrated fumes may be fatal. Moderate fire risk; explosive limits in air 16 to 25%. Forms explosive compounds in contact with silver or mercury. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Fertilizers, either as such or in form of compounds, e.g., ammonium nitrate; manufacture of nitric acid, hydrazine hydrate, hydrogen cyanide, urethane, acrylonitrile, and sodium carbonate (by Solvay process); refrigerant; nitriding of steel; condensation catalyst; synthetic fibers; dyeing; neutralizing agent in petroleum industry; latex preservative; sulfite cooking liquors; fuel cells; rocket fuel; yeast nutrient; developing diazo films.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Compressed Gas label. Not acceptable on passenger planes. (For solutions consult regulations.) See also Haber, Fritz; synthesis gas.

ammonia, aromatic spirits. A mixture of 10% of ammonia in alcohol. Strong, suffocating odor.

Hazard: Flammable; keep tightly closed; irritating to mucous membranes.

Uses: Medicine; veterinary medicine.

ammonia-soda process. See Solvay process.

ammoniated mercury chloride. See mercury, ammoniated.

ammoniated ruthenium oxychloride. See ruthenium red.

ammoniated superphosphate. Fertilizer produced by mixing ammonia with superphosphate in the ratio of 5 parts to 100.

ammonio-cupric sulfate. See copper sulfate, ammoniated.

ammonio-ferric oxalate. See ferric ammonium oxalate.

ammonio-ferric sulfate. See ferric ammonium sulfate.

"Ammono-nite."⁵³² Trademark for a mixture of ammonium nitrate (98%) and coating agents (2%). Used as a fertilizer and blasting agent.

Hazard: Dangerous. See ammonium nitrate.

ammonium acetate $\text{NH}_4(\text{C}_2\text{H}_3\text{O}_2)$.

Properties: White, deliquescent, crystalline mass. Soluble in water, alcohol. M.p. 114°C ; sp. gr. 1.073.

Derivation: By the interaction of glacial acetic acid and ammonia. Combustible.

Uses: Reagent in analytical chemistry; drugs; textile dyeing; preserving meats; foam rubbers; vinyl plastics; explosives.

ammonium acid carbonate. See ammonium bicarbonate.

ammonium acid fluoride. See ammonium bifluoride.

ammonium acid methanearsonate $\text{CH}_3\text{AsO}(\text{OH})\text{ONH}_4$. A post-emergent herbicide; available as "Ansar" 157, a clear solution containing 9.54% elemental arsenic.

Hazard: Highly toxic by ingestion and inhalation.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

ammonium acid phosphate. See ammonium phosphate, monobasic.

ammonium alginate (ammonium polymannuronate) $(\text{C}_6\text{H}_7\text{O}_6 \cdot \text{NH}_4)$. A hydrophilic, colloid substance. See also algin.

Properties: Filamentous, grainy, granular, or powdered; colorless or slightly yellow and may have a slight characteristic smell and taste. Slowly soluble in water forming a viscous solution. Insoluble in alcohol. Low toxicity.

Grades: Technical; F.C.C.

Uses: Thickening agent and stabilizer in food products.

ammonium alum. See aluminum ammonium sulfate.

ammonium aluminum chloride. See aluminum ammonium chloride.

ammonium arsenate $(\text{NH}_4)_2\text{HAsO}_4$.

Properties: White crystals or powder efflorescing in air with loss of ammonia; sp. gr. 1.99; Soluble in water; decomposes in hot water.

Hazard: Highly toxic by ingestion or inhalation.

Shipping regulations: (Rail, Air) Poison label.

ammonium aurin tricarboxylate

$\text{C}(\text{C}_6\text{H}_4\text{OHCOONH}_4)_2(\text{C}_6\text{H}_3(\text{O})\text{COONH}_4)$. Forms colored lakes with aluminum, chromium, iron and beryllium.

ammonium benzenesulfonate (ammonium sulfonate)

$\text{C}_6\text{H}_5\text{SO}_3\text{NH}_4$. M.p. 271°C (decomp.); sp. gr. 1.34. Grade: 35% solution in kerosene.

Hazard: Probably toxic by ingestion. Flammable.

ammonium benzoate $\text{C}_6\text{H}_5\text{COONH}_4$.

Properties: White crystals or powder. Soluble in water, alcohol and glycerol. Decomposes at 198°C ; sp. gr. 1.260; sublimes at 160°C .

Uses: Medicine; food preservative.

ammonium baborate. See ammonium borate.

ammonium bicarbonate (ammonium acid carbonate; ammonium hydrogen carbonate) NH_4HCO_3 .

Properties: White crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.586; m.p. decomposes at 36° to 60°C . Noncombustible. Nontoxic.

Derivation: By heating ammonium hydroxide with an excess of carbon dioxide, and evaporation.

Impurities: Ammonium carbonate.

Grades: Technical; C.P.; F.C.C.

Containers: 100-lb drums; carloads.

Hazard: Evolves irritant fumes on heating to 95°F .

Uses: Production of ammonium salts; dyes; leavening agent for cookies, crackers, cream puff doughs; fire-extinguishing compounds; pharmaceuticals; degreasing textiles; blowing agent for foam rubber.

ammonium bichromate. See ammonium dichromate.

ammonium bifluoride (ammonium acid fluoride; ammonium hydrogen fluoride) NH_4HF_2 .

Properties: White crystals, deliquescent; sp. gr. 1.211; soluble in water and alcohol.

Derivation: Action of ammonium hydroxide on hydrofluoric acid with subsequent crystallization.

Hazard: Toxic by inhalation. Corrosive to skin. Tolerance (as F): 2.5 mg per cubic meter of air.

Uses: Ceramics; chemical reagent; etching glass (white acid); sterilizer for brewery, dairy and other equipment; electroplating; processing beryllium.

Shipping regulations: (Rail) (liquid) Corrosive liquid, n.o.s. White label. (Air) (solid or solution) Corrosive label.

ammonium binoxalate $(\text{NH}_4)\text{HC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water. Sp. gr. 1.556; decomposes on heating.

Derivation: Action of ammonium hydroxide on oxalic acid with subsequent crystallization.

Hazard: Toxic by ingestion and inhalation.

Uses: Analytical reagent; ink removal from fabrics.

ammonium biphosphate. See ammonium phosphate, monobasic.

ammonium bisulfide. See ammonium sulfide.

ammonium bitartrate (acid ammonium tartrate)

$(\text{NH}_4)\text{HC}_4\text{H}_4\text{O}_6$.

Properties: White crystals. Soluble in water, acids and alkalis; insoluble in alcohol. Sp. gr. 1.636. Low toxicity.

Derivation: By the action of ammonium hydroxide on tartaric acid.

Use: Baking powder.

ammonium borate (ammonium baborate)

$\text{NH}_4\text{HB}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals; efflorescent with loss of ammonia. Soluble in water. Sp. gr. 2.38–2.95. Noncombustible.

Derivation: Action of ammonium hydroxide on boric acid with subsequent crystallization.

Hazard: Evolves irritant fumes, especially when heated.

Uses: Medicine; fireproofing compounds; electrical condensers; herbicide.

ammonium bromide NH_4Br .

Properties: Colorless crystals or yellowish white powder; soluble in water and alcohol; somewhat hygroscopic. Sp. gr. 2.43; m.p., sublimates. Noncombustible.

Derivation: Action of hydrobromic acid on ammonium hydroxide with subsequent crystallization.

Grades: Technical; pure; C.P.; N.F.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Precipitating silver salts for photographic plates; medicine (for its bromide ion); analytical chemistry; process engraving; textile finishing; fire retardant.

ammonium cadmium bromide. See cadmium ammonium bromide.

ammonium carbamate $\text{NH}_4\text{CO}_2\text{NH}_2$.

Properties: White, crystalline rhombic powder; exceedingly volatile; forms urea on heating. Soluble in water and alcohol. Sublimes at 60°C. Decomp. in air evolving ammonia.

Derivation: Interaction of dry ammonia gas and carbon dioxide; recovered from ammonia liquor with ammonia and ammonium carbonate.

Grades: Technical.

Hazard: Evolves irritant fumes, especially when heated.

Use: Fertilizer.

ammonium carbazotate. See ammonium picrate.

ammonium carbonate (crystal ammonia; ammonium sesquicarbonate; hartshorn). A mixture of ammonium acid carbonate and ammonium carbamate.

$(\text{NH}_4)\text{HCO}_3 \cdot (\text{NH}_4)\text{CO}_2\text{NH}_2$.

Properties: Colorless crystal plates or white powder; unstable in air, being converted into the bicarbonate.

Strong odor of ammonia, sharp ammoniacal taste.

Soluble in water; decomposes in hot water, yielding ammonia and carbon dioxide. Noncombustible.

Derivation: Ammonium salts are heated with calcium carbonate.

Method of purification: Sublimation.

Grades: Technical; lumps; cubes; powder; C.P.; N.F.; F.C.C.

Containers: Bottles; barrels; drums.

Hazard: Evolves irritant fumes, especially when heated.

Uses: Ammonium salts; medicine; baking powders; smelling salts; fire extinguishing compounds; pharmaceuticals; textiles (mordant, washing fabrics); fermentation accelerator in wine manufacture; also, organic chemicals, ceramics, in washing wool.

ammonium chlorate. NH_4ClO_3 .

Properties: Colorless or white crystals. Water-soluble.

Derivation: Reaction of ammonium chloride with sodium chlorate in solution.

Hazard: Spontaneous chemical reaction with reducing agents. Powerful oxidizer. When contaminated with combustible materials, it may ignite. Shock-sensitive; may detonate when exposed to heat or vibration, especially when contaminated.

Uses: Explosives.

Shipping regulations: (Rail) Chlorates, n.o.s., Yellow label. (Air) Not acceptable.

ammonium chloride (sal ammoniac) NH_4Cl .

Properties: White crystals; cool, saline taste; somewhat hygroscopic. Soluble in water and glycerol; slightly soluble in alcohol. Sublimes 350°C; sp. gr. 1.54.

Derivation: (a) As a by-product of the ammonia-soda process; (b) reaction of ammonium sulfate and sodium chloride solutions.

Grades: Technical (lumps or granulated); C.P.; U.S.P.; F.C.C.

Containers: Barrels; multiwall paper sacks.

Hazard: Toxic by inhalation. Tolerance (fume), 10 mg per cubic meter of air.

Uses: Dry batteries; mordant (dyeing and printing); soldering flux; manufacture of various ammonia compounds; fertilizer; pickling agent in zinc coating and tinning; electroplating; washing powders; snow treatment; resins and adhesive of urea-formaldehyde; medicine; food industry.

ammonium chloroplatinate. See ammonium hexachloroplatinate.

ammonium chloroplatinite (platinous-ammonium chloride; platinum ammonium chloride) $(\text{NH}_4)_2\text{PtCl}_4$. Dark red ruby crystals; decomposes 140–150°C; soluble in water; insoluble in alcohol. Used in photography.

ammonium chlorosmate. See ammonium hexachlorosmate.

ammonium chromate $(\text{NH}_4)_2\text{CrO}_4$.

Properties: Yellow crystals; soluble in cold water; insoluble in alcohol. Sp. gr. 1.866; m.p., decomposes.

Derivation: Addition of ammonium hydroxide to a

solution of ammonium bichromate; recovery by crystallization.

Impurities: Dichromates.

Grades: Technical; C.P.

Hazard: Toxic by inhalation; strong irritant.

Uses: Mordant in dyeing; photography (sensitizer for gelatin coatings); analytical reagent; catalyst; corrosion inhibitor.

ammonium chrome alum. See chromium ammonium sulfate.

ammonium chromium sulfate. See chromium ammonium sulfate.

ammonium citrate, dibasic $(\text{NH}_4)_2\text{HC}_6\text{H}_5\text{O}_7$.

Properties: White granules; soluble in water; very slightly soluble in alcohol. Low toxicity.

Uses: Pharmaceuticals; rustproofing; cotton printing; plasticizer; analytically in determination of phosphate in fertilizer.

ammonium decaborate. See ammonium pentaborate.

ammonium dichromate (ammonium bichromate)

$(\text{NH}_4)_2\text{Cr}_2\text{O}_7$.

Properties: Orange needles; soluble in water and alcohol. Sp. gr. 2.152 (25°C); m.p., decomposes with slight heating.

Derivation: Action of chromic acid on ammonium hydroxide with subsequent crystallization.

Containers: Bottles; cartons; drums; multiwall paper bags.

Hazard: Dusts and solutions are toxic; irritant to eyes and skin; dangerous fire risk. Strong oxidizing agent; may explode in contact with organic materials. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Mordant for dyeing; pigments; manufacturing of alizarin; chrome alum; oil purification; pickling; manufacture of catalysts; leather tanning; synthetic perfumes; photography; process engraving, and lithography (sensitizer for photo-chemical insolubilization of albumin, etc.) chromic oxide; pyrotechnics.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label.

ammonium dihydrogen phosphate. See ammonium phosphate monobasic.

ammonium dimethyldithiocarbamate $(\text{CH}_3)_2\text{NCS}_2\text{NH}_4$.
Properties: Yellow crystals; soluble in water; decomp. in air.

Grade: 42% solution in water.

Containers: 5-gal cans, 55-gal drums.

Use: Fungicide.

ammonium dinitro-ortho-cresolate.

Hazard: Dangerous in contact with combustible materials. Strong oxidizing agent. Flammable.

Use: Herbicide.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not accepted on passenger planes.

ammonium fluoride NH_4F .

Properties: White crystals; sp. gr. 1.31; decomposed by heat; soluble in cold water.

Derivation: Interaction of ammonium hydroxide and hydrofluoric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C.P.

Containers: 1-lb waxed bottles; 250-lb barrels.

Hazards: Toxic by inhalation. Corrosive to tissue. Tolerance (as F): 2.5 mg per cubic meter of air.

Uses: Fluorides; analytical chemistry; antiseptic in brewing; etching glass; textile mordant; wood preservation.

ammonium fluosilicate (ammonium silicofluoride) $(\text{NH}_4)_2\text{SiF}_6$.

Properties: White, crystalline powder; sp. gr. 2.01; soluble in alcohol and water.

Containers: Drums.

Hazard: Toxic by inhalation. Strong irritant to eyes and skin. Tolerance (as F): 2.5 mg per cubic meter of air.

Uses: Laundry sours; moth proofing; disinfectant in brewing industry; glass etching; light metal casting; electroplating.

ammonium gluconate $\text{NH}_4\text{C}_6\text{H}_{11}\text{O}_7$.

Properties: White powder; soluble in water; insoluble in alcohol. Optical rotation +11.6° (in water). Non-toxic.

Preparation: From gluconic acid by neutralization with ammonia.

Use: Emulsifying agent for cheese and salad dressings.

ammonium glutamate (monoammonium glutamate).
See sodium glutamate.

ammonium hexachloroosmate (ammonium chlorosmate; osmium ammonium chloride) $(\text{NH}_4)_2\text{OsCl}_6$.

Properties: Red powder. Contains 43.5% osmium. Soluble in alcohol, water.

Hazard: Moderately toxic. See osmium.

ammonium hexachloroplatinate (ammonium chloroplatinate; platonic-ammonium chloride; platonic sal ammoniac; platinum ammonium chloride) $(\text{NH}_4)_2\text{PtCl}_6$.

Properties: Orange-red crystals, or yellow powder. Slightly soluble in water; insoluble in alcohol. Sp. gr. 3.06; m.p., decomposes. Low toxicity.

Grades: Technical; C.P.

Containers: Glass bottles.

Uses: Plating; platinum sponge.

ammonium hexafluorogermanate $(\text{NH}_4)_2\text{GeF}_6$.

Properties: White crystalline solid; m.p. 380°C (sublimes); soluble in cold water; insoluble in alcohol; sp. gr. 2.564 g/cc.

ammonium hexanitratocerate. See ceric ammonium nitrate.

ammonium hydrate. See ammonium hydroxide.

ammonium hydrogen carbonate. See ammonium bicarbonate.

ammonium hydrogen fluoride. See ammonium bifluoride.

ammonium hydrosulfide. See ammonium sulfide.

ammonium hydroxide (ammonia solution; aqua ammonia; ammonium hydrate) NH_4OH .

Properties: Colorless liquid; strong odor. Concentrations of solutions range up to about 30% ammonia.

Grades: Technical; C.P.; 16°; 20°; 26°; N.F. (strong); F.C.C.

Containers: Steel tank trucks, tank cars, barges.

Hazard: Toxic by ingestion; Both liquid and vapor extremely irritating, especially to eyes. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Textiles; manufacture of rayon, rubber, fertilizers; refrigeration; condensation polymerization; photography (development of latent images); pharmaceuticals; ammonia soaps; lubricants; fireproofing wood; ink manufacture; explosives; ceramics; ammonium compounds; saponifying fats and oils; organic synthesis; detergent; food additive; household cleanser.

Shipping regulations: (Air) Solutions containing free

ammonia (pressurized), Nonflammable Gas label. Not accepted on passenger planes; containing 10% or more ammonia (nonpressurized), No label required.

ammonium hypophosphite $\text{NH}_4\text{N}_2\text{PO}_2$.

Properties: Colorless crystals or white powder; decomposes when heated. Soluble in water and alcohol. Hazard: Evolves flammable and toxic fumes on heating. See phosphine.

ammonium ichthosulfonate. See ichthammol.

ammonium iodate. NH_4IO_3 . White, odorless, granular powder.

Hazard: Fire risk in contact with organic materials. May be toxic.

Use: Oxidizing agent.

ammonium iodide NH_4I .

Properties: White, hygroscopic crystals or powder; soluble in water or alcohol. Sp. gr. 2.56; m.p., sublimes with decomposition. Affected by light.

Hazard: Moderately toxic.

Uses: Iodides; medicine; photography.

ammonium iron tartrate. See ferric-ammonium tartrate.

ammonium lactate $\text{NH}_4\text{C}_3\text{H}_5\text{O}_3$.

Properties: Colorless to yellowish syrupy liquid. Slight odor of ammonia. Decomposes when hot. Sp. gr. 1.19–1.21 (15°C). Soluble in water and alcohol.

ammonium laurate, anhydrous $\text{C}_{11}\text{H}_{23}\text{COONH}_4$.

Properties: Tan, wax-like material, free from ammonia odor. Soluble in ethyl alcohol, methyl alcohol, cottonseed oil, and mineral oil. Soluble (hot) in naphtha, toluene, and vegetable oil. Sp. gr. (25°C) 0.88; pH (5% dispersion) 7.6–7.8; m.p. 42–56°C; neut. value 120–125. Nontoxic; combustible.

Uses: Production of oil-in-water emulsions with high oil content; cosmetics.

ammonium lignin sulfonate. See lignin sulfonate.

ammonium linoleate $(\text{C}_{17}\text{H}_{31}\text{COONH}_4)$.

Properties: Yellow paste with ammoniacal odor. Soluble in water, ethyl alcohol, methyl alcohol. Emulsifies in naphtha, toluene, mineral oil, and vegetable oil. Sp. gr. 1.1; pH (5% dispersion) 9.5–9.8; total solids 82%. Nontoxic; combustible.

Grades: Technical, 80%.

Uses: Emulsifying agent for oils, waxes, and hydrocarbon solvents; surface tension reducer; detergent; water-repellent finishes.

ammonium metatungstate $(\text{NH}_4)_6\text{H}_2\text{W}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: White, crystalline powder; very soluble in water. Absolute density 4g/cc; m.p., decomp. at 200–300°C to relatively stable anhydrous form, $(\text{NH}_4)_6\text{H}_2\text{W}_{12}\text{O}_{40}$, which decomp. above 300°C to form tungstic oxide, WO_3 .

Containers: Leverpak drums.

Uses: Preparation of high-purity tungsten metal, alloys and chemicals; tungsten catalysts; corrosion-inhibiting solutions.

ammonium metavanadate (ammonium vanadate)

NH_4VO_3 .

Properties: White crystals; insoluble in saturated ammonium chloride solution; slightly soluble in cold water. Sp. gr. 2.326; m.p., breaks up at 210°C. Low toxicity. Nonflammable.

Derivation: Alkali solutions of vanadium pentoxide and precipitation with ammonium chloride.

Uses: For catalyst as vanadium pentoxide; dyes; varnishes; drier for paints and inks; photography.

ammonium molybdate (molybdic acid 85%)

$(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in water; insoluble in alcohol. Sp. gr. 2.27; m.p. decomposes. Nonflammable.

Derivation: Dissolving molybdenum trioxide in aqueous ammonia.

Grades: Technical; C.P.; reagent (contains 85% MoO_3).

Hazard: Moderately toxic and irritant.

Uses: Analytical reagent; pigments; catalyst for dehydrogenation and desulfurization in petroleum and coal technology; production of molybdenum metal; source of molybdate ions.

ammonium 12-molybdophosphate (ammonium phosphomolybdate) $(\text{NH}_4)_3\text{PO}_4 \cdot 12\text{MoO}_3 \cdot 3\text{H}_2\text{O}$, or $(\text{NH}_4)_3\text{PMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Yellow crystalline powder; soluble in alkali; insoluble in alcohol and acids; very slightly soluble in water. Nonflammable.

Derivation: Interaction of ammonium molybdate and phosphoric and nitric acids.

Grade: 91% MoO_3 .

Hazard: May be irritant to skin.

Uses: Reagent; ion exchange columns; photographic additives; imparting water resistance.

ammonium 12-molybdosilicate (ammonium silicomolybdate) $(\text{NH}_4)_4\text{SiMo}_{12}\text{O}_{40} \cdot x\text{H}_2\text{O}$.

Properties: Crystalline, yellow granules; thermally stable. Only slightly soluble in water, ethyl alcohol, and ethyl acetate. Nonflammable.

Grade: Technical; reagent.

Hazard: May be irritant to skin.

Uses: Catalysts; reagents; in atomic energy as precipitants and inorganic ion-exchangers; in photographic processes as fixing agents and oxidizing agents; in plating processes as additives; and in plastics, adhesives, and cement industries for imparting water resistance.

ammonium nickel chloride. See nickel ammonium chloride.

ammonium nickel sulfate. See nickel ammonium sulfate.

ammonium nitrate (Norway saltpeter) NH_4NO_3 . Twelfth highest-volume chemical produced in U.S. (1975).

Properties: Colorless crystals; soluble in water, alcohol, and alkalies. Sp. gr. 1.725; m.p. 169.6°C; b.p. decomposes at 210°C, with evolution of oxygen. Low toxicity.

Derivation: Action of ammonia vapor on nitric acid.

Grades: Usually expressed in percent of nitrogen, as 20.5% N; 33.5% N. FGAN is a fertilizer grade, prilled and usually coated with kieselguhr. Also available as an 83% solution. A temperature-stabilized grade is also available which inhibits breakdown of prills due to crystalline changes.

Containers: Bags; carloads; tank cars; tank trucks.

Hazard: May explode under confinement and high temperatures, but not readily detonated. Ventilate well. To fight fire use large amounts of water. The material must be kept as cool as possible and removed from confinement and flooded with water in event of fire. Explodes more readily if contaminated with combustible materials. Strong oxidizing agent. May be made resistant to flame and detonation by proprietary process involving addition of 5 to 10% ammonium phosphate. The Fertilizer Institute states that the fertilizer grade of ammonium nitrate is not explosive.

Uses: Fertilizer; explosives, especially as prills/oil mixture; pyrotechnics; herbicides and insecticides; manufacture of nitrous oxide; absorbent for nitrogen oxides; ingredient of freezing mixtures; oxidizer in solid rocket propellants; nutrient for antibiotics and yeast; catalyst.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Regulations apply to mixtures, fertilizers, etc.

See also explosive, high.

ammonium nitrate-carbonate mixtures. See calcium ammonium nitrate.

ammonium nitroso-beta-phenyl hydroxylamine. See cupferron.

ammonium oleate $C_{17}H_{33}COONH_4$. An ammonium soap.

Properties: Yellow to brownish, ointment-like mass; ammonium odor; decomposes on heating. Soluble in water and alcohol. Combustible.

Uses: Emulsifying agent; cosmetics.

ammonium oxalate $(NH_4)_2C_2O_4 \cdot H_2O$.

Properties: Colorless crystals; soluble in water. Sp. gr. 1.502; decomposed by heat.

Hazard: Toxic by ingestion.

Uses: Analytical chemistry; safety explosives; manufacture of oxalates; rust and scale removal.

Shipping regulations: (Rail) Poisonous solids, n.o.s., Poison label. (Air) Oxalic salts, solid, Poison label.

ammonium paratungstate. See ammonium tungstate.

ammonium pentaborate (ammonium decaborate)

$(NH_4)_2B_{10}O_{16} \cdot 8H_2O$.

Properties: Crystals or powder; soluble in water.

Uses: Intermediate for boron chemicals; as a power-level control in atomic submarines.

ammonium perchlorate (AP; APC) NH_4ClO_4 .

Properties: White crystals. Soluble in water. Sp. gr. 1.95; m.p., decomposes on heating.

Derivation: Interaction of ammonium hydroxide, hydrochloric acid, and sodium chlorate. Recovery by crystallization.

Hazard: Strong oxidizing agent; ignites violently with combustibles. Shock-sensitive; may explode when exposed to heat or by spontaneous chemical reaction. Sensitive high explosive when contaminated with reducing materials. Skin irritant.

Uses: Explosives; pyrotechnics; analytical chemistry; etching and engraving agent; smokeless rocket and jet propellant.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

ammonium permanganate NH_4MnO_4 .

Properties: Crystal or powder form, having a metallic sheen in rich violet-brown or dark purple shades; a powerful oxidizing material; soluble in water.

Hazard: Strong oxidizing agent; may explode on shock or on exposure to heat. Toxic by ingestion and inhalation of dust and fume.

Shipping regulations: (Rail) Yellow label. (Air) Not acceptable.

ammonium perrhenate NH_4ReO_4 .

Properties: Colorless, only weakly oxidizing solid; stable to heat; density 3.55 g/cc; slightly soluble in cold water but moderately soluble in hot water; decomp. at 365°C.

Derivation: Liquid ion-exchange.

Hazard: Moderate fire risk by reaction with reducing materials.

ammonium persulfate $(NH_4)_2S_2O_8$.

Properties: White crystals; strong oxidizing agent; soluble in water. Sp. gr. 1.98; m.p., decomposes.

Derivation: Electrolysis of a concentrated solution of ammonium sulfate. Recovered by crystallization.

Hazard: Oxidizing agent; fire risk in contact with organic materials.

Uses: Oxidizing agent; bleaching agent; photography; etchant for printed circuit boards; etching copper; electroplating; manufacture of other persulfates; deodorizing and bleaching oils; aniline dyes; preserving food; depolarizer in batteries; washing infected yeast.

ammonium phosphate, dibasic (ammonium phosphate, secondary; diammonium hydrogen phosphate; diammonium phosphate; DAP) $(NH_4)_2HPO_4$.

Properties: White crystals or powder; sp. gr. 1.619; mildly alkaline in reaction; soluble in water; insoluble in alcohol. Noncombustible. Low toxicity.

Derivation: Interaction of ammonium hydroxide and phosphoric acid in proper proportions.

Grades: Technical; C.P.; fertilizer; feed; dentifrice; highly purified, for phosphors; F.C.C.

Uses: Flameproofing of wood, paper, and textiles; coating vegetation to retard forest fires; to prevent afterglow in matches, and smoking of candlewicks; fertilizer (high analysis phosphate type); plant nutrient solutions; manufacture of yeast, vinegar, and bread improvers; feed additive; flux for soldering tin, copper, brass, zinc; purifying sugar; in ammoniated dentifrices; halophosphate phosphors.

ammonium phosphate, hemibasic

$NH_4H_2PO_4 \cdot H_3PO_4$.

Properties: White crystalline material; somewhat hygroscopic. Strongly acid in reaction. Soluble in water. Noncombustible. Low toxicity.

Uses: Nutrient for truck gardens; yeast food; buffer for adjustment of pH values; metal cleaning.

ammonium phosphate, monobasic (ammonium acid phosphate; ammonium biphosphate; ammonium dihydrogen phosphate; ammonium phosphate, primary) $NH_4H_2PO_4$.

Properties: Brilliant white crystals or powder. Mildly acid in reaction. Moderately soluble in water; sp. gr. 1.803. Noncombustible. Low toxicity.

Derivation: Interaction of phosphoric acid and ammonia in proper proportions.

Grades: Technical; C.P.; F.C.C.; single crystals.

Uses: Fertilizers, flameproofing agent; to prevent afterglow in matches; plant nutrient solutions; manufacture of yeast, vinegar, yeast foods, and bread improvers; food additive; analytical chemistry.

ammonium phosphite (neutral ammonium phosphite) $(NH_4)_2HPO_3 \cdot H_2O$.

Properties: Colorless, crystalline mass. Hygroscopic. Soluble in water.

Grades: Technical.

Use: Chemical (reducing agent).

ammonium phosphomolybdate. See ammonium 12-molybdophosphate.

ammonium phosphotungstate (ammonium phosphowolframate) $2(NH_4)_3PO_4 \cdot 24WO_3 \cdot xH_2O$.

Properties: White powder. Soluble in alkali; insoluble in acid; slightly soluble in water.

Derivation: Interaction of ammonium tungstate, ammonium phosphate and nitric acid.

Use: Chemical reagent.

ammonium phosphowolframate. See ammonium phosphotungstate.

ammonium picrate (ammonium carbazoate; ammonium picronitrate) $C_6H_2(NO_2)_3ONH_4$.

Properties: Yellow crystals; sp. gr. 1.72; m.p., decomposes; slightly soluble in water and alcohol.

Hazard: A high explosive when dry; flammable when wet.

Uses: Pyrotechnics; explosive compositions.

Shipping regulations: (Rail) Consult regulations. (Air) Dry, or with less than 10% water. Not acceptable. Wet with not less than 10% water. Flammable Solid label.

ammonium polymannuronate. See ammonium alginate.

ammonium polyphosphate. See urea-ammonium polyphosphate.

ammonium polysulfide $(NH_4)_2S_x$.

Properties: Known only in solution; yellow, unstable; hydrogen sulfide odor; decomposed by acids with evolution of hydrogen sulfide.

Derivation: Passing hydrogen sulfide into 28% ammonium hydroxide and dissolving an excess of sulfur in the resulting solution.

Hazard: Evolves toxic and flammable gas on contact with acids.

Uses: Analytical reagent; insecticide spray.

ammonium reineckate. See Reinecke salt.

ammonium ricinoleate $C_{17}H_{32}OHCOONH_4$.

Properties: White paste. Combustible.

Grades: Technical.

Uses: Detergent; emulsifying agent.

ammonium saccharin $C_7H_8N_2O_3S$.

Properties: White crystals or a white crystalline powder; freely soluble in water. About 500 times as sweet as sucrose in dilute solutions. See saccharin.

Grade: F.C.C.

Use: Nonnutritive sweetener.

ammonium salicylate $C_6H_4OHCOONH_4$.

Properties: Colorless crystals and white powder with pink tinge; odorless; stable in dry air, but affected by light. Soluble in water and alcohol.

Use: Medicine.

ammonium salt. A salt formed on direct union of ammonia or neutralization of ammonium hydroxide with acids. They are in general white and are soluble in water. Usually decomposed by heat into ammonia and the corresponding acid, which may also be decomposed. All ammonium salts liberate ammonia (NH_3) when heated with a strong base, e.g., sodium hydroxide or calcium hydroxide.

ammonium selenate $(NH_4)_2SeO_4$.

Properties: Colorless crystals; sp. gr. 2.194; soluble in water; insoluble in alcohol.

Hazard: Moderately toxic.

Use: Mothproofing agent.

ammonium selenite $(NH_4)_2SeO_3 \cdot H_2O$.

Properties: Colorless or slightly reddish crystals. Keep away from dust or light! Soluble in water.

Grades: Technical.

Hazard: Moderately toxic.

Uses: Analysis (test for alkaloids); glass colorant.

ammonium sesquicarbonate. See ammonium carbonate.

ammonium silicofluoride. See ammonium fluosilicate.

ammonium silicomolybdate. See ammonium 12-molybdosilicate.

ammonium soap. A soap resulting from the reaction of a fatty acid with ammonium hydroxide. Has an appreciable vapor pressure of ammonia and decomposes on continued exposure leaving the fatty acid residue. Usually not sold as detergents but used in toilet preparations and emulsions.

ammonium stearate $C_{17}H_{35}COONH_4$.

Properties: Tan, wax-like solid, free from ammonia odor. Dispersible in hot water. Soluble (hot) in toluene; partially soluble (hot) in butyl acetate and ethyl alcohol. Sp. gr. (22°C) 0.89; pH (3% dispersion) 7.6; m.p. 73–75°C; neutralization value 70–80. Low toxicity. Combustible.

Grades: Available as anhydrous solid or as paste.

Uses: Vanishing creams, brushless shaving creams, other cosmetic products; waterproofing of cements, concrete, stucco, paper and textiles, etc.

ammonium sulfamate $NH_4OSO_2NH_2$.

Properties: White crystalline solid; m.p. 130°C, decomposes at 160°C. Soluble in water. Nonflammable.

Derivation: Hydrolysis of the product obtained when urea is treated with fuming sulfuric acid.

Containers: Bags, carlots, truck loads.

Hazard: Hot acid solutions when enclosed may explode. Moderately toxic by ingestion. Tolerance, 10 mg/cubic meter of air.

Uses: Flameproofing agent for textiles and certain grades of paper; weed and brush killer; electroplating; generation of nitrous oxide.

ammonium sulfate $(NH_4)_2SO_4$.

Properties: Brownish-gray to white crystals according to degree of purity. Soluble in water; insoluble in alcohol and acetone. Sp. gr. 1.77; m.p. 513°C, with decomposition. Low toxicity. Nonflammable.

Derivation: (a) Ammoniacal vapors from destructive distillation of coal react with sulfuric acid, followed by crystallization and drying. (b) Synthetic ammonia is neutralized with sulfuric acid. (c) By-product of manufacture of caprolactam (q.v.); (d) from gypsum, by reaction with ammonia and carbon dioxide.

Method of purifying: Recrystallization or sublimation.

Grades: Commercial; technical; C.P.; enzyme (no heavy metals); F.C.C.

Containers: Bags, drums; bulk in railroad cars and ships.

Uses: Fertilizers; water treatment; fermentation; fireproofing compositions; viscose rayon; tanning; food additive.

ammonium sulfate nitrate.

Properties: A double salt of approximately 60% ammonium sulfate and 40% ammonium nitrate; 26% nitrogen content. White to light gray granules; soluble in water.

Hazard: Oxidizing material; dangerous in contact with organic materials.

Shipping regulations: Nitrates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

ammonium sulfide $(NH_4)_2S$. The true sulfide is stable only in the absence of moisture and below 0°C. The ammonium sulfide of commerce is largely ammonium bisulfide or hydrosulfide, NH_4HS .

Properties: Yellow crystals. Soluble in water, alcohol, and alkalis. M.p., decomposes. Evolves hydrogen sulfide on contact with acids.

Grades: Technical; C.P.; liquid, 40–44%.

Containers: Iron drums; tins; glass bottles; tanks.

Hazard: Strong irritant to skin and mucous membranes. Toxic by skin absorption.

Uses: Textile industry; photography (developers); coloring brasses, bronzes; iron control in soda ash production.

ammonium sulfite $(\text{NH}_4)_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; acid, sulfurous taste. Hygroscopic; sublimes at 150°C with decomposition; soluble in water. Sp. gr. 1.41.

Hazard: Moderately toxic by ingestion and inhalation.

Uses: Chemical (intermediates, reducing agent); medicine; permanent wave solutions; photography.

ammonium sulfocyanate. See ammonium thiocyanate.

ammonium sulfocyanide. See ammonium thiocyanate.

ammonium sulfonate. See ammonium benzenesulfonate.

ammonium sulfuricinoleate.

Properties: Yellow liquid; soluble in alcohol. Combustible.

Grades: Technical.

Containers: 400-lb barrels.

Use: Medicine; furniture polish.

ammonium tartrate $(\text{NH}_4)_2\text{C}_4\text{H}_4\text{O}_6$.

Properties: White crystals; soluble in water and alcohol. Sp. gr. 1.601; decomposes on heating.

Uses: Textile industry; medicine.

ammonium tetrathiocyanodiammonochromate.

See Reinecke salt.

ammonium tetrathiotungstate $(\text{NH}_4)_2\text{WS}_4$.

Properties: Orange-colored, crystalline powder; sensitive to heat; hydrogen sulfide odor; m.p., decomposes. Soluble in water, ammoniacal and amine solutions.

Uses: Source of high purity tungsten disulfide for catalysts, lubricants, semiconductors.

ammonium thiocyanate (ammonium sulfocyanide; ammonium sulfocyanate) NH_4SCN .

Properties: Colorless, deliquescent crystals; soluble in water, alcohol, acetone, and ammonia. Sp. gr. 1.3057; m.p. 149.6°C , decomposes at 170°C .

Derivation: By boiling an aqueous solution of ammonium cyanide with sulfur or polysulfides, or by the reaction of ammonia and carbon disulfide.

Grades: Technical; C.P.; 50–60% solution.

Containers: 50-, 100-lb bags; plastic-lined kegs; drums; solution in tank cars.

Uses: Analytical chemistry; chemicals (thiourea); fertilizers; photography; ingredient of freezing solutions, especially liquid rocket propellants; fabric dyeing; zinc coating; weed killer and defoliant; adhesives; curing resins; pickling iron and steel; electroplating; temporary soil sterilizer; polymerization catalyst; separator of zirconium and hafnium, of gold and iron.

ammonium thioglycollate $\text{HSCH}_2\text{COONH}_4$.

Properties: Colorless liquid, repulsive odor. Evolves hydrogen sulfide. Combustible.

Containers: 55-gal drums, commercial grade.

Uses: Solutions of various strengths are used for hair waving and for hair removal.

ammonium thiosulfate $(\text{NH}_4)_2\text{S}_2\text{O}_3$.

Properties: White crystals, decomposed by heat; very soluble in water; pH of 60% solution 6.5–7.0. Low toxicity.

Grades: Pure crystals (97%); 60% photographic solution.

Uses: Photographic fixing agent, especially for rapid

development; analytical reagent; fungicide; reducing agent; brightener in silver plating baths; cleaning compounds for zinc-base die-cast metals; hair-waving preparations; fog screens.

ammonium tungstate (ammonium wolframate; ammonium paratungstate) $(\text{NH}_4)_6\text{W}_7\text{O}_{24} \cdot 6\text{H}_2\text{O}$. See also ammonium metatungstate.

Properties: White crystals; soluble in water; insoluble in alcohol.

Derivation: Interaction of ammonium hydroxide and tungstic acid with subsequent crystallization.

Containers: Polyethylene bags; Leverpak drums.

Uses: Preparation of ammonium phosphotungstate and other tungsten compounds.

ammonium uranium carbonate. See uranyl ammonium carbonate.

ammonium uranium fluoride. See uranyl ammonium fluoride.

ammonium vanadate. See ammonium metavanadate.

ammonium wolframate. See ammonium tungstate.

ammonium zirconifluoride. See zirconium ammonium fluoride.

ammonium zirconyl carbonate

$(\text{NH}_4)_3\text{ZrOH}(\text{CO}_3)_3 \cdot 2\text{H}_2\text{O}$.

Properties: Available in aqueous solution; sp. gr. 1.238 (24°C). Stable up to about 68°C ; decomposes in dilute acids, alkalies.

Containers: 500-lb drums.

Uses: Ingredient in water repellents for paper and textiles; catalyst; stabilizer in latex emulsion paints; ingredient in floor wax to aid in resistance to detergents; lubricant in fabrication of glass fibers.

ammonobasic mercuric chloride. See mercury, ammoniated.

"Ammonyx."³²⁸ Trademark for a series of quaternary ammonium chloride derivatives, in which the substituents are methyl, ethyl, benzyl, stearyl, lauryl, phenyl and cetyl groups. Some items are similar isoquinolinium and pyridinium salts. These are all cationics. The "O" series are alkylamine oxides, and are nonionics.

Uses: Softeners; wetting agents; emulsifiers; some grades are germicides, fungicides, disinfectants, and slimicides.

"Ammono-Phos."⁸⁴ Trademark for high analysis ammonium phosphate-containing fertilizers.

"Amnic."⁴³³ Trademark for copper-nickel alloy.

amobarbital (5-ethyl-5-isoamylbarbituric acid)

$\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$.

Properties: White, crystalline powder; odorless with bitter taste. M.p. $156\text{--}161^\circ\text{C}$; solutions are acid to litmus. Very slightly soluble in water; soluble in alcohol.

Grade: U.S.P.

Hazard: Toxic by ingestion; may be habit-forming.

Use: Medicine (also as sodium salt).

amodiaquine hydrochloride

$\text{C}_{12}\text{H}_{15}\text{NNHC}_6\text{H}_3(\text{OH})\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot 2\text{HCl} \cdot 2\text{H}_2\text{O}$.

Properties: Yellow, odorless bitter, crystalline solid. M.p. $150\text{--}160^\circ\text{C}$ (dec). Soluble in water; sparingly soluble in alcohol; very slightly soluble in benzene, chloroform, and ether; pH (1% solution) 4.0–4.8.

Grade: N.F.

Use: Medicine (antimalarial).

amorphous. Noncrystalline; having no molecular lattice structure, which is characteristic of the solid state.

All liquids are amorphous; some materials that are apparently solid, such as glasses, or semisolid, such as some high polymers, rubber and sulfur allotropes, also lack a definite crystal structure and a well-defined melting point. They are considered as high-viscosity liquids. The cellulose molecule contains amorphous as well as crystalline areas. Carbon derived by thermal decomposition or partial combustion of coal, petroleum and wood is amorphous (coke, carbon black, charcoal), though other forms (diamond, graphite) are crystalline.

AMP.

- (1) Abbreviation for 2-amino-2-methyl-1-propanol.
- (2) Abbreviation for adenosine monophosphate. See adenylic acid.

A5MP. Abbreviation for adenosine-5-monophosphoric acid. See adenylic acid (muscle adenylic acid)

"Ampco."⁴⁰⁷ Trademark for a series of aluminum-iron-copper alloys containing 6–15% aluminum, 1.5–5.25% iron, balance copper. Resistant to fatigue, corrosion, erosion, wear and cavitation-pitting. Used for bushings, bearings, gears, slides, etc.

"Ampcoflex."⁴⁴¹ Trademark for normal-impact rigid sheet and also pipe and fittings of Type I unplasticized polyvinyl chloride used to fabricate structures where optimum corrosion resistance is desired.

"Ampcoloy."⁴⁰⁷ Trademark for a series of industrial copper alloys including low iron-aluminum bronzes, nickel-aluminum bronzes, tin bronzes, manganese bronzes, lead bronzes, beryllium-coppers and high-conductivity alloys.

"Ampco-Trode."⁴⁰⁷ Trademark for a series of aluminum-bronze, arc-welding electrodes and filler rod, containing 9.0–15.0% aluminum, 1.0–5.0% iron, balance copper, for joining like or dissimilar metals and overlaying surfaces resistant to wear, corrosion, erosion and cavitation-pitting.

AMPD. Abbreviation for 2-amino-2-methyl-1,3-propanediol.

amphetamine (1-phenyl-2-aminopropane; methylphenethylamine; "Benzedrine").
 $C_6H_5CH_2CH(NH_2)CH_3$.

Properties: Colorless, volatile liquid; characteristic strong odor and slightly burning taste; b.p. 200–203°C (dec); flash point 80°F; soluble in alcohol and ether; slightly soluble in water.

Grades: Dextro-, dextrolevo-.

Containers: Glass bottles.

Hazard: Flammable, moderate fire risk. Basis of a group of hallucinogenic, habit-forming drugs which affect the CNS. Sale and use restricted to physicians. Production limited by law.

Use: Medicine. Also available as phosphate and sulfate.

amphibole. A type of asbestos. See asbestos.

ampholyte. A substance that can ionize to form either anions or cations, and thus may act as either an acid or a base. An ampholytic detergent is cationic in acid media and anionic in basic media. Water is an ampholyte. See also amphoteric.

"Amphos."⁴⁴¹ Trademark for phosphorized oxygen-free copper in cast or wrought form.

amphoteric. Having the capacity of behaving either as an acid or a base; thus aluminum hydroxide neu-

tralizes acids with the formation of aluminum salts: $Al(OH)_3 + 3HCl \rightarrow AlCl_3 + 3H_2O$, and also dissolves in strongly basic solutions to form aluminates: $Al(OH)_3 + 3NaOH \rightarrow Na_3AlO_3 + 3H_2O$. Amino acids and proteins are amphoteric, i.e., their molecules contain both an acid group ($COOH$) and a basic group (NH_2). Thus wool can absorb both acidic and basic dyes.

amphotericin B. A polyene antifungal antibiotic.

Properties: Pale yellow semicrystalline powder; m.p. gradual decomposition above 170°C. Insoluble in water; slightly soluble in methanol. Somewhat more soluble in dimethylsulfoxide.

Derivation: Fermentation with *Streptomyces nodosus*.

Commercially available as a deoxycholate complex.

Grade: U.S.P.

Hazard: May have side effects.

Use: Medicine (meningitis treatment).

ampicillin (USAN) (6-(D-alpha-aminophenyl-acetamido)-penicillanic acid) $C_{16}H_{19}N_3O_4S$. An antibiotic; used in medicine. Grade: N.D.

"Amprol."¹²³ Trademark for amprolium (q.v.).

amprolium. 1-[(4-Amino-2-propyl-5-pyrimidinyl)-methyl]-2-picolinium chloride hydrochloride. A coccidiostat.

amprotropine phosphate (phosphate of the *dl*-tropic acid ester of 3-diethylamino-2,2-dimethyl-1-propanol) $C_{18}H_{29}NO_3 \cdot H_3PO_4$.

Properties: Bitter crystals. M.p. 142–144°C. Soluble in water, slightly soluble in alcohol.

Use: Medicine (antispasmodic).

"Ampvar."⁴⁴¹ Trademark for synthetic-resin metal conditioner of the vinyl-phosphoric acid-zinc chromate type used to prepare metal surfaces for the application of corrosion-proof coatings.

"Amthio."⁵⁰ Trademark for an ammonium thiosulfate solution.

Properties: A reddish liquid fertilizer and soil conditioner; used before planting. Contains 12% nitrogen and 26% sulfur. Sp. gr. 1.33; weighs approx 11.1 lb/gal. Can be mixed and applied with many liquid fertilizer solutions, or alone in irrigation water.

Precautions: Avoid contact with skin or eyes.

amygdalic acid. See mandelic acid.

amygdalin (mandelonitrile beta-gentiobioside; amygdaloside) $C_6H_5CH(NOC_2H_5)O_{10}$. A glycoside found in bitter almonds.

Properties: White crystals; bitter taste. Anhydrous form m.p. 214–216°; soluble in water and alcohol; insoluble in ether.

Note: "Bitter almonds contain amygdalin, together with an enzyme that catalyzes its hydrolysis. When the kernels are ground and moistened, a volatile oil produced by the hydrolysis can be distilled from them, consisting mainly of benzaldehyde and hydrocyanic acid. This is the oil of bitter almond, used in pharmacy as a food flavor after removal of the hydrocyanic acid." (Eckey, "Vegetable Fats and Oils.") See also oil of bitter almond.

amyl. The five-carbon aliphatic group C_5H_{11} , also known as pentyl. Eight isomeric arrangements (exclusive of optical isomers) are possible. In addition to this theoretical source of confusion, the amyl compounds occur (as in fusel oil), or are formed (as from the petroleum pentanes) as mixtures of several

isomers, and since their boiling points are close and their other properties similar, it is neither easy nor usually necessary to purify them. As used in this dictionary, amyl means a mixture of isomers, unless a specific isomer is designated. Several entries are under isoamyl. See also amyl alcohol.

amyl acetate (amylacetic ester; banana oil; pear oil) $\text{CH}_3\text{COOC}_5\text{H}_{11}$. Commercial amyl acetate is a mixture of isomers, the composition and properties depending upon the grade and derivation. The principal isomers are isoamyl, normal, and secondary amyl acetates (q.v.).

Properties: Colorless liquid; flash point from 65 to 95°F (C.C.), depending on grade; persistent banana-like odor. Autoignition temp. about 714°F.

Derivation: Esterification of amyl alcohol (often fusel oil) with acetic acid and a small amount of sulfuric acid as catalyst.

Method of purification: Rectification.

Grades: Commercial (85–88%), high test (85–88%), technical (90–95%), pure (95–99%); special antibiotic grade. Amyl acetate is also sold by original source, as from fusel oil, pentane, or Oxo process.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.1 to 7.5%. Moderately toxic by inhalation and ingestion.

Uses: Solvent for lacquers and paints; extraction of penicillin; photographic film; leather polishes; nail polish; warning odor; flavoring agent; printing and finishing fabrics; solvent for phosphors in fluorescent lamps.

Shipping regulations: (Rail) Red label. (Air) Flammable liquid label.

n-amyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; b.p. 148.4°C; m.p. –70.8°C; sp. gr. (20/20°C) 0.879; wt/gal (20°C) 7.22 lbs; flash point (closed cup) 77°F. Very slightly soluble in water; miscible with alcohol and ether. Vapor heavier than air. Autoignition temp. 714°C.

Derivation: Esterification of n-amyl alcohol with acetic acid.

Hazard: Flammable, dangerous fire risk. Moderately toxic. Tolerance, 100 ppm in air.

Uses: See amyl acetate.

Shipping regulations: (Rail) Red label. (Air) Flammable liquid label.

sec-amyl acetate $\text{CH}_3\text{CO}_2\text{C}_5\text{H}_{11}$.

Properties: Colorless liquid. May be a mixture of secondary isomers. Distillation range 123–145°C; odor mild, nonresidual; purity, ester content as amyl acetate, 85–88%; sp. gr. 0.862–0.866 (20/20°C); flash point 89°F (C.C.), wt/gal (20°C) 7.19 lbs (approximate).

Derivation: Esterification of sec-amyl alcohol and acetic acid.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Flammable, moderate fire risk. Moderately toxic. Tolerance, 125 ppm in air.

Uses: Solvent for nitrocellulose and ethyl cellulose; cements; coated paper; lacquers; leather finishes; nail enamels; plastic wood; textile sizing and printing compounds.

amylacetic ester. See amyl acetate.

amyl acid phosphate $(\text{C}_5\text{H}_{11})_2\text{HPO}_4$ and $\text{C}_5\text{H}_{11}\text{H}_2\text{PO}_4$. A mixture of primary and amyl isomers. Water-white liquid; density 1.070–1.090; flash point (COC) 245°F. Insoluble in water; soluble in alcohol; petroleum naphtha. Combustible.

Containers: Up to 55-gal drums.

Hazard: Strong irritant to tissue.

Uses: Curing catalyst and accelerator in resins and coatings; stabilizer; dispersion agent; lubricating and antistatic agent in synthetic fibers.

Shipping regulations: (Air) Corrosive label.

amyl alcohol (amyl hydrate). Eight isomers of amyl alcohol, $\text{C}_5\text{H}_{11}\text{OH}$, are possible (exclusive of several optical isomers) and six are offered commercially. In addition, definite mixtures of the isomers are sold under a variety of names (unfortunately some of them identical with the names of the pure isomers) as well as fusel oil (q.v.), a natural fermentation product. For descriptive data on the pure isomers, see

(1) n-amyl alcohol, primary

(2) 2-methyl-1-butanol (active amyl alcohol, from fusel oil)

(3) isoamyl alcohol, primary

(4) 2-pentanol

(5) 3-pentanol

(6) tert-amyl alcohol

The other two isomers, not described in detail, are

(7) sec-isoamyl alcohol

(8) 2,2-dimethyl-1-propanol

(1), (2), (3) and (8) are primary alcohols, (4), (5) and

(7) are secondary alcohols, and (6) is a tertiary alcohol. (1), (4) and (5) are normal, and (2), (3), (6), (7)

and (8) are branched-chain compounds. (2), (4) and (7) are asymmetric, and have optically active forms.

amyl alcohol, primary. A mixture of primary amyl alcohols made from normal butenes by the Oxo process is sold under this name. It consists of 60% primary n-amyl alcohol, 35% 2-methyl-1-butanol, and 5% 3-methyl-1-butanol. Used as a solvent.

Hazard: Flammable, moderate fire risk. Probably toxic.

n-amyl alcohol, primary (1-pentanol; n-butyl carbinol) $\text{CH}_3(\text{CH}_2)_4\text{OH}$.

Properties: Colorless liquid; mild odor; b.p. 137.8°C; freezing point –78.9°C; sp. gr. (20/20°C) 0.812–0.819; wt/gal (20°C) 6.9 lbs; flash point (open cup) 123°F. Autoignition temp. 572°F. Slightly soluble in water; miscible in all proportions with alcohol, benzene, and ether. Combustible.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentane.

Grades: Technical; C.P.; 98%.

Containers: 55-gal drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation. Lower explosive limit in air, 1.2% by volume. Moderate fire risk.

Uses: Raw material for pharmaceutical preparations; organic synthesis; solvent.

amyl alcohol, primary, active. See 2-methyl-1-butanol.

n-sec-amyl alcohol. See 2- and 3-pentanol.

sec-amyl alcohol, active. See 2-pentanol.

tert-amyl alcohol (dimethyl ethyl carbinol; 2-methyl-2-butanol; amylene hydrate; tert-pentanol).

$(\text{CH}_3)_2\text{C}(\text{OH})\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; camphor odor and burning taste; sp. gr. 0.81 (20/20°C); freezing point –11.9°C; b.p. 101.8°C; refractive index 1.4052 (20°C); wt/gal 6.76 lbs; flash point (open cup) 70°F. Slightly soluble in water; miscible with alcohol and ether; solutions neutral to litmus. Autoignition temp. 819°F.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentanes.

Grades: Technical; C.P.; N.F.

Containers: 55-gal drums.

Hazard: Flammable, dangerous fire risk; moderately toxic by ingestion, inhalation, skin absorption.

Uses: Solvent; flotation agent; organic synthesis; medicine (sedative).

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

amyl alcohol, fermentation. See fusel oil.

amyl aldehyde. See *n*-valeraldehyde.

n-amylamine (pentylamine; 1-aminopentane)

Properties: Colorless liquid; sp. gr. 0.75 (20/20°C); f.p. -55.0°C; b.p. 104.4°C; flash point 45°F (open cup).

Soluble in water, alcohol and ether.

Derivation: Reaction of ammonia and amyl chloride, which gives a mixture of mono-, di-, and triamyl amines.

Grade: Technical.

Containers: 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk. Strong irritant.

Uses: Chemical intermediate; dyestuffs; rubber chemicals; insecticides; synthetic detergents; flotation agents; corrosion inhibitors; solvent; gasoline additive; pharmaceuticals.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

sec-amylamine (2-aminopentane)

Properties: Colorless liquid; b.p. 198°F; sp. gr. 0.7; flash point 20°F.

Hazard: Flammable, dangerous fire risk.

Uses: See *n*-amylamine.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

amylase. A class of enzymes which convert starch into sugars. Fungal and bacterial amylases, from specific fungi and bacteria, have been suggested for commercial fermentation processes. See also amylopsin, diastase, and ptyalin.

Uses: Textile desizing; conversion of starch to glucose sugar in syrups (especially corn syrups); baking (to improve crumb softness and shelf life); dry cleaning (to attack food spots and similar stains).

n-amylbenzene (1-phenyl)pentane $\text{C}_6\text{H}_5\text{CH}_2(\text{CH}_2)_3\text{CH}_3$.

Water-white liquid; mild odor; f.p. -75°C; b.p. 205°C; sp. gr. (20/4°C) 0.8585. Flash point 150°F (open cup). Insoluble in water; soluble in hydrocarbons and coal-tar solvents. Combustible.

Hazard: Probably irritant to skin and eyes; narcotic in high concentrations. Moderate fire risk.

sec-amylbenzene (2-phenyl)pentane.

Properties: Clear liquid; f.p. -75°C; b.p. 190.3°C; sp. gr. 0.861 (20/4°C); flash point 155°F. Combustible.

Grades: Pure, 99.0 mole %; technical, 95.0 mole %.

Hazard: Probably irritant to skin and eyes; narcotic in high concentrations. Moderate fire risk.

Use: Weed control; chemical intermediate.

amyl benzoate. See isoamyl benzoate.

amyl butyrate. See isoamyl butyrate.

amyl carbinol. See 1-hexanol.

n-amyl chloride (1-chloropentane) $\text{CH}_3(\text{CH}_2)_3\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. B.p. 107.8°C; freezing point -99°C; sp. gr. 0.883 (20/4°C); refractive index *n*_D 20/D 1.4128; flash point 54°F (open cup). Miscible with alcohol and ether; insoluble in water. Autoignition temp. 650°F.

Derivation: (a) Distillation of amyl alcohol with salt and sulfuric acid; (b) addition of hydrogen chloride to alpha-amylene.

Grades: Technical.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.4 to 8.6%. May be narcotic in high concentrations.

Use: Chemical intermediate.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

amyl chlorides, mixed.

Properties: Straw to purple-colored liquid; sp. gr. (20°C) 0.88; 95% distills between 85 and 109°C; wt/gal 7.33 lb; refractive index (20°C) 1.406; insoluble in water; water azeotrope at 77-82°C, 90% $\text{C}_5\text{H}_{11}\text{Cl}$ (approximate); miscible with alcohol and ether. Flash point 38°F (open cup).

Components: 1-chloropentane, b.p. 107.8°C; 2-chloropentane, b.p. 96.7°C; 3-chloropentane, b.p. 97.3°C; 1-chloro-2-methylbutane, b.p. 99.9°C; 1-chloro-3-methylbutane, b.p. 98.8°C; 3-chloro-2-methylbutane, b.p. 93.0°C; and 2-chloro-2-methylbutane, b.p. 86.0°C.

Derivation: Vapor phase chlorination of mixed normal pentane and isopentane.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 1.4 to 8.6%. May be narcotic in high concentrations.

Uses: Synthesis of other amyl compounds; solvent; rotogravure ink vehicles; soil fumigation.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

alpha-amylcinnamic alcohol (2-benzylidene-1-heptanol)

Properties: Yellow liquid; floral odor; sp. gr. 0.954-0.962 (25/25°C); soluble in 3 parts 70% alcohol. Combustible.

Derivation: Synthetic.

Use: Perfumery; flavoring

alpha-amylcinnamic aldehyde (jasmine aldehyde; alpha-pentylcinnamaldehyde) $\text{C}_6\text{H}_5\text{CH}:\text{C}(\text{CHO})\text{C}_5\text{H}_{11}$.

Properties: Clear, yellow, oily liquid. Jasmine-like odor. Aldehyde content 97%. Soluble in 6 volumes of 80% alcohol. Sp. gr. 0.962 to 0.968; refractive index 1.554 to 1.559. Combustible.

Derivation: Synthetic.

Grades: Technical; F.C.C.

Uses: Perfumery, flavoring.

amyl para-dimethylaminobenzoate. See "Escalol 506."

alpha-n-amylene. See 1-pentene.

beta-n-amylene. See 2-pentene.

amylene dichloride. See dichloropentane.

amylene hydrate. See tert-amyl alcohol.

amyl formate $\text{HCOOC}_5\text{H}_{11}$.

Properties: Colorless liquid composed of a mixture of isomeric amyl formates with isoamyl formate in predominance. Plum-like odor. Less odoriferous and more active solvent than amyl acetate. It also has

both a lower boiling point and a higher rate of evaporation. Miscible with oils, hydrocarbons, alcohols, ketones. Slightly soluble in water. Sp. gr. 0.880 to 0.885; b.p. 123.5°C; flash point 80°F.

Grades: Technical; F.C.C.

Hazard: Flammable, dangerous fire risk; moderately toxic by ingestion and inhalation.

Uses: Solvent for cellulose esters, resins; solvent mixtures; films and coatings; perfume for leather; flavoring.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

n-amyfuroate (amyf pyromucate) $C_4H_3OCO_2C_5H_{11}$.

Properties: Colorless oil, decomposes on standing. Sp. gr. 1.0335 (20/4°C); b.p. 233°C. Insoluble in water; soluble in alcohol. Combustible; low toxicity.

Derivation: Esterification of furoic acid.

Uses: Perfumes; lacquers.

amyf hydrate. See amyf alcohol.

amyf hydride. See pentane.

amyf hydrosulfide. See amyf mercaptan.

"Amyliq."¹⁷³ Trademark for starch-liquefying enzyme for sizes and adhesives.

amyf mercaptan. Legal label name for pentanethiol (q.v.).

tert-amyf mercaptan. See 2-methyl-2-butanethiol.

amyf nitrate (mixed isomers) $C_5H_{11}NO_3$.

Properties: Colorless liquid; b.p. 145°C; flash point 118°F; sp. gr. at 20°C 0.99; ethereal odor. Combustible.

Hazard: Oxidizing agent; moderate fire risk. Moderately toxic.

Use: Additive to increase cetane number of diesel fuels.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

amyf nitrite (isoamyf nitrite) $(CH_3)_2CHCH_2CH_2NO_2$.

Properties: Yellowish liquid, of peculiar ethereal, fruity odor and pungent aromatic taste. Soluble in alcohol; almost insoluble in water. Decomposes on exposure to air, light, or water. Sp. gr. 0.865–0.875 at 25°C; b.p. 96–99°C.

Derivation: Interaction of amyf alcohol with nitrous acid.

Grades: N.F. (95% min); technical.

Containers: Dark amber glass bottles.

Hazard: Flammable, dangerous fire risk, a strong oxidizing material. Vapor may explode if ignited. Moderately toxic.

Uses: Medicine; perfumes; diazonium compounds.

Shipping regulations: (Rail) Red label (Air) Flammable Liquid label.

amyloglucosidase. An enzyme used commercially to convert starches to dextrose.

"Amylon."³³ Trademark for a high-amylose starch derived from high-amylose corn.

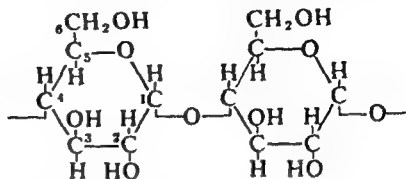

amylopectin. The outer, almost insoluble portion of starch granules. It is a hexosan, a polymer of glucose, and is a branched molecule of many glucose units. It stains violet with iodine and forms a paste with water.

amylopsin (animal diastase). The starch-digesting enzyme of pancreatic juice, the most powerful enzyme of the digestive tract. It is an amylase which converts starches through the soluble-starch stage to various dextrins and maltose. It acts in neutral, slightly acid and slightly alkaline environments with an optimum

pH of 6.3–7.2. It requires the presence of certain negative ions for activation.

Uses: Biochemical research.

amylose. The inner, relatively soluble portion of starch granules. Amylose is a hexosan, a polymer of glucose, and consists of long straight chains of glucose units joined by a 1,4-glycosidic linkage. It stains blue with iodine. Microcrystalline amylose is available, chiefly as a food ingredient and dietary energy source.

ortho-sec-amyfphenol $C_5H_{11}C_6H_4OH$.

Properties: Clear, straw-colored liquid; sp. gr. (30/30°C) 0.955–0.971; initial b.p. not below 235.0°C; final b.p. not above 250.0°C; wt/gal 8.0 lbs; very slightly soluble in water; soluble in oil and organic solvents. Flash point (open cup) 219°F. Combustible.

Uses: Dispersing and mixing agent for paint pastes; antiskinning agent for paint, varnish and oleoresinous enamels; organic synthesis.

para-tert-amyfphenol $(CH_3)_2(C_2H_5)CC_6H_4OH$.

Properties: White crystals; m.p. 93°C; b.p. 265–267°C (138°C at 15 mm); slightly soluble in water; soluble in alcohol and ether. Flash point 232°F (open cup). Combustible.

Containers: Drums; carlots.

Uses: Manufacture of oil-soluble resins; chemical intermediate.

para-tert-amyfphenyl acetate $C_5H_{11}C_6H_4OOCCH_3$.

Properties: Colorless liquid. Sp. gr. (20°C) 0.996; boiling range 253–272°C; odor, fruity. Flash point 240°F. Combustible.

Use: Perfumes; flavorings.

amyf propionate $CH_3CH_2COOC_5H_{11}$. Probably the iso-amyf isomer.

Properties: Colorless, high-boiling liquid; apple-like odor; sp. gr. (20/20°C) 0.869–0.873; wt/gal (20°C) 7.25 lbs (approximate); distillation range 135–175°C; flash point 106°F (open cup); autoignition temp. 712°F; miscible with most organic solvents. Combustible.

Derivation: By reacting amyf alcohol with propionic acid in the presence of sulfuric acid as a catalyst, followed by neutralization, drying and distillation.

Hazard: Moderately toxic; moderate fire hazard.

Uses: Perfumes; lacquers; flavors.

amyf pyromucate. See n-amyf furoate.

amyf salicylate. See isoamyf salicylate.

amyf sulfide. See diamyl sulfide.

amyftrichlorosilane $C_5H_{11}SiCl_3$. A mixture of isomers.

Properties: Colorless to yellow liquid. B.p. 168°C; sp. gr. 1.137 (25/25°C); refractive index n_D^{20} 1.4152; flash point (COC) 145°F. Combustible. Readily hydrolyzed by moisture with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and amyfmagnesium chloride.

Hazard: Highly toxic and corrosive.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

amyl valerate. See isoamyl valerate.

amyl valerianate. See isoamyl valerate.

"Amytal."¹⁰⁰ Trademark for amobarbital, U.S.P.

"Amzirc."⁴³³ Trademark for zirconium-containing copper-base alloys.

anabasine (neonicotine; 2-(3-pyridyl)piperidine)

$C_{10}H_{14}N_2$. A naturally occurring alkaloid.

Properties: Colorless liquid; darkens on exposure to air. B.p. 105°C ; freezing point 9°C ; sp. gr. 1.046 ($20/20^{\circ}\text{C}$); refractive index $n_{20/D}$ 1.5430. Miscible with water; soluble in alcohol and ether.

Derivation: (a) Extraction from *Anabasis aphylla* and *Nicotiana glauca*; (b) synthetic.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Insecticide.

anacardic acid. $C_{22}H_{32}O_3$. The chief component of cashew nutshell oil (q.v.).

anacardium gum. See cashew gum.

anaerobic. Descriptive of a chemical reaction or a microorganism that does not require the presence of air or oxygen; examples are the fermentation of sugars by yeast and the decomposition of sewage sludge by anaerobic bacteria. It also applies to certain polymers that solidify when kept out of contact with air. See also "Loctite"; bacteria.

"**Anaesthesin**."¹⁶² Trademark for ethyl para-aminobenzoate.

analcite (analcime) $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. A mineral; one of the zeolites (q.v.).

Properties: Colorless, white; sometimes greenish-grayish, yellowish or reddish white; hardness 5–5.5; sp. gr. 2.22–2.29.

Occurrence: Europe; United States; Nova Scotia.

analytical chemistry. The subdivision of chemistry concerned with identification of materials (qualitative analysis) and with determination of the percentage composition of mixtures or the constituents of a pure compound (quantitative analysis). The gravimetric and volumetric (or "wet") methods (precipitation, titration, and solvent extraction) are still used for routine work; indeed, new titration methods have been introduced, e.g., cryoscopic, pressuremetric (for reactions that produce a gaseous product), redox methods, and use of a fluoride-sensitive electrode. However, faster and more accurate techniques (collectively called instrumental) have been developed in the last few decades. Among these are infrared, ultraviolet, and x-ray spectroscopy, where the presence and amount of a metallic element is indicated by lines in its emission or absorption spectrum; colorimetry, by which the percentage of a substance in solution, is determined by the intensity of its color; chromatography of various types, by which the components of a liquid or gaseous mixture are determined by passing it through a column of porous material, or on thin layers of finely divided solids; separation of mixtures in ion-exchange columns; and radioactive tracer analysis. Optical and electron microscopy, mass spectrometry, microanalysis, nuclear magnetic resonance (NMR), and nuclear quadrupole resonance (NQR) spectroscopy all fall within the area of analytical chemistry. See also spectroscopy, nuclear magnetic resonance, NQR spectroscopy, chromatography.

anatase (octahedrite). A natural crystallized form of titanium dioxide (q.v.). Sp. gr. 3.8; refractive index 2.5; m.p. 1560°C .

"**Anattene**."³⁴² Trademark for annatto derivatives for use in coloring food-stuffs, i.e., cheeses, oranges.

andalusite Al_2OSiO_4 . A natural silicate of aluminum.

Properties: Gray, greenish, reddish, or bluish in color. Sp. gr. 3.1–3.2; hardness, 7–7.5.

Occurrence: Massachusetts, Connecticut, California, Nevada; Europe; South Africa; Australia.

Use: Constituent of sillimanite refractories; spark plug insulators; laboratory ware; superrefractories.

androgen. A male sex hormone. The androgenic hormones are steroids and are synthesized in the body by the testis, the cortex of the adrenal gland, and, to slight extent, by the ovary.

androsterone. $\text{C}_{19}\text{H}_{30}\text{O}_2$. An androgenic steroid; metabolic product of testosterone (q.v.). The international unit (I.U.) of androgenic activity is defined as 0.1 mg androsterone.

Properties: Crystalline solid; m.p. $185\text{--}185.5^{\circ}\text{C}$; sublimes in high vacuum; dextrorotatory in solution; not precipitated by digitonin; practically insoluble in water; soluble in most organic solvents.

Derivation: Isolation from male urine; synthesis from cholesterol.

Use: Medicine; biochemical research.

anesthetic. A chemical compound that induces loss of sensation in a specific part or all of the body. A brief classification of the more important agents is as follows:

A. General

1. Hydrocarbons

(a) Cyclopropane (U.S.P.). Effective in presence of substantial proportions of oxygen. Flammable.

(b) Ethylene (U.S.P.). Anesthesia quickly induced and recovery rapid. Flammable.

2. Halogenated hydrocarbons

(a) Chloroform. Nonflammable but toxic. Its use is being abandoned because of its high toxicity.

(b) Ethyl chloride. A gas at room temperature; liquefies at relatively low pressure. Applied as a stream from container directly on tissue. Sometimes used in gaseous form as inhalation type general anesthetic. Flammable.

(c) Trichloroethylene. Toxic and flammable. Used as general anesthetic since 1934.

3. Ethers

(a) Ethyl ether (U.S.P.). First anesthetic used in surgery (1842). Now largely replaced with less dangerous types. Highly flammable; explodes in presence of spark or open flame.

(b) Vinyl ether. A liquid having many of the physiological properties of ethylene and ethyl ether. Highly flammable.

4. Miscellaneous

(a) Tribromoethanol. Basal anesthetic, supplemented by an inhalation type when general anesthesia is needed. Ingredient of "Avertin."

(b) Nitrous oxide. Originally prepared by Priestley in 1772 (laughing gas); first used

as anesthetic by Humphry Davy in 1800. Used (with oxygen) largely for dental surgery. Nonflammable

(c) Barbiturates (q.v.).

B. Local

(a) alkaloids (cocaine)

(b) synthetic products (procaine group, e.g., "Novocain," alkyl esters of aromatic acids (topical).

(c) quinine hydrochloride.

anethole (anise camphor; para-methoxypropenylbenzene; para-propenylanisole) $\text{CH}_3\text{CH}:\text{CHC}_6\text{H}_4\text{OCH}_3$. Properties: White crystals with sweet taste; melt at room temperature; odor of oil of anise. Affected by light. Soluble in 8 volumes of 80% alcohol, 1 volume of 90% alcohol. Almost immiscible with water. Sp. gr. 0.983–0.987; refractive index 1.557–1.561; optical rotation 0.08°; m.p. 22–23°C; distillation range 234–237°C.

Derivation: By crystallization from anise or fennel oils; synthetically from para-cresol.

Grades: U.S.P. technical; F.C.C.

Uses: *Perfumes, particularly for dentifrices; flavors; synthesis of anisic aldehyde; licorice candies; color photography (sensitizer in color-bleaching process); microscopy.*

ANFO. A high explosive based on ammonium nitrate. See also explosive, high.

angelic acid (cis-2-methyl-2-butenic acid; alpha-methylcrotonic acid) $\text{CH}_3\text{CH}:\text{C}(\text{CH}_3)\text{COOH}$. The cis isomer of tiglic acid.

Properties: Colorless needles or prismatic crystals; spicy odor. Soluble in alcohol, ether, and hot water. Sp. gr. 0.9539 (76/4°C); m.p. 45°C; b.p. 185°C; refractive index n_D^{20} 1.4434. Low toxicity.

Derivation: From the root of *Angelica archangelica* or from the oil of *Anthemis nobilis* by distillation.

Uses: Medicine; flavoring extracts.

angelica oil.

Properties: Essential oil; strong aromatic odor; spicy taste. Soluble in alcohol. Sp. gr. 0.853–0.918; optical rotation +16° to +41°. Chief known constituents: Phellandrene; valeric acid. Combustible.

Derivation: Distilled from the roots and seeds of *Angelica archangelica*, found principally in Europe.

Grades: Technical; F.C.C.

Uses: Medicine; preparation of liqueurs; perfumery.

"Angio-Conray."³²⁹ Trademark for an 80% solution of sodium iothalamate; used in diagnostic medicine.

angiotensin (angiotonin; hypertensin). A peptide found in the blood, important in its effect on blood pressure. Both a decapeptide and an octapeptide are known. Their amino acid sequences, and hence the complete structures, have been established.

angiotensin amide. USAN name for L-asparaginyl-5-L-valyl angiotensin octapeptide; $\text{C}_{49}\text{H}_{70}\text{N}_{14}\text{O}_{11}$. Described in N.D. Used in medicine.

angiotonin. See angiotensin.

angstrom. A unit of length almost one one-hundred-millionth (10^{-8}) centimeter. The angstrom (abbreviated Å.) is now defined in terms of the wave length of the red line of cadmium (6438.4696 Å.). Used in stating distances between atoms, dimensions of molecules, wavelengths of short-wave radiation, etc. See also nanometer.

anhydride. A chemical compound derived from an acid by elimination of a molecule of water. Thus sulfur

trioxide, SO_3 , is the anhydride of sulfuric acid (H_2SO_4); carbon dioxide, CO_2 , is the anhydride of carbonic acid, H_2CO_3 ; phthalic acid, $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$, minus water gives phthalic anhydride, $\text{C}_6\text{H}_4(\text{CO}_2)\text{O}$. This term should not be confused with anhydrous (q.v.).

anhydrite CaSO_4 . A natural calcium sulfate usually occurring as compact granular masses and resembling marble in appearance. Differs from gypsum in hardness and lack of hydration.

anhydroenneaheptitol (AEH; 4-hydroxy-2H-pyran-3,3,5,5,4(4H,6H)tetramethanol)
 $\text{OCH}_2(\text{CH}_2\text{OH})_2\text{CHOHC}(\text{CH}_2\text{OH})_2\text{CH}_2$.

Uses: Alkyd resins; rosin esters; urethane coatings and foams; surfactants; lubricating oil additives.

"Anhydrol."²¹⁴ Trademark for a gasoline-free solvent composed of 100 gal S.D. ethanol denatured with 10 gal isopropanol (90%) and 1 gal methyl isobutyl ketone.

Properties of anhydrous grade: B.p. 76.2–79.5°C; sp. gr. 0.7895–0.7935 (20/20°C); lb/gal 6.6 (20°C); flash point 54°F.

Grades: Anhydrous to 190 proof.

Containers: 1-gal can; 5- and 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Uses: Solvent in manufacture of printing inks, textile dyestuff solutions, window cleaners, synthetic detergents, aircraft de-icing fluids, and photographic chemicals.

"Anhydron."¹⁰⁰ Trademark for cyclothiazide (q.v.).

anhydrous. Descriptive of an inorganic compound that does not contain water either adsorbed on its surface or combined as water of crystallization. Do not confuse with anhydride (q.v.).

"Anhydrox."⁷³⁶ Trademark for a compound to prevent or overcome anhydrite or gypsum contamination in drilling mud, by pretreatment of the mud to remove calcium and sulfate ions.

anidex. A synthetic fiber designated by the FTC as a cross-linked polyacrylate elastomer.

anileridine (ethyl 1-(para-aminophenethyl)-4-phenylisonipicotate) $\text{C}_{22}\text{H}_{28}\text{N}_2\text{O}_2$.

Properties: White, odorless, crystalline powder. Oxidizes, darkens in air and on exposure to light. Exhibits polymorphism, and of two crystalline forms observed, one melts at about 80°C and the other at about 89°C. Soluble in alcohol and chloroform. Very slightly soluble in water.

Grade: N.F.

Hazard: Toxic by ingestion. Causes addiction.

Use: Medicine (narcotic).

Shipping regulations: Subject to Federal narcotic restrictions.

aniline (aniline oil; phenylamine; aminobenzene)

$\text{C}_6\text{H}_5\text{NH}_2$. One of the most important of the organic bases; the parent substance for many dyes and drugs.

Properties: Colorless oily liquid; characteristic odor and taste; rapidly becomes brown on exposure to air and light. Vapors will contaminate foodstuffs and damage textiles. Soluble in alcohol, ether, and benzene; soluble in water. Sp. gr. 1.0235; m.p. –6.2°C; b.p. 184.4°C; wt/gal (20°C) 8.52 lbs; refractive index n_D^{20} 1.5863; flash point (closed cup) 158°F. Combustible. Autoignition temp. 1418°F.

Derivation: (a) By catalytic vapor-phase reduction of nitrobenzene with hydrogen; (b) Reduction of nitrobenzene with iron filings (hydrochloric acid as catalyst); (c) Catalytic reaction of chlorobenzene and

aqueous ammonia; (d) ammonolysis of phenol (Japan).

Grades: Commercial; C.P.

Containers: Bottles; drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption. An allergen. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Rubber accelerators and antioxidants; dyes and intermediates; photographic chemicals (hydroquinone); isocyanates for urethane foams; pharmaceuticals; explosives; petroleum refining; diphenylamine; phenolics; herbicides, fungicides.

Shipping regulations: (Rail) Poison label. (Air) Poison label. Not acceptable on passenger planes.

aniline acetate $C_6H_5NH_2 \cdot CH_3COOH$.

Properties: Colorless liquid; becomes dark with age; on standing or heating is converted gradually to acetanilide; sp. gr. 1.070–1.072; miscible with water and alcohol. Combustible.

Use: Organic synthesis.

aniline black. A black color developed on cotton and other textiles from a bath containing aniline hydrochloride, an oxidizing agent (usually chromic acid) and a catalyzer (usually a vanadium or copper salt).

aniline chloride. See aniline hydrochloride.

aniline-2,4-disulfonic acid. See 4-amino-meta-benzenedisulfonic acid.

aniline-2,5-disulfonic acid. See 2-amino-para-benzenedisulfonic acid.

aniline dye. Any of a large class of synthetic dyes made from intermediates based upon, or made from, aniline. Most are somewhat toxic and irritating to eyes, skin, and mucous membranes; they are generally much less toxic than the intermediates from which they are derived.

aniline hydrochloride (aniline salt; aniline chloride) $C_6H_5NH_2 \cdot HCl$.

Properties: White crystals; commercial product frequently greenish in appearance; darkens in light and air. Soluble in water, alcohol, and ether. Sp. gr. 1.2215; m.p. 198°C; b.p. 245°C.

Derivation: (a) By passing a current of dry hydrochloric acid gas into an ethereal solution of aniline; (b) neutralizing aniline at 100°C with concentrated hydrochloric acid and subsequent crystallization.

Hazard: Toxic. See aniline.

Uses: Dyes; intermediates; dyeing and printing; aniline black.

Shipping regulations: (Rail) Poisonous solids, n.o.s., Poison label. (Air) Poison label.

aniline ink. A fast-drying printing ink used on kraft paper, cotton fabric, cellophane, polyethylene, etc. The name is due to the fact that original inks for this purpose were solutions of coal-tar dyes in organic solvents. Modern inks usually employ pigments rather than dyes and are of two types: spirit inks, containing organic solvent as the vehicle, and emulsion inks, in which water is the main vehicle.

aniline point. The lowest temperature at which equal volumes of aniline and the test liquid are miscible. Cloudiness occurs on phase separation. Used as a test for components of hydrocarbon fuel mixtures.

aniline salt. See aniline hydrochloride.

para-anilinesulfonic acid. See sulfanilic acid.

aniline yellow. See para-aminoazobenzene.

1-anilino-4-hydroxyanthraquinone

$C_6H_4(CO)_2C_6H_2(OH)NHC_6H_5$ (tricyclic). A chemical intermediate.

Hazard: Probably toxic.

6-anilino-1-naphthol-3-sulfonic acid. See phenyl-2-amino-5-naphthol-7-sulfonic acid.

7-anilino-1-naphthol-3-sulfonic acid. See phenyl-2-amino-8-naphthol-6-sulfonic acid.

anilinophenol. See para-hydroxydiphenylamine.

animal black. See bone black, ivory black.

animal diastase. See amylpsin.

animal oil. See bone oil.

animal starch. See glycogen.

anion. An ion having a negative charge; anions in a liquid subjected to electric potential collect at the positive pole or anode. Examples are hydroxyl, OH^- ; carbonate, CO_3^{--} ; phosphate, PO_4^{--} .

ortho-anisaldehyde (ortho-methoxybenzaldehyde; ortho-anisic aldehyde) $C_6H_4(OCH_3)CHO$.

Properties: White to light tan solid, burned, slightly phenolic odor; b.p. 238°C; m.p. (2 crystalline forms) 38–39°C and 3°C; sp. gr. (liquid) 1.1274 (25/25°C); (solid) 1.258 (25/25°C); refractive index (n_D 20) 1.5608; flash point 244°F; insoluble in water. Soluble in alcohol. Combustible.

Grade: 95% (min.).

Use: Intermediate.

para-anisaldehyde (aubepine; para-anisic aldehyde; para-methoxybenzaldehyde) $C_6H_4(OCH_3)CHO$.

Properties: Colorless to pale yellow liquid, having odor of hawthorn. Insoluble in water. Soluble in 5 volumes of 50% alcohol. Sp. gr. 1.119–1.122; refractive index 1.570–1.572; m.p. 0°C; b.p. 248°C. Combustible.

Derivation: Obtained from anethole or anisole by oxidation.

Grades: Liquid and crystals, latter being the disulfite compound.

Uses: Perfumery; intermediate for antihistamines; electroplating; flavoring.

anise alcohol. See anisic alcohol.

anise camphor. See anethole.

anise oil (anise seed oil; aniseed oil). See anethole.

anisic acid (papr-methoxybenzoic acid)

$CH_3OC_6H_4COOH$.

Properties: White crystals or powder; sp. gr. 1.385 (4°C); m.p. 184°C; b.p. 275–280°C; soluble in alcohol and ether; almost insoluble in water. Low toxicity.

Derivation: Oxidation of anethole.

Use: Medicine; repellent and ovicide.

anisic alcohol (anisyl alcohol; anise alcohol; paramethoxybenzyl alcohol) $CH_3OC_6H_4CH_2OH$.

Properties: Solidifies at room temperature; has a floral odor suggesting hawthorn. Soluble in 1 volume of 50% alcohol. Sp. gr. 1.111–1.114; refractive index 1.541–1.545; boiling range 255–265°C. Combustible.

Derivation: Obtained from anisic aldehyde, by reduction.

Grades: Technical; F.C.C.

Uses: In perfumery, for light floral odors; pharmaceutical intermediate; flavoring.

anisic aldehyde. See anisaldehyde.

ortho-anisidine (ortho-methoxyaniline; ortho-amino-anisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{NH}_2$.

Properties: Reddish or yellowish colored oil, becomes brownish on exposure to air; volatile with steam; sp. gr. 1.097 (20°C); b.p. 225°C; f.p. 5°C; soluble in dilute mineral acid, alcohol, and ether; slightly soluble in water.

Derivation: (a) Reduction of ortho-nitroanisole with tin (or iron) and hydrochloric acid; (b) heating ortho-aminophenol with potassium methyl sulfate.

Method of purification: Steam distillation.

Grades: 99% (1% maximum moisture).

Containers: 55-, 110-gal drums; tank cars.

Hazard: Toxic by inhalation. Absorbed by skin; strong irritant. Tolerance, 0.5 mg per cubic meter of air.

Use: Intermediate for azo dyes and for guaiacol.

para-anisidine (para-methoxyaniline; para-amino-anisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{NH}_2$.

Properties: Fused, crystalline mass; crystallizing point 57.2°C min; sp. gr. 1.089 (55/55°C); b.p. 242°C; soluble in alcohol, and ether; slightly soluble in water.

Derivation: (a) Reduction of para-nitroanisole with iron filings and hydrochloric acid; (b) methylation of para-aminophenol.

Grades: Technical.

Containers: 500-, 800-lb drums.

Hazard: Toxic by inhalation. Absorbed by skin; strong irritant. Tolerance, 0.5 mg per cubic meter of air.

Uses: Azo dyestuffs, intermediate.

anisindione (2-para-anisyl-1,3-indandione) $\text{C}_{16}\text{H}_{12}\text{O}_3$.

Properties: Pale yellow crystals; m.p. 156–157°C.

Grade: N.D.

Use: Medicine.

anisole (methylphenyl ether; methoxybenzene) $\text{C}_6\text{H}_5\text{OCH}_3$.

Properties: Colorless liquid; aromatic odor; soluble in alcohol and ether; insoluble in water. Sp. gr. 0.999 (15/15°C); f.p. -37.8°C; b.p. 155°C; refractive index (n_D 20/D) 1.5150–1.5170; flash point 125°F (open cup). Combustible.

Derivation: From sodium phenate and methyl chloride; heating phenol with methyl alcohol.

Uses: Solvent; perfumery; vermicide; intermediate; flavoring.

anisotropic. Descriptive of crystals whose index of refraction varies with the direction of the incident light. This is true of most crystals, e.g., calcite (Iceland spar); it is not true of isometric (cubic) crystals, which are isotropic (q.v.).

anisoyl chloride $\text{CH}_3\text{OC}_6\text{H}_4\text{COCl}$.

Properties: Clear crystals or amber liquid. M.p. 22°C; b.p. 262–263°C. Soluble in acetone and benzene; decomposed by water or alcohol. Fumes in moist air. Containers: Drums.

Uses: Intermediate for dyes and medicines.

Hazard: Toxic; solutions are corrosive to tissue.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

anisyl acetate (para-methoxybenzyl acetate) $\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{COCH}_3$.

Properties: Colorless liquid, lilac-odor. Soluble in 4 vols. of 60% alcohol. Sp. gr. 1.104–1.107; refractive index 1.514–1.516. Combustible.

Derivation: Reaction of anisic alcohol with acetic anhydride.

Grades: Technical; F.C.C.

Use: Perfumery; flavoring.

anisylacetone. Generic name for 4-(para-methoxyphenyl)-2-butanone, $\text{CH}_3\text{OC}_6\text{H}_4\text{C}_2\text{H}_4\text{COCH}_3$. A colorless to pale yellow liquid; m.p. 8°C. Used in insect attractants; organic synthesis; flavoring. Combustible.

anisyl alcohol. See anisic alcohol.

anisyl formate (para-methoxybenzyl formate) $\text{CH}_3\text{OC}_6\text{H}_4\text{CH}_2\text{OCOH}$.

Properties: Colorless liquid, lilac odor. Soluble in 5.5 vols. of 70% alcohol. Sp. gr. 1.139–1.141. Combustible.

Uses: Perfumery; flavoring.

2-para-anisyl-1,3-indandione. See anisindione.

annatto. Vegetable dyestuff containing coloring principle called bixin, $\text{C}_{25}\text{H}_{30}\text{O}_4$, the mono-methyl ester of a dibasic acid having 24 carbons.

Properties: Soluble in alcohol and water.

Derivation: From the seeds of Bixa orellana.

Occurrence: South America; West Indies; India.

Uses (as extract): Coloring margarine, sausage casings, etc., food-product marking inks. For details see regulations of Meat Inspection Division, USDA, and FDA regulations.

annealing. Maintenance of glass or metal at a specified temperature for a specific length of time (at least three days for plate glass), and then gradually cooling it at a predetermined rate. This treatment removes the internal strains resulting from previous operations, and eliminates distortions and imperfections; a clearer, stronger and more uniform material results. See also tempering.

annellation. A chemical reaction in which one cyclic or ring structure is added to another to form a polycyclic compound.

"Ano."³⁰⁷ Trademark for a series of dyestuffs used for coloring anodized aluminum. See anodic coating.

anode. The positive electrode of an electrolytic cell, to which negatively charged ions travel when an electric current is passed through the cell. Such anodes are usually made of graphite or other form of carbon, though titanium has been successfully introduced in the chlor-alkali industry. In a primary cell (battery or fuel cell) the anode is the negative electrode. See also cathode; electrode.

anode mud. Residue obtained from the bottom of a copper or other plating bath. In the electrolytic refining of copper the anode mud contains the relatively inert metals platinum, silver and gold and is usually collected and treated for the recovery of these metals and other rare elements.

anode process. See electrophoresis.

anodic (anodized) coating. The electrolytic treatment of aluminum, magnesium, and a few other metals as a result of which heavy, stable films of oxides are formed on their surfaces. A thin oxide film will form on an aluminum surface without special treatment on exposure of the metal to air. This provides excellent resistance to corrosion. This fact led to the development of electrochemical processes to produce much thicker and more effective protective and decorative coatings. The chief electrolytes used are sulfuric, oxalic and chromic acids. The metal acts as the anode. Such anodic coatings are hard and have good electrical insulating properties. Their ability to absorb dyes and pigments makes it possible to obtain finishes in a complete range of colors, includ-

ing black. The luster of the underlying metal gives them a metallic sheen; colorants can be used to reproduce the color of any metal with which the aluminum might be used. Anodized coatings can be used as preparatory treatments to electroplating; copper, nickel, cadmium, silver and iron have been successfully deposited over oxide coatings. See also aluminum.

anomer. A specific kind of diastereoisomer (or epimer) occurring in some sugars and other substances having asymmetric carbon atoms.

"Anoplex."⁷⁸⁵ Trademark for the sodium bisulfite complex of anisaldehyde $[\text{C}_6\text{H}_4(\text{OCH}_3)\text{HC}(\text{OH})\text{SO}_3\text{Na}]$.

Properties: Dry, white powder; slightly soluble in water.

Containers: 100-lb fiber drums.

Uses: Compounding of brighteners requiring a uniform dry solid bisulfite complex for electroplating.

ANPO. Abbreviation for alpha-naphthylphenyloxazole (q.v.).

"Ansar."⁵⁴⁸ Trademark for a series of herbicides.

"AnSCO Preventol."³⁰⁷ Trademark for a series of fungicides and bactericides.

"Ansol" Solvent.¹⁹² Trademark for ethyl alcohol, with high ester and hydrocarbon content designed to increase solvency. Used in resin-solvent systems.

Containers: Up to tank cars and trucks.

Hazard: Flammable, dangerous fire risk.

"Anstac-2M."²³⁸ Trademark for an antistatic and cleaning agent for plastics, such as methyl methacrylates, vinyls, and polystyrenes.

Containers: 1-qt bottles; 1-, 5-gal drums.

Uses: In aircraft, sign, novelty, electrical, photographic, optical, and other industries.

antacid. Any mildly alkaline substance, such as sodium bicarbonate, taken internally in water solution to neutralize excess stomach acidity.

antagonist, structural (antimetabolite). An organic compound that is structurally related to a biologically active substance (enzyme, nucleic acid, amino acid, etc.) and which acts as an inhibitor of its growth and development. Such biological antagonism exists between sulfa drugs and *p*-aminobenzoic acids, and also between histamine and a group of compounds collectively called antihistamines (q.v.). One of the most important of these from an agricultural standpoint is imidazole (q.v.) which, together with similar compounds, is used to "antagonize" the metabolism of insects, especially those attacking fabrics; it is also being used in irrigation waters to protect plants from deleterious pests. Structural antagonists have important medical applications in the complex field of allergic disease. See also chemotherapy; antigen-antibody.

"Antara."³⁰⁷ Trademark for a series of high-molecular-weight organic phosphate esters offering lubricity, corrosion inhibition, and surface-active properties in oil- or water-based systems including automotive engine oils, hydraulic fluids, cutting oils, and automatic transmission fluids. Available as free acids and neutralized salts.

"Antaron FC-34."³⁰⁷ Trademark for a high foaming, water soluble, amphoteric surfactant with soap-like

qualities; a complex fatty amido compound; 40% active.

Uses: Fulling agent and detergent for woolen and worsted fabrics, effective under neutral, acid and alkaline conditions; recommended for use in bubble baths, detergents; in soaps for dedusting purposes.

"Antarox."³⁰⁷ Trademark for a series of surfactants. Uses: Viscose spin bath additive, preventing accumulation of sludge in pipe lines, reels, etc.; prevents clogging of spinnerets; in manufacture of cellophane, prevents deposits from forming on extrusion slits and rollers; in the steel industry, to obtain cleaner sheets in the final wash of the reduced sheet during cold reduction.

antazoline $\text{C}_{17}\text{H}_{19}\text{N}_3$.

Properties: White, odorless crystalline powder with bitter taste. M.p. 237–241° (dec). Sparingly soluble in alcohol and water; practically insoluble in benzene and ether.

Use: Medicine (antihistamine). Available as hydrochloride and phosphate.

anteiso-. Prefix denoting an isomer (usually a fatty acid or derivative) which has a single, simple branching attached at the third carbon from the end of a straight chain, in distinction to an iso- compound, where the attachment is to the second carbon from the end. For example, isododecanoic acid would be $\text{CH}_3\text{CH}(\text{CH}_3)(\text{CH}_2)_8\text{COOH}$, while anteisododecanoic acid would be $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)(\text{CH}_2)_7\text{COOH}$.

"Antepar."³⁰¹ Trademark for anhydrous piperazine citrate.

anthelmecin. USAN name for an antibiotic substance produced by *Streptomyces longissimus*.

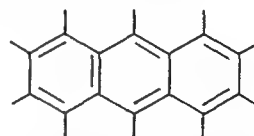

anthocyanin. A flavonoid plant pigment which accounts for most of the red, pink, and blue colors in plants, fruits and flowers. Water-soluble. See also flavonoid.

"Anthomine."³⁰⁰ Trademark for a dying assistant primarily for use in wool dyeing.

anthophyllite $(\text{Mg}, \text{Fe})_7\text{Si}_8\text{O}_{22}(\text{OH})_2$. A natural magnesium-iron silicate. See asbestos.

anthracene $\text{C}_6\text{H}_4(\text{CH})_2\text{C}_6\text{H}_4$.

Properties: Yellow crystals with blue fluorescence. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.25 (27/4°C); m.p. 217°C; b.p. 340°C; flash point 250°F (closed cup). Combustible. It has semi-conducting properties.

Derivation: (a) By salting out from crude anthracene oil, and draining. The crude salts are purified by pressing and finally, by the use of various solvents, phenanthrene and carbazole are removed; (b) by distilling crude anthracene oil with alkali carbonate in iron retorts, the distillate containing only anthracene and phenanthrene. The latter is removed by carbon disulfide.

Method of purification: By sublimation with superheated steam, or by crystallization from benzene followed by sublimation; for very pure crystals, by zone melting of solid anthracene.

Impurities: Phenanthrene, carbazole and chrysene.

Grades: Commercial (90 to 95%); pure crystals.

Hazard: Carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Uses: Dyes; alizarin; phenanthrene; carbazole; anthraquinone; calico printing; as component of smoke screens; as scintillation counter crystals; organic semiconductor research.

anthracene oil. A coal-tar fraction boiling in the range 270–360°C; a source of anthracene and similar aromatics. Also used as a wood preservative, and pesticide, except on food crops.

1,8,9-anthracenetriol. See anthralin.

anthracite. See coal.

anthragallic acid. See anthragallol.

anthragallol (1,2,3-trihydroxyanthraquinone; anthragallic acid) $C_6H_4(CO)_2C_6H(OH)_3$. Tricyclic.

Properties: Brown powder. Soluble in alcohol, ether, glacial acetic acid; slightly soluble in water and chloroform. Sublimes at 290°C.

Derivation: Product of the reaction of benzoic, gallic, and sulfuric acids.

Use: Dyeing.

"Anthragen."³⁰⁷ Trademark for a series of lake colors. Used for printing inks, wallpaper, coated paper, paint, rubber, and organic plastics.

"Anthralan."³⁰⁷ Trademark for a series of acid dyestuffs. Used on wool.

anthralin (1,8,9-anthracenetriol; 1,8-dihydroxyanthranol) $C_{14}H_{10}O_3$.

Properties: Odorless, tasteless, yellow powder. M.p. 176–181°C. Filtrate from water suspension is neutral to litmus. Soluble in chloroform, acetone, benzene, and in solutions of alkali hydroxide; slightly soluble in alcohol, ether, and glacial acetic acid; insoluble in water. Combustible.

Derivation: By catalytic reduction of 1,8-dihydroxyanthraquinone with hydrogen at high pressure.

Grade: N.F. (95%).

Hazard: Moderately toxic by ingestion, inhalation and skin absorption. Do not use on scalp or near eyes.

Use: Medicine (treatment of psoriasis).

anthranilic acid (ortho-aminobenzoic acid) $C_6H_4(NH_2)(CO_2H)$.

Properties: Yellowish crystals; sweetish taste; soluble in hot water, alcohol, and ether. M.p. 144–146°C. Combustible. Sublimes.

Derivation: Treatment of phthalimide with an alkaline hypobromite solution.

Grades: Technical (95–98%); 99% or better.

Hazard: May be toxic by ingestion.

Uses: Dyes, drugs, perfumes and pharmaceuticals.

anthranol (9-hydroxyanthracene) $C_{14}H_9OH$.

Properties: Crystals, m.p. 120°C; soluble in organic solvents with a blue fluorescence. Changes in solution to anthrone. Combustible.

Use: Dyes.

anthranone. See anthrone.

"Anthrapole."³⁰⁰ Trademark for a group of dye carriers or assistants, for use in dyeing polyester fibers and blends. Active ingredients are aromatic esters, chlorinated hydrocarbons and phenol derivatives. Emulsifying agents are incorporated.

anthrapurpurin (1,2,7-trihydroxyanthraquinone; isopurpurin; purpurin red) $C_{14}H_3OH(CO)_2C_6H_2(OH)_2$. Tricyclic.

Properties: Orange-yellow, crystalline needles. Soluble in alcohol and alkalies; slightly soluble in ether and hot water. M.p. 369°C; b.p. 462°C. Probably low toxicity.

Derivation: By fusion of anthraquinonedisulfonic acid with caustic soda and potassium chlorate; the melt is run into hot water and the anthrapurpurin precipitated by hydrochloric acid.

Uses: Dyeing; organic synthesis.

anthraquinone $C_6H_4(CO)_2C_6H_4$.

Properties: Yellow needles. Soluble in alcohol, ether, and acetone; insoluble in water. Sp. gr. 1.419–1.438; m.p. 286°C; b.p. 379–381°C; flash point (closed cup) 365°F. Combustible. Low toxicity.

Derivation: (a) By heating phthalic anhydride and benzene in the presence of aluminum chloride and dehydrating the product; (b) by condensation of 1,4-naphthoquinone with butadiene.

Method of purification: Sublimation.

Grades: Sublimed; 30% paste (sold on 100% basis); electrical 99.5%.

Containers: Bags; drums.

Uses: Intermediate for dyes and organics; organic inhibitor; bird repellent for seeds.

See also anthraquinone dye.

anthraquinone-1,5- and 1,8-disulfonic acids (rho acid, chi acid respectively) $C_{14}H_8O_6S_2$.

Properties: In their pure state, slightly yellow to white crystals. The technical grade is grayish-white. Soluble in water and strong sulfuric acid. The 1,8-isomer is the more soluble. The 1,5-disulfonic acid melts with decomposition at 310–311°C. The 1,8-isomer melts with decomposition at 293–294°C. Probably low toxicity.

Derivation: Anthraquinone is sulfonated with fuming sulfuric acid in the presence of mercury or mercuric oxide to a mixture of the 1,5- and 1,8-disulfonic acids which are separated by fractional crystallization.

Method of purification: Fractional crystallization from strong sulfuric acid or in form of their alkali salts from either acid or alkaline solutions.

Grades: Technical.

Use: Dyes.

anthraquinone dye. A dye whose molecular structure is based on anthraquinone ($C_6H_4(CO)_2C_6H_4$). The chromophore groups are $>C=O$ and $>C=C<$; the benzene ring structure is important in the development of color. C.I. numbers from 58000 to 72999. These are acid or mordant dyes when OH or HSO_3 groups respectively are present. Those anthraquinone dyes that can be reduced to an alkaline soluble leuco (vat) derivative that has affinity for fibers, and which can be reoxidized to the dye, are known as anthraquinone vat dyes. They are largely used on cotton, rayon, and silk, and have excellent properties of color and fastness, and relatively low toxicity.

anthrarufin. See 1,5-dihydroxyanthraquinone.

anthrone (anthranone; 9,10-dihydro-9-oxoanthracene) $C_{14}H_{10}O$. The keto, more stable form of anthranol.

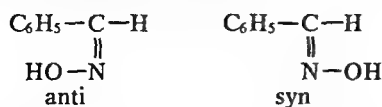

Properties: Colorless needles; m.p. 156°C; insoluble in water; soluble in alcohol, benzene, and hot sodium hydroxide.

Derivation: Reduction of anthraquinone with tin and hydrochloric acid.

Use: Rapid determination of sugar in body fluids, and of animal starch in liver tissue; general reagent for carbohydrates; organic synthesis.

anti- (1) A prefix used in designating geometrical isomers in which there is a double bond between the

carbon and nitrogen atoms. This prevents free rotation so that two different spatial arrangements of substituent atoms or groups are possible. When a given pair of these are on opposite sides of the double bond, the arrangement is called *anti*-; when they are on the same side it is called *syn*-, as indicated below:

These prefixes are disregarded in alphabetizing chemical names.

(2) A prefix meaning "against" or "opposed to," as in antibody, antimalarial, etc.

antianxiety agent. See psychotropic drug.

antibiotic. A chemical substance produced by microorganisms that has the capacity, in dilute solutions, to inhibit the growth of other microorganisms or destroy them. Only about 20 out of several hundred known have proved generally useful in therapy; those that are used must conform to FDA requirements. The most important groups of antibiotic-producing organisms are the bacteria, lower fungi or molds, and actinomycetes. These antibiotics belong to very diverse classes of chemical compounds. Most of the antibiotics produced by bacteria are polypeptides (such as tyrothricin, bacitracin, polymyxin). The penicillins are the only important antibiotics produced by fungi. Actinomycetes produce a wide variety of compounds (actinomycin, streptomycin, chloramphenicol, tetracycline). The antimicrobial activity (antibiotic spectrum) of antibiotics varies greatly; some are active only upon bacteria, others upon fungi, still others upon bacteria and fungi; some are active on viruses, some on protozoa, and some are also active on neoplasms. An organism sensitive to an antibiotic may, upon continued contact with it, develop resistance and yet remain sensitive to other antibiotics. *Note:* A number of antibiotics have been restricted by FDA, both for direct use by humans and as additives to animal feeds. Among those that are in question are streptomycin, chloramphenicol, tetracycline and some forms of penicillin.

See also penicillin; cephalosporin.

antibody. See antigen-antibody.

antiblock agent. A substance, e.g., a finely divided solid of mineral nature, which is added to a plastic mix to prevent adhesion of the surfaces of films made from the plastic to each other or to other surfaces. They are of particular value in polyolefin and vinyl films. The hard, infusible particles tend to roughen the surface and thus maintain a small air space between adjacent layers of the film, thus preventing adhesion. Silicate minerals are widely used for this purpose. Another type of antiblock function is performed by high-melting waxes, which bloom to the surface and form a layer that is harder than the plastic.

anticaking agent. An additive used primarily in certain finely divided food products that tend to be hygroscopic to prevent or inhibit agglomeration and thus maintain a free-flowing condition. Such substances as starch, calcium metasilicate, magnesium carbonate, and magnesium stearate are used for this purpose in table salt, flours, sugar, coffee, whiteners, and similar products.

anticancer agent. Any of several antibiotic drugs reported to be effective in treatment of various types of cancer. One of these is adriamycin, produced by fermentation of a mold fungus; approved for clinical research by FDA, it is said to be effective against leukemia, breast cancer and bladder cancer; it has deleterious side effects involving the heart. Other such agents are daunorubicin and carminomycin.

anticholinesterase. See cholinesterase inhibitor; nerve gas; insecticide.

antichlor. Any product which serves to neutralize and remove hypochlorite or free chlorine after the bleaching operation. For many years the term was considered synonymous with sodium thiosulfate, but it may equally be applied to sodium disulfite or any other product used for the purpose.

anticoagulant. A complex organic compound, often a carbohydrate, that has the property of retarding the clotting or coagulation of blood. The most effective of these is heparin (q.v.), which acts by interfering with the conversion of prothrombin to thrombin and by inhibiting the formation of thromboplastin. In addition to their specific clinical uses, anticoagulants have been applied with limited success to rodenticides (see warfarin). They are regarded as cumulative poisons, requiring multiple ingestions to be lethal. One type (diaphenadione) has been found to reduce blood cholesterol in experimental animals.

antidepressant. See psychotropic drug.

antidote. Any substance that inhibits or counteracts the effects of a poison which has entered the body by any route. Mild acids or alkalies (except sodium bicarbonate) exert neutralizing action if corrosive materials have been swallowed; for noncorrosive poisons warm salt water or milk may be given to cause vomiting. Activated charcoal in water is effective in protecting the throat and stomach linings, except for corrosive poisons. Nothing should be administered by mouth if the subject is unconscious. Artificial respiration may be necessary. In no case should alcohol be used as an antidote. Atropine is known to be an antidote for poisoning by cholinesterase inhibitors.

antiemetic agent. A compound, usually classed as a pharmaceutical, that inhibits or prevents nausea. A well-known type is dimenhydrinate ("Dramamine") which is useful to counteract motion sickness, nausea due to pregnancy, etc. A more recent antiemetic is a benzoquinoline derivative used for nausea resulting from anesthesia ("Emete-con."²⁹⁹)

antienzyme. A substance present in the substrate which restricts or negates the catalytic activity of the enzyme on that substrate.

antifertility agent. A synthetic steroid sex hormone of the type normally produced by the body during pregnancy. Said to act by simulating the conditions of pregnancy and thus suppressing ovulation, which automatically prevents conception. The hormones used are basically of two kinds: (1) progestin (synthetic progesterone) and (2) synthetic estrogen. There are also several other derivatives, all of which are much stronger than natural progesterone and estrogen when taken orally. The chemical modifications are necessary for oral potency.

Injectable contraceptives that remain effective over much longer periods than the oral type are also avail-

able. The active ingredient is medoxyprogesterone acetate. Experimental work is also being done with N,N'-octaethylenediamine bis(dichloroacetamide) ("Fertilysin"). An estrogen-free type is available in England (chloromadinone acetate); it is said to be less effective, but with less tendency to blood clotting, than estrogenic types.

Hazard: FDA requires that oral contraceptives carry a label warning of the tendency of these agents to form blood clots. There is also a possibility that they have other adverse side effects.

Note: Proteins and peptides which act as enzyme inhibitors have been identified in the semen of some mammals.

"**Antifoam A.**"¹⁴⁹ Trademark for a silicone defoamer used to prevent or suppress foams in a wide variety of aqueous and nonaqueous systems. Generally effective at concentrations in the range of 1 to 200 ppm. Permissible in food processing up to 10 parts per million. Also available as a water-dilutable emulsion.

"**Antifoam 3, 5, 7, 9, 44, 60, 66.**"²⁴⁵ Trademark for silicone emulsions and fluids designed for the prevention or suppression of foam in aqueous and nonaqueous systems. Antifoams 3 and 44 used in food-grade applications.

"**Antifoam C-1 and HP.**"¹⁰⁸ C-1 is a light-colored water-soluble liquid; HP a dry, powdered, water dispersible blend containing organic dispersing agents and sodium sulfite.

Uses: Foaming and carryover control in steam boilers. Improves steam purity; disperses sludge; minimizes blowdown.

antifoam agent. See defoaming agent.

antifouling paint. An organic coating formulated especially for use on the hulls and bottoms of ships, boats, buoys, pilings, and the like, to protect them from attack by barnacles, teredos, and other marine organisms. The chief specific ingredient is a metallic naphthenate, e.g., copper naphthenate; mercury compounds are also used.

antifreeze. (1) Water additive. Any compound that lowers the freezing point of water. Both sodium chloride and magnesium chloride were once used, but their extreme corrosive properties made them a liability in automotive cooling systems. Methyl alcohol requires only 27% by volume for protection to 0°F. Due to its tendency to evaporate rapidly at operating temperatures, its flammability and low boiling point (147°F), it has been replaced by glycol derivatives, which are relatively noncorrosive, nonflammable, have very low evaporation rate, and are effective heat-exchange agents. A concentration of about 35% protects against freezing to 0°F. Ethylene and propylene glycol antifreezes can be carried in an automotive cooling system for several years without damage, and are satisfactory coolants at summer operating temperatures. Methoxy propanol has been introduced as an antifreeze-coolant for diesel engines. See also coolant.

(2) Gasoline additive. A proprietary preparation trademarked "Drygas."⁵⁸⁰ consisting of methyl alcohol, isopropyl alcohol, or mixtures of these, which lower the freezing point of water enough to inhibit ice formation in feed lines and carburetors. It is added directly to the gasoline. It is highly toxic and flammable.

"**Anti-Fume S Solution.**"²⁸ Trademark for a durable protective agent for inhibiting and fading of dyed acetate by atmospheric gases.

antigen-antibody. An antibody is a blood serum protein of the globulin fraction, which is formed in response to introduction of an antigen. It has a molecular weight of about 160,000. An antigen is an infective organism (protein) with molecular weight of at least 10,000; it is able to induce formation of an antibody in an organism into which it is introduced (by injection). Thus an animal is able to resist infections to which it has previously been exposed. The entire science of immunology is due to antigen-antibody reactions, the most outstanding feature of which is their specificity.

The antibodies produced in the bloodstream can react only with the homologous antigen, or with those of a similar molecular structure. As a result, the animal can destroy a particular virus or bacterium and become immune. The specificity of antigens is due not so much to the molecules as a whole as to its configuration; certain radicals (polar and quaternary ammonium groups) seem to "mate" with corresponding complementary structures in the antibody molecule. A precipitate or agglutinate (q.v.) is formed by the reaction, which is analogous to colloidal (catalytic) reactions in some respects, e.g., surface configuration. See also allergen; immunochemistry; antagonist, structural.

"**Anti-Germ 500.**"²⁹⁹ Trademark for a highly concentrated and potent disinfectant, sanitizer and deodorizer with residual bacteriostatic action. Effective against a broad range of bacteria and fungi. Contains two quaternary ammonium compounds and isopropyl alcohol.

antiglobulin. An agent used to coagulate globulin.

antihistamine. A synthetic substance structurally analogous to histamine whose presence in minute amounts prevents or counteracts the action of excess histamine formed in body tissues. These compounds are usually complex amines of various types, and also have other physiological effects and medical uses. Examples are, chlorpheniramine maleate, dimenhydrinate, diphenhydramine hydrochloride, imidazole, pheniramine maleate, pyrilamine maleate, thonzylamine hydrochloride, tripeleennamine hydrochloride. See also antagonist, structural.

antihypertensive agent. An organic compound having the property of lowering blood pressure in animals and man; among the better-known types are the alkaloid reserpine and its derivative, syrosingopine; guanethidine sulfate; alpha-methyl dopa (α -methyl-3,4-dihydroxyphenylalanine); and hydralazine. They function by various nerve-blocking mechanisms involving structural antagonism. They should be taken only by prescription.

antiknock agent. Any of a number of organometallic compounds, most important of which are lead alkyls, that increase the octane number of a gasoline when added in low percentages by reducing knock, especially in high-compression engines. Knock is caused by spontaneous oxidation reactions in the cylinder head, resulting in loss of power and characteristic ignition noise. Branched-chain hydrocarbon gasolines ameliorate this problem, and antiknock additives virtually eliminate it. Tetraethyllead, the most effective of these, has been used for many years, but its contribution to air pollution has necessitated considerable reduction of its use in automotive fuels. Lead-free gasolines (which contain only 0.05 gram per gallon) are available for use in engines equipped with catalytic converters. A rare-earth compound (beta-diketoenolate)

is claimed to have substantial antiknock properties; cerium compounds are also being researched.

antilymphocytic serum (ALS). An immunological suppressant for use in organ transplants. It acts to control the build-up of rejection factors in the blood which result from introduction of foreign organs into the body. See also immunochemistry.

"Antilac."¹⁶⁵ Trademark for liquid antimony lactate containing 15% available antimony oxide. Recommended as a replacement for technical tartar emetic. See "Mordantine."

antimalarial agent. A natural or synthetic drug of the alkaloid type that is specific to combating malaria, a disease of the tropics. Most of the synthetic types are derivatives of 8-aminoquinoline (nitrogen-containing heterocyclic compounds) developed by research teams before and during the Second World War. Quinine (q.v.) has been the standard natural antimalarial drug for centuries. The first synthetic was pamaquin (1926), but it proved too toxic for more than limited use. Mepacrin ("Atabrin") was developed in 1932; it was used in the war and was found more effective than quinine, though it discolored the skin. Chloroquine (q.v.) and pentaquine followed, the former being preferable to mepacrin with no skin discoloration. A more recently discovered non-heterocyclic called proguanil (1945) has the advantages of lower cost and toxicity than other antimalarials. See also chemotherapy.

antimatter. See antiparticle.

antimetabolite. See antagonist, structural; antihistamine.

antimonial lead alloy (hard lead). Lead containing from about 6 to 28% antimony. Common grades are as follows: (a) 15% antimony; resistant to sulfuric acid; used in type metal; (b) national stock pile specification, 10.7–11.3% antimony; (c) battery grids; 5–11% antimony; (d) battery terminals; 4% antimony; (e) cable sheaths; 1% antimony.

antimonic. The variation of the name antimony used for compounds in which the antimony has a valence of five, as antimony pentachloride, pentasulfide, etc.

antimonic acid. See antimony pentoxide.

antimonic anhydride. See antimony pentoxide.

antimonite. See stibnite.

antimonous (antimonious). The variation of the name antimony used for compounds in which the antimony has a valence of three, as in antimony tribromide, antimony trichloride, antimony trioxide, antimony trisulfide.

antimonous sulfide. See antimony trisulfide.

antimony Sb (from Latin stibium). Element of atomic number 51; Group VA of the Periodic Table. 2 stable isotopes.

Properties: Atomic weight 121.75; valences 3, 4, and 5; silver-white solid; m.p. 630.5°C; b.p. 1635°C; low thermal conductivity; Mohs hardness 3 to 3.5. Oxidized by nitric acid; unattacked by HCl in absence of air; reacts with H₂SO₄. Nontoxic as solid. Combustible. A semiconductor.

Forms: Besides the stable metal there are two allotropes—yellow crystalline and amorphous black modifications.

Ores: Stibnite, kermasite, tetrahedrite, livingstonite, jamisonite.

Occurrence: Algeria, Bolivia, China, Mexico, South Africa, Peru, Yugoslavia.

Derivation: Reduction of stibnite with iron scrap; direct reduction of natural oxide ores. About half the antimony used in U.S. is recovered from lead-base battery scrap metal.

Grades: Up to 99.999% pure; technical; powder; commercial grade in 55-lb cases 10 × 10 × 2½".

Containers: 224-lb cases.

Hazard: Toxic as fume. Tolerance (as Sb) 0.5 mg per cubic meter of air. Use with adequate ventilation.

Uses: Hardening alloy for lead, especially storage batteries and cable sheaths; bearing metal; type metal; solder; collapsible tubes and foil; sheet and pipe; semiconductor technology (99.999% grade); pyrotechnics.

antimony 124. Radioactive antimony isotope.

Properties: Half-life, 60 days; radiation, beta and gamma. The chemical form used is often antimony trichloride and oxychloride in hydrochloric acid solution.

Uses: As a tracer (q.v.) especially in solid state studies, and marker of interfaces between products in pipe lines; the gamma ray has sufficient energy to eject neutrons from beryllium. Convenient portable neutron sources, which may be reactivated in a nuclear reactor, are made by irradiation of an antimony pellet encased in a beryllium shell.

Hazard: Toxic; radioactive material.

Shipping regulations: (Rail, Air) Consult regulations.

antimony 125. Radioactive antimony isotope. Half-life 2.4 years; emits beta and gamma rays.

Hazard: Radioactive poison.

Shipping regulations: (Rail, Air) Consult regulations.

antimony black. Metallic antimony in the form of a fine powder produced by electrolysis or chemical action on an antimony salt solution. See also antimony trisulfide.

antimony bromide. See antimony tribromide.

antimony, caustic. See antimony trichloride.

antimony chloride. See antimony trichloride.

antimony chloride, basic. See antimony oxychloride.

antimony fluoride. See antimony trifluoride.

antimony hydride (stibine) SbH₃.

Properties: Colorless gas; m.p. -88°C; b.p. -17°C.

Derivation: Action of HCl on antimony/metal compounds such as Zn₃Sb₂; also released by reduction of antimony compounds in HCl solutions with zinc or other reducing metal.

Hazard: Toxic. Tolerance, 0.1 ppm in air; 0.5 mg per cubic meter of air (as Sb).

antimony iodide. See antimony triiodide.

antimonyl. The radical or group SbO, which occurs commonly in formulas of antimony compounds. Thus, SbOCl is often named antimonyl chloride, and numerous other antimony compounds are sometimes named in a similar manner.

antimony lactate Sb(C₃H₅O₃)₃.

Properties: Tan-colored mass. Solution in water.

Grades: Technical.

Containers: 500-lb barrels.

Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Mordant in fabric dyeing.

antimony oxide. See antimony trioxide.

antimony oxychloride (antimony chloride, basic; antimonyl chloride) SbOCl .

Properties: White powder; m.p. 170°C (decomposes); soluble in hydrochloric acid and alkali tartrate solutions; insoluble in alcohol, ether, and water.

Derivation: Interaction of water and antimony chloride.

Hazard: Toxic. Tolerance (as Sb) 0.5 mg per cubic meter of air.

Uses: Antimony salts; flameproofing textiles.

antimony pentachloride (antimony perchloride) SbCl_5 .

Properties: Reddish-yellow, oily liquid. Offensive odor. Hygroscopic. Solidifies by absorption of moisture.

Decomposed by excess water into hydrochloric acid and antimony pentoxide. Soluble in an aqueous solution of tartaric acid, in hydrochloric acid, and chloroform. M.p. 2.8°C ; sp. gr. 2.34; b.p. 92°C (30 mm).

Derivation: Action of chlorine on antimony powder.

Containers: Drums.

Hazard: Toxic and corrosive. Fumes in moist air and reacts strongly with organic materials. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Analysis (testing for alkaloids and cesium); dyeing; intermediates; as chlorine carrier in organic chlorinations.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

antimony pentafluoride SbF_5 .

Properties: Liquid; sp. gr. 2.99 (23°C); m.p. 7°C ; b.p. 149.5°C ; hydrolyzed by water; soluble in potassium fluoride, liquid sulfur dioxide.

Derivation: Antimony pentachloride and anhydrous hydrogen fluoride.

Containers: Steel cylinders.

Hazard: Toxic; corrosive to skin and tissue. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Use: Catalyst and/or source of fluorine in fluorination reactions.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

antimony pentasulfide (antimony red; antimony persulfide; antimony sulfide golden, Sb_2S_5).

Properties: Orange yellow powder; odorless; insoluble in water; soluble in concentrated hydrochloric acid with evolution of hydrogen sulfide; soluble in alkali. Decomposes on heating.

Hazard: Flammable, dangerous fire risk near oxidizing materials. Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Red pigment; rubber accelerator.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

antimony pentoxide (antimonic anhydride; antimonic acid; stibic anhydride) Sb_2O_5 .

Properties: White or yellowish powder; sp. gr. 5.6; m.p. 450°C ; loses oxygen above 300°C ; insoluble in water; soluble in strong bases forming antimonates; insoluble in acids except concentrated hydrochloric.

Derivation: Action of concentrated nitric acid on the metal or the trioxide.

Hazard: Oxidizing material. Moderate fire risk. Tolerance (as Sb), 0.5 mg per cubic meter of air. Toxic by inhalation.

Use: Preparation of antimonates and other antimony compounds.

antimony perchloride. See antimony pentachloride.

antimony persulfide. See antimony pentasulfide.

antimony potassium tartrate (tartar emetic; potassium antimonyl tartrate; tartrated antimony) $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: Transparent, odorless crystals, efflorescing on exposure to air, or white powder; sweetish, metallic taste. Sp. gr. 2.6; at 100°C loses all its water. Soluble in water, glycerol; insoluble in alcohol. Aqueous solution is slightly acid.

Derivation: By heating antimony trioxide with a solution of potassium bitartrate and subsequent crystallization.

Grades: Technical; crystals; powdered; C.P.; U.S.P.

Containers: Drums; barrels.

Hazard: Toxic by ingestion and inhalation. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Textile and leather mordant; medicine; insecticide.

antimony salt (deHaens salt). Mixture of antimony trifluoride and either sodium fluoride or ammonium sulfate.

Properties: White crystals; soluble in water.

Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Use: Dyeing and printing textiles.

antimony sodiate. See sodium antimonate.

antimony sodium thioglycollate $\text{C}_4\text{H}_4\text{O}_4\text{NaS}_2\text{Sb}$.

Properties: White or pink powder; odorless or with a faint mercaptan odor; freely soluble in water; insoluble in alcohol.

Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Use: Medicine.

antimony sulfate (antimony trisulfate) $\text{Sb}_2(\text{SO}_4)_3$.

Properties: White powder or lumps. Deliquescent. Decomposes in water. Sp. gr. 3.62 (4°C).

Hazard: Toxic and flammable; tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Matches; pyrotechnics.

antimony tribromide (antimony bromide) SbBr_3 .

Properties: Yellow, deliquescent, crystalline mass. Soluble in carbon disulfide, hydrobromic acid, hydrochloric acid, ammonia. Decomposed by water.

Sp. gr. 4.148; m.p. 96.6°C ; b.p. 280°C .

Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

Uses: Analytical chemistry; mordant; manufacturing antimony salts.

antimony trichloride (antimonous chloride; antimony chloride; caustic antimony) SbCl_3 .

Properties: Colorless, transparent, crystalline mass. Very hygroscopic. Fumes slightly in air. Soluble in alcohol, acetone, acids; with water forms antimony oxychloride. Sp. gr. 3.14; b.p. 223.5°C ; m.p. 73.2°C .

Derivation: Interaction of chlorine and antimony or by dissolving antimony sulfide in hydrochloric acid.

Grades: Technical; C.P.

Containers: Crystals: bottles; pails. Liquid: bottles, jugs; demijohns; carboys.

Hazard: Corrosive liquid or solid. Strong irritant to eyes and skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Antimony salts; bronzing iron; mordant; manufacturing lakes; chlorinating agent in organic synthesis; pharmaceuticals; fireproofing textiles.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

antimony trifluoride (antimony fluoride) SbF₃.

Properties: White to gray crystals, hygroscopic. M.p. 292°C; sp. gr. 4.58; soluble in water. Grade: 99–100%.
 Hazard: Toxic; strong irritant to eyes and skin. Tolerance (as Sb), 0.5 mg per cubic meter of air.
 Uses: Porcelain; pottery; dyeing; fluorinating agent.

antimony triiodide (antimony iodide) SbI₃.

Properties: Red crystals. Volatile at high temperatures. Soluble in carbon disulfide, hydrochloric acid, and solution of potassium iodide; insoluble in alcohol and chloroform, decomposes in water with precipitation of oxyiodide. Sp. gr. 4.768; m.p. 167°C; b.p. 401°C.
 Derivation: Action of iodine on antimony.
 Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.

antimony trioxide (antimony white; antimony oxide). Sb₂O₃. Occurs in nature as valentinite.

Properties: White, odorless, crystalline powder. Sp. gr. 5.67; m.p. 655°C. Insoluble in water; soluble in concentrated hydrochloric and sulfuric acids, strong alkalis; amphoteric.
 Derivation: Burning antimony in air; adding ammonium hydroxide to antimony chloride; directly from low-grade ores.
 Grades: Technical; pigment.
 Containers: Bags; barrels.
 Hazard: Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air; may cause dermatitis.
 Uses: Flameproofing of textiles, paper, and plastics (chiefly polyvinyl chloride); paint pigments; ceramic opacifier; catalyst; intermediate; staining iron and copper; phosphors; mordant; glass decolorizer.

antimony trisulfate. See antimony sulfate.**antimony trisulfide (antimony orange; black antimony; antimony needles; antimonous sulfide; antimony sulfide) Sb₂S₃.**

Properties: (a) Black crystals; (b) orange-red crystals. Insoluble in water; soluble in concentrated hydrochloric acid, and sulfide solutions; Sp. gr. 4.562; m.p. 546°C.
 Derivation: (a) Occurs in nature as black crystalline stibnite (q.v.). (b) As precipitated from solutions of salts of antimony, the trisulfide is an orange-red precipitate, which is filtered, dried and ground.
 Grades: Technical.
 Containers: Barrels; bags.
 Hazard: Explosion risk in contact with oxidizing materials. Toxic. Tolerance (as Sb), 0.5 mg per cubic meter of air.
 Uses: Vermilion or yellow pigment; antimony salts; pyrotechnics; matches; percussion caps; camouflage paints (reflects infrared radiation in same way as green vegetation).

antimycin A (C₂₈H₄₀O₉N₂). An antibiotic substance said to have strong fungicidal properties.

Properties: Crystals, M.p. 139–140°C; soluble in alcohol, ether, acetone, and chloroform; slightly soluble in benzene, carbon tetrachloride, and petroleum ether; insoluble in water.
 Derivation: From Streptomyces.
 Use: Active against a large group of fungi, but in general not against bacteria; possible insecticide and miticide.

antioxidant. An organic compound added to rubber, natural fats and oils, food products, gasoline and lubricating oils to retard oxidation, deterioration, rancidity, and gum formation, respectively. Rubber

antioxidants are commonly of an aromatic amine type, such as di-beta-naphthyl-para-phenylenediamine and phenyl-beta-naphthylamine; a fraction of a percent affords adequate protection. Many antioxidants are substituted phenolic compounds (butylated hydroxyanisole, di-tert-butyl-para-cresol, and propyl gallate). Food antioxidants are effective in very low concentrations (not more than 0.01% in animal fats) and not only retard rancidity but protect the nutritional value by minimizing the breakdown of vitamins and essential fatty acids. Sequestering agents, such as citric and phosphoric acids, are frequently employed in antioxidant mixtures to nullify the harmful effect of traces of metallic impurities.

Note: Maximum concentration of food antioxidants approved by FDA is 0.02%.

antiozonant (antiozidant). A substance used to reverse or prevent the severe oxidizing action of ozone on elastomers, both natural and synthetic. Among antiozonant materials used are petroleum waxes, both amorphous and microcrystalline, secondary aromatic amines such as N,N-diphenyl-para-phenylenediamine, quinoline, and furan derivatives. See also ozone.**antiparticle (antimatter).** A subatomic particle identical in mass with electrons, protons, and neutrons but opposite in electrical charge or (in the case of the neutron) in magnetic moment. Thus a positron is an electron with a positive charge; an antiproton is a proton with a negative charge; an antineutron has no charge but has a magnetic moment opposite to that of a neutron. A photon has no antiparticle, since it has no property except motion. When an antiparticle collides with its opposite particle (that is, a collision of an electron and a positron), both particles are annihilated and their masses are converted to photons of equivalent energy. The same is true of other subatomic particles (neutrinos, mesons, etc.), which are fantastically short-lived (of the order of billionths of a second). The quantum-mechanical concepts that led to the discovery of antiparticles include that of "strangeness," which is expressed numerically.**antiperspirant.** Any substance having a mild astringent action which tends to reduce the size of skin pores and thus restrain the passage of moisture on local body areas. The most commonly used antiperspirant agent is aluminum chlorohydrate; use of zirconium compounds in antiperspirant sprays has been virtually discontinued because of their suspected carcinogenicity, though they are permissible in creams. Antiperspirants exert a neutralizing action which gives them deodorant properties. The FDA classifies them as drugs rather than as cosmetics.**antipsychotic agent.** See psychotropic drug.**antipyrine (phenazone; 2,3-dimethyl-1-phenyl-3-pyrazolin-5-one). (CH₃)₂(C₆H₅)C₃HN₂O.**

Properties: Colorless crystals or powder; odorless; slightly bitter taste; sp. gr. 1.19; m.p. 110–113°C; b.p. 319°C; soluble in water, alcohol, and chloroform; slightly soluble in ether.
 Derivation: Condensation of methylphenylhydrazine and ethyl acetoacetate.
 Method of purification: Crystallization.
 Grades: Technical; N.F.
 Containers: Drums; barrels.
 Hazard: Moderately toxic by ingestion.
 Uses: Medicine; an analytical reagent for nitrous acid, nitric acid, and iodine number.

antipyrine chloral hydrate. See chloral hydrate antipyrine.

antiscorbutic. Tending to prevent scurvy. See ascorbic acid.

antiseptic. A substance applied to humans or animals that retards or stops the growth of microorganisms without necessarily destroying them, e.g., alcohol; boric acid and borates; certain dyes, as acriflavine; menthol; hydrogen peroxide; hypochlorites; iodine; mercuric chloride; and phenol. Many of these are corrosive and poisonous and should be used with great caution. Among the newer antiseptics are hexachlorophene, which also has some degree of toxicity, and some quaternary ammonium compounds. See also disinfectant; sanitizer; fumigant.

antiskinning agent. A liquid antioxidant used in paints and varnishes to inhibit formation of an oxidized film on the exposed surface in cans, pails, or other open containers.

antistatic agent. The marked tendency of thermoplastic polymers to accumulate static charges, which result in adherent particles of dust and other foreign matter, has required study of possible means of eliminating or reducing this property. The following have been tried. (1) Development of more electrically conductive polymers, e.g., tetracyanoquinodimethane. (2) Incorporation of additives which migrate to the surface of the plastic or fiber and modify its electrical properties; examples of these are fatty quaternary ammonium compounds, fatty amines, and phosphate esters; other types of antistatic additives are hygroscopic compounds, such as polyethylene glycols, and hydrophobic slip additives that markedly reduce the coefficient of friction of the plastic. (3) Copolymerization of an antistatic resin with the base polymer.

"Antistine" Phosphate.³⁰⁵ Trademark for antazoline phosphate.

"Antox."²⁸ Trademark for rubber antioxidant; a condensation product of butyraldehyde-aniline. Amber liquid.

"Antozite."^{69,119} Trademark for a series of antiozonants for use in rubber and synthetic rubber.

1. N,N'-Di(2-octyl)-para-phenylenediamine.

2. N,N'-Di-3(5-methylheptyl)-para-phenylenediamine.

MPD. N,N'-Bis(1,4-dimethylpentyl)-para-phenylenediamine.

"Antron."²⁸ Trademark for nylon textile fibers in the form of continuous filament yarns and staple.

ANTU. Abbreviation for alpha-naphthylthiourea (q.v.).

AP. Abbreviation for ammonium perchlorate (q.v.).

"Apamide."²⁷² Trademark for acetaminophen. See para-acetylamino-phenol. Used in medicine.

APAP. Abbreviation for acetyl-para-amino-phenol. See para-acetylamino-phenol.

"Asapol" W-1345.³⁰⁹ Trademark for a completely sulfonated ester of a high molecular weight alcohol; used in many textile operations.

apatite. A natural calcium phosphate (usually containing fluorine) occurring in the earth's crust as phosphate rock. It is also the chief component of the bony structure of teeth. See also fluoridation.

Properties: Color variable; sp. gr. 3.1-3.2; hardness 5; frequently in hexagonal crystals.

Occurrence: Eastern U.S., California; U.S.S.R.; Canada; Europe.

Uses: Source of phosphorus and phosphoric acid; manufacture of fertilizers; laser crystals.

APC. Abbreviation for ammonium perchlorate.

"Apco."²⁰⁰ Trademark for a series of petroleum solvents with carefully graded boiling ranges and known flash points; some are deodorized. Available in up to tank car lots. Combustible.

Uses, according to specific properties: Dry cleaning; degreasing; extraction; paint and varnish thinner; wood- and weed-treating solvent.

apholate. Generic name for 2,2,4,4,6,6-hexakis(1-aziridinyl)-2,2,4,4,6,6-hexahydro-1,3,5,2,4,6-triazatriphosphorine. An insect sterilant. Prevents reproduction of certain insects by inhibiting formation of DNA in eggs.

Hazard: Probably toxic by ingestion.

aphrodine. See yohimbine.

API. Abbreviation for American Petroleum Institute. (q.v.).

API gravity. A scale of measurement adopted by the American Petroleum Institute. It runs from 0.0 (equivalent to specific gravity 1.076) to 100.0 (equivalent to specific gravity 0.6112). The API values as used in the petroleum industry decrease as specific gravity values increase.

"Apiezon."⁴³¹ Trademark for a series of hydrocarbon oils, greases and waxes that are produced by molecular distillation and characterized by very low vapor pressures and good thermal stability. Used as lubricants and seals in high vacuum equipment and operations; as a stationary phase in gas chromatography. Combustible.

apo- A prefix denoting formation from, or relationship to, another compound, e.g., apomorphine.

APO. See triethylenephosphoramidate.

apocarotenal. Food color; supplied in dark purplish-black beadlets. Vitamin A activity 120,000 units/gram. Dispersible in warm water. Approved for food use by FDA.

"Apodol."⁴¹² Trademark for anileridine (q.v.).

Appert, Francois (1750-1840). French pioneer in the science of food preservation. Though not a chemist, his work on application of heat to food products was in effect a form of home preserving, which eventually developed into the canning industry. The idea of destroying bacteria by heat treatment was later applied more exhaustively by Pasteur.

apple acid. See malic acid.

apple oil. See isoamyl valerate.

applied research. The experimental investigation of a specific practical problem for the immediate purpose of creating a new product, improving an older one, or evaluating a proposed ingredient. The experimental program is set up to answer the question "What happens?" rather than "Why does it happen?" Examples might be the determination of the value of a new rubber antioxidant; the substitution of one drying oil for another in paint formulation; or the development of a new synthetic product.

"Appramine."⁴² Trademark for cream-colored, cationic fatty amides. Disperse readily in water at temperatures above 60°C. Used as softening agents for all types of textile fibers.

"Appretole."⁴² Trademark for a cream-colored anionic fatty amide dispersion. Disperses readily in water above 60°C. Used as a softener for cotton and rayon textile fabrics.

"Apresoline."³⁰⁵ Trademark for hydralazine hydrochloride (q.v.).

aprotic solvent. A type of solvent which neither donates nor accepts protons. Examples: dimethylformamide; benzene; dimethyl sulfoxide.

"APW."²⁴⁴ Trademark for a compound consisting of a balanced blend of buffered alkalies and a surface-active agent.

Properties: Soluble in water; total Na₂O content 39.9%; percent of total Na₂O in active form 24.0%; percent of total Na₂O in inactive form 15.9%; white, granular dedusted mechanical mix.

aqua ammonia. See ammonium hydroxide.

"Aquablak."¹³³ Trademark for carbon black and bone black aqueous dispersions used in latex paints, latex compounding, paper coatings, leather finishing, etc.

"Aquabond."⁵⁵³ Trademark for dry and liquid resinous adhesives.

"Aquace."²⁶⁶ Trademark for vinyl acetate-ethylene copolymer emulsions.

Properties: 55% to 57% solids; 200 to 600 cps; 4.5 to 6.0 pH; 0.13μ to 0.17μ average particle size; nonionic; 8.9 to 9.1 lbs per gal.

Containers: Bulk; 55-gal lined steel or fiber drums.

Uses: Binder for pigments in paper coatings; exterior or interior paints; adhesives and textiles.

"Aquadag."⁴⁴⁶ Trademark for a dispersion of colloidal graphite in water. Used as a lubricant for dies, tools, and molds for metalworking, glassmaking, etc.; conductive coating.

"Aquagel."²³⁶ Trademark for a gel-forming colloidal bentonite clay used in drilling muds. See also bentonite.

"Aqualin."¹²⁵ Trademark for a herbicide, biocide, and slimicide; contains 92% acrolein.

Hazard: See acrolein.

Uses: Herbicide used to control aquatic weeds; biocide to control microorganisms in oil well injection water; slimicide to control slime-forming organisms in pulp and paper mills.

"Aquapel."²⁶⁶ Trademark for a series of alkylketene dimers prepared from long chain fatty acids. Used for paper sizing.

"Aquadprint."²⁹³ Trademark for a resin-bonded pigment color for printing on textiles. The vehicle, an oil-in-water emulsion, contains a water-insoluble binder which adheres to the fibers and anchors the color permanently to the cloth.

aqua regia (nitrohydrochloric acid; chloronitrous acid; chloroazotic acid).

Properties: Fuming yellow, suffocating, volatile liquid. Derivation: A mixture of nitric and hydrochloric acids, usually one part of nitric acid to three or four parts of hydrochloric acid.

Grades: Technical.

Containers: Glass bottles.

Hazard: Toxic; a powerful oxidizing agent; corrosive liquid.

Uses: Metallurgy; testing metals; dissolving metals (platinum, gold, etc.).

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes. Legal label name: nitrohydrochloric acid.

"Aquaresin."⁷³ Trademark for glycol bori-borate.

Properties: Water-white viscous liquid which is non-drying. Odorless. Soluble in water, methyl alcohol, glycerine, and diethylene glycol; insoluble in ethyl alcohol and toluene. Sp. gr. (25°C) 1.375; pH (5% dispersion) 8.0.

Uses: Textile lubricant and softener; softener or plasticizer for glues, gelatins, gums; adhesive for cellophane, glassine; sealing joints in systems carrying oils, hydrocarbons; fire retardant for treating paper, leather, textiles; prevention of caking in pigments in water suspensions.

"Aquarex."²⁸ Trademark for a series of wetting agents for elastomers. They act as stabilizers and mold lubricants.

"Aquadrol."³⁰⁰ Trademark for water repellents of the wax-mordant metal salt type for textiles.

"Aquadol."⁵⁷ Trademark for a highly sulfonated castor oil.

"Aquasorb AR."³²⁹ Trademark for a phosphorus pentoxide (P₂O₅)-based desiccant.

Hazard: May be flammable and caustic.

"Aqua-Tone."²⁹ Trademark for a series of polyvinyl acetate emulsion coatings that are easily applied, quick drying, completely washable and resistant to the effects of sunlight, mildew, and most industrial fumes.

"Aquazinc."³⁵⁴ Trademark for an aqueous dispersion of zinc stearate containing a wetting agent and designed to replace powdered zinc stearate for many applications in order to eliminate the dust, fire hazard, and other difficulties encountered with the dry material. It will volatilize at or below 100°C.

Uses: Manufacture of butyl rubber, neoprene adhesives, various types of rubber latex, etc.

"Aquet."²⁰⁴ Trademark for a product used to raise the pH of swimming pool water.

Ar Symbol for argon approved by IUPAC.

"A.R."³²⁹ Trademark for chemical products for laboratory and industrial use which are specially produced and controlled to meet critical purity and uniformity requirements.

arabic gum (acacia gum). The dried water-soluble exudate from the stems of *Acacia Senegal* or related species.

Properties: Thin flakes, powder, granules or angular fragments; color white to yellowish white, almost odorless, and have a mucilaginous taste. Completely soluble in hot and cold water, yielding a viscous solution of mucilage; insoluble in alcohol. The aqueous solution is acid to litmus. Nontoxic; combustible.

Occurrence: Sudan, West Africa, Nigeria.

Composition: A carbohydrate polymer, complex and highly branched. The central core or nucleus is D-galactose and D-glucuronic acid (actually the calcium, magnesium, and potassium salts), to which are attached sugars such as L-arabinose and L-rhamnose.

Grades: U.S.P.; F.C.C. (both grades as acacia).

- Containers: Bags; multiwall paper sacks; barrels.
 Uses: Pharmaceuticals; adhesives; inks; textile printing; cosmetics; thickening agent and colloidal stabilizer in confectionery and food products.
- arabinogalactan.** A water-soluble polysaccharide extracted from timber of the western larch trees. It is a complex highly branched polymer of arabinose and galactose.
 Properties: Dry, light tan powder; readily soluble in hot and cold water; both powder and solutions relatively stable. Nontoxic; combustible.
 Uses: Dispersing and emulsifying agent; lithography.
- arabinose** (pectin sugar; gum sugar) $C_5H_{10}O_5$. Both the D- and L-enantiomers occur naturally. L-Arabinose is common in vegetable gums, especially arabic.
 Properties: White crystals. Soluble in water and glycerin; insoluble in alcohol and ether. M.p. $158.5^\circ C$; sp. gr. 1.585 ($20/4^\circ C$). Nontoxic. Combustible.
 Uses: Medicine; culture medium.
- Ara-C.** Abbreviation for cytosine arabinoside (q.v.).
- arachidic acid** (eicosanoic acid) $CH_3(CH_2)_{18}COOH$. A widely distributed but minor component of the fats of peanut oils and related plant species.
 Properties: Shining, white, crystalline leaflets. Soluble in ether; slightly soluble in alcohol; insoluble in water. M.p. $75.4^\circ C$; sp. gr. 0.8240 ($100/4^\circ C$); b.p. $205^\circ C$ (1 mm), $328^\circ C$ (decomposes); refractive index 1.4250 ($100^\circ C$). Nontoxic; combustible.
 Derivation: From peanut oil.
 Grades: Technical 99%.
 Uses: Organic synthesis; lubricating greases, waxes, and plastics; source of arachidyl alcohol; biochemical research.
- arachidonic acid** (5,8,11,14-eicosatetraenoic acid). $CH_3(CH_2)_4(CH:CHCH_2)_4(CH_2)_4COOH$. A C_{20} unsaturated fatty acid. Nontoxic; combustible. An essential fatty acid.
 Properties: Liquid; m.p. $-49.5^\circ C$; iodine value 333.50.
 Source: Liver; brain; lecithin.
 Grade: 99% methyl ester.
 Uses: Medicine; biochemical research.
- arachidyl alcohol** (1-eicosanol) $CH_3(CH_2)_{18}CH_2OH$. A long-chain saturated fatty alcohol, much like stearyl alcohol.
 Properties: White, wax-like solid. M.p. $66.5^\circ C$; b.p. $220^\circ C$ (3 mm); $369^\circ C$ at 760 mm. Refractive index 1.455; soluble in hot benzene. Combustible; low toxicity.
 Derivation: Ziegler synthesis (trialkylaluminum process).
 Grades: Technical; 99%.
 Containers: Up to tankcars.
 Uses: Lubricants, rubber, plastics, textiles; research.
- arachin** (arachine). A protein from peanut, a globulin containing arginine, histidine, lysine, cystine. Yellow green syrup. Soluble in water and alcohol; insoluble in ether. Nontoxic; combustible.
- aragonite.** A form of calcium carbonate appearing in pearls. See nacre.
- aralkyl.** See arylalkyl.
- aramid.** Generic name for a distinctive class of aromatic polyamide fibers. It differs from nylon in chemical structure and physical properties. See polyamide.
- "Aramite."**²⁴⁴ Trademark for 2-(para-tert-butylphenoxy) isopropyl 2-chloroethyl sulfite $(CH_3)_3CC_6H_4OCH_2CH(CH_3)OSOOC_2H_4Cl$.
 Properties: Clear, light-colored oil; sp. gr. 1.148–1.152 ($20^\circ C$); b.p. $175^\circ C$ (0.1 mm); very soluble in common organic solvents; insoluble in water; noncorrosive.
 Grades: Technical (90% min.); wettable powder; emulsifiable concentrates; dusts.
 Hazard: Irritant to eyes and skin; toxic by ingestion. Use may be restricted.
 Uses: Acaricide on a wide variety of vegetation.
- "Aranox."**²⁴⁸ Trademark for para-(para-tolysulfonylamido)-diphenylamine.
 $CH_3C_6H_4SO_2NHC_6H_4NHC_6H_5$.
 Properties: Gray powder; sp. gr. 1.32; m.p. $135^\circ C$ min; soluble in acetone, benzene and ethylene dichloride; insoluble in gasoline and cold water; slightly soluble in hot water or hot alkaline solutions which extract it from thin rubber sheets after considerable exposure.
 Uses: Antioxidant for light-colored rubber products.
- "Arapahoe Pre-Mix."**¹⁰⁹ Trademark for mixtures of liquid scintillation-counting materials.
- "Arasan."**²²⁸ Trademark for seed disinfectants based on thiram (q.v.).
 Hazard: Moderately toxic by ingestion.
- "Arazate."**²⁴⁸ Trademark for zinc dibenzyl dithiocarbamate (q.v.).
- arbutin** (ursin). Available commercially in both natural and synthetic forms. Pure synthetic arbutin is hydroquinone-beta-D-glucopyranoside, $C_{12}H_{16}O_7$.
 Properties: (pure synthetic): White powder; m.p. $199-200^\circ C$; soluble in water and alcohol; stable in storage.
 Derivation: A glucoside found in the leaves of the cranberry and blueberry and in the roots, trunks and leaves of most pear species. Pure arbutin can be prepared synthetically from acetobromoglucose and hydroquinone in presence of alkali.
 Uses: Medicine; possible industrial oxidation inhibitor, polymerization inhibitor, color stabilizer, intermediate.
- archeological chemistry.** Application of the techniques of analytical chemistry to identification of materials found in excavations. Among those used are micro-analytical methods, spectroscopic analysis, x-rays, and other types of nondestructive tests. For age determination, C-14 measurement (chemical dating) has been a valuable tool. See also chemical dating.
- "Arcturus Red."**¹⁴¹ Trademark for azo red pigments derived from beta-naphthol.
 Grades: Resinated and nonresinated.
 Uses: Printing inks, especially flexographic inks for printing on foil, rubber, plastics.
- arecoline** (arecaine methyl ester; methyl 1,2,5,6-tetrahydro-1-methylnicotinate; methyl arecainate) $C_8H_{13}O_2N$. Alkaloid obtained from Areca catechu or betel nut.
 Properties: Colorless, odorless, oily liquid; strongly alkaline; optically inactive; b.p. $209^\circ C$; sp. gr. 2.02; soluble in water, alcohol, chloroform, ether; volatile with steam. Combustible.
 Hazard: Moderately toxic.
 Use: Medicine (also as hydrobromide)
- arene.** See aromatic.
- "Areskap."**⁵⁸ Trademark for sodium butyl-ortho-phenylphenolsulfonate in liquid or dry powder form.
 Uses: Wetting, penetrating and spreading agent for insecticides, embalming fluids.
- "Aresket."**⁵⁸ Trademark for sodium butylbiphenyl-sulfonate in dry powder form.
 Uses: Wetting, penetrating, and spreading agent.

argentite (silver glance) Ag_2S . Lead-gray to black or blackish-gray mineral. A natural silver sulfide. Contains 87.1% silver. Differs from other soft black minerals in cutting like wax. Soluble in nitric acid. Sp. gr. 7.2–7.36; Mohs hardness 2–2.5.

Occurrence: Nevada, Colorado, Montana; Mexico; Chile; Canada.

Use: An important ore of silver.

argentum. The Latin name for silver, hence the symbol Ag in chemical nomenclature.

arginase. An enzyme producing ornithine and urea by splitting arginine. It is found in liver.

Use: Biochemical research.

arginine (guanidine aminovaleric acid; amino-4-guanidovaleric acid)

$\text{NHC}(\text{NH}_2)\text{NH}(\text{CH}_2)_3\text{CH}(\text{NH}_2)\text{COOH}$. An essential amino acid for rats, occurring naturally in the L(+) form. Available as the glutamate and hydrochloride.

Properties: Prisms from water containing 2 molecules of H_2O , anhydrous plates from alcohol solution; dehydrates at 105°C ; decomposes at 244°C ; sparingly soluble in alcohol; insoluble in ether. Nontoxic.

Derivation: Widely found in animal and plant proteins. It is precipitated as the flavianate from gelatin hydrolyzate in industry.

Containers: Drums.

Uses: Biochemical research; medicine; pharmaceuticals; dietary supplement.

argon Ar. Inert element of atomic number 18, in noble gas group of the Periodic System. Atomic weight 39.948; occurs in air to extent of 0.94% by volume.

Properties: Colorless, odorless, tasteless, monatomic gas; it is not known to combine chemically with any element, but forms a stable clathrate (q.v.) with beta-hydroquinone; m.p. -189.3°C ; b.p. -185.8°C ; sp. gr. 1.38 (air = 1); sp. vol. 9.7 cu ft/lb (70°F , 1 atm). Slightly soluble in water. Noncombustible; an asphyxiant gas.

Derivation: (a) By fractional distillation of liquid air. (b) By the treatment of atmospheric nitrogen with certain metals such as magnesium and calcium to form nitrides. (c) Recovery from natural gas oxidation bottoms steam in ammonia plant. (d) Originally formed by radioactive decay of potassium 40.

Methods of purification: (a) Highly purified argon is obtained by passing the gas through a bed of titanium at 850°C . (b) Synthetic zeolite molecular sieves separate oxygen from argon to give high purity gas.

Grades: Technical; highest purity (99.995%).

Containers: Steel cylinders (technical); hermetically sealed glass flasks (highest purity); tube trailers.

Uses: Inert gas shield in arc welding; furnace brazing; plasma jet torches (with hydrogen); electric and specialized light bulbs (neon, fluorescent, sodium vapor, etc.); titanium and zirconium refining; flushing molten metals (steel) to remove dissolved gases; in Geiger-counting tubes, lasers; inert gas or atmosphere in miscellaneous applications.

Shipping regulations: (Rail) (gas) Green label; (pressurized liquid) Green label. (Air) (gas) Nonflammable Compressed Gas label; (liquid, nonpressurized) No label required; (liquid, low-pressure) Not acceptable on passenger planes; (liquid, pressurized) Nonflammable Compressed Gas label. Not acceptable on passenger planes.

"Argo" Steepwater.³⁰ Trademark for a liquid concentrate of proteins, soluble nutrients, unidentified

growth factors (U.G.F.); 53.0–56.0% solids, pH 3.7–4.2. Used in manufacture of enzymes and for drugs and pharmaceuticals. Shipped in tank cars. See also corn steep liquor.

"Argyrol." Trademark for an organic compound of silver and a protein, used in medicine for its specific antiseptic and bacteriostatic action. Low toxicity.

"Aridex."²⁸ Trademark for renewable water repellents used in textile industry.

"Aridye."²⁹³ Trademark for a product and process for printing colors on textiles using permanent and insoluble pigments suspended in an organic vehicle, into which water is emulsified to give printing consistency. The vehicle contains a water-insoluble binder which adheres to the cloth and anchors the color permanently to the fibers.

"Ariperm."³⁰⁰ Trademark for a gas-fading inhibitor for application to dyed acetate fabrics. Protects the dyes from fading due to acid gases in the atmosphere.

"Aristocort."³¹⁵ Trademark for triamcinolone (q.v.).

"Arizole."²⁵² Trademark for a group of terpene products, including anethole and sulfate pine oil. Used in perfumes, soaps, etc.

"Arkolene."³⁰⁰ Trademark for textile wetting agents of the alkylarylsulfonate type, sodium or ammonium salts.

"Arkolube."³⁰⁰ Trademark for textile lubricating and softening agents, based on silicones, polyethylenes, and waxes.

"Arko Stat-Ex."³⁰⁰ Trademark for antistatic agent for use on synthetic fibers.

"Arkotan."³⁰⁰ Trademark for a synthetic tanning agent for leather. Ammonium salt of a naphthalenesulfonic acid complex.

"Arlacel."⁸⁹ Trademark for each of a series of nonionic emulsifiers for use in cosmetics and pharmaceuticals. They are fatty acid partial esters of polyols or polyol anhydrides.

"Arlax."⁸⁹ Trademark for noncrystallizing industrial humectant solution, containing 83% solids consisting of sorbitol and related polyhydric materials.

Use: For flexibilizing and moisture-conditioning in industrial applications, including tobacco, glue compositions, cellulose products, etc.

"Armac."¹⁵ Trademark for a series of amine acetate salts derived from primary, secondary or tertiary amines. The alkyl groups range from C_8 to C_{18} .

Uses: Anticaking agents; biocides; cationic emulsifiers; corrosion inhibitors; mineral flotation agents; pigment dispersants; pigment flushing agents; textile assistants.

"Armalon."²⁸ Trademark for TFE-fluorocarbon fiber felt and also for TFE-fluorocarbon resin-coated glass fabrics, tapes, and laminates

"Armazide."²⁰⁴ Trademark for an algacide for swimming pools.

"Armeen."¹⁵ Trademark for a series of high-molecular-weight aliphatic amines: primary, secondary and tertiary. Available in chain lengths ranging from C_8 to C_{18} and up to 92% purity of a single homolog, also in natural mixtures of these chains derived from coco, soya or tallow fatty acids.

Uses: Biocides; catalysts; chemical intermediates; corrosion inhibitors; curing agents; detergents; emulsifiers; mineral flotation agents; mold release agents; petroleum additives; pigment grinding aids; rubber reclaiming agents.

"Armide."¹⁵ Trademark for a series of high-melting, wax-like amides derived from fatty acids.

Uses: Antiblocking agents in plastic formulations; antitack and antiscratch agents in printing inks; dye solubilizers; mutual solvents for waxes and plastics.

"Armofos."¹ Trademark for sodium tripolyphosphate, anhydrous $\text{Na}_3\text{P}_3\text{O}_{10}$.

Uses: Sequestering agent for iron, calcium and magnesium ions; soap builder; detergent mixtures; deflocculator in drilling muds; paper, ceramics and textiles.

"Armosul."¹⁵ Trademark for alpha-sulfonated alkyl acids, C_{16} and C_{18} . Biodegradable and suitable for detergent preparations. Used in mineral flotation.

"Armotan."¹⁵ Trademark for a series of sorbitan and polysorbate esters of fatty acids.

Uses: Boding agents; corrosion inhibitors; defoamers; dispersants; emulsifiers; lubricants; opacifiers; solubilizers; stabilizers; wetting agents. Approved for many food uses.

Armstrong's acid. See naphthalene-1,5-disulfonic acid.

"Arnel."³⁵² Trademark for an acetate fiber made from cellulose triacetate. It has a higher melting point and is less soluble than cellulose acetate.

Properties: Staple or continuous filament. Tensile strength (psi) 20,000–26,000; elongation 22–28%; sp. gr. 1.3; moisture regain 3.2%; m.p. approximately 300°C; soluble in methylene chloride, glacial acetic acid, chloroform; swollen by acetone and trichloroethylene. Combustible.

Uses: Knitted and woven fabrics for wearing apparel, alone and blended with other fibers; laundry pads; electrical insulation; laminated papers.

arnica. Medication derived from a plant; usually in tinctures of various strengths. Used topically for relief of bruises, strains, etc.

Hazard: Toxic by ingestion; 1 ounce of 20% tincture may cause severe poisoning.

"Arochem."²²¹ Trademark for a series of hard coating resins, including modified phenolics, modified alcohols, ester gums, modified maleics.

"Aroclor."³⁸ Trademark for a series of polychlorinated polyphenols: liquids, resins, or solids.

Properties: Water-white mobile liquids and pale yellow viscous oils to light amber resins and opaque crystalline solids. Some types are combustible.

Hazard: May be toxic by ingestion and inhalation; absorbed by skin.

Uses: As dielectric liquids; as impregnating agents for electrical apparatus; thermostat fluids; swelling agents for transmission seals; additives or base for lubricants, oils and greases; plasticizers for celluloses, vinyls, and chlorinated rubber.

"Aroflat."²²¹ Trademark for a series of oxidizing alkyds in a petroleum solvent for flat wall coatings.

"Aroflint."²²¹ Trademark for a two-component system for industrial and marine finishes.

"Arolast."²²¹ Trademark for a set of components for urethane elastomer.

"Aromaldehydes."¹⁸³ Trademark for a series of simulated terpeneless oils.

aromatic (arene). A major group of unsaturated cyclic hydrocarbons containing one or more rings; these are typified by benzene, which has a six-carbon ring containing three double bonds. The vast number of compounds of this important group, derived chiefly from petroleum and coal tar, are rather highly reactive and chemically versatile. The name is due to the strong and not unpleasant odor characteristic of most substances of this nature. Certain 5-membered cyclic compounds such as the furan group (heterocyclic) are analogous to aromatic compounds.

Note: The term "aromatic" is often used in the perfume and fragrance industries to describe essential oils, which are not aromatic in the chemical sense.

aromaticity. A stable electron shell configuration in organic molecules, especially those related to benzene. See resonance, orbital theory.

aromatization. See hydroforming.

"Aromin."⁵¹ Trademark for a highly aromatic solvent widely used as a carrier for chemical pesticides.

"Aromox."¹⁵ Trademark for a series of methylated or ethoxylated amine oxides derived from high-molecular-weight aliphatic amines.

Uses: Foam and suds stabilizers in detergent and cosmetic formulations; surfactants.

"Aroset."²²¹ Trademark for a thermosetting acrylic resin solution to be used as a coating.

"Arox."⁵¹ Trademark for specially compounded fluid lubricants for all air tools.

"Arquad."¹⁵ Trademark for a series of quaternary ammonium salts containing one or two alkyl groups ranging from C_8 to C_{18} .

Uses: Corrosion inhibitors; emulsifiers; germicides and sanitizing agents; textile fabric softeners.

Arrhenius, Svante (1859–1927)

Native of Sweden, Nobel prize in chemistry, 1903. Best known for his fundamental investigations on electrolytic dissociation of compounds in water and other solvents, and for his basic equation stating the increase in the rate of a chemical reaction with rise in temperature:

$$\frac{d \ln k}{dT} = \frac{A}{RT^2}$$

in which k is the specific reaction velocity, T is the absolute temperature, A is a constant usually referred to as the energy of activation of the reaction, and R is the gas law constant.

arsacetic (sodium acetylarsanilate; sodium para-acetylaminophenylarsonate)

$\text{CH}_3\text{CONHC}_6\text{H}_4\text{AsO(OH)ONa}$.

Properties: White, crystalline powder; odorless, tasteless, free of arsenous or arsenic acid; solutions will admit of thorough sterilization. Soluble in cold, but more so in warm water.

Hazard: Highly toxic by ingestion.

Use: Medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsanilic acid (atoxylic acid; para-aminobenzenearsonic acid; para-aminophenylarsonic acid)

$\text{C}_6\text{H}_4\text{NH}_2 \cdot \text{AsO(OH)}_2$.

Properties: White, crystalline powder; practically odorless; soluble in hot water; slightly soluble in cold water, alcohol, and acetic acid; insoluble in acetone, benzene, chloroform, and ether. M.p. 232°C.

Derivation: By condensing aniline with arsenic acid,

removing the excess of aniline by steam distillation in alkaline solution and setting the acid free by hydrochloric acid.

Hazard: Highly toxic. Yields flammable vapors on heating above melting point.

Uses: Arsanilates; manufacture of arsenical medicinal compounds, such as arsphenamine, etc.; veterinary medicine; grasshopper bait.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsenic As. A nonmetallic element of atomic number 33; group VA of Periodic Table; atomic weight 74.9216; valence 2,3,5; no stable isotopes.

Properties: Silver-gray brittle, crystalline solid that darkens in moist air. Allotropic forms: black, amorphous solid (beta-arsenic); yellow, crystalline solid. Sp. gr. 5.72 (commercial product ranges from 5.6 to 5.9); m.p. 814°C (36 atm); sublimes at 613°C (1 atm); Mohs hardness 3.5; insoluble in water, caustic and nonoxidizing acids. Attacked by HCl in presence of oxidant. Reacts with nitric acid. Low thermal conductivity; a semiconductor.

Derivation: Flue dust of copper and lead smelters, from which it is obtained as white arsenic (arsenic trioxide) in varying degrees of purity. This is reduced with charcoal. The commercial grade is not made in U.S.

Grades: Technical; crude (90–95%); refined (99%); semiconductor grade 99.999%; single crystals.

Containers: Bottles; drums; barrels.

Hazard: Highly toxic by ingestion and inhalation. The ACGIH tolerance for arsenic and its compounds for workroom exposures is 0.5 mg per cubic meter of air (as As), but OSHA has proposed that this limit be lowered to 0.004 mg for 8-hour exposure, with a maximum limit of 0.01 for short exposures. There is said to be considerable evidence that arsenic is carcinogenic, and that all inorganic arsenic compounds are occupational carcinogens.

Uses (metallic form): Alloying additive for metals, especially lead and copper (shot, battery grids, cable sheaths, boiler tubes). High-purity (semiconductor) grade: used to make gallium arsenide for dipoles and other electronic devices; doping agent in germanium and silicon solid state products; special solders; medicine.

Shipping regulations: (Rail, Air) Poison label. See also arsenic trioxide.

arsenic acid (orthoarsenic acid) $\text{H}_3\text{AsO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Arsenic pentoxide is also sometimes called arsenic acid.

Properties: White, translucent crystals. Soluble in water, alcohol, alkali, glycerin. Sp. gr. 2–2.5; m.p. 35.5°C; b.p. loses water at 160°C.

Derivation: By digestion of arsenic with nitric acid.

Grades: Pure; technical; C.P.

Containers: Glass bottles; barrels.

Hazard: Highly toxic by ingestion.

Uses: Manufacture of arsenates; glass making; wood treating process; defoliant (under special regulations); desiccant for cotton; soil sterilant.

Shipping regulations: (Rail, Air) Poison label.

arsenical Babbitt. See Babbitt metal.

arsenical nickel. See niccolite.

arsenic anhydride. See arsenic pentoxide.

arsenic, black (beta-arsenic). See arsenic.

arsenic bromide. Legal label name for arsenic tribromide. (q.v.).

arsenic chloride. See arsenic trichloride.

arsenic disulfide (arsenic monosulfide; ruby arsenic; red arsenic glass; red arsenic sulfide; red arsenic) As_2S_2 or AsS . Occurs as mineral, realgar (q.v.).

Properties: Orange-red powder. Soluble in acids and alkalis; insoluble in water. Sp. gr. 3.4–2.6; m.p. 307°C. **Derivation:** By roasting arsenopyrite and iron pyrites and sublimation.

Grades: Technical.

Containers: Steel drums.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Leather industry, depilatory agent; paint pigment; shot manufacture; pyrotechnics; rodenticide.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label. Legal label name: arsenic sulfide.

arsenic hydride. See arsine.

arsenic pentafluoride AsF_5 . A gas; b.p. –52.8°C.

Grade: About 98%.

Containers: 50-g, 1-lb cylinders.

Hazard: Highly toxic by inhalation.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsenic pentasulfide As_2S_5 .

Properties: Yellow or orange powder. Soluble in nitric acid and alkalis; insoluble in water; decomposes to sulfur and the trisulfide when heated.

Derivation: By precipitation from arsenic acid in a hydrochloric acid solution with hydrogen sulfide. It is filtered, then dried.

Grades: Technical.

Containers: Barrels; boxes.

Hazard: Highly toxic by inhalation.

Uses: Paint pigments; blue fire; other arsenic compounds.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsenic pentoxide (arsenic oxide; arsenic anhydride; arsenic acid) As_2O_5 .

Properties: White, amorphous solid; deliquescent. Forms arsenic acid in water. Soluble in water, alcohol. Sp. gr. 4.086; m.p. 315°C.

Derivation: By action of oxidizing agent such as nitric acid on arsenious oxide.

Containers: Drums; cartons; boxes; tins.

Hazard: Highly toxic.

Uses: Arsenates; insecticides; dyeing and printing.

Shipping regulations: (Rail, Air) Poison label.

arsenic sesquioxide. See arsenic trioxide.

arsenic sulfide. Legal label name for arsenic disulfide (q.v.).

arsenic thioarsenate $\text{As}(\text{AsS}_4)$

Properties: Dry, free-flowing yellow powder; stable; high-melting. Insoluble in water and organic solvents but soluble in aqueous caustics.

Hazard: Highly toxic.

Uses: Scavenger for certain oxidation catalysts and thermal protectant for metal-bonded adhesives and coating resins.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsenic tribromide (arsenic bromide; arsenious bromide; arsenous bromide) AsBr_3 .

Properties: Yellowish-white hygroscopic crystals; sp. gr. 3.54 (25°C); m.p. 33°C; b.p. 221°C. Decomposed by water.

Derivation: Direct union of arsenic and bromine.

Hazard: Highly toxic.

Uses: Analytical chemistry; medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label. Legal label name: arsenic bromide.

arsenic trichloride (arsenic chloride; arsenious chloride; arsenous chloride; caustic arsenic chloride; fuming liquid arsenic) $AsCl_3$.

Properties: Colorless or pale yellow, oily liquid. Soluble in concentrated hydrochloric acid and most organic liquids; decomposed by water. Fumes in moist air. B.p. 130.5°C; m.p. -18°C; sp. gr. 2.163 (14/4°C); noncombustible.

Derivation: (a) By action of chlorine on arsenic; (b) by distillation of arsenic trioxide with concentrated hydrochloric acid.

Grades: Technical.

Containers: Bottles; 20-, 55-gal drums.

Hazard: Highly toxic; strong irritant to eyes and skin.

Uses: Intermediate for organic arsenicals (pharmaceuticals, insecticides).

Shipping regulations: (Rail, Air) Poison label.

arsenic triiodide (arsenous iodide; arsenious iodide; arsenic iodide) AsI_3 .

Properties: Orange-red shining crystalline scales or powder; unstable in sunlight or moisture; sp. gr. 4.70 (25°C); m.p. 146°C; sublimes when heated slowly. Soluble in alcohol, ether, carbon disulfide, chloroform, and benzene; soluble in water with hydrolysis.

Derivation: By the direct union of arsenic and iodine.

Hazard: Highly toxic.

Uses: Analytical chemistry; medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

arsenic trioxide (crude arsenic; white arsenic; arsenious acid; arsenious oxide; arsenous anhydride) As_2O_3 .

Properties: White, odorless, tasteless powder; slightly soluble in water; soluble in acids and alkalies; soluble in glycerin; sp. gr. 3.865; sublimes at 193°C.

Derivation: Smelting of copper and lead concentrates. Flue dust, to which pyrite or galena concentrates are added, yields As_2O_3 vapor. Condensation gives product of varying purity called crude arsenic (90-95% pure). A higher-purity oxide called white arsenic is obtained by resubliming the crude As_2O_3 (99+% pure).

Containers: Drums; barrels; carloads.

Hazard: Highly toxic by ingestion or dust inhalation. May be carcinogenic. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Pigments, ceramic enamels, aniline colors; decolorizing agent in glass; insecticide; rodenticide; herbicide; sheep and cattle dip; hide preservative; wood preservative; preparation of other arsenic compounds.

Shipping regulations: (Rail, Air) Poison label.

arsenic trisulfide (arsenious sulfide; arsenic sulfide, yellow; arsenous sulfide; arsenic tersulfide) As_2S_3 .

Properties: Yellow crystals or powder, changes to a red form at 170°C; sp. gr. 3.43; m.p. 300°C; insoluble in water and hydrochloric acid; dissolves in alkaline sulfide solutions and in nitric acid.

Derivation: Occurs in nature as the mineral orpiment. May be precipitated from arsenious acid solution by the action of hydrogen sulfide.

Grades: Technical; pigment; single crystals.

Hazard: Highly toxic.

Uses: Pigment; reducing agent; pyrotechnics; glass used for infrared lenses.

Shipping regulations: Arsenical compounds, n.o.s. Poison label.

arsine (arsenic hydride) AsH_3 .

Properties: Colorless gas; m.p. -113.5; b.p. -55°C; decomposes 230°C; soluble in water; slightly soluble in alcohol, alkalies.

Derivation: Reaction of aluminum arsenide with water or HCl; electrochemical reduction of arsenic compounds in acid solutions.

Grades: Technical; 99% pure or in mixture with other gases.

Containers: Steel cylinders.

Hazard: Highly toxic. Tolerance, 0.05 ppm in air.

Use: Organic synthesis; military poison gas; doping agent for solid state electronic components.

Shipping regulations: (Air) Not acceptable. (Rail) Poison gas, n.o.s. Poison Gas label. Not accepted by express.

arsphenamine. A specific for syphilis originally developed by Ehrlich, but no longer in use. It was a derivative of arsenic and benzene. See Ehrlich.

arthinol $C_{11}H_{14}NO_3S_2As$. Cyclic 3-hydroxypropylene ester of 3-acetamido-4-hydroxydithiobenzenearsonous acid.

Properties: White, odorless, microcrystalline powder; sparingly soluble in alcohol; very slightly soluble in water.

Hazard: Toxic in high concentrations.

Use: Medicine.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s. Poison label.

l-arterenol. See levarterenol.

"Artic."²⁸ Trademark for refrigeration grade of methyl chloride (q.v.).

artificial cinnabar. See mercuric sulfide, red.

artificial snow. A copolymer of butyl and isobutyl methacrylate, often dispersed from an aerosol bomb or other atomizing device; used in decorative window displays, etc. Man-made snow is crystallized water vapor made by mechanical means.

"Arubren CP."⁴⁷⁰ Trademark for a highly chlorinated aliphatic hydrocarbon compound used in rubber compounds to decrease flammability of vulcanizates.

arylalkyl. A compound containing both aliphatic and aromatic structures, e.g., alkyl benzenesulfonate. Also called aralkyl.

aryl. A compound whose molecules have the ring structure characteristic of benzene, naphthalene, phenanthrene, anthracene, etc., i.e., either the six-carbon ring of benzene or the condensed six-carbon rings of the other aromatic derivatives. For example, an aryl group may be phenyl, C_6H_5 or naphthyl ($C_{10}H_9$).

As Symbol for arsenic.

as- Abbreviation for asymmetrical; same as uns- (q.v.).

ASA. Abbreviation for acrylic ester-modified styrene-acrylonitrile terpolymer. See also "Luran S."

asarone. See 2,4,5-trimethoxy-1-propenylbenzene.

asbestos. A group of impure magnesium silicate minerals which occur in fibrous form. Colors: white, gray, green, brown. Sp. gr. 2.5. Noncombustible.

(1) Serpentine asbestos is the mineral chrysotile, a magnesium silicate. The fibers are strong and flexible

so that spinning is possible with the longer fibers. A microcrystalline form trademarked "Avibest" has been developed.

(2) Amphibole asbestos includes various silicates of magnesium, iron, calcium, and sodium. The fibers are generally brittle and cannot be spun but are more resistant to chemicals and to heat than serpentine asbestos.

(3) Amosite.

Occurrence: Yukon, Quebec, Vermont, Mexico, Arizona, California, North Carolina, Africa, Italy.

Hazard: Toxic by inhalation of dust particles. An active carcinogen. Tolerance, 5 fibers/cc of air more than 5 microns in length.

Uses: Fireproof fabrics; brake lining; gaskets; roofing compositions; electrical and heat insulation; paint filler; chemical filters; reinforcing agent in rubber and plastics; component of paper dryer felts; diaphragm cells.

ascaridole $C_{10}H_{16}O_2$ 1,4-Peroxido-para-menthene-2.

Properties: A liquid, naturally occurring peroxide; B.p. 84°C (5 mm); sp. gr. 1.011 (13/15°C); refractive index $n_{20/D}$ 1.4743.

Derivation: By vacuum distillation of chenopodium oil.

Hazard: Strong oxidizing agent; explodes on heating to 130°C or in contact with organic acids. Toxic by ingestion.

Uses: Initiator in polymerization; medicine.

Shipping regulations: (Rail) Peroxides, organic, liquid, Yellow label. (Air) Not acceptable.

"**Ascarite**."¹⁶ A trademark for sodium hydrate-asbestos absorbent, for rapid and quantitative absorption of carbon dioxide, in the determination of carbon in iron and steel by direct combustion method, and other analyses.

Grades: Mesh 8-20, 20-30.

ascorbic acid (L-ascorbic acid; vitamin C)

$\text{OCOCOH:COHCHCHOHCH}_2$. A dietary factor which must be present in the diet of man to prevent scurvy. It cures scurvy and increases resistance to infection. Ascorbic acid presumably acts as an oxidation-reduction catalyst in the cell. It is readily oxidized; citrus juices should not be exposed to air for more than a few minutes before use.

Properties: White crystals (usually plates, sometimes needles); m.p. 192°C ; soluble in water; slightly soluble in alcohol; insoluble in ether, chloroform, benzene, petroleum ether, oils, and fats; stable to air when dry. Nontoxic.

Sources: Food source: citrus fruits, tomatoes, potatoes, green leafy vegetables, other fruits and vegetables. Commercial source: Synthetic product made by fermentation of sorbitol.

Units: One international unit is equivalent to 0.05 mg of L-ascorbic acid.

Grades: U.S.P.; F.C.C.

Containers: Glass bottles; fiber cans; multiwall paper drums.

Uses: Medicine; nutrition; color fixing, flavoring, and preservative in meats and other foods; oxidant in bread doughs; abscission of citrus fruit in harvesting; reducing agent in analytical chemistry. The ferric, calcium and sodium salts are available for biochemical research.

ascorbic acid oxidase. An enzyme found in plant tissue which acts upon ascorbic acid in the presence of oxygen to produce dehydroascorbic acid.

Use: Biochemical research.

ascorbyl palmitate $C_{22}H_{38}O_7$. A white or yellowish-white powder having a citrus-like odor. M.p. $116-117^\circ$; soluble in alcohol, animal and vegetable oils; slightly soluble in water.

Derivation: Palmitic and L-ascorbic acids.

Grade: F.C.C.

Uses: Antioxidant for fats and oils; source of vitamin C; stabilizer; emulsifier.

-ase. A suffix characterizing the names of many enzymes, e.g., diastase, cellulase, cholinesterase, etc. However, the names of some enzymes end in -in (pepsin, rennin, papain).

"**Aseptoform**."¹⁹ Trademark for esters of para-hydroxybenzoic acid, such as "Aseptoform" methyl, "Aseptoform" propyl, "Aseptoform" butyl.

ash. Mineral content of a material remaining after complete combustion.

askarel. A generic descriptive name for synthetic electrical insulating (dielectric) material which when decomposed by the electric arc evolves only nonexplosive gases or gaseous mixtures. Examples are chlorinated aromatic derivatives, particularly pentachlorodiphenyl and trichlorobenzene, but also including pentachlorodiphenyl oxide, pentachlorophenylbenzoate, hexachlorodiphenylmethane, pentachlorodiphenyl ketone, and pentachloroethylbenzene. Nonflammable.

Uses: Insulating medium in transformers; dielectric fluid.

See also dielectric; transformer oil.

A.S.M. Abbreviation for American Society for Metals (q.v.).

asparagic acid. See aspartic acid.

L-asparaginase. An enzyme used in the treatment of certain types of leukemia. Produced by biochemical activity of certain bacteria. Yields are now in excess of 3500 units per gram of source.

asparagine (alpha-aminosuccinamic acid; beta-asparagine; althein; aspartamic acid; aspartamide)

$\text{NH}_2\text{COCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. The beta amide of aspartic acid, a nonessential amino acid, existing in the D(+) and L(-) isomeric forms as well as the DL-racemic mixture. L(-)-asparagine is the most common form. Nontoxic.

Properties L(-)-asparagine monohydrate: White crystals; m.p. $234-235^\circ\text{C}$; acid to litmus; nearly insoluble in ethanol, methanol, ether, and benzene; soluble in acids and alkalis.

Derivation: Widely distributed in plants and animals, both free and combined with proteins.

Uses: Biochemical research; preparation of culture media; medicine.

asparaginic acid. See aspartic acid.

1-L-asparaginyl-5-L-valyl angiotensin octapeptide. See angiotensin amide.

aspartamic acid. See asparagine.

aspartamide. See asparagine.

aspartic acid (asparaginic acid; asparagic acid; amino-succinic acid) $\text{COOHCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A natu-

rally occurring nonessential amino acid. The common form is L(+)-aspartic acid. Nontoxic.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether; optically active.

DL-aspartic acid: M.p. 278–280°C with decomposition; sp. gr. 1.663 (12/12°C).

L(+)-aspartic acid: M.p. 251°C.

D(-)-aspartic acid: M.p. 269–271°C with decomposition; sp. gr. 1.6613.

Source: Young sugar cane; sugar beet molasses.

Derivation: Hydrolysis of protein; reaction of ammonia with diethyl fumarate.

Uses: Biological and clinical studies; preparation of culture media; organic intermediate; dietary supplement; detergents; fungicides; germicides; metal complexation; synthetic sweetener base (L-form).

Available commercially as D(-), L(+), and DL-aspartic acid.

aspartocin. USAN for antibiotic produced by *Streptomyces griseus*.

aspergillie acid $C_{12}H_{20}N_2O_2$. 2-Hydroxy-3-isobutyl-6-(1-methylpropyl)pyrazine 1-oxide. An antibiotic from strains of *Aspergillus flavus*. Nontoxic.

Properties: Solid. M.p. 97°C; insoluble in cold water; soluble in common organic solvents and dilute acids. Hydrochloride melts at 178°C and is soluble in water.

asphalt (petroleum asphalt, Trinidad pitch, mineral pitch). A dark-brown to black cementitious material, solid or semisolid in consistency, in which the predominating constituents are bitumens, which occur in nature as such or are obtained as residua in petroleum refining (ASTM). It is a mixture of paraffinic and aromatic hydrocarbons and heterocyclic compounds containing sulfur, nitrogen, and oxygen.

Properties: Black solid or viscous liquid; sp. gr. about 1.0; soluble in carbon disulfide. Flash point 450°F; autoignition temp. 900°F; solid softens to viscous liquid at about 200°F; penetration value (paving) 40–300 (roofing) 10–40. Good electrical resistivity. Combustible; low toxicity.

Occurrence: California, Trinidad, Venezuela, Cuba, Canada (Athabasca tar sands).

Containers: Drums, barrels, tank trucks, tank cars.

Uses: Paving and road-coating; roofing; sealing and joint filling; special paints; adhesive in electrical laminates and hot-melt compositions; diluent in low-grade rubber products; fluid loss control in hydraulic fracturing of oil wells; medium for radioactive waste disposal; pipeline and underground cable coating; rust-preventive hot-dip coatings; base for synthetic turf; water-retaining barrier for sandy soils; supporter of rapid bacterial growth in converting petroleum components to protein.

See also bacteria; protein; asphalt, blown.

asphalt, blown (mineral rubber, oxidized asphalt, condensed asphalt). Black, friable solid obtained by blowing air at high temperature through petroleum-derived asphalt, with subsequent cooling. Penetration value 10–40; softening point 185–250°F. Combustible. Uses are primarily roofing, as diluent in low-grade rubber products, and as thickener in oil-based drilling fluids. Shipped in 55-gal. metal drums. For further information on asphalt, refer to the Asphalt Institute, 1270 Avenue of the Americas, New York, N.Y.

asphalt, cut-back. A liquid petroleum product, produced by fluxing an asphaltic base with suitable distillates. (A.S.T.M.)

Properties: Flash point (open cup) 50°F. Solubility

of residue from distillation in carbon tetrachloride 99.5%.

Hazard: Flammable, dangerous fire hazard.

Use: Road surfaces.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

asphaltene. A component of the bitumen in petroleum, petroleum products, malthas, asphalt cements, and solid native bitumens, soluble in carbon disulfide but insoluble in paraffin naphthas. (A.S.T.M.)

asphalt, liquid. See residual oil; asphalt.

asphalt, oxidized. See asphalt, blown.

asphalt paint. Asphaltic base in a volatile solvent with or without drying oils, resins, fillers, and pigments. Ground asbestos is frequently used as a component of heavy asphaltic paints for roofing and waterproofing purposes.

Hazard: Flammable; dangerous fire risk.

asphyxiant gas. A gas which has little or no positive toxic effect but which can bring about unconsciousness and death by replacing air and thus depriving an organism of oxygen. Among the so-called asphyxiant gases are carbon dioxide, nitrogen, helium, methane, and other hydrocarbon gases.

aspidospermine $C_{22}H_{30}O_2N_2$.

Properties: White to brownish-yellow crystalline alkaloid. M.p. 108°C; b.p. 200°C (1 to 2 mm); sublimes at 180°C under reduced pressure. Soluble in fats and fixed oils; sparingly soluble in absolute alcohol and ether. Its sulfate and hydrochloride are soluble in water.

Hazard: Moderately toxic by ingestion.

Use: Medicine.

aspirin (acetylsalicylic acid; ortho-acetoxybenzoic acid). $CH_3COOC_6H_4COOH$.

Properties: White crystals or white, crystalline powder. Odorless; slightly bitter taste. Stable in dry air; slowly hydrolyzes in moist air to salicylic and acetic acids. Soluble in water, alcohol, chloroform, and ether; less soluble in absolute ether. Dissolves with decomposition in solutions of alkali hydroxides and carbonates. M.p. 132–136°C; b.p. 140°C (dec.).

Derivation: Action of acetic anhydride on salicylic acid.

Method of purification: Crystallization.

Grades: Technical, U.S.P.

Containers: 25-lb boxes; 25-, 100-, 250-lb drums.

Hazard: An allergen; may cause local bleeding, especially of the gums; 10-gram dosage may be fatal. Dust dispersed in air is serious explosion risk.

Use: Medicine (anodyne).

"Aspon." Trademark for a concentrate of tetra-n-propyl dithionopyrophosphate, a liquid insecticide.

assay. Determination of the content of a specific component of a mixture, with no evaluation of other components. Such determinations are made on ores of various metals (especially precious metals), on pharmaceutical products to validate the amount of drug present in a given unit, and on organisms (bacteria) to determine their reactions to an antibiotic or insecticide. The latter procedure is called bioassay. Ores are assayed by heat fractionation, organic materials by solvent extraction and chemical separation.

assistant. A term loosely used in the textile industry for any chemical compound that aids in a processing step, e.g., scouring, dyeing, bleaching, finishing, etc. See also auxiliary; dyeing assistant.

association. A reversible chemical combination due to any of the weaker classes of chemical bonding forces. Thus the combination of two or more molecules due to hydrogen bonding, as in the union of water molecules with one another, or of acetic acid molecules with water molecules, is called association; also, combination of water or solvent molecules with molecules of solute or with ions, i.e., hydrate formation, or solvation. Formation of complex ions or chelates, as copper ion with ammonia or copper ion with 8-hydroxyquinoline, are other examples. Aqueous solutions of soaps or synthetic detergents are often called association colloids.

A-stage resin (resole; one-step resin). An alkaline catalyzed thermosetting phenol-formaldehyde type resin consisting primarily of partially condensed phenol alcohols. At this stage the product is fully soluble in one or more common solvents (alcohols, ketones) and is fusible at temperatures below 150°C. On further heating and without use of a catalyst or additive, the resin is eventually converted to the insoluble, infusible cross-linked form (C-stage). The A-stage resin is a constituent of most commercial laminating varnishes, and is also used in special molding powders. See B-stage resin, C-stage resin, novolak; phenol-formaldehyde resin.

astatine At Element of atomic number 85. Group VIIA of Periodic Table; atomic weight 211. Heaviest number of the halogen family. It has 20 isotopes, all radioactive; derived by alpha bombardment of bismuth. The two most stable isotopes have half-lives of about 8 hours. Astatine occurs in nature to the extent of about one ounce in entire earth's crust. Like iodine, it concentrates in the thyroid gland. Its use in medicine is still experimental.

"Asterol" Dihydrochloride.¹⁹⁰ Trademark for a brand of diamthazole dihydrochloride (q.v.).

A.S.T.M. Abbreviation for American Society for Testing and Materials (q.v.).

"Aston 108."³²⁸ Trademark for a thermosetting polyamine, 20% active.

Uses: Durable antistatic agents; softeners.

Aston, Francis William (1877–1945). This noted English chemist and physicist carried out much of his work with J. J. Thomson at Cambridge. He was the pioneer investigator of isotopes and his method of separating the lighter from the heavier atomic nuclei provided the technique that later developed into the mass spectroscopy, which utilizes a magnetic field for this purpose. Aston received the Nobel prize for this discovery in 1922, just three years after Rutherford performed the first transmutation of elements. Aston also correctly estimated the energy content of a hydrogen atom and predicted the controlled release of this energy.

"Astracel."¹⁰⁷ Trademark for a group of fast dyes for union shades on polyester-carbon blended fabrics.

astrochemistry. Strictly, the application of radioastronomy (microwave spectroscopy) to determination of the existence of chemical entities in the gas clouds of interstellar space.

Astrochemistry also includes the occurrence of elements and compounds in celestial bodies, including their atmospheres. Such data have been obtained from spectrographic study of the light from the sun and stars, from analysis of meteorites, and from

actual samples from the moon. The most abundant element is hydrogen. Over 25% of the elements, including carbon, have been identified, as well as water, carbon dioxide, ammonia, and the following organic compounds: ethane, methane, acetylene, formaldehyde, formic acid, methyl alcohol, hydrogen cyanide, carbon monoxide and acetonitrile. When applied to the planets only, the science is called chemical planetology (q.v.).

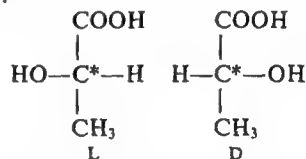

"Astrol."³⁰⁷ Trademark for a group of fast alizarin direct blues.

"Astrosil."⁵⁴⁰ Trademark for a flexible silica fabric (over 99% SiO₂).

Properties: High-temperature resistance, 2000°F; low expansion coefficients; excellent ablation characteristics; resembles fiber glass fabrics in appearance; compatible with phenolics, polyesters, epoxies and can be impregnated on either horizontal or vertical coating equipment.

Uses: Nose cones, heat shields, nozzle exit cones, blast shields, liquid propulsion ablative chambers; furnace insulation; diffusion bonding blankets; brazing applications; liquid, gas and molten metal filtration; die lubricant for metal extrusion; conformable seal for soaking pit covers.

asymmetry. A molecular structure in which an atom having four tetrahedral valences is attached to four different atoms or groups. The most common cases involve the carbon atom, though they may exist also with other elements such as nitrogen and sulfur. An example of this structure is lactic acid, which contains one asymmetric carbon (indicated by *). In such cases two optical isomers (L and D enantiomers) result which are nonsuperposable mirror images of each other:

Amino acids are also characterized by asymmetric carbons. Many compounds have more than one asymmetric carbon, e.g., tartaric acid, sugars, terpenes, etc. This results in the possibility of many optical isomers, the number being determined by the formula 2^n , where n is the number of asymmetric carbons. See also optical isomer; enantiomer; glyceraldehyde.

At Symbol for astatine.

"Atabrine" Hydrochloride.¹⁶² Trademark for quina-crine hydrochloride (q.v.).

atactic. A type of polymer molecule in which substituent groups or atoms are arranged randomly above and below the backbone chain of atoms, when the latter are all in the same plane. See polymer, stereospecific.

"Atarax."²⁹⁹ Trademark for hydroxyzine hydrochloride (q.v.).

-ate. A suffix having two different meanings. (1) In inorganic compounds it indicates a salt whose metal or radical is in the highest oxidation state, as calcium sulfate, ammonium nitrate, etc. (2) In engineering terminology it means "result of," as in precipitate, condensate, alkylate, distillate, etc.

ATE. Abbreviation for aluminum triethyl. See triethyl aluminum.

"Atlac."⁸⁹ Trademark for a series of polyester resins for use in reinforced plastics.

"Atlacide."¹⁴⁷ Trademark for herbicide containing 58% sodium chlorate.

"Atlas."¹⁴⁷ Trademark for a series of pesticides containing various amounts of sodium arsenite.

Hazard: Highly toxic by ingestion.

"Atlavon."⁴¹ Trademark for synthetic-resin sheet lining of the plasticized polyvinyl chloride type used to protect steel tanks at temperatures up to 160°F without brick sheathing. Outstanding resistance to oxidizing acids.

"Atlatic 31."⁴¹ Trademark for a hot-melt asphaltic lining material used as a resilient membrane between concrete and acid brick sheathing.

"Atlox."⁸⁹ Trademark for series of emulsifiers developed for use with agricultural pesticides.

ATM. Abbreviation for aluminum trimethyl. See trimethyl aluminum.

atmosphere. (1) The pressure exerted by the air at sea level (14.696 psi), which will support a column of mercury 760 mm high (about 30 in.). This is standard barometric pressure, though it varies slightly with local meteorological conditions. It is often used to indicate working pressures of steam. The accepted abbreviation is atm.

(2) Any environmental gas or mixture of gases, e.g., an atmosphere of nitrogen, or an inert atmosphere.

(3) The air itself, as atmospheric oxygen.

atmosphere, controlled. As used in the technology of food preservation and storage, a gaseous environment in which the concentrations of oxygen, carbon dioxide and nitrogen are held constant at a specific level, the temperature also being controlled. CA storage techniques were introduced on a commercial scale in the U.S. in 1940.

atmospheric pollution. See air pollution.

"Atmul."⁸⁹ Trademark for a series of mono- and diglyceride emulsifiers used in baked goods and other food products.

atom. The smallest possible unit of an element, consisting of one or more protons and (except hydrogen) two or more neutrons located in the nucleus, and one or more electrons which revolve around it. The protons are positively charged; the neutrons have no charge; the electrons are negatively charged. As each atom contains the same number of protons as electrons, the atom is electrically neutral. Atoms of the various elements differ in mass (weight), that is, in the number of neutrons and protons, and also in the number of electrons. Atoms of a given element are identical, but an element may have atoms of slightly different masses, called isotopes (q.v.). Individual atoms of uranium and thorium have been resolved at 5 angstrom units in the scanning electron microscope. Motion pictures of uranium atoms at magnification of 7.5 million times have been made at the Enrico Fermi Institute at University of Chicago.

Atoms of the same or different elements combine to form molecules; when the atoms are of two or more different elements, these molecules are called compounds (q.v.). Atoms remain essentially unchanged in chemical reactions, except that some of the outermost electrons may be removed, shared,

or transferred, as occurs in oxidation, ionization, and chemical bonding. A few atomic species disintegrate as a result of nuclear changes, and thus become radioactive. Heavy, unstable atoms such as uranium-235 and plutonium can be split by bombardment with high-energy particles, yielding tremendous energy. See also electron, proton, bonding, orbital theory, ionization, radioactivity, fission.

atomic energy. See nuclear energy.

Atomic Energy Commission. See Energy Research and Development Administration.

atomic hydrogen welding. A method of welding in which hydrogen gas is passed through an arc between two tungsten electrodes. The arc breaks down the molecules to form atomic hydrogen. The recombination of the atoms to form molecules and the combustion of the molecular hydrogen in atmospheric oxygen produce a flame temperature of 4000-5000°C.

atomic number. The number of positive charges carried by the nucleus of an atom, which is equal to the number of negative charges represented by the electrons. With a few exceptions, it is the number of the element in the sequence obtained by arranging the elements in the order of increasing atomic weight. See also Periodic Table; mass number.

atomic theory. See Dalton, John.

atomic volume. The atomic weight of an element divided by its density.

atomic weight. The mass (q.v.) of an atom of an element compared with the mass of the carbon-12 isotope taken as the standard at 12. The carbon-12 standard results in atomic weights for natural carbon of 12.011 and for oxygen of 15.9994, because of the slight difference involved in averaging the weights of the isotopic forms. Official atomic weight designations are released periodically by the IUPAC.

ATP. Abbreviation for adenosine triphosphate.

"Atpet."⁸⁹ Trademark for a series of emulsifiers used in conjunction with oil as corrosion inhibitors, solubilizers for production of soluble cutting oils, and water-block removal agents in oil well drilling.

atrazine. Generic name for 2-chloro-4-ethylamino-6-isopropylamino-s-triazine; used as a herbicide, plant growth regulator and weed-control agent for corn etc., and for noncrop and industrial sites.

atropamine. See apatropine.

atropine (daturine) C₁₇H₂₃NO₃. An alkaloid obtained from species of *Atropa*, *Datura* or *Hyoscyamus*.

Properties: White crystals or white crystalline powder; optically inactive (but usually contains levorotatory hyoscyamine). Soluble in alcohol, ether, chloroform, and glycerol. Slightly soluble in water. M.p. 114-116°C.

Derivation: By extraction from *Datura stramonium*, or synthetically.

Grades: Technical; N.F.

Hazard: Toxic. An allergen.

Use: Medicine; antidote for cholinesterase-inhibiting compounds (organophosphorus insecticides, nerve gases); artificial respiration is also necessary.

attapulgit. (Mg,Al)₂Si₈O₂₂(OH)₄·4H₂O. A hydrated aluminum-magnesium silicate, the chief ingredient of fuller's earth (q.v.). See also clay.

Uses: Drilling fluids; decolorizing oils; filter medium.

attar (otto) An essential oil (fragrance) made by steam distillation of flowers, especially roses. See essential oil; perfume; rose oil.

atto-. Prefix meaning 10^{-18} unit (symbol a). E.g., 1 ag = 1 attogram = 10^{-18} gram.

Au Symbol for gold, from Latin *aurum*.

"Aura."¹⁰⁸ Trademark for a powdered, chlorinated, alkaline polyphosphate detergent for mechanical dishwashing.

auramine $(\text{CH}_3)_2\text{NC}_6\text{H}_4(\text{C}:\text{NH})\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$.
Properties: Yellow flakes or powder; soluble in water, alcohol, and ether.
Uses: Yellow dye for paper, textiles, leather; also an antiseptic; fungicide.

"Aurantiol."²²⁷ $\text{C}_{18}\text{H}_{27}\text{O}_3\text{N}$. Trademark for hydroxycitronellal-methyl anthranilate Schiff base (methyl N-3,7-dimethyl-7-hydroxyoctylidene-anthranilate).

aureolin. See Indian yellow.

"Aureomycin."³¹⁵ Trademark for chlortetracycline hydrochloride. An antibiotic. Must conform to FDA requirements.

"Auric."²⁸ Trademark for a ferric oxide brown pigment.

auric and aurous compound. See corresponding gold compound.

aurin (para-rosolic acid) $(\text{C}_6\text{H}_4\text{OH})_2\text{CC}_6\text{H}_4\text{O}$. A tri-phenylmethane derivative.

Properties: Reddish-brown pieces with greenish metallic luster; easily powdered; insoluble in water, benzene, and ether; soluble in alcohol.

Hazard: May be toxic.

Uses: Indicator; dye intermediate.

austenite. A component of steel; a nonmagnetic solid solution of carbon or ferric carbide in gamma iron. Very unstable below its critical temperature, but may be obtained in high carbon steels by rapid quenching from high temperatures. Addition of manganese and nickel lowers critical transition temperature and stable austenite may be obtained at room temperature. Characterized by a face-centered cubic lattice.

austenitic alloys (austenitic steels). Alloys of iron, chromium, nickel noted for their resistance to corrosion.

Australian bark. See wattle bark.

autocatalysis. A catalytic reaction induced by a product of the same reaction. This occurs in some types of thermal decomposition, in autoxidation, and in many biochemical systems, as when an enzyme activates its own precursor. See also autoxidation.

autoclave. A chamber, usually of cylindrical shape, provided with a door or gate at one end which can be securely closed during operation. It is built heavily enough to accommodate steam pressures of considerable magnitude. It is used to effect chemical reactions requiring high temperature and pressure, such as open-steam vulcanization of rubber. Sizes vary from laboratory units to production size, which may be over 50 ft long and 3 or more feet in diameter; the latter are provided with baffles to ensure equal distribution of the entering steam. Autoclaves are also used in certain sterilization processes.

"Autoset."⁶⁵ Trademark for urea-formaldehyde resin for use as a binder in the manufacture of particle board.

autoignition point (ignition point). The minimum temperature required to initiate or cause self-sustained combustion in any substance in the absence of a spark or flame. Ignition temperature varies, depending upon the test method. Some approximate ignition temperatures are the following: acetone 1000°F, amyl acetate 750°F, aniline 1000°F, butane 806°F, carbon disulfide 212°F, ethyl ether 356°F, phenol 1319°F, toluene 1000°F, white pine shavings 507°F, cotton batting 446°F, magnesium powder (fine) 883°F, nitrocellulose film 279°F. (National Fire Protection Assn.) See also flash point.

automotive exhaust emission. See air pollution.

autoxidation. A spontaneous, self-catalyzed oxidation occurring in the presence of air; it usually involves a free-radical mechanism. It is initiated by heat, light, metallic catalysts, or free-radical generators. Industrial processes such as manufacture of phenol and acetone from cumene are based on autoxidation. Other instances are the drying of vegetable oils, the spoilage of fats, gum formation in lubricating oils, and the degradation of high polymers exposed to sunlight for long periods. See also autocatalysis.

auxiliary. Any of a number of chemical compounds used in some phase of textile processing. They may be classified as follows: (1) fats, oils, and waxes; (2) starches, gums, and glues (sizing); (3) soaps and detergents; (4) inorganic chemicals (bleaching, mercerizing); (5) organic solvents; (6) special-purpose products (flameproofing, mildew-proofing, repellent and decorative coatings, and permanent press resins). They are sometimes also called assistants.

auxin. A natural or synthetic plant growth hormone that regulates longitudinal cell structure so as to permit bending of the stalk or stem in phototropic response. The natural materials are formed in small amounts in the green tips of growing plants, in root tips, and on the shaded side of growing shoots. 3-Indoleacetic acid (q.v.), is the most important natural auxin. See also plant growth regulator.

auxochrome. A radical or group of atoms whose presence is essential in enabling a colored organic substance to be retained on fibers. The best examples are the groups $-\text{COOH}$, $-\text{SO}_3\text{H}$, $-\text{OH}$ and $-\text{NH}_2$.

"AV20."⁵⁰⁷ Trademark for a vitreous, 85% pure alumina, used in ceramics. Impervious to gas; compressive strength 250,000 psi; max. service temperature 2550°F; hardness (Mohs) 8.5. Fabricated by dry press or extrusion methods.

"Avadex."⁵⁸ Trademark for a series of liquid or granular herbicides containing 2,3-dichloroallyl diisopropylthiocarbamate. Widely used to control growth of wild oats in agricultural crops.
Hazard: May be toxic by ingestion and inhalation.

"Availaphos."⁶² Trademark for a mineral supplement supplying phosphorus and calcium in readily available form for animal and poultry feeds.

"Avertin."¹⁶² Trademark for tribromoethanol solution of amylene hydrate. An anesthetic (q.v.).

aviation gasoline. See gasoline.

"Avibest."⁵⁵ Trademark for a microcrystalline form of asbestos.

"Avicel."²⁶¹ Trademark for microcrystalline cellulose, a highly purified particulate form of cellulose; particle size ranges from <1 to 150 microns, average varies with grade; density 1.55 (bulk density 0.3–0.5). Insoluble in dilute acid, organic solvents, oils; swells in dilute alkali. Dispersible in water to form stable gels or pourable suspensions. Adsorbs oily and syrupy materials.

Uses: Aid to stabilization and emulsification; ingredient in foods; suspending agent; binder and hardening agent in tabletting; separatory medium in column and thin-layer chromatography; pure cellulose raw material.

avidin. A protein occurring in egg white, where it comprises about 0.2% of the total protein. It has the property of combining firmly with biotin (q.v.) and rendering it unavailable to organisms, since proteolytic enzymes do not destroy the avidin-biotin complex. Avidin loses its ability to combine with biotin when subjected to heat; hence cooked egg white does not lead to biotin deficiency.

Hazard: Toxic by ingestion, but inactivated by heat.

"Aviron."⁴⁴³ Trademark for metal-complex dyes for polyamide fibers.

"Avisun."⁴²⁹ Trademark for polypropylene resin; molecular weight 100,000–500,000; sp. gr. 0.90–0.92; m.p. 347°F. Available in a variety of molding and film grades.

"Avitene."⁵⁵ Trademark for a microcrystalline form of collagen (q.v.).

"Avitex."⁷²⁸ Trademark for a group of textile softeners, lubricants, and antistatic agents. Both anionic and cationic types.

"Avitone."⁷²⁸ Trademark for a group of chemical compounds based on hydrocarbon sodium sulfonates that are used principally as softening, lubricating, and finishing agents for textiles, leather, and paper.

avocado oil. An edible oil high in unsaturated fatty acids.

Properties: Sp. gr. 0.91; acid value 1–7; saponification value 177–198; iodine value 71–95; solidification temp. 7–9°C; refractive index (40°C), 1.461–1.465. Faint odor, bland taste, greenish color. Non-toxic.

Source: Pulp of the avocado, *Persea americana*; occurs naturally in Central America; cultivated in Brazil, California, Florida, West Indies, Hawaii.

Chief constituents: Oleic, palmitic and linoleic acids.

Containers: Drums.

Uses: Cosmetic creams; hair conditioners; suntan preparations; salad oils.

Avogadro's law. A principle stated in 1811 by the Italian chemist Amadeo Avogadro (1776–1856), namely, that equal volumes of gases at the same temperature and pressure contain the same number of molecules, regardless of their chemical nature and physical properties. This number (Avogadro's number) is 6.023×10^{23} ; it is the number of molecules of any gas present in a volume of 22.41 liters, and is the same for the lightest gas (hydrogen) as for a heavy gas such as CO₂ or Br₂. Avogadro's number is one of the fundamental constants of chemistry. It permits calculation of the amount of pure substance (mole), which is the basis of stoichiometric relationships. It also makes possible determination of how much heavier a simple molecule of one gas is than that of another, as a

result of which the relative molecular weights of gases can be ascertained by comparing the weights of equal volumes. Avogadro's number (conventionally represented by *N* in chemical calculations) is now considered to be the number of atoms present in 12 grams of the carbon-12 isotope (one mole of carbon-12), and can be applied to any type of chemical entity. See also mole.

"Avolin."¹⁸⁸ C₆H₄(COOCH₃)₂. Trademark for a special perfume grade of dimethyl phthalate (q.v.).

"Avril."²⁶¹ Trademark for a high wet modulus rayon fiber, usually marked in various blends with other fibers.

A.Z. See 1,1'-azobisformamide.

aza- Prefix indicating the presence of nitrogen in a heterocyclic ring.

3-azabicyclo(3,2,2)nonane C₈H₁₅N.

Properties: White-tan solid; m.p. 180°C (sublimes); partially soluble in water; solubility decreases with an increase in temperature. Readily soluble in alcohol; density 4.67 lb/gal (20°C).

Use: Intermediate for the preparation of pharmaceuticals and rubber chemicals.

"Azak."²⁶⁶ Trademark for an herbicide, 2,6-di-tert-butyl-p-tolyl methylcarbamate (q.v.).

azathioprine (Imuran). An immunosuppressive drug administered for the purpose of inhibiting the natural tendency of the body to reject foreign tissues by one or more types of immunizing reactions, i.e., formation of leucocytes or antibodies. It has been used with some success in cases of kidney and liver transplants.

6-azauridine (6-azauracil riboside; as-triazine-3,5(2H, 4H)dione riboside).

Derivation: Microbiological fermentation.

Use: Research on cell formation and cancer.

azelaic acid (nonanedioic acid; 1,7-heptanedicarboxylic acid). COOH(CH₂)₇COOH.

Properties: Yellowish to white crystalline powder; m.p. 106°C; b.p. 365°C (decomp.); soluble in hot water, alcohol, and organic solvents. Low toxicity.

Derivation: Oxidation of oleic acid by ozone.

Grades: Technical.

Uses: Organic synthesis; lacquers; production of hydrotropic salts; alkyd resins; polyamides; polyester adhesives; low-temperature plasticizers; urethane elastomers.

azelaoyl chloride ClOC(CH₂)₇COCl.

Properties: B.p. 125–130°C (3 mm). Slowly decomposes in cold water; soluble in hydrocarbons and ethers.

Uses: Organic synthesis.

azeotrope. See azeotropic mixture.

azeotropic distillation. A type of distillation in which a substance is added to the mixture to be separated in order to form an azeotropic mixture with one or more of the components of the original mixture. The azeotrope or azeotropes thus formed will have boiling points different from the boiling points of the original mixture and will permit greater ease of separation.

azeotropic mixture (azeotrope). A liquid mixture of two or more substances which behaves like a single substance in that the vapor produced by partial evaporation of liquid has the same composition as the liquid. The constant boiling mixture exhibits either a

maximum or minimum boiling point as compared with that of other mixtures of the same substances.

azide. Any of a group of compounds having the characteristic formula $R(N_3)_x$. R may be almost any metal atom, a hydrogen atom, a halogen atom, the ammonium radical, a complex $[Co(NH_3)_6]$, $[Hg(CN)_2M]$ with $M = Cu, Zn, Co, Ni$ an organic radical (e.g., methyl, phenyl, nitrophenol, dinitrophenol, *p*-nitrobenzyl, ethyl nitrate, etc.), and a variety of other groups or radicals. The azide group has a chain structure ($N=N=N$) rather than a ring structure. All the heavy metal azides, hydrogen azide, and most if not all of the light metal azides (under appropriate conditions) are explosive; they should be handled with utmost care and protected from light, shock, and heat. Many of the organic azides are also explosive. See also lead azide, hydrogen azide.

aziminobenzene. See 1,2,3-benzotriazole.

azine dye. A class of dyes derived from phenazine ($C_6H_4N_2C_6H_4$) (tricyclic). The chromophore group may be $>C=N-$; but the color is probably due to the characteristic unsaturation of the benzene rings. The members of the group are quite varied in application. The nigrosines (Colour Index 50415-50440) and safranines (Colour Index 50200-50375) are examples of this group. See also dye, synthetic.

aziphos. See methyl aziphos.

1-aziridineethanol (*N*-(2-hydroxyethylethyleneimine)
 $C_2H_4NCH_2CH_2OH$. Colorless liquid; b.p. 167.9°C; flash point 185°F (open cup). Combustible.
Handling: Inhibited with 1-3% dissolved sodium hydroxide.
Hazard: Toxic. Irritant to skin and eyes.
Use: Chemical intermediate.

aziridine. A compound based on the ring structure

$\begin{array}{c} \text{CH}_2\text{NHCH}_2 \\ | \quad | \\ \text{CH}_2 \quad \text{CH}_2 \end{array}$. See ethyleneimine, which is aziridine itself; ethylethyleneimine; propyleneimine; polypropyleneimine; 1-aziridineethanol.

azlon. Generic name for a manufactured fiber in which the fiber-forming substance is composed of any regenerated naturally occurring protein (Federal Trade Commission). Proteins from corn, peanuts and milk have been used. Azlon fiber has a soft hand, blends well with other fibers, and is used, in general, like wool. Combustible.

azobenzene (diphenyldiimide; benzeneazobenzene)
 $C_6H_5N_2C_6H_5$.

Properties: Yellow or orange crystals; m.p. 68°C; b.p. 297°C; sp. gr. 1.203 (20/4°C); soluble in alcohol and ether; insoluble in water. Combustible.
Derivation: Reduction of nitrobenzene with sodium stannite.
Hazard: Moderately toxic.
Use: Manufacture of dyes, and rubber accelerators; fumigant; acaricide.

azobenzene-para-sulfonic acid $C_{12}H_{10}O_3N_2S$.

Properties: Orange crystals; m.p. 129°C.
Hazard: Moderately toxic.
Uses: Intermediate and reagent chemicals.

1,1'-azobisformamide (AZ; azodicarbonamide)
 $H_2NCONNCONH_2$.

Properties: Yellow powder; sp. gr. (20/20°C) 1.65;

m.p., above 180°C (dec.); insoluble in common solvents; soluble in dimethyl sulfoxide. Nontoxic. Hydrolyzes at high temperatures to nitrogen, carbon dioxide, and ammonia.

Derivation: From hydrazine.

Grades: Technical, F.C.C.

Uses: Blowing agent for plastics and rubbers; maturing agent for flours.

azobisisobutyronitrile $(CH_3)_2C(CN)NNC(CN)(CH_3)_2$.

Properties: White powder; m.p. 105°C (dec); insoluble in water; soluble in many organic solvents and in vinyl monomers.

Containers: Fiber drums.

Hazard: May be toxic by ingestion.

Uses: Catalyst for vinyl polymerizations and for curing unsaturated polyester resins; blowing agent for plastics.

"Azocel."⁵⁵² Brand name for 1,1'-azobisformamide (q.v.).

azodicarbonamide. See 1,1'-azobisformamide.

azouline (benzeneazonaphthylethylenediamine)
 $C_{18}H_{18}N_4$.

Properties: Red crystals; m.p. 107-108°C.

Use: Reagent for rapid determination of penicillin in blood, urine and other media.

"Azodrin" Insecticide.¹²⁵ Trademark for dimethyl phosphite of 3-hydroxy-*N*-methyl-*cis*-crotonamide, $(CH_3O)_2P(O)OC(CH_3):CHC(O)NHCH_3$.

Properties: Reddish brown solid with a mild ester odor; b.p. 125°C; soluble in water and alcohol; very slightly soluble in kerosene and diesel fuel. Commercially available as a water-miscible solution.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Flammable, dangerous fire risk. Use may be restricted.

Uses: Controls certain insects which attack cotton plants.

azo dye. A synthetic dye that has $-N=N-$ as a chromophore group in its molecular structure and is produced from amino compounds by the processes of diazotization and coupling. Over half of the commercial dyestuffs are in this general category. By varying the chemical composition it is possible to produce acid, basic, direct, or mordant dyes. This general group is subdivided as monoazo, disazo, trisazo, and tetrazo according to the number of $-N=N-$ groups in the molecule. Examples are Chrysoidine Y. Bismarck Brown 2R and Direct Green B. See also dye, synthetic.

azoic dye. An insoluble azo dye made on or in the fiber, except direct dyes that are further developed on the fiber. Formerly called developed, ice, or ingrain colors. See also dye, synthetic.

azophenylene. See phenazine.

"Azosol."³⁰⁷ Trademark for a series of dyestuffs; soluble in organic solvents.

Uses: Coloring spirit lacquers and spirit inks.

azosulfamide (disodium 2-(4'-sulfamylphenylazo)-7-acetamido-1-hydroxynaphthalene-3,6-disulfonate)

$C_{18}H_{14}N_4Na_2O_{10}S_3$.

Properties: Dark red, odorless, tasteless powder. Soluble in water with an intense red color; practically insoluble in organic solvents.

Use: Medicine.

azote. The French word for nitrogen (*a* = not, plus *zoo* = alive, as in *zoon* = animal). Nitrogen-bearing compounds can be recognized by this root word as in such terms as *azo*, *azide*, *azobenzene*, *carbazole*, *thiazole*, etc. The derivation is due to the chemical inertness of nitrogen.

azotic acid. See nitric acid.

azoxytoluidine. See diaminoazoxytoluene.

azulene $C_{16}H_{26}O$. The blue coloring matter of chamomile, wormwood and other essential oils. A terpene.

Properties: Blue, oily liquid; b.p. 170°C ; sp. gr. 0.987; insoluble in water.

Use: Cosmetics.

azure blue. See cobalt blue.

azuresin (azure A carbacrylic resin).

Properties: Moist, irregular, dark blue or purple granules. Slightly pungent odor.

Derivation: Carbacrylic cation-exchange resin, in reversible combination with 3-amino-7-dimethylaminophenazathionium chloride (azure A dye).

Grade: N.F.

Use: Medicine (diagnostic test).

B

B Symbol for boron.

Ba Symbol for barium.

Ba-137. See cesium 137.

babassu oil. A nondrying, edible oil expressed from the kernels of the Babassu palm which grows in profusion in Brazil.

Composition: 44% lauric acid, 15% myristic acid, 16% oleic acid, balance mixed acids. Usable in foods and soap-making, but supply is limited by cost of exploitation of large quantities potentially available. Combustible; nontoxic.

Babbitt metal. One of a group of soft alloys used widely for bearings. They have good bonding characteristics with the substrate metal, maintain oil films on their surfaces and are nonseizing and antifricition. Used as cast, machined or preformed bimetallic bearings in the form of a thin coating on a steel base; the main types are lead base, lead silver base, tin base, cadmium base, and arsenical. The latter contains up to 3% arsenic.

Hazard: Dust may be toxic by inhalation.

Babcock test. A rapid test for butterfat in milk introduced by Stephen M. Babcock in 1890 and now in world-wide use in the dairy industry.

B acid. See 1-amino-8-naphthol-3,5-disulfonic acid.

"Baciferm."³¹⁹ Trademark for zinc bacitracin antibiotic feed supplement.

bacitracin. An antibiotic, of polypeptide structure, produced by the metabolic processes of *Bacillus subtilis*. It is effective against many Gram-positive bacteria, but ineffective against most aerobic Gram-negative bacteria.

Properties: White to pale buff, hygroscopic powder; odorless or with slight odor; bitter taste. Powder is stable to heat but solutions deteriorate at room temperature. Freely soluble in water; soluble in alcohol, methanol, and glacial acetic acid; insoluble in acetone, chloroform, and ether. Solutions are neutral or slightly acid to litmus. Nontoxic.

Grade: U.S.P., having a potency of about 40 to 50 units per milligram.

Use: Medicine; feed supplement.

bacitracin methylene disalicylate.

Properties: White to gray-brown powder. Slight unpleasant odor; less bitter than bacitracin. Soluble in water, pyridine, ethanol; less soluble in acetone, ether, chloroform, benzene; pH of saturated aqueous solution 3.5-5.0. Available also as the sodium salt.

Use: Antibiotic; food additive.

bacteria. A type of microorganism often composed of a single cell, in the form of straight or curved rods (bacilli), spheres (cocci), or spiral structures. Their chemical composition is primarily protein and nucleic acid. Some types, called anaerobic, are able to live and reproduce in the absence of air or oxygen;

aerobic types require oxygen. Filamentous bacteria are related to blue-green algae; molds that yield antibiotics (Actinomycetes) are of this type. Pathogenic bacteria are infectious organisms that cause such diseases as pneumonia, tuberculosis, syphilis, and typhus. The staining of bacteria for microscopic identification was originated by Koch. Bacteria are often classified as Gram-positive or Gram-negative (q.v.). Food spoilage is often induced by bacterial contamination; but there are many beneficial types of bacteria in the body, e.g., intestinal flora, that aid in metabolism. Bacteria rich in proteins can be produced by fermentation of animal wastes for feed supplements.

Uses: (1) Fermentation processes used in baking and the manufacture of alcohol, wine, vinegar, beer (yeast), and antibiotics (molds). See also (3).

(2) Fixation of atmospheric nitrogen in the soil.

(3) Reaction with hydrocarbons (methane and other paraffins) to yield proteins (yeasts).

(4) Purification of sewage sludge, activated by bacteria (see sewage sludge).

(5) Reaction with cellulose to form biopolymers (q.v.) and high-protein foodstuffs.

(6) Reaction with waste materials (coal and cement dusts, gasworks effluent) to release plant nutrients for inexpensive fertilizers (U.S.S.R.).

(7) Precipitation and concentration of uranium and some other metals by compounds obtained from bacteria grown on carbonaceous materials such as lignin and cellulose.

(8) Formation of azo compounds in soil treated with the herbicide propanil.

(9) Miscellaneous reactions, e.g., oxidation of pentaerythritol to tris (hydroxymethyl) acetic acid; conversion of the sulfur in gypsum to elemental sulfur via hydrogen sulfide.

See also fermentation; virus; enzyme.

bactericide (germicide). Any agent that will kill bacteria, especially those causing disease. Bactericides vary greatly in their potency and specificity. They may be other organisms (bacteriophages), chemical compounds, or short-wave radiation. See also virus; antibiotic.

bacteriophage. A type of virus which attacks and destroys bacteria by surrounding and absorbing them.

bacteriostat. A substance which prevents or retards the growth of bacteria. Examples are quaternary ammonium salts and hexachlorophene. See also antiseptic.

baddeleyite (zirconia). ZrO_2 . A natural zirconium oxide. Properties: Color, black, brown, yellow, to colorless; streak white; luster submetallic to vitreous to greasy. M.p. 2500-2950°C. Highly resistant to chemicals. Sp. gr. 5.5-6.0.

Grades: Crude (53%, 73-75%); purified (98%).

Occurrence: Brazil; Ceylon.

Uses: Corrosion- and heat-resistant applications; source of zirconium.

Badische acid. See 2-naphthylamine-8-sulfonic acid.

Baekeland, L. H. (1863-1944). Born in Ghent, Belgium, did early research in photographic chemistry and invented Velox paper (1893). After working for several years in electrolytic research he undertook fundamental study of the reaction products of phenol and formaldehyde which culminated in his discovery in 1907 of phenol-formaldehyde polymers, originally called "Bakelite." The reaction itself had been investigated by Bayer in 1872, but Baekeland was the first to learn how to control it to yield dependable results on a commercial scale. The Bakelite Co. (now a division of Union Carbide) was founded in 1910. (See phenolformaldehyde resins).

bagasse. A form of cellulose derived as a by-product of the crushing of sugar-cane. Contains a high proportion of hemicellulose (q.v.). After pulping with either soda or kraft cooking liquor, it can be made into a low grade of paper. It is also used in compressed form as an insulating board in construction; medium for growth of nutritive bacteria; animal feeds; manufacture of furfural. See "Celotex".

Hazard: Toxic by inhalation of dust. Dust is flammable in high concentrations in air.

"Bairstat" 14E.^{440a} Trademark for an internal antistatic agent (q.v.) especially adapted for polyethylene and polypropylene. Chemically it is N,N-bis(2-hydroxyethyl)-alkyl amine. Approved for use in packaging films for food products.

bait. An insecticide or rodenticide placed in such a way as to attract the pest. Arsenic compounds and Bordeaux mixture are typical insect baits. All types are highly toxic. See pesticide.

"Bake Aid." Trademark for hydrated monocalcium phosphate.

Properties: White, free-flowing, crystalline powder. F.C.C. grade.

Use: "Rope" preventive in bread baking.

"Bakelite."²¹⁴ Trademark for polyethylene, polypropylene, epoxy, phenolic, polystyrene, phenoxy, parylene, polysulfone, ethylene copolymers, ABS, acrylics, and vinyl resins and compounds.

baking finish. A paint or varnish that requires baking at temperatures above 150°F for the development of desired properties (ASTM). Such finishes are based on oil-modified alkyd, melamine, epoxy, nitrocellulose or urea resins, or combinations of these; baking is often done by infrared radiation, producing high molecular weight coatings that are dense and tough.

baking powder. A synthetic leavening agent widely used in the baking industry. There are several types, all of which are composed of a carbonate, a weak acid or acidic compound, and a filler. A typical composition is sodium bicarbonate, tartaric acid or monobasic calcium phosphate, and cornstarch. Ingredients sometimes used are ammonium carbonate and potassium bitartrate. Upon contact with moisture and heat, the active ingredients react to evolve carbon dioxide, which "raises" the dough in the early minutes of heat exposure, thus producing a stable solid foam. Wheat flour gluten is sufficiently elastic to retain the bubbles of carbon dioxide.

baking soda. See sodium bicarbonate.

BAL. Abbreviation for British Anti-Lewisite. See 2,3-dimercaptopropanol.

"Balan."⁵³⁰ Trademark for benefin; a selective herbicide.

balance. Exact equality of the number of atoms of various elements entering into a chemical reaction and the number of atoms of those elements in the reaction products. For example, in the reaction $\text{NaOH} + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O}$, the atoms in the input side are hydrogen 2, sodium 1, oxygen 1, and chlorine 1; each of these is also present in the products, though in different combination. The atoms of catalysts (when present) do not enter into reactions, and therefore are not involved. The balance of chemical reactions follows the law of conservation of mass.

The term "material balance" is used by chemical engineers in designing processing equipment; it denotes a precise list of all the substances to be introduced into a reaction and all those that will leave it in a given time, the two sums being equal.

balata. See rubber, natural.

"Balco."¹¹⁵ Trademark for an alloy of 70% nickel and 30% iron.

Properties: Density, 8.46 g/cm³; resistivity, 20 ohm-μcm; tensile strength, 70,000 psi.

Uses: Square-loop laminated cores for magnetic amplifiers.

"Bali-Hi."⁷⁹ Trademark for a limed special dark wood resin.

Properties: Color "B"; m.p. (cap. tube) 105°C; s.p. (Ball & Ring) 127°C; acid number 42; 5% lime (approx.); sp. gr. (25/25°C) 1.13.

Use: Black and dark colored news inks.

"Ballast"¹⁵⁵ Trademark for an alloy composed of nickel 99.70%; cobalt, 0.08%; iron, 0.17%.

Properties: M.p. 1455°C; sp. gr. 8.90; tensile strength at 20°C 55,000 psi; resistivity at 20°C 7.90 microhm cm.

Uses: Electron tubes.

ball clay. A clay that has good plasticity, strong bonding power, high refractoriness and fires to a white or cream colored product. Used as bonding and plasticizing agents, or chief ingredients of whiteware, porcelains, stoneware, terra cotta, glass refractories; floor and wall tile. See also clay.

balsam. A resinous mixture of varying composition obtained from several species of evergreen trees or shrubs. Contains oleoresins, terpenes, and usually cinnamic and benzoic acids. All types are soluble in organic liquids and insoluble in water. Some have a penetrating, pleasant odor; they are combustible and in general non-toxic. The best-known types are:

(1) Peru balsam, from Central America, is a thick, viscous liquid (sp. gr. 1.15) containing vanillin. Used in flavoring, chocolate manufacture, as an ingredient in expectorants and cough syrups, and as a fragrance in shampoos and hair conditioners. A mild allergen. Shipped in drums.

(2) Tolu balsam, a plastic solid, is derived from a related tree in Colombia; its uses are similar to Peru balsam. Shipped in cans. Source of tolu oil. Odorless.

(3) Copaiba balsam, from Brazil and Venezuela (sp. gr. 0.94-0.99), is a viscous liquid used in varnishes and lacquers, as an odor fixative, and in medicine. It is the source of copaiba oil. Shipped in cans or drums.

(4) Balm of Gilead, from a Middle Eastern shrub, is used in perfumery and medicine. Shipped in bags.

(5) Canada balsam, from the North American balsam fir, is a liquid of sp. gr. 0.98; used in microscopy, in fine lacquers, as a flavoring, and as a fragrance.

- (6) Benzoin resin (Benjamin gum). See benzoin resin.
- bamboo.** A grass or plant native to southeast Asia having a rather high cellulose content which makes possible its use for specialty papers. Its fibers are longer than those of most other plants of this type, and are comparable to those of coniferous woods. Its composition is: total cellulose 58%, alpha-cellulose 35%, pentosans 28%, lignin 23%. Also used for making light furniture, fishing rods, etc. Combustible.
- "Bamca."**⁵⁰⁵ Trademark for a brand of substituted alpha-methylhydrocinnamic aldehyde.
Properties: Clear, slightly yellow liquid; sp. gr. 0.942; refractive index ($n_{20/D}$), 1.503; acid value 5.0; flash point T.C.C., 204°F. Combustible.
Use: Floral-type perfume.
- banana oil.**
(1) (banana liquid). A solution of nitrocellulose in amyl acetate or similar solvent, so termed because of its penetrating banana-like odor.
(2) Synonym for amyl acetate.
- band, absorption.** See absorption band.
- "Bandane."**³¹⁶ Trademark for polychlorodicyclopentadiene isomers; used as an herbicide.
- "Ban-Kal."**²⁰⁴ Trademark for a nonfoaming liquid acid cleaner for dairies and food-processing plants.
- "Banox."**¹⁰⁸ Trademark for a series of dry, powdered, phosphate-type corrosion inhibitors. No. 1 is artificially colored. No. 1-P and WT are colorless.
Uses: Refrigerator cars; refrigeration brine; cooling towers and small water systems.
- "Banthine."**⁷⁰ Trademark for methantheline bromide.
- Banting, Sir Frederick (1891-1941).** A native of Ontario, Banting did his most important work in endocrinology. His brilliant research culminated in the preparation of the antidiabetic hormone which he called insulin (q.v.), derived from the "isles of Langerhans" in the pancreas. He received the Nobel prize in medicine for this work, together with MacLeod of the University of Toronto. In 1930 the Banting Institute was founded in Toronto. He was killed in an airplane crash during World War II.
- "Banvel" D.**³¹⁶ Trademark for an herbicide containing 2-methoxy-3,6-dichlorobenzoic acid (dimethylamine salt).
- BAP.** Abbreviation for benzyl-para-aminophenol (q.v.).
- "Barafene."**²⁹³ Trademark for coatings used to prevent permeation of volatile ingredients, oils and oxygen through polyolefin containers.
- "Barafos."**²³⁶ Trademark for a polyphosphate compound for the treatment of drilling mud to reduce viscosity and gel strength.
- "Baragel."**²³⁶ Trademark for a compound of purified bentonite and an organic base.
Uses: Gelling agent for lubricating oils to prepare non-melting greases.
- "Barak."**²⁸ Trademark for dibutylammonium oleate, $(C_4H_9)_2NH_2COO(C_{17}H_{33})$.
Properties: Translucent, light brown liquid. Combustible.
Use: To activate accelerators and improve processing of rubber and synthetic rubbers.
- barban.** Generic name for 4-chloro-2-butynyl meta-chlorocarbaniolate, $C_6H_4(Cl)NHCOOCH_2C:CCH_2Cl$; herbicide and plant growth regulator.
- barberite.** A nonferrous alloy containing 88.5% copper, 5% nickel, 5% tin, 1.5% silicon. Sp. gr. 8.80; m.p. 1070°C. It offers good resistance to sulfuric acid in all dilutions up to 60%, sea water, moist sulfurous atmospheres, and mine waters.
- barbital (diethylmalonylurea; diethylbarbituric acid; "Veronal").** $C_8H_{12}N_2O_3$.
Properties: White crystals or powder; bitter taste; odorless; stable in air; m.p. 187-192°C; soluble in hot water, alcohol, ether, acetone, and ethyl acetate.
Derivation: By the interaction of diethyl ester or diethylmalonic acid and urea.
Grades: Technical; C.P.
Hazard: See barbiturate.
Use: Medicine (sedative); stabilizer for hydrogen peroxide.
See also barbiturate.
- barbiturate.** A derivative of barbituric acid (q.v.) which produces depression of the central nervous system and consequent sedation. Used (by prescription only) for sedative and anesthetic purposes.
Hazard: Toxic and habit-forming. Several types, including amo-, seco-, and pentobarbital are under government restriction.
- barbituric acid (malonylurea, pyrimidinetrione, 2,4,6-tri-oxohexahydro pyrimidine).**
 $OCNHCOCH_2CONH \cdot 2H_2O$.
Properties: White crystals, efflorescent; odorless; m.p. 245°C with some decomposition; slightly soluble in water and alcohol; soluble in ether. Forms salts with metals.
Derivation: By condensing malonic acid ester with urea.
Grades: Technical.
Containers: 1-, 5-lb glass bottles; tins.
Hazard: See barbiturate.
Uses: Preparation of barbiturates; polymerization catalyst; dyes.
- "Barden"**²⁸⁵ Trademark for a group of hydrous aluminum silicates (sedimentary kaolins) from South Carolina.
Properties: Sp. gr. 2.60; bulk density, aerated, 18-20 lbs/cu ft, packed, 35-40 lb/cu ft; creamy white; pH 4.5-5; air-floated; particle size 90% less than 2 microns.
Containers: 50-lb multiwall bags or bulk.
Uses: In pesticides; boxboard, flooring and tile adhesives, fertilizers, roofing granules, putties, caulking compounds, etc.
- "Bardol"**¹⁷⁵ Trademark for a coal-tar oil with aromatic content.
Properties: Dark-colored liquid; sp. gr. 1.07-1.12 (25/25°C); distillation at 300°C, 60% max; low viscosity at 40°F. Combustible.
Containers: 55-gal steel drums; tank trucks; tank cars.
Uses: Swelling agent for natural and synthetic elastomers; dispersing agent for blacks and mineral fillers; tackifier; plasticizer.
- barite (BaSO₄).** Natural barium sulfate (q.v.); barytes; heavy spar.

barium Ba Alkaline-earth element of atomic number 56, Group IIA of Periodic Table. Atomic weight 137.34. Valence 2. Seven stable isotopes.

Properties: Silver-white, somewhat malleable metal. Sp. gr. 3.6; values for melting and boiling points are reported ranging from 704°C to 850°C for m.p. and from 1140°C to 1637°C for b.p. The most acceptable values based on reliable original work appear to be m.p. 710°C and b.p. 1500°C. Extremely reactive; reacts readily with water, ammonia, halogens, oxygen, and most acids. Gives green color in flame. Extrudable and machinable.

Occurrence: Ores of barite and witherite (Georgia, Missouri, Arkansas, Kentucky, California, Nevada, Canada, Mexico).

Derivation: Reduction of barium oxide with aluminum or silicon in a vacuum at high temperature.

Forms: Rods, wire, plate, powder.

Grades: Technical; pure.

Hazard: Toxic. Flammable (pyrophoric) at room temperature in powder form; store under inert gas, petroleum, or other oxygen-free liquid. When heated to about 200°C in hydrogen, barium reacts violently, forming BaH₂. Tolerance for all soluble barium compounds is 0.5 mg per cubic meter in air.

Uses: Getter alloys in vacuum tubes; deoxidizer for copper; Frary's metal; lubricant for anode rotors in x-ray tubes; spark-plug alloys.

Shipping regulations: (Rail) Flammable solid, (n.o.s.) Yellow label. (Air) Flammable Solid label.

barium 137. See cesium 137.

barium acetate Ba(C₂H₃O₂)₂ · H₂O.

Properties: White crystals. Soluble in water; insoluble in alcohol. Sp. gr. 2.02; m.p., decomposes.

Derivation: Acetic acid is added to a solution of barium sulfide. The product is recovered by evaporation and subsequent crystallization.

Grades: Technical; C.P.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Chemical reagent; acetates; textile mordant; catalyst manufacture; paint and varnish driers.

Shipping regulations: (Air) Barium compounds, n.o.s., water- or acid-soluble: Poison label.

barium aluminate 3BaO · Al₂O₃.

Properties: Gray pulverized mass, soluble in water, acids.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Ceramics; water treatment.

Shipping regulations: See barium acetate.

barium azide Ba(N₃)₂. Crystalline solid; sp. gr. 2.936; loses nitrogen at 120°C; soluble in water; slightly soluble in alcohol.

Hazard: Toxic. Explodes when shocked or heated. Tolerance, see under barium.

Uses: High explosives.

Shipping regulations: (Air) Not acceptable when dry, or wet with less than 50% water. Wet with more than 50% water. Flammable Solid label. Not acceptable on passenger planes. (Rail) 50% or more water-wet. Yellow label.

barium binoxide. See barium peroxide.

barium borotungstate (barium borowolframite) 2BaO · B₂O₃ · 9WO₃ · 18H₂O.

Properties: Large, white crystals. Effloresces in air. Keep well stoppered! Soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Making borotungstates.

Shipping regulations: See barium acetate.

barium borowolframite. See barium borotungstate.

barium bromate Ba(BrO₃)₂ · H₂O.

Properties: White crystals or crystalline powder. Slightly soluble in water; insoluble in alcohol. Sp. gr. 3.820; decomposes at 260°C.

Derivation: By passing bromine into a solution of barium hydroxide, barium bromide and barium bromate being formed which are separated by crystallization.

Grades: Pure, reagent.

Hazard: Moderate fire risk in contact with organic materials. Toxic by ingestion. Tolerance, see under barium.

Uses: Analytical reagent; oxidizing agent.

Shipping regulations: See barium acetate.

barium bromide BaBr₂ · 2H₂O.

Properties: Colorless crystals. Soluble in water and in alcohol. Sp. gr. 3.852, m.p. anhydrous BaBr₂ 847°C.

Derivation: Interaction of barium sulfide and hydrobromic acid, with subsequent crystallization.

Grades: Technical; C.P.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Manufacturing bromides; photographic compounds.

Shipping regulations: See barium acetate.

barium carbonate BaCO₃.

Properties: White powder; found in nature as the mineral witherite. Insoluble in water; soluble in acids (except sulfuric). Sp. gr. 4.275; m.p. 174°C at 90 atm; 811°C at 760 mm.

Derivation: Precipitated BaCO₃ is made by reaction of Na₂CO₃ or CO₂ with barium sulfide.

Grades: Technical; C.P.; reagent 99.5%.

Containers: Bags; carload (bulk).

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Treatment of brines in chlorine-alkali cells to remove sulfates; rodenticide; barium salts; ceramic flux; optical glass; case-hardening baths; ferrites; in radiation-resistant glass for color television tubes.

Shipping regulations: See barium acetate.

barium chlorate Ba(ClO₃)₂ · H₂O.

Properties: Colorless prisms or white powder. Soluble in water. Sp. gr. 3.179; m.p. 414°C. Combustible.

Derivation: Electrolysis of barium chloride.

Grades: Technical; C.P.; reagent.

Hazard: Toxic by ingestion. Tolerance, see under barium. Strong oxidizing agent; fire risk in contact with organic materials.

Uses: Pyrotechnics; explosives; textile mordant; manufacture of other chlorates.

Shipping regulations: (Rail) Yellow label. (Air) (dry or wet), Oxidizer label.

barium chloride BaCl₂ · 2H₂O.

Properties: Colorless flat crystals. Soluble in water; insoluble in alcohol. Sp. gr. 3.097; m.p. 960°C (anhydrous). Combustible.

Derivation: (a) By the action of hydrochloric acid on barium carbonate or barium sulfide; (b) by heating a mixture of BaSO₄, carbon, and calcium chloride.

Grades: Technical (crystals or powdered) 99%; crystalline; powdered; C.P.

Containers: Bottles; multiwall paper sacks; drums; carloads.

Hazard: Toxic by ingestion; 0.8 gram may be fatal. Tolerance, see under barium.

Uses: Chemicals (artificial barium sulfate, other barium salts); reagent; lube oil additives; boiler compounds; pigments; manufacture of white leather.
Shipping regulations: See barium acetate.

barium chromate (lemon chrome; ultramarine yellow; baryta yellow; Steinbuhl yellow) BaCrO_4 .

Properties: Heavy, yellow, crystalline powder. Soluble in acids; insoluble in water. Sp. gr. 4.498. Combustible.

Derivation: Interaction of barium chloride and sodium chromate. The precipitate is washed, filtered and dried.

Grades: Technical; C.P.

Hazard: Toxic. Tolerance, see under barium.

Uses: Safety matches; pigment in paints, ceramics; fuses; pyrotechnics; metal primers; ignition control devices.

Shipping regulations: See barium acetate.

See also chrome yellow.

barium citrate $\text{Ba}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Grayish white crystalline powder. Soluble in water, hydrochloric and nitric acids.

Hazard: Toxic; tolerance, see barium.

Uses: Manufacture of barium compounds; stabilizer for latex paints.

Shipping regulations: See barium acetate.

barium cyanide $\text{Ba}(\text{CN})_2$.

Properties: White, crystalline powder. Soluble in water and alcohol.

Derivation: By the action of hydrocyanic acid on barium hydroxide with subsequent crystallization.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Metallurgy; electroplating.

Shipping regulations: (Rail, Air) Poison label.

barium cyanoplatinite (platinum barium cyanide; barium platinum cyanide) $\text{BaPt}(\text{CN})_4 \cdot 4\text{H}_2\text{O}$.

Properties: Yellow or green crystals; m.p. 100°C ($-2\text{H}_2\text{O}$); sp. 2.08; soluble in water, insoluble in alcohol.

Grades: C.P.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: X-ray screens.

Shipping regulations: See barium acetate.

barium dichromate (barium bichromate) $\text{BaCr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Brownish-red needles or crystalline masses. Soluble in acids, decomposed by water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium diorthophosphate. See barium phosphate, secondary.

barium dioxide. See barium peroxide.

barium diphenylamine sulfonate $(\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{SO}_3)_2\text{Ba}$.

Properties: White crystals, soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Indicator in oxidation-reduction titrations.

Shipping regulations: See barium acetate.

barium dithionate (barium hyposulfate) $\text{BaS}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water; slightly soluble in alcohol. Sp. gr. 4.536.

Derivation: Action of manganese dithionate on barium hydroxide.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium diuranate. See uranium-barium oxide.

barium ethylsulfate $\text{Ba}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water and alcohol. Combustible.

Derivation: Interaction of barium hydroxide and ethylsulfuric acid.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Organic preparations.

Shipping regulations: See barium acetate.

barium fluoride BaF_2 .

Properties: White powder. Sparingly soluble in water.

Sp. gr. 4.828; m.p. 1354°C .

Derivation: Interaction of barium sulfide and hydrofluoric acid followed by crystallization.

Grades: Technical; C.P.; single pure crystals, 99.98%.

Hazard: Toxic by ingestion. Tolerance. See under barium.

Uses: Ceramics; manufacture of other fluorides, crystals for spectroscopy, electronics, dry-film lubricants.

Shipping regulations: See barium acetate.

barium fluosilicate (barium silicofluoride) BaSiF_6H .

Properties: White, crystalline powder. Insoluble in water.

Grades: Technical.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Ceramics; insecticidal compositions.

Shipping regulations: See barium acetate.

barium fructose diphosphate. See fructose diphosphate, calcium and barium salts.

barium hexafluorogermanate BaGeF_6 . White crystalline solid; m.p. about 665°C ; dissociates to barium fluoride and germanium fluoride; sp. gr. 4.56 g/cc.

Hazard: Probably toxic.

barium hydrate. See barium hydroxide.

barium hydrosulfide $\text{Ba}(\text{SH})_2$.

Properties: Yellow crystals. Hygroscopic. Soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium hydroxide, anhydrous $\text{Ba}(\text{OH})_2$. Available commercially. See barium hydroxide hydrates, following.

barium hydroxide, monohydrate (barium monohydrate) $\text{Ba}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: White powder; soluble in dilute acids; slightly soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Manufacture of oil and grease additives; barium soaps and chemicals. Refining of beet sugar; alkalizing agent in water softening; sulfate removal agent in treatment of water and brine; boiler scale removal; dehairing agent; catalyst in manufacture of phenol-formaldehyde resins; insecticide and fungicide; sulfate controlling agent in ceramics; purifying agent for caustic soda; steel carbonizing agent; glass.

Shipping regulations: See barium acetate.

barium hydroxide, octahydrate (barium hydrate; barium octahydrate; caustic baryta) $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder or crystals; absorbs carbon dioxide from air. Keep well stoppered! Soluble in water, alcohol and ether. Sp. gr. 2.18; m.p. 78°C , losing its water of crystallization (m.p. anhydrous $\text{Ba}(\text{OH})_2$ 408°C).

Derivation: (a) By dissolving barium oxide in water with subsequent crystallization. (b) By precipitation from an aqueous solution of the sulfide by caustic soda. (c) By heating barium sulfide in earthenware retorts into which a current of moist carbonic acid is passed after which superheated steam is passed over the resulting heated carbonate.

Impurities: Iron and calcium in commercial grades.

Grades: Technical (crystals or anhydrous powder); C.P.; ACS reagent.

Containers: Barrels; multiwall paper sacks.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Organic preparations; barium salts; analytical chemistry. See also the monohydrate.

Shipping regulations: See barium acetate.

barium hydroxide pentahydrate (barium pentahydrate) $\text{Ba}(\text{OH})_2 \cdot 5\text{H}_2\text{O}$.

Properties: Translucent free-flowing white flakes; density 65 lb/cu ft (approx.).

Containers: 100-lb paper bags; 400-lb fiber drums.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Same as the octahydrate.

Shipping regulations: See barium acetate.

barium hypophosphite $\text{BaH}_2(\text{PO}_2)_2$.

Properties: White, crystalline powder; odorless; soluble in water; insoluble in alcohol.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Medicine.

Shipping regulations: See barium acetate.

barium hyposulfate. See barium dithionate.

barium hyposulfite. See barium thiosulfate.

barium iodate. $\text{Ba}(\text{IO}_3)_2$.

Properties: White, crystalline powder. Slightly soluble in water, hydrochloric and nitric acids; insoluble in alcohol. Sp. gr. 5.23; m.p., decomposes at 476°C .

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium iodide $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; decomposes and reddens on exposure to air. Soluble in water; slightly soluble in alcohol. Sp. gr. 5.150; m.p., loses $2\text{H}_2\text{O}$ and melts at 740°C .

Derivation: Action of hydriodic acid on barium hydroxide or of barium carbonate on ferrous iodide solution.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Preparation of other iodides.

Shipping regulations: See barium acetate.

barium manganate (manganese green; Cassel green) BaMnO_4 .

Properties: Emerald-green powder. Insoluble in water; decomposed by acids. Sp. gr. 4.85.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Paint pigment.

barium mercury bromide. See mercuric barium bromide.

barium mercury iodide. See mercuric barium iodide.

barium metaphosphate $\text{Ba}(\text{PO}_3)_2$.

Properties: White powder; slowly soluble in acids; insoluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Glasses, porcelains and enamels.

Shipping regulations: See barium acetate.

barium metasilicate. See barium silicate.

barium molybdate BaMoO_4 .

Properties: White powder; slightly soluble in acids and water. Absolute density 4.7 g/cc; approximate m.p. 1600°C .

Grade: Crystal, 99.84% pure.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Electronic and optical equipment; pigment in paints and other protective coatings.

Shipping regulations: See barium acetate.

barium monohydrate. See barium hydroxide, monohydrate.

barium monosulfide. See barium sulfide.

barium monoxide. See barium oxide.

barium nitrate $\text{Ba}(\text{NO}_3)_2$.

Properties: Lustrous, white crystals. Soluble in water; insoluble in alcohol. Sp. gr. 3.244; m.p. 575°C . Strong oxidizing agent.

Derivation: By the action of nitric acid on barium carbonate or sulfide.

Grades: Technical; crystals; fused mass or powder; C.P.

Containers: Barrels; multiwall paper sacks; drums.

Hazard: Dangerous fire risk in contact with organic materials. Toxic. Tolerance, see under barium.

Uses: Pyrotechnics (gives green light); incendiaries; chemicals (barium peroxide); ceramic glazes; rodenticide; electronics.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

barium nitrite $\text{Ba}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White to yellowish, crystalline powder. Soluble in alcohol, water. Sp. gr. 3.173; decomposed at 217°C .

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Diazotization.

Shipping regulations: See barium acetate.

barium octahydrate. See barium hydroxide, octahydrate.

barium oxalate $\text{BaC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder. Sp. gr. 2.66. Insoluble in water; soluble in dilute nitric or hydrochloric acids.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Analytical reagent; pyrotechnics.

Shipping regulations: See barium acetate.

barium oxide (barium monoxide; barium protoxide; calcined baryta) BaO .

Properties: White to yellowish-white powder; absorbs carbon dioxide readily from air. Soluble in acids; reacts violently with water to form the hydroxide. Sp. gr. 5.72; m.p. 1923°C .

Derivation: Decomposition of carbonate at high temperature in presence of carbon; oxidation of barium nitrate.

Grades: Technical regular grind (208 lb/cu ft); tech-

nical fine grind (175 lb/cu ft); porous, carbide-free; 97%.

Containers: Glass bottles; hermetically sealed cans.

Hazard: Toxic by ingestion. Skin irritant. Tolerance, see under barium.

Uses: Dehydrating agent; detergent for lubricating oils.

Shipping regulations: (Air) No label required.

barium pentahydrate. See barium hydroxide pentahydrate.

barium perchlorate $\text{Ba}(\text{ClO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in alcohol and water. Sp. gr. 2.74; m.p. 505°C.

Hazard: Toxic by ingestion. Oxidizing material; fire and explosion risk in contact with organic materials. Tolerance, see under barium.

Use: Manufacture of explosives; experimentally in rocket fuels.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

barium permanganate $\text{Ba}(\text{MnO}_4)_2$.

Properties: Brownish-violet crystals. Soluble in water.

Hazard: Toxic by ingestion. Oxidizing material. Fire and explosion risk in contact with organic materials. Tolerance, see under barium.

Uses: Strong disinfectant; manufacture of permanganates.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

barium peroxide (barium binoxide; barium dioxide; barium superoxide) BaO_2 and $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$.

Properties: Grayish-white powder. Slightly soluble in water. Sp. gr. 4.96; m.p. 450°C; decomposes 800°C. Oxidizing agent.

Derivation: By heating BaO in oxygen or air at about 1000°F.

Grades: Technical; reagent.

Hazard: Toxic by ingestion. Oxidizing material. Fire and explosion risk in contact with organic materials. Tolerance, see under barium. Skin irritant. Keep cool and dry.

Uses: Bleaching; decolorizing glass; thermal welding of aluminum; manufacture of hydrogen peroxide.

Shipping regulations: See barium perchlorate.

barium phosphate, secondary (barium diorthophosphate) BaHPO_4 .

Properties: White powder. Soluble in nitric acid (dilute), hydrochloric acid (dilute); slightly soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium platinum cyanide. See barium cyanoplatinite.

barium potassium chromate (Pigment E) $\text{BaK}(\text{CrO}_4)_2$.

Properties: Pale yellow pigment. As compared with other chromate pigments, it has a low chloride and sulfate content and forms stronger, more elastic paint films. Sp. gr. 3.65.

Derivation: By a kiln reaction at 500°C between potassium dichromate and barium carbonate.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Component of anticorrosive paints for use on iron, steel, and light metal alloys.

Shipping regulations: See barium acetate.

barium protoxide. See barium oxide.

barium pyrophosphate $\text{Ba}_2\text{P}_2\text{O}_7$.

Properties: White powder, soluble in acids and ammonium salts; very slightly soluble in water.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium silicate (barium metasilicate) BaSiO_3 . Colorless powder; sp. gr. 4.4; b.p. 1604°C. Insoluble in water; soluble in acids. Used in ceramics.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Shipping regulations: See barium acetate.

barium silicofluoride. See barium fluosilicate.

barium-sodium niobate. A synthetic electro-optical crystal used to produce coherent green light in lasers; also to make such devices as electro-optical modulators and optical parametric oscillators. The crystal undergoes no optical damage from laser irradiation at high power levels.

barium stannate $\text{BaSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: White crystalline powder, sparingly soluble in water, readily in hydrochloric acid.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Use: Production of special ceramic insulations requiring dielectric properties.

Shipping regulations: See barium acetate.

barium stearate $\text{Ba}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White crystalline solid; insoluble in water or alcohol; m.p. 160°C; sp. gr. 1.145. Combustible.

Hazard: Toxic. Tolerance, see under barium.

Uses: Waterproofing agent; lubricant in metalworking, plastics and rubber; wax compounding; preparation of greases; heat and light stabilizer in plastics.

barium sulfate [barytes (natural); blanc fixe (artificial, precipitated); basofor]. BaSO_4 .

Properties: White or yellowish, odorless, tasteless powder. Soluble in concentrated sulfuric acid; sp. gr. 4.25–4.5; particle size, 2–25 microns; m.p. 1580°C. Nontoxic. Noncombustible.

Derivation: (a) By treating a solution of a barium salt with sodium sulfate (salt cake). (b) By-product in manufacture of hydrogen peroxide. (c) Occurs in nature as the mineral barite (Arkansas, Missouri, Georgia, Nevada, Canada, Mexico).

Grades: Technical, dry, pulp, bleached, ground, floated, natural; C.P.; U.S.P.; x-ray.

Containers: 5-lb bottles; 100-, 250-lb drums; wooden barrels; multiwall paper sacks.

Uses: Weighting mud in oil-drilling; paper coatings; paints; filler and delustrant for textiles, rubber, linoleum, oilcloth, plastics, and lithograph inks; base for lake colors; x-ray photography; opaque medium for gastrointestinal radiography; in battery plate expanders.

barium sulfide (barium monosulfide; black ash) BaS .

Properties: Yellowish-green or gray powder or lumps. Soluble in water, decomposes to the hydrosulfide.

Sp. gr. 4.25.

Derivation: Barium sulfate (crude barite) and coal are roasted in a furnace. The melt is lixiviated with hot water, filtered and evaporated.

Impurities: Iron, arsenic.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Dehairing hides; fireproofing agent; barium salts; generating pure hydrogen sulfide for analytical purposes.

Shipping regulations: See barium acetate.

barium sulfite BaSO_3 .

Properties: White powder, decomposed by heat. Soluble in hydrochloric acid (dilute); insoluble in water. Grades: Technical; C.P.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Analysis; paper manufacturing.

Shipping regulations: See barium acetate.

barium sulfocyanide. See barium thiocyanate.

barium superoxide. See barium peroxide.

barium tartrate. $\text{BaC}_4\text{H}_4\text{O}_6$

Properties: White crystals; sp. gr. 2.98; soluble in water; insoluble in alcohol.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Pyrotechnics.

Shipping regulations: See barium acetate.

barium thiocyanate (barium sulfocyanide) $\text{Ba}(\text{SCN})_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals. Soluble in water and in alcohol. Deliquescent.

Derivation: By heating barium hydroxide with ammonium thiocyanate and subsequent crystallization.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Making aluminum or potassium thiocyanates; dyeing; photography.

Shipping regulations: See barium acetate.

barium thiosulfate (barium hyposulfite) $\text{BaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder; slightly soluble in water. Insoluble in alcohol. Sp. gr. 3.5; decomposed by heat.

Hazard: Toxic by ingestion. Tolerance, see under barium.

Uses: Explosives; luminous paints; matches; varnishes.

Shipping regulations: See barium acetate.

barium titanate BaTiO_3 .

Properties: Light gray-buff powder; m.p. 3010°F ; sp. gr. 5.95; insoluble in water and alkalies; slightly soluble in dilute acids; soluble in concentrated sulfuric acid and hydrofluoric acid.

Hazard: Tolerance, see under barium.

Uses: Ferroelectric ceramic. Single crystals, either pure or doped with iron, are used in storage devices, dielectric amplifiers, and digital calculators.

Shipping regulations: See barium acetate.

barium tungstate (barium wolframate; barium white; tungstate white; wolfram white) BaWO_4 .

Properties: White powder. Insoluble in water. Sp. gr. 5.04. Low toxicity.

Uses: Pigment; in x-ray photography for manufacture of intensifying and phosphorescent screens.

barium uranium oxide. See uranium barium oxide.

barium white. See barium tungstate.

barium wolframate. See barium tungstate.

"Barium XA."³⁵⁴ Trademark for a product used by manufacturers of high quality tool steels. Eliminates chain type occlusions and degasifies the steel.

barium zirconate BaZrO_3 .

Properties: Light gray-buff powder; sp. gr. 5.52; density 140 lb/cu ft; m.p. 4550°F ; insoluble in water and alkalies; slightly soluble in acid.

Uses: Manufacture of a white, easily colored silicone rubber compound having good heat stability at temperatures up to 500°F ; electronics.

barium zirconium silicate A complex of BaO , ZrO_2 , SiO_2 .

Properties: White powder. Density 118 lb/cu ft; m.p. 2800°F ; insoluble in water, alkalies. Slightly soluble in acids; soluble in hydrofluoric acid.

Containers: 80-lb paper bags; 500-lb drums.

Hazard: Toxic by ingestion.

Uses: Production of electrical resistor ceramics; glaze opacifiers; stabilizer for colored ground coat enamels.

Shipping regulations: See barium acetate.

barn. A unit of measurement, equal to 10^{-24} square centimeter, for the cross-section target area of the nucleus of an atom.

"Barnesite."⁸⁸ Trademark for a special rare earth for instrument lens polishing.

"Baroco."²³⁶ Trademark for a high yield clay, compounded for the preparation of drilling muds for use in formations containing moderate quantities of salt or other oil field electrolytes that may flocculate ordinary drilling muds.

"Baroid."²³⁶ Trademark for a weighting material manufactured from selected barytes (barium sulfate ore). Added to drilling muds to increase unit weight, thus increasing the hydrostatic head on the formations being drilled in deep wells, to prevent the walls from caving.

barometric pressure. The pressure of the air at a particular point on or above the surface of the earth. At sea level this pressure is sufficient to support a column of mercury about 29.9 in. in height (760 mm), equivalent to 14.7 pounds per square inch absolute (psia) or 1 atmosphere.

"Baron."²³³ Trademark for a weed-killing composition containing 2-(2,4,5-trichlorophenoxy)ethyl-2,2-dichloropropionate.

"Bar-O-Sil."³⁰⁴ Trademark for a complex barium silicate vinyl stabilizer.

Properties: Fine white powder; sp. gr. 2.5, refractive index 1.5.

Containers: Fiberboard drums containing 50 lb.

Uses: Supplementary stabilizer for barium-cadmium and/or zinc types. Useful in film, sheeting, extrusions and dispersion resin systems. Controls plating, hazing, crocking and fogging.

"Barosperse."³²⁹ Trademark for a special barium sulfate formulation used in radiographic examinations of the gastro-intestinal tract.

barrier, moisture. Any substance that is impervious to water or water vapor. Most effective are high-polymer materials like vulcanized rubber, phenol-formaldehyde resins, polyvinyl chloride, and polyethylene, which are widely used as packaging films. The chief factors involved are polarity, crystallinity, and degree of cross-linking. Water-soluble surfactants and protective colloids increase the susceptibility of a film to water penetration. Any pigments and fillers must be completely wetted by the polymer. Properly formulated paints are effective moisture barriers.

barthrin. Generic name for a synthetic analog of allethrin described as the 6-chloropiperonyl ester of chrysanthemum monocarboxylic acid. Used as insecticide with applications similar to allethrin and other analogs as furethrin, ethythrins and cyclothrin. Relatively nontoxic to humans.

"Bartyls."¹² Trademark for a series of compounded antiskinning agents. Developed for use in low concentrations in printing inks, paints and varnishes.

baryta, calcined. See barium oxide.

baryta, caustic. See barium hydroxide.

baryta water. A solution of barium hydroxide.

baryta yellow. See barium chromate.

barytes. See barium sulfate.

"Basacryl."⁴⁰ Trademark for a series of cationic dye-stuffs for the dyeing and printing of polyacrylonitrile fiber.

basal metabolism. See metabolism.

"Basazol."⁴⁰ Trademark for dyes used in printing and dyeing fabrics composed of cellulosic fibers.

base. Any of a large class of compounds with one or more of the following properties: bitter taste, slippery feeling in solution, ability to turn litmus blue and to cause other indicators to take on characteristic colors, ability to react with (neutralize) acids to form salts. Included are both hydroxides and oxides of metals.

Water-soluble hydroxides, such as sodium, potassium, and ammonium hydroxide, undergo ionization to produce hydroxyl ion (OH^-) in considerable concentration, and it is this ion that causes the previously mentioned properties common to bases. Such a base is strong or weak according to the fraction of the molecules which break down (ionize) into positive ion and hydroxyl ion in the solution. Base strength in solution is expressed by pH (q.v.). Common strong bases (alkalies) are sodium and potassium hydroxides, ammonium hydroxide, etc. These are caustic and corrosive to skin, eyes, and mucous membranes. The pH range of bases is from 7.1 to 13.

Modern chemical terminology defines bases in a broader manner. A Lowry-Bronsted base is any molecular or ionic substance that can combine with a proton (hydrogen ion) to form a new compound. A Lewis base is any substance that provides a pair of electrons for a covalent bond with a Lewis acid (q.v.). Examples of such bases are hydroxyl ion and most anions, metal oxides, compounds of oxygen, nitrogen, sulfur with nonbonded electron pairs (such as water, ammonia, hydrogen sulfide).

For hard and soft bases, see Lewis electron theory.

BASF process. A process for producing acetylene by burning a mixture of low molecular weight hydrocarbons (as, natural gas) with oxygen to produce a 2700°F temperature. The combustion products and cracked gases are quickly chilled by scrubbing with water, and the acetylene is separated by distillation and solvent extraction from ethylene, carbon monoxide, hydrogen and other reaction products. The Sachsse process is similar.

basic. Descriptive of a compound that is more alkaline than other compounds of the same name. See, e.g., lead carbonate, basic; basic salt.

basic dichromate. See bismuth chromate.

basic lining. A furnace lining containing basic compounds that decompose under furnace conditions to give basic oxides. The usual basic linings contain calcium and magnesium oxides or carbonates.

"Basicol."¹⁸⁸ Trademark for a series of essential oils intended as replacements for oils of lavender, geranium, lemon, pine, ylang ylang, neroli and orris root.

basic oxide. An oxide which is a base or which forms a hydroxide when combined with water, and/or which will neutralize acidic substances. Basic oxides are all metallic oxides, but there is a great variation in the degree of basicity. Some basic oxides such as those of sodium, calcium and magnesium combine with water with vigor or with relative ease, and also neutralize all acidic substances rapidly and completely. The oxides of the heavy metals are only weakly basic, do not dissolve or react with water to any extent, and neutralize only the more strongly acidic substances. There is a gradual transition from basic to acidic oxides and certain oxides, as aluminum oxide, show both acidic and basic properties. See also base.

basic research. See fundamental research.

basic salt. A compound belonging in the category of both salt and base because it contains OH^- (hydroxide) or O^{2-} (oxide) as well as the usual positive and negative radicals of normal salts. Among the best examples are bismuth subnitrate, often written BiONO_3 , and basic copper carbonate, $\text{Cu}_2(\text{OH})_2\text{CO}_3$. Most basic salts are insoluble in water and many are of variable composition.

basic slag. A slag produced in the manufacture of steel. It contains a variable amount of tricalcium phosphate, calcium silicate, lime and oxides of iron, magnesium and manganese. Used as a fertilizer for its phosphorus and lime. See also slag.

basis metal. In electroplating, the metal that is being coated; it constitutes the cathode and may be any of a large number of metals.

"Basogal P."⁴⁰ Trademark for leveling agent for vat dyeing.

batch distillation. Distillation in which the entire sample of the material to be distilled, the charge, is placed in the still before the process is begun and product is withdrawn only from the condenser of the apparatus.

bating. In leather processing, the treatment of delimed skins with pancreatin or other tryptic enzyme to give a softer and smoother-grained product. The extent of bating varies from none for sole leather to ten hours or more for soft kid skins. The chemical mechanism is not clearly defined.

batrachotoxinin A ($\text{C}_{24}\text{H}_{33}\text{NO}_4$). An isomeric component of batrachotoxin, the strongest neurotoxin among venoms. It is a steroidal alkaloid; the A form is only 1/500th as strong as the complete venom, but is still as toxic as strychnine. It is found in the so-called poison dart frog of Colombia. Its structure has been elucidated; when synthesized it may prove useful in medicine. See also, snake venom.

battery. An electrochemical device that generates electric current by converting chemical energy to electrical energy. Its essential components are positive and negative electrodes made of more or less electrically conductive materials, a separating medium, and an electrolyte. There are four major types: (1) primary batteries (dry cells), which are not reversible and in which the anode (zinc) is the negative plate and the

cathode (graphite) is the positive plate, with ammonium chloride as electrolyte; (2) secondary or storage batteries, which are reversible and can be recharged, and in which lead sponge is the negative plate (anode) and lead oxide the positive plate (cathode), with sulfuric acid as electrolyte; (3) nuclear and solar cells, or energy converters; and (4) fuel cells. For further information see dry cell; storage battery; voltaic cell; fuel cell; solar cell.

battery acid (electrolyte acid). Sulfuric acid of strengths suitable for use in storage batteries. Water-white, odorless and practically free from iron.

Derivation: By diluting high-grade commercial sulfuric acid with distilled water to standard strengths.

Containers: Glass carboys; tank cars.

Hazard: Corrosive to skin and tissue. See also sulfuric acid.

Use: Storage batteries.

Shipping regulations: (Rail) White label. (Air) Corrosive battery fluid, not over 47% strength, Corrosive label. Legal label name, electrolyte acid.

battery limits. That portion of a chemical plant in which the actual processes are carried out, as distinguished from storage buildings, offices and other subordinate structures, called offsites.

batu. A variety of East India copal resin. See East India.

Baumé (Bé). An arbitrary scale of specific gravities devised by the French chemist Antoine Baumé and used in the graduation of hydrometers. The relations to specific gravity (at 60/60°F) are as follows: °Bé = 145 - 145/sp. gr. for materials heavier than water; °Bé = 140/sp. gr. - 130 for materials lighter than water.

bauxite. A natural aggregate of aluminum-bearing minerals, more or less impure, in which the aluminum occurs largely as hydrated oxides. It is usually formed by prolonged weathering of aluminous rocks. Contains 30-75% Al_2O_3 , 9-31% H_2O , 3-25% Fe_2O_3 , 2-9% SiO_2 , and 1-3P TiO₂. Nontoxic; noncombustible.

Properties: White cream, yellow, brown, gray or red; sp. gr. 2-2.55; Mohs hardness 1-3. Insoluble in water; decomposed by hydrochloric acid.

Occurrence: Australia, Jamaica, France, Guiana, Guinea, U.S. (Arkansas), Brazil.

Uses: Most important ore of aluminum; aluminum chemicals; abrasives; aluminous cement; refractories; decolorizing and deodorizing agent; catalysts; filler in rubber, plastics, paints, cosmetics.

See also Bayer process; Hall process.

Note: Due to increasing cost of bauxite, the use of other Al-containing minerals is under active investigation.

"Baycovin."⁴⁷⁰ Trademark for diethylpyrocarbonate.

Bayer process. Process for making alumina from bauxite. The main use of alumina is in the production of metallic aluminum. Bauxite is mixed with hot concentrated sodium hydroxide, which dissolves the alumina and silica. The silica is precipitated and the dissolved alumina is separated from the solids, diluted, cooled and then is crystallized as aluminum hydroxide. The aluminum hydroxide is calcined to give anhydrous alumina, which is then shipped to reduction plants. See also Hall process.

Bayer's acid. See 2-naphthylamine-7-sulfonic acid; also crocein acid.

"Baygon."¹⁸¹ Trademark for ortho-isopropoxyphenyl methylcarbamate (q.v.).
Uses: Molluscicide.

"Baymal."²²⁸ Trademark for a colloidal alumina whose chemical formula is $AlOOH$.

Properties: White powder; dispersible in water to form a stable, positively charged, colloidal sol. Ultimate particles are fibrillar crystals approximately 100 millimicrons long by 5 millimicrons in diameter.

Grades: Technical and drug.

Containers: 5-, 50-lb fiber drums.

Uses: High temperature binders and adhesives; coatings for metals and ceramics; emulsifying and thickening agent; flocculating agent for clarification and purification; chromatographic separations.

bay oil. See myrcia oil.

"Bayol."⁵¹ Trademark for technical-grade white mineral oils that are widely used where U.S.P. or N.F. quality is not required.

"Baytex."¹⁸¹ Trademark for O,O-dimethyl (O-(4 (methylthio)-meta-tolyl)phosphorothioate. See fen-thion.

"Baytown."¹¹⁰ Trademark for a series of "cold", styrene-butadiene copolymers (SBR), many of which contain carbon black and/or extending oil.

BBO. See 2,5-dibiphenyloxazole.

BBP. Abbreviation for butyl benzyl phthalate (q.v.).

BCWL. Abbreviation for basic carbonate white lead. See lead carbonate, basic.

"BDA."²³³ Trademark for inhibited hydrochloric acid solution containing surfactants. Used in limestone and dolomite formations, in oil-well fracturing and acidizing.

Be Symbol for beryllium.

Bé. Abbreviation for Baumé (q.v.).

"Beaconol."³⁵⁴ Trademark for a group of sulfonated fatty alcohols used as detergents, wetting agents, and dispersing agents in the paper, textile, paint, and rubber industries.

"Bearflex."⁵⁰⁰ Trademark for a group of oils used in plasticizers and as extenders for light-colored compounds.

"Beatad."²⁶⁶ Trademark for a series of pregelatinized starches, either alone or with selected cellulose gums, for use as paper and paperboard additives.

"Beckacite."³⁶ Trademark for fumaric, maleic and modified phenolic resins.

"Beckamine."⁷³⁶ Trademark for urea-formaldehyde resins (q.v.).

Beckmann rearrangement. The conversion of a ketone oxime to a substituted amide by an intermolecular rearrangement brought about by a catalyst. For example, the oxime of cyclohexanone is converted into caprolactam, with sulfuric acid as catalyst.

"Beckolin."⁷³⁶ Trademark for synthetic drying oils. Two grades available: Light and dark. Nonvolatile, 100%; color 4-7 (Hellige-Klett); acid number 6-16; viscosity X to Y (Gardner-Holdt).
Uses: Paint, varnish, and enamel products.

"Beckosol."⁷³⁶ Trademark for phenolated, phthalic-free, rosin-modified, pure drying and pure non-drying alkyd resins.

Becquerel, Henri (1851-1908). French physicist who shared the Nobel Prize in physics with the Curies for the discovery of the radioactivity of uranium salts. He also discovered the deflection of electrons by a magnetic field as well as the existence and properties of gamma radiation.

beer. See brewing.

beerstone. A deposit occurring during brewing operations on containers and consisting of calcium oxalate and organic material.

beeswax. Wax from the honeycomb of the bee. Beeswax consists largely of myricyl palmitate, cerotic acid and esters, and some high-carbon paraffins.

Properties: Brown or white (bleached) solid with faint odor. Sp. gr. 0.95; melting range 62-65°C; insoluble in water; slightly soluble in alcohol; soluble in chloroform, ether, and oils. Combustible; non-toxic.

Grades: Technical; crude; refined; N.F.; F.C.C.; U.S.P. (white).

Containers: Bags; bricks and slabs in 100-lb cartons.

Uses: Furniture and floor waxes; shoe polishes; leather dressings; anatomical specimens; artificial fruit; textile sizes and finishes; church candles; cosmetic creams; lipsticks; adhesive compositions.

beet molasses. See molasses.

beet sugar. See sucrose.

behenic acid (docosanoic acid) $\text{CH}_3(\text{CH}_2)_{20}\text{COOH}$. A saturated fatty acid; a minor component of the oils of the type of peanut and rapeseed.

Properties: Liquid; m.p. 80.0°C; b.p. 306°C (60 mm), 265°C (15 mm); sp. gr. 0.8221 (100/4°C); refractive index 1.4270 (100°C). Combustible; low toxicity.

Derivation: Peanut oil; occurs in ben oil, hydrogenated mustard oil and rapeseed oil.

Grades: Technical; 99%.

Uses: Cosmetics; waxes; plasticizers; chemicals; stabilizers.

behenone $\text{C}_{22}\text{H}_{44}\text{O}$. An aliphatic ketone. Insoluble in water. Inert; compatible with high-melting waxes, fatty acids. Incompatible with resins, polymers, and organic solvents at room temperature, but compatible with them at high temperature. Used as anti-blocking agent

behenyl alcohol (1-docosanol) $\text{CH}_3(\text{CH}_2)_{20}\text{CH}_2\text{OH}$. A long-chain, saturated fatty alcohol.

Properties: Colorless waxy solid; m.p. 71°C; b.p. 180°C (0.22 mm). Insoluble in water; soluble in ethanol and chloroform. Low toxicity. Combustible.

Derivation: Reduction of behenic acid with lithium aluminum hydride as catalyst.

Grades: Technical; 99%.

Uses: Synthetic fibers; lubricants; evaporation retardant on water surfaces.

Beilstein, F. K. (1838-1906). A German chemist noted for his compilation "Handbuch der Organischen Chemie," the first edition of which appeared in 1880. A multi-volume compendium of the properties and reactions of organic compounds, it has been revised several times and remains a unique and fundamental contribution to chemical science.

BEK. See butyl ethyl ketene.

belladonna (deadly nightshade; banewort). An herbaceous perennial bush (*Atropa belladonna*) of which

the leaves and roots are used for their content of hyoscyamine and atropine.

Occurrence: Southern and central Europe; Asia Minor; Algeria; cultivated in North America, England, France.

Grades: Belladonna leaf, U.S.P.; belladonna root.

Containers: Boxes; bales.

Hazard: Highly toxic.

Use: Medicine (gastrointestinal relaxant).

bemberg. A cuprammonium rayon fiber. Flammable, not self-extinguishing.

"Bemol."⁷⁴⁵⁶ Trademark for a series of solid lubricants for extreme temperature/high vacuum use, such as various forms of molybdenum disulfide, niobium diselenide, tungsten disulfide.

"Bemul."⁷³⁴⁵ Trademark for a nontoxic, practically odorless emulsifying agent; a pure white, edible glycerol monostearate in bead form; m.p. 58-59°C; completely dispersible in hot water; completely soluble in alcohols and hot hydrocarbons.

Uses: Pharmaceuticals, cosmetics, and foodstuffs; protective coating for edible hygroscopic powders, tablets, and crystals; pour-point depressant for lubricating oils; textile sizes; etc.

"Benadryl."⁷³³⁰ Trademark for diphenhydramine hydrochloride.

"Ben-A-Gel."⁷³⁰⁴ Trademark for highly beneficiated hydrous magnesium silicate for aqueous systems. Used for thickening or gelling water systems, or as a suspension agent, and an emulsion stabilizer in oil-in-water emulsions.

bench gas. See coal gas.

Benedict solution. A water solution of sodium carbonate, copper sulfate and sodium citrate. The blue color changes to a red, orange, or yellow precipitate or suspension in the presence of a reducing sugar such as glucose, and is therefore used in testing for such materials, especially for urinalysis in the treatment of diabetes. See Fehling's solution.

beneficiation. A process used in extractive metallurgy whereby an ore, either metallic or nonmetallic, is concentrated in preparation for further processing (smelting). Calcination (q.v.) is often an important step in beneficiation; others are physical separation of high-grade ore from impurities (gangue) by screening, washing, milling or magnetic means. A process for removing sulfur from coal by chemical comminution has been developed. This is a type of beneficiation.

benefin (N-butyl-N-ethyl-alpha, alpha, alpha-trifluoro-2,6-dinitro-para-toluidine) $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{CF}_3\text{NC}_4\text{H}_9$.

Properties: Yellow-orange solid; m.p. 65-66.5°C; b.p. 121-122°C (0.5 mm). Slightly soluble in water; readily soluble in acetone and xylene.

Hazard: May be toxic.

Use: Herbicide.

"Benemid."⁷¹²³ Trademark for probenecid; used in medicine.

Benjamin gum. See benzoin resin.

"Benodaine."⁷¹²³ Trademark for piperoxan hydrochloride.

benomyl (methyl-1-(butylcarbamoyl)-2-benzimidazole-carbamate). Generic name for a post-harvest fungicide for peaches, apples, etc. Toxic. Use may be restricted.

"Bentolite."⁷⁴⁷ Trademark for a series of white bentonites from Texas.

Grades: H and L, high and low gelling.

Uses: Suspending agent; thixotropic agent; adhesives; ceramic bonding and plasticizing agent; desiccant; medicated powders.

"Bentone."⁷⁰⁴ Trademark for organic derivatives of hydrous magnesium aluminum silicate minerals.

Uses: Gelling and pigment-suspending agents.

bentonite. A colloidal clay (aluminum silicate) composed chiefly of montmorillonite. There are two varieties: (1) sodium bentonite (Wyoming or western), which has high swelling capacity in water; and (2) calcium bentonite (southern), with negligible swelling capacity.

Properties: (Wyoming) Light to cream-colored impalpable powder; forms colloidal suspension in water, with strongly thixotropic properties. Nontoxic; non-combustible.

Occurrence: Wyoming; Mississippi; Texas; Canada; Italy; U.S.S.R.

Containers: Paper bags; drums; bulk carloads.

Uses: Oil-well drilling fluids; cement slurries for oil-well casings; bonding agent in foundry sands and pelletizing of iron ores; sealant for canal walls; thickener in lubricating greases and fireproofing compositions; cosmetics; decolorizing agent; filler in ceramics, refractories, paper coatings; asphalt modifier; polishes and abrasives; food additive; catalyst support. See also clay.

"Benzahex."¹⁴⁷ Trademark for a group of insecticides containing gamma-benzene hexachloride.

Hazard: See benzene hexachloride.

benzalacetone. See benzylidene acetone.

benzalazine (benzylidene azine) $C_6H_5CH:NN:CHC_6H_5$.

Properties: Yellow crystals; m.p. 91-93°C; insoluble in cold water; soluble in benzene and hot alcohol.

Uses: Stabilizer; polymerization catalyst; ultraviolet absorbent; reagent and intermediate.

benzal chloride. See benzyl dichloride.

benzaldehyde (benzoic aldehyde; synthetic oil of bitter almond) C_6H_5CHO .

Properties: Colorless or yellowish, strongly refractive, volatile oil with odor resembling oil of bitter almond, and burning aromatic taste; oxidizes readily; miscible with alcohol, ether, fixed and volatile oils; slightly soluble in water. Sp. gr. 1.0415 (25/4°C; refractive index (20°C) 1.5440-1.5464; f.p. -56°C; b.p. 178°C. Flash point 145°F (C.C.). Oxidizes in air to benzoic acid. Combustible. Autoignition temp. 377°F.

Derivation: (a) Air oxidation of toluene with uranium or molybdenum oxides as catalysts; (b) chlorination of toluene with hydrolysis by acid or alkali.

Impurities: Usually chlorine derivatives.

Method of purification: Rectification.

Grades: Technical; N.F. Note: The specifications, especially regarding impurities, vary considerably for the grades used for dye manufacture from those used in perfumery.

Containers: Tins; carboys; drums; tank cars.

Hazard: Moderately toxic by ingestion.

Uses: Chemical intermediate for dyes, flavoring materials, perfumes, and aromatic alcohols; solvent for oils, resins, some cellulose ethers, cellulose acetate and nitrate; flavoring compounds; synthetic perfumes; manufacture of cinnamic acid, benzoic acid; pharmaceuticals; photographic chemicals.

See also oil of bitter almond.

benzaldehyde cyanohydrin. See mandelonitrile.

benzaldehyde green. See malachite green.

benzalkonium chloride. A mixture of alkyl dimethylbenzylammonium chlorides of general formula $C_6H_5CH_2N(CH_3)_2RCl$ in which R is a mixture of the alkyls from C_8H_{17} to $C_{18}H_{37}$. It is a typical quaternary ammonium salt.

Properties: White or yellowish-white, amorphous powder or gelatinous pieces. Aromatic odor and very bitter taste; soluble in water, alcohol or acetone; almost insoluble in ether; slightly soluble in benzene. Water solutions foam strongly when shaken and are alkaline to litmus.

Grade: U.S.P.

Hazard: Toxic by ingestion and skin absorption.

Uses: Cationic detergent; surface antiseptic; fungicide.

benzamide (benzoylamide) $C_6H_5CONH_2$.

Properties: Colorless crystals; m.p. 130°C; b.p. 288°C; sp. gr. 1.341. Soluble in hot water, hot benzene, alcohol, and ether. Combustible.

Derivation: From benzoyl chloride and ammonia or ammonium carbonate.

Grades: Technical.

Uses: Organic synthesis.

benzaminoacetic acid. See hippuric acid.

benzanilide (benzoylaniline; phenylbenzamide)

$C_6H_5NH(COC_6H_5)$.

Properties: White to reddish crystals and powder, closely related to acetanilide, containing benzoyl in place of acetyl radical. Sp. gr. 1.306; m.p. 160-162°C. Soluble in alcohol; insoluble in water; slightly soluble in ether.

Derivation: From benzoic anhydride and aniline with caustic soda.

Uses: Intermediate in the synthesis of dyes, drugs and perfumes.

benzanthrone $C_{17}H_{10}O$, a four-ring system.

Properties: Pale yellow needles; soluble in alcohol and other organic solvents. M.p. 170°C.

Derivation: (a) From anthranol and glycerol by condensation by means of sulfuric acid (anthranol is made from anthraquinone); (b) from anthracene in sulfuric acid solution by addition of glycerol and heating to 100-110°C until the anthracene disappears. The reaction mass is then diluted with water, salted out and purified.

Method of purification: Crystallization from toluene.

Use: Dyes.

benzathine penicillin G (N,N'-dibenzylethylenediamine dipenicillin G) $2C_{16}H_{18}N_2O_4S \cdot C_{16}H_{20}N_2 \cdot 4H_2O$.

Properties: White, odorless, crystalline powder; slightly soluble in alcohol; practically insoluble in water; pH of a saturated solution is 4.5-7.5.

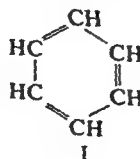

Grade: U.S.P.

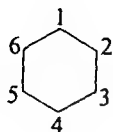

Use: Medicine (antibiotic).

benzazimide. See 4-ketobenzotriazine.

"Benzedrine."⁷⁷¹ Trademark for amphetamine sulfate.

benzene C_6H_6 . Thirteenth in order of high-volume chemicals produced in U.S. (1975).

III

IV

Structure: I. Complete ring showing all elements.

II. Standard ring showing double bonds only.

III. Simple ring without double bonds, with numerals indicating position of carbon atoms to which substituent atoms or groups may be attached (2 = ortho, 3 = meta, 4 = para).

IV. Generalized structure, with enclosed circle suggesting the resonance of this compound.

These structures are also referred to as the benzene nucleus.

Properties: Colorless to light-yellow, mobile, nonpolar liquid of highly refractive nature; aromatic odor; vapors burn with smoky flame; b.p. 80.1°C; m.p. 5.5°C; sp. gr. 0.8790 (20/4°C); wt/gal 7.32 lb; refractive index (n_D 20) 1.50110; flash point (closed cup) 12°F; surface tension 29 dynes/cm. Autoignition temp. 1044°F. Miscible with alcohol, ether, acetone, carbon tetrachloride, carbon disulfide, acetic acid; slightly soluble in water.

Derivation: (a) Hydrodealkylation of toluene or of pyrolysis gasoline (q.v.); (b) transalkylation of toluene by disproportionation reaction; (c) catalytic reforming of petroleum; (d) fractional distillation of coal tar.

Grades: Crude; straw color; motor; industrial pure (2°C); nitration (1°C); thiophene-free; 99 mole %; 99.94 mole %; nanograde.

Containers: Drums; tank cars; barges.

Hazard: Flammable, dangerous fire risk. Explosive limits in air, 1.5 to 8% by volume. Toxic by ingestion, inhalation, and skin absorption. Tolerance, 25 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Ethylbenzene (for styrene monomer); dodecylbenzene (for detergents); cyclohexane (for nylon); phenol; nitrobenzene (for aniline); maleic anhydride; dodecylbenzene; chlorobenzene; diphenyl; benzene hexachloride; benzene-sulfonic acid; solvent; anti-knock gasoline.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also aromatic.

benzene azimide. See 1,2,3-benzotriazole.

benzeneazoanilide. See diazoaminobenzene.

benzeneazobenzene. See azobenzene.

benzeneazo-para-benzeneazo-beta-naphthol ("Sudan" III; tetraazobenzene-beta-naphthol) $C_6H_5NNC_6H_4-4-NN-1-C_{10}H_6-2-OH$. A red dye; C.I. 26100.

Properties: Brown powder; m.p. 195°C; insoluble in water; soluble in alcohol and oils.

Uses: Coloring oils red; biological stain.

benzeneazonaphthylethylenediamine. See azodine.

benzenecarboxylic acid. See benzoic acid.

benzenediazonium chloride $C_6H_5N(N)Cl$.

Properties: Ionic salt. Very soluble in water; insoluble in most organic solvents.

Hazard: Explodes on heating.

Use: Dye intermediate.

Shipping regulations: Not listed. Consult authorities.

benzene dibromide. See dibromobenzene.

benzene-ortho-dicarboxylic acid. See phthalic acid.

benzene-para-dicarboxylic acid. See terephthalic acid.

benzene hexachloride (BHC). A commercial mixture of isomers of 1,2,3,4,5,6-hexachlorocyclohexane (q.v.). insecticide. The gamma isomer is toxic. Use may be restricted. See also lindane.

benzenemonosulfonic acid. See benzenesulfonic acid.

benzenephosphinic acid (phenylphosphinic acid)

Properties: Colorless crystals; m.p. 82-84°C; sp. gr. 1.376 (29°C). Decomposes at 200°C. Stable in air. Soluble in water, alcohol, acetone. Slightly soluble in ether; insoluble in benzene, hexane, carbon tetrachloride. Combustible.

Containers: 100-lb fiber drums.

Uses: Antioxidant; intermediate for metallic salt formation; accelerator for organic peroxide catalysts.

benzenephosphonic acid (phenylphosphonic acid)

Properties: Colorless crystals. M.p. 158°C; sp. gr. 1.475 (4°C); decomposes at 275°C; soluble in water, alcohol, carbon tetrachloride. Combustible.

Containers: 100-lb fiber drums.

Uses: Intermediate in antifouling paint agents; catalyst in organic reactions.

benzenephosphorus dichloride $C_6H_5PCl_2$.

Properties: Highly reactive colorless liquid. M.p. -51°C; b.p. 224.6°C; sp. gr. 1.315 (25°C); refractive index 1.5958 (n_D 25/D). Soluble in common inert organic solvents; fumes in air; hydrolyzes in water.

Containers: 55-gal stainless steel drums.

Hazard: Flammable; corrosive to skin and tissue.

Uses: Organic synthesis, for derivation of plasticizers, polymers, antioxidants; oil additives.

Shipping regulations: (Rail) Red label. (Air) Corrosive label. Not acceptable on passenger planes.

benzenephosphorus oxydichloride $C_6H_5POCl_2$.

Properties: Reactive colorless liquid. M.p. 3.0°C; b.p. 258°C; sp. gr. 1.197 (25°C); refractive index 1.5585 (n_D 25/D). Soluble in common inert organic solvents; hydrolyzes in water. Combustible.

Containers: 55-gal nickel drums.

Hazard: Strong irritant to skin.

Uses: Organic synthesis, for derivation of plasticizers, polymers, antioxidants, oil additives.

benzenesulfonic acid (benzenemonosulfonic acid; phenylsulfonic acid) $C_6H_5SO_3H$.

Properties: Fine, deliquescent needles or large plates; m.p. 65-66°C when anhydrous; with 1.5 molecules water, m.p. is 43-44°C; soluble in water and alcohol; slightly soluble in benzene; insoluble in ether and carbon disulfide.

Derivation: By reacting benzene with fuming sulfuric acid.

Uses: Manufacture of phenol, resorcinol and other organic syntheses, and as a catalyst.

benzene-1,3,5-tricarboxylic acid chloride. See trimesoyl trichloride.

benzenoid. Any organic compound containing or derived from the benzene ring structure, e.g., phenol,

nitrobenzene, anthracene, styrene. This large array of unsaturated compounds, derived chiefly from petroleum and coal tar, provides a broad base for the synthesis of polymers, dyes, and intermediates. See also aromatic.

benzoyl trichloride. See benzotrichloride.

benzethonium chloride. A synthetic quaternary ammonium compound, $C_{27}H_{42}ClNO_2$.

Properties: Colorless, odorless plates. Very bitter taste; m.p. 164–166°C. Soluble in water, alcohol, and acetone. Aqueous solution yields flocculent white precipitate with soap solutions.

Grade: N.F.

Hazard: Highly toxic by ingestion; 1 gram may be fatal.

Use: Antiseptic; cationic detergent.

benzhydrol (benzohydrol; diphenylmethanol; diphenylcarbinol) $(C_6H_5)_2CHOH$.

Properties: Needlelike colorless crystals; m.p. 69°C; b.p. 298°C, 176°C (13 mm). Slightly soluble in water, easily soluble in alcohol, ether, chloroform and carbon disulfide. Combustible.

Derivation: Reduction of benzophenone with magnesium or zinc dust.

Use: Preparation of other organic compounds, including certain antihistamines; insecticide.

benzhydryl bromide. See diphenylmethyl bromide.

benzhydryl chloride $(C_6H_5)_2CHCl$.

Properties: Water-white to light straw-colored liquid; refractive index 1.596; m.p. 16°C; b.p. 140°C (3mm). Combustible.

Uses: Organic synthesis.

2-(benzhydryloxy)-N,N-dimethylethylamine hydrochloride. See diphenhydramine hydrochloride.

benzidine (benzidine base; para-diaminodiphenyl) $NH_2(C_6H_4)_2NH_2$.

Properties: Grayish-yellow, white or reddish gray crystalline powder; m.p. 127°C; b.p. 400°C; soluble in hot water, alcohol, and ether; slightly soluble in water. Combustible. Also available as the hydrochloride.

Derivation: (a) By reducing nitrobenzene with zinc dust in alkaline solution followed by distillation; (b) by electrolysis of nitrobenzene, followed by distillation; (c) nitration of diphenyl followed by reduction of the product with zinc dust in alkaline solution, with subsequent distillation.

Grades: Technical (paste; powder 80–85%).

Hazard: Toxic by ingestion, inhalation, and skin absorption. A carcinogen.

Uses: Organic synthesis; manufacture of dyes, especially of Congo red; detection of blood stains; stain in microscopy; reagent; stiffening agent in rubber compounding.

Shipping regulations: (Air) Poison label.

benzinedicarboxylic acid. See diaminodiphenic acid.

benzidine dye. Any of a group of azo dyes derived from 3,3'-dichlorobenzidine; they include yellow and orange colors claimed to be light-fast and alkali-resistant. Congo Red is derived from benzidine and naphthionic acid. These compounds are active carcinogens and physical contact with them should be avoided.

benzidine sulfate. $C_{12}H_{12}N_2 \cdot H_2SO_4$.

Properties: White crystalline powder. Soluble in ether; sparingly soluble in water, alcohol, dilute acids.

Derivation: Action of sulfuric acid or sodium sulfate

on benzidine with subsequent recovery by precipitation.

Hazard: Toxic by ingestion and skin absorption. A carcinogen.

Use: Organic synthesis.

benzil (dibenzoyl) $C_6H_5CO \cdot COC_6H_5$.

Properties: Yellow needles. Soluble in alcohol and ether; insoluble in water. M.p. 95°C; b.p. 346–348°C; sp. gr. 1.521.

Derivation: From benzoin by oxidation with nitric acid.

Use: Organic synthesis; insecticide.

benzilic acid (diphenylglycolic acid) $(C_6H_5)_2C(OH)COOH$.

Properties: White to tan powder with a characteristic odor; m.p. 148–151°C; soluble in hot water and alcohol. Combustible.

Containers: Bottles; drums.

Uses: Chemical intermediate.

benzine. The name "benzine" is archaic and misleading and should not be used. (A.S.T.M. Petroleum

Definitions D-288). Do not confuse with benzene. Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also ligroin.

benzocaine. See ethyl para-aminobenzoate.

benzodihydropyrone (dihydrocoumarin) $C_9H_8O_2$ (bicyclic).

Properties: White to light yellow oily liquid with a sweet odor; congeals at 23°C. Insoluble in water; soluble in alcohol, chloroform and ether. Combustible.

Uses: Perfumery.

"Benzoflex."³¹⁶ Trademark for a series of plasticizers which are dibenzoate esters of dipropylene glycol or any of several polyethylene glycols.

Uses: Primary plasticizer for vinyl resins; adhesive formulations; some grades in food packaging adhesives.

benzofuran. See coumarone.

benzoglycolic acid. See mandelic acid.

benzoguanamine (2,4-diamino-6-phenyl-s-triazine) $C_6H_5C_3N_3(NH_2)_2$.

Properties: Crystals; sp. gr. 1.40 (d 25/4); m.p. 227–228°C. Soluble in methyl "Cellosolve," alcohol, and dilute hydrochloric acid; partially soluble in dimethylformamide and acetone; practically insoluble in chloroform, ethyl acetate; insoluble in water, benzene, and ether. Combustible.

Derivation: Prepared from benzonitrile and dicyandiamide in the presence of sodium and liquid ammonia.

Containers: Drums; tank cars.

Uses: Thermosetting resins, resin modifiers; chemical intermediate for pesticides, pharmaceuticals and dyestuffs.

benzohydrol. See benzhydrol.

benzoic acid (carboxybenzene; benzenecarboxylic acid; phenylformic acid) C_6H_5COOH . It occurs naturally in benzoin resin (q.v.).

Properties: White scales or needle crystals with odor of benzoin or benzaldehyde; sp. gr. 1.2659; m.p. 121.25°C; b.p. 249.2°C; sublimes at 100°C; freely volatile in steam; flash point (closed cup) 250°F; soluble in alcohol, ether, chloroform, benzene, carbon disulfide, carbon tetrachloride, and turpentine; slightly soluble in water. Combustible.

Derivation: (a) Decarboxylation of phthalic acid by steam, in the presence of catalysts; (b) chlorination

of toluene to yield benzotrichloride, which is hydrolyzed to benzoic acid; (c) oxidation of toluene; (d) from benzoin resin (q.v.).

Method of purification: Sublimation.

Grades: Technical; C.P.; U.S.P.; F.C.C.

Containers: Barrels; multiwall paper sacks; drums; tanks.

Hazard: May cause nausea and gastroenteric disturbance. Possible allergic reactions. Use restricted to 0.1% in foods.

Uses: Sodium and butyl benzoates; plasticizers; benzoyl chloride; alkyl resins; food preservative; seasoning tobacco; flavors; perfumes; dentifrices; medicine (germicide).

benzoic aldehyde. See benzaldehyde.

benzoic trichloride. See benzotrichloride.

benzoin (bitter almond-oil camphor; benzoylphenyl carbinol; 2-hydroxy-2-phenylacetophenone; phenylbenzoyl carbinol) $C_6H_5CHOHCOC_6H_5$.

Properties: White or yellowish crystals; slight camphor odor; m.p. 137°C; slightly soluble in water and ether; soluble in acetone and hot alcohol. Optically active. Combustible.

Derivation: Condensation of benzaldehyde in an alkaline cyanide solution.

Uses: Organic synthesis; intermediate; photopolymerization catalyst.

Note: Do not confuse with benzoin resin. (q.v.).

alpha-benzoin oxime (benzoin antioxieme)

$C_6H_5CHOHC:NOHC_6H_5$. Solid; m.p. 150–152°C.

Uses: Organic intermediates and photographic chemicals.

benzoin resin (gum benzoin; Benjamin gum).

Properties: Reddish-brown globules; balsamic, vanilla-like odor; brittle at room temperature, but softened by heat. Soluble in warm alcohol and carbon disulfide; insoluble in water.

Source: Obtained from the *Styrax* tree in Southeast Asia and Sumatra. The Sumatran grade is higher-melting and only 75% soluble in alcohol.

Grades: Technical; tincture U.S.P.

Constituents: Benzoic acid, cinnamic acid, vanillin.

Uses: Source of benzoic acid; perfumery; cosmetics; medicine (antiseptic and expectorant).

Note: Do not confuse with benzoin (q.v.).

benzol. Obsolete name for benzene, no longer in approved use.

benzonitrile (phenyl cyanide) C_6H_5CN .

Properties: Colorless oil; almond-like odor; sharp taste; viscosity (100°F) 1.054 centistokes; refractive index 1.5289; soluble in boiling water, alcohol, and ether; slightly soluble in cold water. Sp. gr. 1.0051; b.p. 190.7°C; m.p. -13.1°C.

Derivation: From benzoic acid by heating with lead thiocyanate.

Hazard: Toxic and flammable.

Uses: Manufacture of benzoguanamine; intermediate for rubber chemicals; solvent for nitrile rubber, specialty lacquers, and many resins and polymers, and for many anhydrous metallic salts.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

benzophenol. See phenol.

benzophenone (diphenylketone) $(C_6H_5)_2CO$.

Properties: White prisms, with sweet, rose-like odor.

Soluble in alcohol and ether; insoluble in water; m.p. 47.5°C; b.p. 305°C. Combustible.

Purification: Crystallization from alcohol.

Grades: Free from chlorine (FFC); also F.C.C.

Containers: Tin cans; fiberboard containers; drums.

Uses: Organic synthesis; odor fixative; derivatives are used as ultraviolet absorbers; flavoring; soap fragrance; pharmaceuticals; polymerization inhibitor for styrene.

benzophenone oxide. See xanthone.

3,3',4,4'-benzophenone tetracarboxylic dianhydride (BTDA) $C_{17}H_6O_7$.

Properties: Free-flowing powder; m.p. 228°C.

Uses: Epoxy curing agent; heat-resistant polymers, specialty alkyl resins, polyesters and plasticizers.

benzopyrene (benzopyrene) $C_{20}H_{12}$. A polynuclear (five-ring) aromatic hydrocarbon. Found in coal tar, cigarette smoke, and in the atmosphere as a product of incomplete combustion. Occurs as benzo[a]pyrene and benzo[e]pyrene.

Properties (benzo[a]pyrene): Yellowish crystals; m.p. 179°C; b.p. 310–312°C (10 mm). Insoluble in water; slightly soluble in alcohol; soluble in benzene, toluene, xylene.

Hazard: An active carcinogen. Toxic by inhalation.

benzopyrone. See coumarin.

benzoquinone. See quinone.

benzosulfimide. See saccharin.

benzothiazole C_6H_4SCHN (bicyclic).

Properties: Yellow liquid with unpleasant odor; b.p. 227°C; slightly soluble in water; soluble in alcohol. Combustible.

Hazard: May be toxic by ingestion.

Use: Rubber accelerators.

benzothiazyl disulfide. See 2,2'-dithiobisbenzothiazole.

benzothiazyl 2-cyclohexylsulfenamide. See N-cyclohexyl-2-benzothiazolesulfenamide.

2-benzothiazyl-N,N-diethylthiocarbamyl sulfide (diethylthiocarbamic acid, 2-benzothiazoyl ester) $(C_6H_4SCN)SSCN(C_2H_5)_2$.

Properties: Free-flowing, light yellow to tan powder; sp. gr. 1.27; m.p. 69°C (min).

Uses: Rubber accelerator.

benzothiazyl disulfide. See 2,2'-dithiobisbenzothiazole.

1,2,3-benzotriazole (aziminobenzene; benzene azimide) $C_6H_4NHN_2$.

Properties: White to light tan, odorless, crystalline powder; boiling range 201–204°C (15 min); very stable toward acids and alkalis, and toward oxidation and reduction. Its basic characteristics are very weak but it forms stable metallic salts. Can exist in 2 tautomeric forms. Soluble in alcohol and benzene; slightly soluble in water.

Containers: Bottles; fiber drums.

Hazard: Moderately toxic by ingestion.

Uses: Photographic restrainer; chemical intermediate; derivatives used as ultraviolet absorbers.

benzotrichloride (toluene trichloride; benzenyl trichloride; benzoic trichloride; phenylchloroform) $C_6H_5CCl_3$.

Properties: Colorless to yellowish liquid; fumes in air; hydrolyzes in presence of water; penetrating odor.

Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.38; b.p. 213–214°C; m.p. –5°C; refractive index 1.5584.

Derivation: Chlorination of boiling toluene.

Method of purification: Rectification.

Hazard: Moderately toxic; fumes highly irritant.

Use: Synthetic dyes; organic synthesis.

benzotrifluoride (toluene trifluoride; trifluoromethylbenzene) $C_6H_5CF_3$.

Properties: Water-white liquid with aromatic odor. B.p. 102.1°C; m.p. –29.1°C; sp. gr. 1.1812 (25/4°C); refractive index 1.4146. Flash point (closed cup) 54°F. Miscible with alcohol, acetone, benzene, carbon tetrachloride, ether, and *n*-heptane; insoluble in water.

Containers: 55-gal drums.

Hazard: Toxic by inhalation. Flammable, dangerous fire risk. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Intermediate for dyes, and pharmaceuticals; as a solvent and dielectric fluid; vulcanizing agent; insecticides.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid, n.o.s., Flammable Liquid label.

trans-beta-benzoylacrylic acid $C_6H_5COCH:CHCOOH$.

Properties: Straw yellow needles or plates; m.p. 99°C; soluble in most solvents but only slightly soluble in cold water and ligroin. Combustible.

Containers: Polyethylene-lined fiber drums.

Uses: Reagent for characterizing phenols; intermediate in the manufacture of bactericides, insecticides, surface-active agents and the upgrading of drying oils.

N-benzoyl-L(+)-alanine. See alanine.

benzoylamide. See benzamide.

benzoylaminoacetic acid. See hippuric acid.

benzoylaniline. See benzaniline.

benzoyl chloride C_6H_5COCl .

Properties: Transparent, colorless liquid; pungent odor; vapor causes tears. Sp. gr. 1.2188; m.p. –0.5°C; b.p. 197.2°C; refractive index (n_D 20) 1.5536; flash point 162°F. Soluble in ether and carbon disulfide; decomposes in water. Combustible.

Derivation: (a) Interaction of benzoic acid and sulfuric chloride; (b) benzotrichloride and water in the presence of zinc chloride; (c) phosphorus tri- or pentachloride and benzoic acid.

Containers: Drums; tank trucks.

Grades: Technical; C.P.

Hazard: Strong irritant to skin and tissue. Toxic by ingestion and inhalation.

Uses: Medicine; intermediate for introduction by benzoyl groups; intermediate for other organics.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

benzoyl-2,5-diethoxyaniline $C_6H_5CONHC_6H_5(OC_2H_5)_2$.

Properties: Gray pellets; m.p. 83–84°C. Used as an intermediate for pharmaceuticals, dyestuffs and other organic chemicals.

Hazard: May be toxic.

benzoylferrocene (phenyl ferrocenyl ketone)

$C_6H_5FeC_5H_4COC_6H_5$.

Properties: Dark red crystalline solid; m.p. 107–108°C.

Hazard: May be toxic.

Uses: Intermediate.

benzoyl fluoride, C_6H_5COF .

Containers: Available in quantities up to 5 lb in aluminum bottles.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Manufacture of acyl and other fluorides.

benzoylglycin. See hippuric acid.

benzoylglycocoli. See hippuric acid.

benzoyl peroxide (dibenzoyl peroxide) $(C_6H_5CO)_2O_2$.

Properties: White, granular, crystalline solid; tasteless; faint odor of benzaldehyde. Active oxygen, about 6.5%. Soluble in nearly all organic solvents; slightly soluble in alcohols and vegetable oils; slightly soluble in water. M.p. 103–105°C; decomposes explosively above 105°C. Autoignition temp. 176°F; sp. gr. 1.3340 (25°C).

Grades: Technical, wet or dry; F.C.C.

Containers: 1-lb net fiber containers or polyethylene-lined bags; standard cases contain 5, 25, and 50 containers.

Hazard: Flammable and explosive. May explode spontaneously when dry (1% of water). Never mix unless at least 33% water is present. Caution!! Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Bleaching agent for flour, fats, oils, and waxes; polymerization catalyst; drying agent for unsaturated oils; pharmaceutical and cosmetic purposes; rubber vulcanization without sulfur; burn out agent for acetate yarns; production of cheese; embossing vinyl flooring (proprietary).

Shipping regulations: (Rail) Yellow label. (Air) Organic peroxide label. Not acceptable on passenger planes.

benzoylphenyl carbinol. See benzoin.

2-benzoylpyridine $C_6H_5COC_5H_4N$.

Properties: Colorless liquid. Freezing point 42.7°C; insoluble in water.

Grade: 98% (minimum).

Use: Organic synthesis.

4-benzoylpyridine $C_6H_5COC_5H_4N$.

Properties: Colorless liquid. Freezing point 71.4°C; insoluble in water.

Grade: 98% (minimum).

Use: Organic synthesis.

benzoylsulfonic imide. See saccharin.

benzozone. See acetyl benzoyl peroxide.

1,2-benzphenanthrene. See chrysene.

benzyl abietate $C_{19}H_{29}COOCH_2C_6H_5$.

Properties: Nonvolatile, viscous liquid which resembles Canada balsam. Soluble in most anhydrous solvents. See also balsam.

benzyl acetate (phenylmethyl acetate)

$C_6H_5CH_2OOCCH_3$.

Properties: Water-white liquid; floral odor. Soluble in alcohol and ether. Slightly soluble in water; soluble in alcohol. Flash point 216°F (closed cup). Sp. gr. 1.059–1.062 (15°C); b.p. 212°C; refractive index 1.5015–1.5035. Combustible. Autoignition temp. 862°F.

Derivation: (a) By treating benzyl chloride with sodium acetate in various solvents; (b) by esterification of benzyl alcohol with acetic anhydride or acetic acid. Method of purification: Distillation.

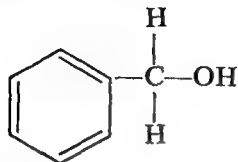

Grades: Free-from-chlorine grade which should have an ester content of 97% but for which lower grade material is sometimes substituted; technical grade which is not free from chlorine and for which ester content varies considerably; F.C.C.

Containers: 55-gal drums; carboys; cans; bottles.

Hazard: Moderately toxic; irritant to skin.

Uses: Artificial jasmine and other perfumes; soap perfume; flavoring; solvent and high boiler for cellulose acetate and nitrate, natural and synthetic resins; oils; lacquers; polishes; printing inks; varnish removers.

benzyl alcohol (alpha-hydroxytoluene; phenylmethanol; phenylcarbinol) $C_6H_5CH_2OH$.

Properties: Water-white liquid; slight odor; sharp, burning taste. B.p. $206^{\circ}C$; flash point $213^{\circ}F$; sp. gr. 1.040–1.050 ($25/25^{\circ}C$); refractive index ($20^{\circ}C$) 1.5385–1.5405. Somewhat soluble in water; miscible with alcohol, ether and chloroform. Combustible, low toxicity. Autoignition temp. $817^{\circ}F$.

Derivation: (a) By hydrolysis of benzyl chloride; (b) from benzaldehyde by catalytic reduction or Cannizzaro reaction.

Method of purification: Distillation and chemical treatment.

Grades: Free from chlorine (F.F.C.); technical; N.F.; textile; photographic reagent; F.C.C.

Uses: Perfumes and flavors; photographic developer for color movie films; dyeing nylon filament, textiles and sheet plastics; solvent for dyestuffs, cellulose esters, casein, waxes, etc.; heat-sealing polyethylene films; intermediate for benzyl esters and ethers; local anesthetic; cosmetics, ointments, emulsions; ball point pen inks; stencil inks.

benzylamine (aminotoluene) $C_6H_5CH_2NH_2$.

Properties: Light amber liquid; strongly alkaline reaction. Soluble in alcohol, ether, and water. Sp. gr. 0.9813; b.p. $184.5^{\circ}C$; refractive index ($n_{20/D}$) 1.540. Combustible.

Derivation: From benzyl chloride and ammonia.

Use: Chemical intermediate for dyes, pharmaceuticals, and polymers.

N-benzyl-para-aminophenol (BAP)
 $C_6H_5CH_2NHC_6H_4OH$.

Properties: Light brown powder, melts between 84 – $90^{\circ}C$; 96–99% pure; solubility 50% in anhydrous methanol, 50% in 95% ethyl alcohol, 0.06% in water; 0.1–0.5% in gasoline, varying with chemical nature of gasoline.

Hazard: Carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Use: In cracked gasoline, in concentration of 0.001–0.004% by weight to prevent gum formation.

2-benzylamino-1-propanol

$C_6H_5CH_2NHCH(CH_2OH)CH_3$.

Properties: White to yellow solid. Both *l* and *dl*-forms are available. M.p. (*dl*-form) 70 – $73^{\circ}C$. Specific rotation (*l*-form) $+38^{\circ}$ to $+44^{\circ}$ (1.0% solution in alcohol) at $25^{\circ}C$. Combustible.

benzylaniline $C_6H_5NHCH_2C_6H_5$.

Properties: Colorless prisms. Soluble in alcohol and ether; insoluble in water. M.p. $33^{\circ}C$; b.p. $310^{\circ}C$.

Use: Organic synthesis.

benzylbenzene. See diphenylmethane.

benzyl benzoate $C_6H_5CH_2OOC C_6H_5$.

Properties: Water-white liquid; readily freezes. Sharp, burning taste and faint aromatic odor. Supercools easily. Insoluble in water and glycerin; soluble in alcohol, chloroform and ether. Sp. gr. 1.116–1.120 ($25/25^{\circ}C$); b.p. $325^{\circ}C$; m.p. $18.8^{\circ}C$; refractive index 1.568–1.569 ($20^{\circ}C$). Flash point, $298^{\circ}F$. Combustible; low toxicity.

Derivation: (a) By a Cannizzaro reaction from benzaldehyde; (b) by esterifying benzyl alcohol with benzoic acid; (c) by treating sodium benzoate with benzyl chloride.

Method of purification: Distillation and crystallization.

Grades: Technical; U.S.P.; F.C.C.

Containers: 55-gal drums (tinned); 100-lb aluminum drums; cans; bottles.

Uses: Fixative and solvent for musk in perfumes and flavors; medicine (external); plasticizer; miticide.

benzyl bromide (alpha-bromotoluene) $C_6H_5CH_2Br$.

Properties: Clear, refractive liquid. Pleasant odor. Not easily hydrolyzed. Soluble in alcohol, benzene, ether, insoluble in water. A lachrymator. Sp. gr. 1.438 at $16^{\circ}C$; b.p. 198 – $199^{\circ}C$; m.p. $-39^{\circ}C$; vapor density 5.8.

Derivation: (a) Bromination of toluene; (b) interaction of benzyl alcohol and hydrobromic acid.

Hazard: Corrosive to skin and tissue.

Uses: Making foaming and frothing agents; organic synthesis.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

benzyl butyrate $C_3H_7COOCH_2C_6H_5$.

Properties: Liquid; fruity odor; b.p. $240^{\circ}C$; density 1.016 ($17.5^{\circ}C$); soluble in alcohol. Combustible.

Grades: Technical; F.C.C.

Uses: Plasticizer; odorants and flavoring.

benzyl carbinol. See phenethyl alcohol.

benzyl "Cellosolve." See ethylene glycol monobenzyl ether.

benzyl chloride (alpha-chlorotoluene) $C_6H_5CH_2Cl$.

Properties: Colorless liquid; pungent odor. A lachrymator. Sp. gr. 1.090–1.111 ($25/25^{\circ}C$); m.p. $-43^{\circ}C$; b.p. $179^{\circ}C$; $n_{25/D}$ 1.5365; flash point $153^{\circ}F$ (O.C.). Combustible. Autoignition temp. $1085^{\circ}F$. Soluble in alcohol and ether; insoluble in water.

Derivation: By passing chlorine over boiling toluene until it has increased 38% in weight. The product is washed with water and separated by fractional distillation.

Grades: Technical; C.P.; 95%; redistilled.

Forms: Anhydrous; stabilized (with aqueous sodium carbonate solution).

Containers: Anhydrous (unstabilized); 475-lb nickel drums; 100-lb carboys. Stabilized: 475-lb steel drums; tank trucks; tank cars.

Hazard: Intensely irritating to eyes and skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Dyes; intermediates; benzyl compounds; synthetic tannins; perfumery; pharmaceuticals; manufacture of photographic developer; gasoline gum inhibitors; penicillin precursors; quaternary ammonium compounds.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

benzyl chlorocarbonate (benzyl chloroformate)
 $C_6H_5CH_2OCOCl$.

Properties: Oily liquid, with lachrymatory properties; odor of phosgene; decomposes over $100^\circ C$; reacts with water to form hydrochloric acid.
 Hazard: Irritant to eyes. Emits highly toxic phosgene fumes when heated to $100^\circ C$.
 Use: Peptide synthesis.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

benzyl chloroformate. See benzyl chlorocarbonate.

ortho-benzyl-para-chlorophenol (chlorophene, USAN; "Santophen"; sepiophene; 4-chloro-alpha-phenyl-ortho-cresol) $C_6H_5CH_2C_6H_4OHCl$.

Properties: White to light tan or pink flakes; crystallizing point $45^\circ C$ min; sp. gr. 1.202–1.206 ($55/55^\circ C$); odor slight phenolic. Insoluble in water; highly soluble in alcohol and other organic solvents; dispersible in aqueous media with the aid of soaps or synthetic dispersing agents; noncorrosive to most metals. Combustible.

Containers: 22- and 55-gal lacquer-lined drums.
 Hazard: Moderately toxic and irritant.

Uses: Active principle or enhancing agent for disinfectants.

benzyl cinnamate (cinnamein) $C_9H_7O_2 \cdot C_7H_7$.

Properties: White crystals; aromatic odor; m.p. $39^\circ C$; congealing point min $34^\circ C$; b.p. $244^\circ C$ (25 mm); insoluble in water; soluble in alcohol. Low toxicity.
 Grades: Technical; F.C.C.
 Uses: Perfumery and flavors.

benzyl cyanide (phenylacetonitrile; alpha-tolunitrile)
 $C_6H_5CH_2CN$.

Properties: Colorless oily liquid; aromatic odor; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0157; m.p. $-24^\circ C$; b.p. $230^\circ C$; refractive index (n_D²⁵) 1.5211.

Derivation: Interaction of benzyl chloride and potassium cyanide.

Grades: Technical.
 Containers: Metal drums; tins; bottles.
 Hazard: Highly toxic.

Use: Organic synthesis; especially penicillin precursors.
 Shipping regulations: (Rail) Poisonous liquid, n.o.s., Poison label. (Air) Poison label.

benzyl dichloride (benzylidene chloride; benzal chloride; chlorobenzal; alpha, alpha-dichlorotoluene)
 $C_6H_5CHCl_2$.

Properties: Colorless oily liquid; faint aromatic odor; sp. gr. 1.295 ($16^\circ C$); m.p. $-16.1^\circ C$; b.p. $207^\circ C$; refractive index 1.5502 ($20^\circ C$); soluble in alcohol, ether, and in dilute alkali; insoluble in water. Combustible.

Derivation: Chlorination of toluene, until two formula weights of chlorine are absorbed, in absence of catalysts but presence of light.
 Hazard: Toxic; strong irritant and lachrymator.

Uses: Dyes.
 Shipping regulations: (Air) Poison label. (Rail) Poisonous liquids, n.o.s., Poison label. Legal label name (Air) benzylidene chloride.

N-benzylidethanolamine $C_6H_5CH_2N(C_2H_4OH)_2$.
 Properties: Colorless to light yellow liquid; completely miscible with water. Sp. gr. 1.073; refractive index 1.5345–1.5375; distilling range 240 – $255^\circ C$.
 Uses: Corrosion inhibitor; intermediate.

N-benzylidimethylamine $C_6H_5CH_2N(CH_3)_2$.

Properties: Colorless to light yellow liquid. Sp. gr. 0.894 ($27^\circ C$); refractive index 1.4985–1.5005 ($25^\circ C$); b.p. 180 – $182^\circ C$; distilling range 65 – $68^\circ C$ (18 mm). Combustible.

Uses: Intermediate, especially for quaternary ammonium compounds; a dehydrohalogenating catalyst; corrosion inhibitor; acid neutralizer.

benzyl disulfide. See dibenzyl disulfide.

N-benzylethanolamine $C_6H_5CH_2NH(C_2H_4OH)$.

Properties: Colorless to light yellow liquid. Sp. gr. 1.044 ($27^\circ C$); refractive index 1.5400–1.5430; distillation range 240 – $255^\circ C$. Combustible.

Uses: Corrosion inhibitor; intermediate.

benzyl ethyl ether $C_6H_5CH_2OC_2H_5$.

Properties: Colorless, oily liquid; aromatic odor; volatile in steam; insoluble in water; miscible with alcohol and ether. B.p. $185^\circ C$; sp. gr. 0.949; refractive index 1.4955 at $20^\circ C$. Combustible.

Derivation: By boiling benzyl chloride with either sodium or potassium ethylate.

Hazard: Narcotic in high concentrations; may be skin irritant.

Uses: Organic synthesis; flavoring.

benzyl ethylsalicylate $C_6H_5CH_2OOCCH_2OC_2H_5$.
 Used as fixative and solvent in perfumes.

benzyl fluoride $C_6H_5CH_2F$.

Properties: Colorless liquid. Forms acicular crystals on prolonged cooling. Sp. gr. 1.022 at $25^\circ C$; b.p. $139.8^\circ C$ (753 mm); m.p. $-35^\circ C$.

Derivation: By decomposing benzyltrimethylammonium fluoride.

Hazard: Toxic and irritant. Tolerance (as F): 2.5 mg per cubic meter of air.

Use: Organic synthesis.

benzyl formate $C_6H_5CH_2OOCH$.

Properties: Colorless liquid; fruity-spicy odor. Resembles benzyl acetate in many respects but differs in its greater volatility. Sp. gr. 1.083–1.087; refractive index, 1.511–1.513; b.p. $203^\circ C$; miscible with alcohols, ketones, oils, aromatic, aliphatic and halogenated hydrocarbons; insoluble in water.

Hazard: May be narcotic in high concentrations.

Uses: Perfumes; flavoring; solvent for cellulose esters.

benzylhexadecyldimethylammonium chloride. See cetalkonium chloride.

benzylhydroquinone. See para-benzoyloxyphenol.

benzylidene acetone (benzalacetone; methyl styryl ketone; 4-phenyl-3-buten-2-one) $C_6H_5CHCHCOCH_3$.

Properties: Colorless crystals; odor of coumarin. Soluble in alcohol, ether, benzene, and chloroform; insoluble in water. M.p. $42^\circ C$; congealing point $39^\circ C$ (min); b.p. 260 – $262^\circ C$; refractive index 1.5836 at $46^\circ C$; density (15/ $15^\circ C$) 1.0377. Combustible.

Derivation: Condensation of benzaldehyde and acetone.

Use: Organic synthesis; perfumery; fixative, flavoring.

benzylidene azine. See benzalazine.

benzylidene chloride. Legal label name for benzyl dichloride.

2-benzylidene-1-heptanol. See alpha-amylcinnamic alcohol.

benzyl iodide $C_6H_5CH_2I$.

Properties: Colorless crystals or liquid. Soluble in alcohol, carbon disulfide and ether; insoluble in water. Sp. gr. 1.7335; m.p. $34.1^\circ C$; b.p., decomposes.

Derivation: Interaction of benzyl chloride and hydriodic acid.

Hazard: Moderately toxic and irritant.

benzyl isoamyl ether. See isoamyl benzyl ether.

benzyl isobutyl ketone. See 4-methyl-1-phenyl-2-pentanone.

benzyl isoeugenol (1- α -phenyl-4-propenylveratrole) $\text{CH}_3\text{CHCHC}_6\text{H}_3(\text{OCH}_3)\text{OCH}_2\text{C}_6\text{H}_5$.

Properties: White crystalline solid; floral odor of the carnation type. Soluble in alcohol and ether. Combustible.

Use: Perfumery; fixative.

N-benzylisopropylamine $\text{C}_6\text{H}_5\text{CH}_2\text{NH}(\text{CH}_3\text{CHCH}_3)$.

Properties: Colorless to yellow liquid; sp. gr. 0.895 (25°C); refractive index 1.4995–1.5015 (25°C). Combustible.

Uses: Rust inhibitor; intermediate.

benzyl isothiocyanate $\text{C}_6\text{H}_5\text{CH}_2\text{NCS}$. Colorless to slightly yellow liquid; a lachrymator.

Hazard: Toxic; irritating to tissues.

Use: Chemical intermediate.

benzyl mercaptan. See benzyl thiol.

benzylmethylamine $\text{C}_6\text{H}_5\text{CH}_2\text{NHCH}_3$.

Properties: Colorless to light yellow liquid. Sp. gr. 0.936 (25°C); refractive index 1.5185–1.5220 (25°C); distillation range 183–188°C. Combustible.

Uses: Organic synthesis.

N-benzyl-N,N-methylethanolamine

$\text{C}_6\text{H}_5\text{CH}_2\text{NCH}_3(\text{C}_2\text{H}_4\text{OH})$.

Properties: Colorless to light yellow liquid; sp. gr. 1.006 (27°C); refractive index 1.5250–1.5270 (25°C); distillation range 95–105°C (2 mm). Combustible.

Uses: Corrosion inhibitor; intermediate.

3-benzyl-4-methyl umbelliferone $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_3\text{C}_9\text{H}_4\text{O}_3$.

Properties: Tan crystalline powder; m.p. 255°C min; slightly soluble in ethyl alcohol; insoluble in water.

Use: Optical whitening agent; intermediate.

para-benzoyloxyphenol (benzylhydroquinone; "Agerite Alba") $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_6\text{H}_4\text{OH}$.

Properties: Light tan powder; sp. gr. 1.26; faint odor; m.p. 121–122°C. Slightly soluble in water; practically insoluble in petroleum hydrocarbons; very soluble in benzene and alkalis. Low toxicity. Combustible.

Use: Rubber antioxidant; stabilizer; polymerization inhibitor; chemical intermediate.

benzyl pelargonate $\text{C}_6\text{H}_5\text{CH}_2\text{OCC}_8\text{H}_{17}$. Liquid; sp. gr. 0.962 (15.5/15.5°C); b.p. 315°C; mild odor. Used in flavors and perfumes; bactericides and fungicides; organic synthesis.

para-benzylphenol (4-hydroxydiphenylmethane)

$\text{C}_6\text{H}_5\text{CH}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: White crystals from ethyl alcohol; m.p. 84°C; b.p. 320–322°C. Soluble in ethyl alcohol, ether, chloroform, benzene, acetic acid, caustic alkalis; moderately soluble in hot water. Combustible.

Hazard: Toxic by ingestion.

Uses: Antiseptic and germicide; organic synthesis.

benzyl phenylacetate $\text{C}_6\text{H}_5\text{CH}_2\text{COOCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid; honeylike odor. Soluble in alcohol; sp. gr. 1.097–1.099; refractive index 1.554–1.556. Combustible.

Uses: Perfumery and flavors.

benzyl phenyl ketone. See deoxybenzoin.

benzyl propionate $\text{C}_2\text{H}_5\text{COOCH}_2\text{C}_6\text{H}_5$. Similar to benzyl acetate but has sweeter odor.

Properties: Liquid. B.p. 220°C; sp. gr. 1.036 (17.5°C); insoluble in water. Combustible.

Grades: Technical; F.C.C.

Uses: Perfumes; flavoring.

benzylpyridine $\text{C}_6\text{H}_5\text{CH}_2\text{C}_5\text{H}_4\text{N}$.

Properties: Liquid. Boiling point 276.8°C; m.p. 13.6°C; sp. gr. (20°C) 1.061; refractive index 1.5797. Insoluble in water. Combustible.

benzyl salicylate $\text{C}_6\text{H}_4(\text{OH})\text{COOCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid; faint sweet odor. Soluble in 9 vols. of 90% alcohol. Sp. gr. 1.176–1.179; refractive index 1.580–1.581; m.p. min 24°C; b.p. (26 mm) 208°C. Combustible. Low toxicity.

Grades: Technical; F.C.C.

Uses: Perfume fixative; solvent for synthetic musk; sun-screening lotions; soap odorant.

benzyl succinate (dibenzyl succinate)

$\text{C}_6\text{H}_5\text{CH}_2\text{OOCCH}_2\text{CH}_2\text{COOCH}_2\text{C}_6\text{H}_5$.

Properties: White crystalline powder, almost tasteless. Soluble in alcohol, ether, chloroform, also in fixed and volatile oils; insoluble in water. M.p. 45°C. Combustible.

benzyl sulfide $(\text{CH}_2\text{C}_6\text{H}_5)_2\text{S}$.

Properties: Colorless plates. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0712; m.p. 49°C.

Derivation: Action of potassium sulfide on benzyl chloride and subsequent distillation.

Use: Organic synthesis.

benzyl thiocyanate $\text{C}_6\text{H}_5\text{CH}_2\text{CNS}$.

Properties: Colorless crystals; m.p. 41°C; b.p. 230°C; insoluble in water; soluble in alcohol and ether. Low toxicity.

Containers: 5-25 lb drums.

Hazard: Moderate fire hazard.

Use: Insecticide.

benzyl thiol. (benzyl mercaptan; α -toluenethiol). $\text{C}_6\text{H}_5\text{CH}_2\text{SH}$.

Properties: Colorless liquid; b.p. 195°C; insoluble in water; soluble in alcohol and carbon disulfide; flash point (closed cup) 158°F; sp. gr. 1.05; strong odor; combustible.

Hazard: Toxic by inhalation; irritant to tissue.

Uses: Odorant; flavors.

2-benzyl-6-thiouracil. $\text{C}_6\text{H}_5\text{CH}_2\text{C}_4\text{H}_3\text{N}_2\text{OS}$. A drug intermediate.

benzyltrimethylammonium chloride

$\text{C}_6\text{H}_5\text{CH}_2\text{N}(\text{CH}_3)_3 \cdot \text{Cl}$. A quaternary ammonium salt.

Properties: Colorless crystals; stable up to 135°C, above which benzyl chloride and trimethylamine are formed. Readily soluble in water, ethyl alcohol, and butanol; slightly soluble in butyl phthalate and tributyl phosphate. Properties of 60% solution: Sp. gr. (20/20°C) 1.07; wt/gal 8.90 lb; f.p. less than -50°C.

Grades: 60–62% aqueous solution.

Containers: Bottles; carboys; 50-gal coated drums.

Uses: Solvent for cellulose; gelling inhibitor in polyester resins; intermediate.

benzyltrimethylammonium hexafluorophosphate

$\text{C}_6\text{H}_5\text{CH}_2\text{N}(\text{CH}_3)_3\text{PF}_6$. Crystals; m.p. 160°C.

Hazard: Probably toxic by ingestion, and irritant to skin.

4-benzyltrimethylammonium methoxide
 $C_6H_5CH_2(CH_3)_3NOCH_3$. A quaternary ammonium salt.

Properties: Yellow liquid; decomposes on distillation.
 Hazard: Probably toxic by ingestion, and irritant to skin.

Uses: Catalyst; organic-soluble strong base.

benzynes C_6H_4 . An unsaturated cyclic hydrocarbon with a structure similar to benzene, in which one of the double bonds is replaced by a triple bond. It may be prepared from benzenediazonium-2-carboxylate or from isatoic anhydride.

"Beraloy."¹⁵⁵ Trademark for beryllium-copper alloys supplied in two grades: "Beraloy" A (1.80–2.05% beryllium) and "Beraloy" D (1.60–1.80% beryllium) "Beraloy" A meets A.S.T.M. Specifications B-194-51T and B-197-51T.

Properties: High electrical conductivity; high resistance to fatigue; very low hysteresis or drift; easily formed when annealed; high strength and rigidity when heat treated; corrosion resistant.

Forms: Strip, round wire, flat wire.

Uses: Diaphragms; springs; fabrication of lightweight, intricate parts.

berberine $C_{20}H_{19}NO_5$.

Properties: White to yellow crystals; m.p. 145°C (anhydrous); insoluble in water; soluble in ether and alcohol. Salts of berberine are: berberine bisulfate, berberine sulfate, and berberine hydrochloride. All three are yellow crystals, slightly soluble in water.

Derivation: From the root of *Berberis vulgaris* or *Hydrastis canadensis*.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Medicine, in form of alkaloid, its sulfate or hydrochloride.

bergamot oil.

Properties: An essential oil. Brownish-yellow to green liquid; agreeable odor; bitter taste. Linalyl acetate content 34–45%. Soluble in alcohol and glacial acetic acid; affected by light. Sp. gr. (25/25°C) 0.875–0.880; optical rotation +8° to +24°; refractive index 1.4650–1.4675 (20°C). Chief constituents: Limonene; linalyl acetate; linalool.

Derivative: By expression from the fruits of citrus bergamia Risso et Poiteau.

Grades: N.F.; Italian.

Containers: Cans.

Uses: Perfumery; flavoring.

berkelium Bk Synthetic radioactive element with atomic number 97 first produced (1949) as the 243 isotope by bombarding americium with helium ions in a cyclotron. The chemical properties of berkelium have been studied by tracer techniques and are similar to those of the other transuranium elements. Its oxidation behavior is similar to that of the rare earth cerium. It has a m.p. of 986°C. There are 8 isotopes ranging from 243 to 250; the 249 isotope has been made by neutron bombardment of curium 244. Atomic weight uncertain; 249 is generally accepted. The following compounds have been identified by x-ray diffraction: berkelium dioxide (BkO_2), berkelium sesquioxide (Bk_2O_3), berkelium trifluoride (BkF_3), berkelium trichloride ($BkCl_3$), and berkelium oxychloride ($BkOCl$).

Berlin blue. Any of a number of the varieties of iron blue pigments. See iron blue.

Berlin red. A red pigment consisting, essentially, of red iron oxide.

Berthelot, M. P. E. (1827–1917). French chemist who did fundamental work on the organic synthesis of hydrocarbons, fats, and carbohydrates. Opposed the then current idea that a "vital force" is responsible for synthesis. Did important work on explosives for French government. He was one of the first to prove that all chemical phenomena depend on physical forces that can be measured.

Berthollet, Claude Louis (1748–1822). French chemist. Followed Lavoisier, but did not accept the latter's contention that oxygen is the characteristic constituent of acids. He was the first to propose chlorine as a bleaching agent. His essay on chemical physics (1803) was first attempt to explain this subject. His speculations on stoichiometry, especially as regards relative masses of reacting atoms, profoundly affected later theories of chemical affinity.

beryl. $Be_3Al_2(SiO_3)_6$ sometimes with replacement of Be by Na, Li, Cs. A natural silicate of beryllium and aluminum. See beryllium.

beryllia. See beryllium oxide.

beryllides. Intermetallic compounds made by chemically combining beryllium with such metals as zirconium and tantalum.

beryllium Be Element of atomic number 4, group IIA of the periodic system. Atomic weight 9.0121. Valence 2; no stable isotopes.

Properties: A hard, brittle, gray-white metal; sp. gr. 1.85; m.p. 1280°C; soluble in acids (except nitric) and alkalis. Resistant to oxidation at ordinary temperatures. High heat capacity and thermal conductivity. It is the lightest structural metal known; can be fabricated by rolling, forging, and machining. Joining is chiefly by shrink-fitting; brazing and welding are difficult. Highly permeable to x-rays.

Occurrence: Beryl, the ore of beryllium, is found chiefly in South Africa, Rhodesia, Brazil, Argentina and India. Principal sources in U.S. are Colorado, Maine, New Hampshire, and South Dakota. There are undeveloped deposits in Canada.

Derivation: The ore is converted to the oxide or hydroxide, then to the chloride or fluoride. The halide may be (a) reduced in a furnace by magnesium metal, or (b) reduced by electrolysis. (c) Liquid extraction with an organophosphate chelating agent can be used as a method of purification, or as an alternate process on the ore itself.

Grades: Technical; over 99.5% pure.

Forms: Hot-pressed or cold-pressed and sintered blocks; sheet (0.04 inch); tube; rods; wire; powder.

Hazard: Highly toxic, especially by inhalation of dust. Tolerance, 0.002 mg per cubic meter of air.

Uses: Structural material in space technology; moderator and reflector of neutrons in nuclear reactors; special windows for x-ray tubes; in gyroscopes, computer parts, inertial guidance systems; additive in solid propellant rocket fuels; Be-Cu alloys (q.v.). Shipping regulations: (flake or powder) (Air) Poison label. (Rail) Poisonous solids, n.o.s.. Poison label.

beryllium acetate, basic $Be_4O(C_2H_3O_2)_6$.

Properties: White crystals; m.p. 285–286°C; b.p. 330–331°C; insoluble in water; hydrolyzed by hot water and dilute acids. Soluble in chloroform and other organic solvents. Can be crystallized from hot acetic acid in very pure form.

Hazard: Highly toxic by inhalation and ingestion.

Use: Source of pure beryllium salts.

Shipping regulations: (Rail, Air) Beryllium compounds, n.o.s., Poison label.

beryllium acetylacetonate $\text{Be}(\text{C}_5\text{H}_7\text{O}_2)_2$. Crystalline powder; slightly soluble in water; resistant to hydrolysis. A chelating nonionizing compound. M.p. 108°C ; b.p. 270°C ; freely soluble in alcohol and ether; slightly soluble in water.

Hazard: Highly toxic by inhalation and ingestion.

Shipping regulations: (Rail, Air) Beryllium compounds, n.o.s., Poison label.

beryllium carbide Be_2C .

Properties: Fine hexagonal, hard, refractory crystals; attacked vigorously by strong, hot alkali solutions forming methane gas and alkali beryllate. Sp. gr. 1.91; decomposes above 2100°C .

Derivation: By direct interaction of elemental Be and carbon; by reduction of beryllium oxide with carbon above 1500°C .

Hazard: Highly toxic by inhalation.

Use: Atomic energy applications; experimental rocket fuels.

Shipping regulations: See beryllium acetate.

beryllium carbonate (basic beryllium carbonate)

$\text{BeCO}_3 + \text{Be}(\text{OH})_2$.

Properties: White powder. Variable composition. Soluble in acids; insoluble in water.

Hazard: Highly toxic by inhalation and ingestion.

Shipping regulations: See beryllium acetate.

beryllium chloride BeCl_2 .

Properties: White or slightly yellow, deliquescent crystals; sweetish taste. M.p. 440°C ; b.p. 520°C ; sp. gr. 1.90. Very soluble in water; soluble in alcohol, benzene, ether, carbon disulfide. Readily hydrolyzed.

Derivation: By passing chlorine over a mixture of beryllium oxide and carbon.

Hazard: Highly toxic by inhalation and ingestion.

Shipping regulations: (Rail, Air) Poison label.

beryllium copper. A precipitation-hardenable alloy; often also contains nickel or cobalt, and has relatively high electrical conductivity, high strength, and high hardness.

Properties: Specific gravity 8.22. Tensile strength of heat-treated sheet 175,000 psi, elongation 5% in 2 inches; Brinell hardness; 350; good electrical conductivity. Typical analysis: copper 97.4; beryllium 2.25; nickel 0.35.

Hazard: Moderately toxic as powder. Avoid inhalation.

Uses: In electrical switch parts; watch springs; optical alloys; electronic equipment; valves and parts; spot-welding electrodes; nonsparking tools; springs and diaphragms; shims; cams; and bushings.

Note: A comparatively recent development is an 85 copper, 9 nickel, 6 tin alloy reported to be 15% stronger than Be-Cu.

beryllium fluoride BeF_2 .

Properties: Hygroscopic solid; m.p. 800°C ; sp. gr. 1.986. Readily soluble in water; sparingly soluble in alcohol.

Derivation: By the thermal decomposition (at 900 – 950°C) of ammonium beryllium fluoride.

Hazard: Highly toxic by inhalation and ingestion. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Production of beryllium metal by reduction with magnesium metal.

Shipping regulations: See beryllium acetate.

beryllium hydrate. See beryllium hydroxide.

beryllium hydride BeH_2 . White solid.

Properties: Reacts with water, dilute acids, methyl alcohol, liberating hydrogen. When heated to 220°C it liberates hydrogen rapidly.

Hazard: Fire risk when exposed to water, organic materials, and heat. Highly toxic.

Uses: Experimentally in rocket fuels.

Shipping regulations: See beryllium acetate.

beryllium hydroxide (beryllium hydrate) $\text{Be}(\text{OH})_2$.

Properties: White powder; decomposed to the oxide at 138°C ; soluble in acids, alkalies; insoluble in water.

Derivation: By precipitation with alkali from pure beryllium acetate, basic.

Grades: Technical.

Hazard: Highly toxic by inhalation and ingestion.

Shipping regulations: (Rail, Air) Poison label.

beryllium metaphosphate $\text{Be}(\text{PO}_3)_2$.

Properties: White porous powder or granular material; has a high melting point; insoluble in water.

Hazard: Highly toxic by inhalation and ingestion.

Uses: Raw material for special ceramic compositions; catalyst carrier.

Shipping regulations: See beryllium acetate

beryllium nitrate $\text{Be}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White to faintly yellowish, deliquescent mass; m.p. 60°C ; decomposes 100 – 200°C ; soluble in water, alcohol.

Derivation: Action of nitric acid on beryllium oxide, with subsequent evaporation and crystallization; reaction of beryllium sulfate with barium nitrate.

Grades: Technical; C.P.

Uses: Chemical reagent; gas mantle hardener.

Hazard: Highly toxic by inhalation. Oxidizing material; dangerous fire risk.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

beryllium nitride Be_3N_2 .

Properties: Hard, refractory white crystals; m.p. $2200 \pm 40^\circ\text{C}$; reacts with mineral acids to form the corresponding salts of beryllium and ammonia. Readily attacked by strong alkali solutions, liberating ammonia.

Derivation: By heating beryllium metal powder in a dry, oxygen-free nitrogen atmosphere at temperatures of 700 – 1400°C .

Hazard: Highly toxic by inhalation.

Uses: Atomic energy; production of the radioactive carbon isotope C^{14} for tracer uses; experimental rocket fuels.

Shipping regulations: (Rail, Air) Beryllium compounds, n.o.s., Poison label.

beryllium oxide (beryllia) BeO .

Properties: White powder. A unique ceramic material. Sp. gr. 3.016; m.p. 2570°C . Hardness (Mohs) 9. Soluble in acids and alkalies; insoluble in water. High electrical resistivity and thermal conductivity; transparent to microwave radiation; undamaged by nuclear radiation. High heat-stress resistance. Can be fabricated into finished shapes.

Derivation: By heating beryllium nitrate or hydroxide.

Grades: Technical; C.P.; pure; single crystals.

Hazard: Highly toxic by inhalation. Keep container tightly closed and flush out after use (MCA).

Uses: Electron tubes; resistor cores; windows in klystron tubes; transistor mountings; high-temperature

reactor systems; additive to glass, ceramics and plastics; preparation of Be compounds.

Shipping regulations: (Rail, Air) Poison label.

beryllium potassium fluoride (potassium beryllium fluoride) $\text{BeF}_2 \cdot 2\text{KF}$.

Properties: White, crystalline masses. Soluble in water; insoluble in alcohol.

Hazard: Highly toxic by inhalation and ingestion.

Tolerance (as F), 2.5 mg per cubic meter of air.

Shipping regulations: See beryllium acetate.

beryllium silicate Be_2SiO_4 . Single crystals available, spherical and prismatic.

Shipping regulations: See beryllium acetate.

beryllium sodium fluoride (sodium beryllium fluoride) $\text{BeF}_2 \cdot 2\text{NaF}$.

Properties: White, crystalline mass. Soluble in water. M.p. about 350°C .

Hazard: Highly toxic by inhalation and ingestion. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Making pure beryllium metal.

Shipping regulations: See beryllium acetate.

beryllium sulfate $\text{BeSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water; insoluble in alcohol. Sp. gr. 1.713; decomposes at 540°C .

Hazard: Highly toxic by inhalation and ingestion.

Shipping regulations: (Rail, Air) Poison label.

Berzelius, J. J. (1779–1848). A native of Sweden, Berzelius was one of the foremost chemists of the 19th century. He made many contributions to both fundamental and applied chemistry: he coined the words *isomer* and *catalyst*; classified minerals by chemical composition; recognized organic radicals which maintain their identity in a series of reactions; discovered selenium and thorium and isolated silicon, titanium and zirconium; did pioneer work with solutions of proteinaceous materials which he recognized as being different from "true" solutions.

"Besk."²⁰⁴ Trademark for a high-foaming heavy duty manual cleaner for dairies and food-processing plants.

"Be Square."¹²⁸ Trademark for grades of petroleum microcrystalline wax. Melting range $170\text{--}175^\circ$, $180\text{--}185^\circ$, $190\text{--}195^\circ\text{F}$.

BET. Abbreviation for Brunauer, Emmett, and Teller, applied to an equation and method for determining the surface area of an adsorbent such as carbon.

beta- (β). A prefix having meanings analogous to those of alpha (q.v.).

(1) It indicates (a) the position of a substituent atom or radical in a compound; (b) the second position in a naphthalene ring; or (c) the attachment of a chemical unit to the side-chain of an aromatic compound.

(2) It refers to a secondary allotropic modification of a metal or compound.

(3) It designates a type of radioactive decay. See beta particle.

"Betacote"¹³² Trademark for a series of urethane prepolymers specifically designed for flame-proofing coatings on wood. Coatings 6 mils thick on Douglas fir have a flame-spread rating of 55.

"Betaflux."²⁵ Trademark for petalite (q.v.).

betaine hydrochloride (lysine hydrochloride) $\text{C}_6\text{H}_{11}\text{O}_2\text{N} \cdot \text{HCl}$.

Properties: Colorless crystals; m.p. $227\text{--}228^\circ\text{C}$ (dec.); soluble in water and alcohol; insoluble in chloro-

form and ether. Aqueous solutions are strongly acid. Liberates hydrogen chloride at the melting point. Low toxicity.

Grades: Technical.

Containers: Drums.

Uses: Source of hydrogen chloride in solders and fluxes; organic synthesis; medicine (muscular degeneration).

betaine phosphate $\text{C}_5\text{H}_{11}\text{O}_2\text{N} \cdot \text{H}_3\text{PO}_4$.

Properties: White, odorless granules; acid taste; m.p. $198\text{--}200^\circ\text{C}$; very soluble in water.

Grades: Technical.

Uses: Source of phosphoric acid.

"Betalign."⁵²⁹ Trademark for a self-luminous light source consisting of a phosphor-lined glass capsule into which tritium gas has been introduced under pressure. Available in numerous configurations, colors, and luminosities. Used for illumination of panels, meters, dials, instruments, etc.

"Betalin" S.¹⁰⁰ Trademark for thiamine hydrochloride U.S.P. (q.v.).

betamethasone (9-fluoro-11 β , 17,21-trihydroxy-16 β -methylpregna-1,4-diene-3,20-dione) A corticosteroid hormone.

Properties: White, odorless, crystalline powder; m.p. 240°C with some decomposition. Sparingly soluble in acetone and alcohol; insoluble in water.

Grade: N.D.; N.F.

Uses: Medicine.

"Betanol."³⁵⁴ Trademark for a group of dispersing agents consisting of high molecular weight esters. They form dispersions which are stable over a wide pH range in the presence of acids and mineral salts. They can be used to prepare both water-in-oil and oil-in-water emulsions.

Uses: Cosmetics, pharmaceuticals, textiles, paints.

"Betanox" Special.²⁴⁸ Trademark for low-temperature reaction product of phenyl-beta-naphthylamine and acetone.

Properties: Tan powder; sp. gr. 1.16; m.p. above 120°C ; soluble in acetone, benzol, and ethylene dichloride; insoluble in water and gasoline.

Uses: Antioxidant for wire insulation, tire treads, carcass, inner tubes, dark-colored footwear, proofing, and mechanical goods.

beta particle. A charged particle emitted from a radioactive atomic nucleus, either natural or manmade. Their energies range from 0 to 4 MeV. They carry a single charge; if this is negative, the particle is identical with an electron; if positive, it is a positron. Beta rays (streams of these particles) may cause skin burns, and are harmful if they enter the body. Protection can be afforded by a thin sheet of metal. See also electron; decay, radioactive.

"Betasan"¹ (N-beta-O, O-diisopropyl dithiophosphoryl ethyl benzene sulfonamide). Trademark for a concentrated herbicide, both liquid and granular. Hazard: May be toxic.

betazole hydrochloride (3-(2-amioethyl)pyrazole dihydrochloride) $\text{C}_5\text{H}_7\text{N}_3 \cdot 2\text{HCl}$.

Properties: White, crystalline, nearly odorless powder; pH of 5% solution 1.5; m.p. not higher than 240°C . Soluble in water; practically insoluble in chloroform. Low toxicity.

Grades: U.S.P.

Use: Medicine (substitute for histamine).

betel. See arecoline.

bethanechol chloride (carbamylmethylcholine chloride) $\text{H}_2\text{NCOOCH}(\text{CH}_3)\text{CH}_2\text{N}(\text{CH}_3)_3\text{Cl}$.

Properties: Colorless hygroscopic crystals with amine-like odor. Exhibits polymorphism. Of two crystalline forms, one melts about 211° and the other 219°C . Very soluble in water; freely soluble in alcohol; practically insoluble in chloroform, benzene, and ether. Stable in air; pH (1% solution) 5.5–6.5.

Derivation: Propylene chlorohydrin is treated with phosgene and then with ammonia in ether. The product is heated with trimethylamine.

Grade: U.S.P.

Hazard: Toxic in overdose.

Use: Medicine (intestinal disorders).

Bettendorf's reagent. A reagent used for the detection of arsenic in presence of bismuth and antimony compounds. It consists of a concentrated solution of stannous chloride in fuming hydrochloric acid.

Hazard: Highly toxic; strong irritant to tissue.

Betterton-Kroll process. A process for obtaining bismuth and purifying desilverized lead that contains bismuth. Metallic calcium or magnesium is added to the molten lead to cause formation of high melting intermetallic compounds with bismuth. These separate as a surface scum and are skimmed off. The excess calcium and magnesium are removed from the lead by use of chlorine gas as mixed molten chlorides of lead or zinc. Bismuth of 99.995% purity is produced in this way.

Betts process. An electrolytic process for removing impurities from lead, in which pure lead is deposited on a thin cathode of pure lead, from an anode containing as much as 10% of silver, gold, bismuth, copper, antimony, arsenic, selenium, and other impurities. The electrolyte is lead fluosilicate and fluosilicic acid. The scrap anodes and the residues of impurities associated with them are either recast into anodes or treated to recover antimonial lead, silver, gold, bismuth, etc.

befula oil. See methyl salicylate.

"Beutene."²⁴⁸ Trademark for a butyraldehyde-aniline reaction product.

Properties: Reddish-brown, free-flowing liquid; sp. gr. 0.95; soluble in acetone, benzol, and ethylene dichloride; slightly soluble in gasoline; insoluble in water.

Uses: Rubber accelerator.

BFE. Abbreviation for bromotrifluoroethylene (q.v.).

BF_3 -ether complex. See boron trifluoride etherate.

BF_3 -MEA. See boron trifluoride monoethylamine.

BF_3 -MeOH. See boron trifluoride-methanol.

BFPO. Abbreviation for bis(dimethylamino)fluorophosphine oxide. See dimefox.

BHA. Abbreviation for butylated hydroxyanisole (q.v.).

BHC. Abbreviation for benzene hexachloride (q.v.).

BHT. Abbreviation for butylated hydroxytoluene. See 2,6-di-tert-butyl-para-cresol.

Bi Symbol for bismuth.

bi- Prefix meaning two; di- is preferred in chemical nomenclature; exceptions are bicarbonate, bisulfate, bitartrate, in which it indicates the presence of hydrogen in the molecule, i.e., NaHCO_3 (sodium bicarbonate). See also bis-.

bialamicol hydrochloride (USAN) (6,6'-diallyl- α , α '-bis(diethylamino)-4,4'-bi-ortho-cresol dihydrochloride) $\text{C}_{28}\text{H}_{44}\text{N}_2\text{O}_2 \cdot 2\text{HCl}$. Crystals; m.p. 209 – 210°C ; soluble in water.

Use: Medicine.

bibenzyl. See diphenylethane, symmetrical.

bicalcium phosphate. See calcium phosphate, dibasic.

bicarburetted hydrogen. See ethylene.

"Bicillin."²⁴ Trademark for benzathine penicillin G.

bicyclic. An organic compound in which two (only) ring structures occur. They may or may not be the same type of ring. See naphthalene.

bicyclohexyl (dicyclohexyl) $\text{C}_{12}\text{H}_{22}$.

Properties: Colorless, mobile liquid with pleasant odor. B.p. 238.5°C ; f.p. 1 to 3°C ; sp. gr. 0.883 ($25/16^\circ\text{C}$); wt/gal 7.37 lb; refractive index (n_{D}^{20}) 1.480; flash point 165°F . Combustible. Autoignition temp. 471°F .

Derivation: Hydrogenation of diphenyl (q.v.).

Hazard: May be toxic.

Uses: High-boiling solvent and penetrant.

"Bidrin."¹²⁵ Trademark for dimethyl phosphate of 3-hydroxy-N,N-dimethyl-cis-crotonamide. $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3):\text{CHC}(\text{O})\text{N}(\text{CH}_3)_2$.

Properties: Brown liquid with a mild ester odor; b.p. 400°C ; miscible in water and xylene; slightly soluble in kerosine and diesel fuel. Commercially available water-miscible solution.

Uses: Insecticide.

biformin. An antibiotic produced by the fungus *Polyporus biformis*, reported to be active against various bacteria and fungi.

"B-I-K."²⁴⁸ Trademark for a surface-coated urea.

Properties: White powder; sp. gr. 1.32; melting range 129 – 134°C ; soluble in water. Surface coating not soluble in water, but is soluble in rubber. Slightly soluble in acetone; insoluble in benzene, gasoline and ethylene dichloride.

Uses: Promoter for azodicarbonamide, a nitrogen blowing agent; activator for thiazoles, sulfenamides, and thiurams; odor reducer when used with nitroso-amine-type blowing agents.

"Bikalith."⁸⁸ Trademark for a series of lithium silicate ores including lepidolite, petalite, spodumene, and eucryptite. Used in glass-making and ceramics.

bile acid. An acid found in bile (the secretion of the liver). Bile acids are steroids, having a hydroxyl group, and a five-carbon-atom side chain terminating in a carboxyl group. Cholic acid is the most abundant bile acid in human bile. Others are deoxycholic and lithocholic acids. The bile acids do not occur free in bile but are linked to the amino acids, glycine and taurine. These conjugated acids are water-soluble; their salts are powerful detergents and as such, aid in the absorption of fats from the intestine.

bilirubin (bilifulvin) $\text{C}_{32}\text{H}_{36}\text{O}_6\text{N}_4$. Red coloring matter of bile. Chemical structure related to hemoglobin.

Properties: Orange-red powder; m.p. 192°C ; soluble in acids, alkalis, chloroform and benzene; insoluble in water; very slightly soluble in alcohol and ether.

Derivation: From bile pigment.

Use: Analytical chemistry.

bimetal. A combination of two metals in which one metal is clad on another. Bimetallic couples of metals with different expansion coefficients are used as temperature indicators and control instruments.

binapacryl. Generic name for 2-sec-butyl-4,6-dinitrophenyl 3-methyl-2-butenate,
 $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{C}_6\text{H}_2(\text{NO}_2)_2\text{OOCCHC}(\text{CH}_3)\text{CH}_3$.
 Hazard: Probably toxic by ingestion and inhalation.
 Use: Acaricide and fungicide.

binary. Descriptive of a system containing two and only two components. Such a system may be a chemical compound composed of two elements, an element and a group (hydroxyl, methyl, etc.), or two groups e.g., oxalic acid; it may also be a two-component solution or alloy.

bind. To exert a strong physiochemical attraction, as often occurs between various proteins and water in hydrophilic gels, between organic dyes and fabrics, or between acids or bases and various chemical complexes.

binder. The film-forming ingredient in paint, usually either a drying oil or a polymeric substance; a resin used in foundry casting.
 See also paint.

binding energy. The binding energy of a nucleus is the minimum energy required to dissociate it into its component neutrons and protons. Neutron or proton binding energies are those required to remove a neutron or a proton, respectively, from a nucleus. Electron binding energy is that required to remove an electron from an atom or a molecule. (Atomic Energy Commission). See also mass defect; fission; ionization.

bioassay. See assay.

"Biobate."¹⁷³ Trademark for an enzymatic preparation for use in bating in the leather industry.

"Biocheck."¹⁰⁸ Trademark for a family of biocides, fungicides, and slimicides.
 Containers: 55 gal. drum.
 Uses: Controlling and eliminating microbiological growth in pulp and paper mill water systems. Also for antibacterial papers.

biochemical oxygen demand (B.O.D.). A standardized means for estimating the degree of contamination of water supplies, especially those which receive contamination from sewage and industrial wastes. (See also sewage sludge, biodegradability). It is expressed as the quantity of dissolved oxygen (in mg/liter) required during stabilization of the decomposable organic matter by aerobic biochemical action. Determination of this quantity is accomplished by diluting suitable portions of the sample with water saturated with oxygen and measuring the dissolved oxygen in the mixture both immediately and after a period of incubation, usually five days. See also dissolved oxygen (D.O.) and oxygen consumed (C.O.D.) as related terms.

biochemistry. Originally a subdivision of chemistry, but now an independent science, biochemistry includes all aspects of chemistry that apply to living organisms. Thus photochemistry is directly involved with photosynthesis (q.v.) and physical chemistry with osmosis (q.v.)—two phenomena that underlie all plant and animal life. Other important chemical mechanisms that apply directly to living organisms are catalysis, which takes place in biochemical systems by the agency of enzymes (q.v.); nucleic acid and protein constitution and behavior, which is known to

control the mechanism of genetics; colloid chemistry, which deals in part with the nature of cell walls, muscles, collagen, etc.; acid-base relations, involved in the pH of body fluids; and such nutritional components as amino acids, fats, carbohydrates, minerals, lipids, and vitamins, all of which are essential to life. The chemical organization and reproductive behavior of microorganisms (bacteria and viruses) and a large part of agricultural chemistry are also included in biochemistry. See also nutrition, cell, nucleic acid.

biocide. General name for any substance that kills or inhibits the growth of microorganisms such as bacteria, molds, slimes, fungi, etc. Many of them are also toxic to humans. Biocidal chemicals include chlorinated hydrocarbons, organometallics, halogen-releasing compounds, metallic salts, organic sulfur compounds, quaternary ammonium compounds, and phenolics. See also antiseptic, disinfectant, fungicide.

bicolloid. An aqueous colloidal suspension or dispersion produced by or within a living organism. Blood, milk, and egg yolk are examples.

bioconversion. Utilization of animal manures, garbage and similar organic wastes for production of fuel gases by digestion or destructive distillation. See also biogas.

biocytin $\text{C}_{16}\text{H}_{28}\text{N}_4\text{O}_4\text{S}$ (epsilon-N-biotinyl-L-lysine). A naturally occurring complex of biotin isolated from yeast. Water-soluble crystals; m.p. 228.5°C. It is believed to be an intermediate in the utilization of biotin by animal organisms.

biodegradability. The susceptibility of a substance to decomposition by microorganisms; specifically, the rate at which detergents and pesticides and other compounds may be chemically broken down by bacteria and/or natural environmental factors. Branched chain alkylbenzene sulfonates (ABS) are much more resistant to such decomposition than are linear alkylbenzene sulfonates (LAS), in which the long straight alkyl chain is readily attacked by bacteria (q.v.). If the branching is at the end of a long alkyl chain (isoalkyls), the molecules are about as biodegradable as the normal alkyls. The alcohol sulfate anionic detergents and most of the nonionic detergents are biodegradable. Among pesticides, the organophosphorus types, while highly toxic are more biodegradable than DDT and its derivatives. Tests on a number of compounds gave results as follows: Easily biodegraded: n-propanol, ethanol, benzoic acid, benzaldehyde; ethyl acetate. Less easily biodegraded: ethylene glycol, isopropanol, orthocresol, diethylene glycol, pyridine, triethanolamine. Resistant to biodegradation: aniline, methanol, monoethanolamine, methyl ethyl ketone, acetone. Additives that accelerate biodegradation of polyethylene, polystyrene, and other plastics are available.

bioethics. An interdisciplinary science for which research facilities were established in 1971; it encompasses the ethical and social issues resulting from advances in medicine and the biosciences; its scope includes a number of areas of importance to chemistry, e.g., reproductive and genetic phenomena, organ transplants, gerontology and antiaging techniques, biological warfare, contraception, etc. The Kennedy Institute at Georgetown University, Washington, D.C., is the chief center for information about this developing aspect of biomedical science.

bioflavonoid. A group of naturally occurring substances thought to maintain normal conditions in the walls of the small blood vessels. The bioflavonoids are widely distributed among plants, especially citrus fruits, black currants and rose hips (hesperidin, rutin, quercetin). They have little or no medicinal value.

biogas. Methane produced by digestion of manure in small-scale units on farms. Pilot-scale production is planned (from cow dung) in Texas and Oklahoma for use in home heating.

biogeochemistry. A branch of geochemistry dealing with the interactions between living organisms and their mineral environment. It includes among other studies that of the effect of plants on the weathering of rocks; of the chemical transformations that produced petroleum and coal; of the concentration of specific elements in vegetation at some time in the geochemical cycle (iodine in sea plants, uranium in some forms of decaying organic matter); and of the organic constituents of fossils.

bioluminescence. See chemiluminescence.

biomas. (1) As used by fuel and energy technologists, this term refers to the total uncontrolled plant growth in a given area; it is considered as a possible source of energy by chemical, bacterial, and enzymic conversion, after present supplies of fossil fuels have been exhausted. It is estimated that 5% of world biomass (which totals about 145 billion tons) could be converted to enough synthetic fuel to satisfy world requirements, and that those of the U.S. could be met by conversion of the biomass obtained by intensive cultivation of about 6% of its continental land area. The term also includes water-growing plants such as the various forms of algae.

(2) A more specific definition, used by marine technologists, is the amount of living matter, both plant and animal, that is present in a given segment of ocean floor, expressed in grams per square meter. This is called the standing crop. By far the highest values occur in shallow water, e.g., in a Pacific coastal area (littoral) biomass has been determined to be from 1000 to 5000 g/sq m, compared with 200 g/sq m at a depth of 200 m and 5 g/sq m at 4000 m.

biomaterial. Any material used as a surgical implant within the body to replace or support tissue; these include metals, ceramics, plastics, elastomers, carbon in various forms, bone derivatives, and the like. They must be entirely compatible with the interior environment, be nondegradable, and completely non-toxic; they must also duplicate as closely as possible the properties of the tissues they replace. Numerous materials used in dental surgery are included.

"bioMeT 12."²⁸⁸ Trademark for a rodent-repellent coating for cables in which the active ingredient is a mixture of tributyl tin salts. It has proved 95% effective in preventing destruction of telephone cables by rats and other rodents. Flexible, transparent, and effective for six months or more, it is applied mechanically over the plastic cable sheathing. Can also be used to protect other types of wiring, shipping containers, and similar products.

"Bionol."³⁰⁷ Trademark for a series of cationic bactericidal agents composed of 50% alkyl dimethyl benzyl ammonium chloride.

Uses: Disinfectant; germicide; deodorant.

"Biopal" VRO-20.³⁰⁷ Trademark for an iodophor, consisting of a solution of 20% available iodine in alkyl-phenoxypoly(ethyleneoxy)ethanol.

Properties: Brownish-black liquid; readily soluble in water. Slowly decreases in activity in the presence of light, and should be packed in dark amber bottles or in suitably lined metal containers. Has both detergent and germicidal properties.

Hazard: Toxic by ingestion.

Uses: Bactericide, sporocide, fungicide, and protozoicide in hard or soft water and at high or low temperatures.

biopolymer. A water-soluble polymer resulting from the action of bacteria (genus *Xanthomonas*) on carbohydrates. The viscosity is almost as low as that of water; chromium ion can be added to increase viscosity, if desired. Such polymers are being used as viscosity builders in oil-well drilling muds, and as thickeners and gel strength additives in aqueous media. See also fermentation.

biophyl. A highly refined form of verxite (q.v.), in excess of 99% pure hydrobiotite (magnesium-iron-aluminum silicate). Used in foods and pharmaceuticals.

biosynthesis. Synthesis of edible single-cell proteins by a fermentation process; the basic ingredients of one process are a specially developed yeast strain, oxygen or air, ethyl alcohol or other carbonaceous substance such as acetic acid or paraffin hydrocarbons, nitrogen source, and an inorganic salt solution. These are fermented at 40°C, centrifuged, and dried. Other methods are also under development. See also amino acid; protein.

biotin (vitamin H) C₁₀H₁₆N₂O₃S. 2'-Keto-3,4-imidazolido-2-tetrahydrothiophene-*n*-valeric acid. Biotin, frequently referred to as a member of the vitamin B complex, is necessary for the maintenance of health in animals and for growth of many microorganisms. It influences fat metabolism, decarboxylation and carbon dioxide fixation and deamination of some amino acids. It is closely related metabolically to pantothenic acid and folic acid. A biotin deficiency may be induced by ingestion of avidin (q.v.), a raw-egg protein, because of the formation of a nonabsorbable biotin-avidin complex. Biotin is synthesized in the intestinal tract of humans; therefore, normally not required.

Properties: White crystals; m.p. 230–232°C; soluble in water and alcohol; insoluble in naphtha and chloroform; stable to heat; stable in neutral or acid solutions; destroyed by strong alkali or oxidizing agents.

Sources: Egg yolk, kidney, liver, yeast, milk, molasses. Units: Amounts are expressed in milligrams or micrograms of biotin.

Grades: Practical; F.C.C.

Containers: Bottles.

Uses: Medicine; nutrition.

N-biotinyl-L-lysine. See biocytin.

biotite. A component of igneous rocks and of soil, similar to mica. It is a silicate of magnesium, iron, potassium and aluminum.

biphenyl. See diphenyl.

ortho-biphenylamine. See ortho-aminobiphenyl.

ortho-biphenyl biguanide

Properties: White to faintly pink powder; m.p. above 150°C on dried material; ash not over 0.5%. Soluble in alcohol, "Carbitol" and "Cellosolve"; very slightly soluble in water.

Containers: 50-lb paper bags; 150-lb fiber drums.

Use: Soap antioxidant.

birefringent. Descriptive of a type of crystal which separates an impinging light ray into two components that are at right angles to each other; as a result, two images appear, each of which is caused by a light ray vibrating in only one direction (plane-polarized light). Such anisotropic crystals (Iceland spar) are used in nicol prisms. See also nicol; anisotropic.

bis-. Prefix meaning "twice" or "again." Used in chemical nomenclature to indicate that a chemical grouping or radical occurs twice in a molecule, e.g., bisphenol A, where two phenolic groups appear $(\text{CH}_3)_2\text{C}(\text{C}_6\text{H}_5\text{OH})_2$. See also following entries.

2,2-bis(acetoxymethyl)propyl acetate

$\text{CH}_3\text{C}(\text{CH}_2\text{OOCCH}_3)_2\text{CH}_2\text{OOCCH}_3$. Colorless liquid; $n(20/\text{D})$ 1.4359. Used as a plasticizer.

bisacodyl (4,4'-(2-pyridylmethylene)diphenol diacetate; bis-(para-acetoxymethyl)-2-pyridylmethane) $(\text{CH}_3\text{COOC}_6\text{H}_4)_2\text{CHC}_5\text{H}_4\text{N}$.

Properties: Tasteless crystals; m.p. 38°C. Practically insoluble in water and alkaline solutions. Soluble in acids, alcohol, acetone, propylene glycol and other organic solvents.

Grade: N.D.

Use: Medicine.

bisamides. General formula $\text{RCONHR}'\text{NHCOR}$. When R and R' have high molecular weights they are hard, light-colored waxes.

bis(2-aminoethyl)sulfide $(\text{H}_2\text{NCH}_2\text{CH}_2)_2\text{S}$. An ethyleneimine derivative.

Properties: Colorless liquid; f.p. 2.6°C; b.p. 238°C; density 8.7 lb/gal; refractive index 1.5277; flash point 246°F; very soluble in water, benzene and ethanol. Combustible.

Uses: See ethyleneimine.

N,N-bis(3-aminopropyl)methylamine

Properties: Liquid; sp. gr. 0.9307 (20/20°C); b.p. 240°C; f.p. -29.6°C; flash point 220°F. Completely soluble in water. Combustible.

Hazard: Moderately toxic and irritant.

Uses: Chemical intermediate.

1,3-bis(2-benzothiazolylmercaptomethyl)urea (1,3-bis[2-benzothiazolylthio)methyl]urea) $(\text{C}_6\text{H}_4\text{NCS} \cdot \text{SCH}_2\text{NH})_2\text{CO}$.

Properties: Buff to light tan powder; m.p. 220°C; sp. gr. 1.38 (25°C).

Use: Rubber accelerator.

para-bis[2-(5-para-biphenyloxy)azoyl]benzene

Properties: Shiny yellow flakes; m.p. 327-328°C; fluorescence peak 4400Å; sparingly soluble in toluene.

Grade: Purified.

Use: Scintillation counter; wave length shifter in liquid scintillators.

2,2-bis(para-bromophenyl)-1,1,1-trichloroethane.

The bromine analog of DDT.

Hazard: Probably toxic by skin absorption.

Use: Insecticide.

bis(tert-butylperoxy)-2,5-dimethylhexane

A cross-linking agent for polymers.

See "Varox".

bis(2-chloroethoxy)methane. See dichloroethyl formal.

4-[para-bis(2-chloroethyl)amino]phenyl]butyric acid.

See chlorambucil.

5-bis(2-chloroethyl)amino]uracil (uracil mustard)

$\text{CONHCONHCHCN}(\text{C}_2\text{H}_4\text{Cl})_2$. A cream-white, odorless, crystalline compound; moderately soluble in methanol and acetone. Used in medicine.

bis(2-chloroethyl) ether. See dichloroethyl ether.

bis(chloromethyl)ether.

Properties: Reported to form spontaneously from formaldehyde and chloride ions in moist air.

Hazard: Carcinogenic to animals in low concentrations; a known occupational carcinogen.

Uses: Intermediate for ion-exchange resins; laboratory reagent.

1,1'-bis(chloromercuriferrocene [1,1-di(chloromercuri)ferrocene]). $(\text{ClHgC}_5\text{H}_4)_2\text{Fe}$.

Hazard: Highly toxic by ingestion.

Uses: Inorganic polymers.

Shipping regulations: (Rail, Air) Mercury compounds, solid (n.o.s.), Poison label.

3,3-bis(chloromethyl)oxetane. See "Penton."

bis(para-chlorophenoxy)methane $(\text{ClC}_6\text{H}_4\text{O})_2\text{CH}_2$.

Properties: Solid; m.p. 65°C; insoluble in water and oils; soluble in ether and acetone.

Hazard: Moderately toxic by ingestion.

Use: Acaricide.

2,2-bis(para-chlorophenyl)-1,1-dichloroethane. See TDE.

1,1-bis(para-chlorophenyl)ethanol. See di(para-chlorophenyl)ethanol.

1,1'-bis(para-chlorophenyl)-2,2,2-trichloroethanol (4,4'-dichloro-alpha-trichloromethylbenzhydrol)

(Kelthane) $\text{CCl}_3\text{C}(\text{C}_6\text{H}_4\text{Cl})_2\text{OH}$. An alcohol analog of DDT.

Hazard: Toxic by inhalation and ingestion.

Use: Miticide.

bis-cyclopentadienyliron. See dicyclopentadienyliron.

bis(2,6-diethylphenyl)carbodiimide

Properties: Light yellow to red-brown liquid with faintly acid odor; sp. gr. 1.007 (20/20°C); b.p. 192-194°C (0.4 mm); $n(23/\text{D})$ 1.591. Soluble in inert organic solvents. Combustible.

Hazard: Toxic by inhalation. Damaging to eyes.

Uses: Stabilizers in polyester and urethane systems; intermediate for textile chemicals and pharmaceuticals.

2,6-bis(dimethylaminomethyl)cyclohexanone

Sp. gr. 0.95 (68°F).

Uses: Preservative for aqueous paint systems, casein, pigment dispersions and adhesives.

2,6-bis(dimethylaminomethyl)cyclohexanone dihydrochloride $\text{C}_{12}\text{H}_{22}\text{N}_2\text{O} \cdot 2\text{HCl}$. Free-flowing, white to off-white crystalline salt.

Uses: Preservative for aqueous systems, latex paints, adhesives, coatings, wax emulsions, casein and starch solutions.

bis(1,3-dimethylbutyl)amine

Properties: Liquid; sp. gr. 0.772–0.778 (20/20°C); distillation range 179.0–205°C; 6.5 lb/gal; flash point 160°F. Combustible.

N,N'-bis(1,4-dimethylpentyl)-para-phenylenediamine

(diheptyl-para-phenylenediamine) $\text{C}_6\text{H}_4(\text{NHC}_7\text{H}_{15})_2$.

Properties: Amber to red liquid; sp. gr. 0.90; solidification temperature 45°F. Combustible.

Uses: Gasoline antioxidant and sweetener.

1,3-bisethylaminobutane

$\text{C}_2\text{H}_5\text{NHCH}_2\text{CH}_2\text{CHNH}(\text{C}_2\text{H}_5)\text{CH}_3$. Water-white amine, boiling range 179–185°C. Combustible.

N,N'-bis(1-ethyl-3-methylpentyl)-para-phenylenediamine

$\text{C}_6\text{H}_4(\text{NHC}_8\text{H}_{17})_2$.

Properties: Dark reddish brown liquid; sp. gr. 0.90 approx; wt/gal 7.5 lb; combustible.

Use: Antioxidant for polyunsaturated elastomers.

2,2-bis(para-ethylphenyl)-1,1-dichloroethane. See 1,1-dichloro-2,2-bis(para-ethylphenyl)ethane.**bisethylxanthogen** $(\text{C}_2\text{H}_5\text{OCSS})_2$.

Properties: Yellow needles; onion-like odor; m.p. 28–32°C. Insoluble in water; freely soluble in benzene, ether, petroleum fractions.

Grades: 58% solution in oil.

Containers: 5-gal cans; 30-gal drums.

Uses: Weed control; rubber accelerator; fungicide.

1,3-bis(3-glycidoxypentyl)tetramethyldisiloxane

Properties: Liquid; sp. gr. 0.99 (25°C); n(25°C) 1.4500; b.p. about 185°C (2 mm). Soluble in acetone and benzene; insoluble in water. Flash point 300°F. Combustible.

Containers: Up to 55-gal drums.

Use: Chemical intermediate.

bishydroxycoumarin [3,3'-methylenebis(4-hydroxycoumarin)]dicoumarol] $\text{C}_{19}\text{H}_{12}\text{O}_6$.

Properties: White or creamy-white, crystalline powder; faint pleasant odor and slightly bitter taste; m.p. 287–293°C. Readily soluble in solutions of fixed alkali hydroxides; slightly soluble in chloroform; practically insoluble in water, alcohol and ether.

Derivation: (a) Originally, extracted from spoiled sweet clover; (b) synthetically from methyl acetylsalicylate, sodium, and formaldehyde.

Grade: U.S.P.

Hazard: High dosage may cause hemorrhage.

Use: Anticoagulant for blood.

bis(1-hydroxycyclohexyl) peroxide $\text{C}_6\text{H}_{10}(\text{OH})_2\text{O}_2$.

Properties: Fine white powder; m.p. 66–68°C. Active oxygen 6.6% min.

Hazard: Dangerous fire risk in contact with organic materials. Strong oxidizing agent.

Use: Catalyst for polymerization of polyester resins.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Peroxide, organic, solid, n.o.s., Organic Peroxide label.

N,N-bis(2-hydroxyethyl)alkylamine. Clear liquid used as an antistatic for blow molding applications for polyolefins. Approved for use in food packaging films.**bis(hydroxyethyl) butynediol ether**

Properties: Dark brown liquid; sp. gr. 1.136 (25/15°C); solidifies at < –15°C; distillation range 116–235°C (10 mm).

Hazard: May decompose with explosive violence under alkaline conditions at high temperature.

Uses: Intermediate for polyesters, plasticizers, and plastics; nickel brightener in electroplating; corrosion inhibitor; pickling inhibitor prior to copper plating.

bis(hydroxyethyl) cocoamine oxide. A derivative of coconut oil (q.v.) claimed to be useful as a gasoline additive to inhibit rust formation and icing of carburetors; also used as foaming agent in shampoos, detergents, tooth pastes and the like.**N,N-bis(hydroxyethyl)oleamide**

A technical grade containing 25% excess amine. Light-amber liquid with faint odor. Used as a surface-active agent.

beta-bishydroxyethyl sulfide. See thiodiglycol.**1,3-bishydroxymethylurea.** See dimethylolurea.**4,4-bis(4-hydroxyphenyl)pentanoic acid** (diphenolic acid; DPA) $\text{CH}_3\text{C}(\text{C}_6\text{H}_4\text{OH})_2\text{CH}_2\text{CH}_2\text{COOH}$.

Properties: Light tan granules; m.p. 170–173°C; sp. gr. 1.30–1.32. Soluble in acetic acid, acetone, and ethanol; insoluble in benzene, carbon tetrachloride, and xylene. Slightly soluble in water.

Uses: Paint formulations; coatings and finishes.

bishydroxyphenyl sulfone. See dihydroxydiphenyl sulfone.**1,4-bis(2-hydroxypropyl)-2-methylpiperazine**

Properties: Liquid; b.p. 145°C at 3 mm Hg; sp. gr. 1.0013 (25/25°C); n(20/D) 1.4803; flash point 300°F; miscible in water. Combustible; odor-free.

Uses: Catalyst; chemical intermediate.

2,4-bis(isopropylamino)-6-methoxy-s-triazine

White extruded pellets.

Hazard: Toxic by ingestion.

Use: Industrial herbicide.

bis-keto-triazine ("Permafresh" 110). Water-white liquid; 40% active. Can be cured with magnesium chloride to provide chlorine resistance; compatible with optical brighteners. Used as a wash/wear finish for cellulose and blends of cellulose.**"Bismanol" (MnBi).** An alloy or compound of bismuth and manganese which has an exceptionally high coercive force (3400 oersteds) and a high energy product. Produced by U.S. Naval Ordnance Laboratory by powder metallurgy methods, and used as a permanent magnet.**Bismarck Brown R**

Toluene-2,4-diazo-bis-meta-toluylenediamine hydrochloride.

Properties: Dark brown powder; soluble in water and alcohol.

Derivation: Action of nitrous acid on toluylene diamine.

Use: Dye for wool and leather; biological stain.

Bismarck Brown Y (4,4'-[meta-phenylenebis(azo)]bis-(meta-phenylenediamine) dihydrochloride)
 $C_6H_4-1,3-[NNC_6H_3-2,4-(NH_2)]_2 \cdot HCl)_2$
 Used as a dye; biological stain.

"Bismate."⁹ Trademark for bismuth dimethyldithiocarbamate. (q.v.).

bis(2-methoxyethoxy)ethyl ether. See dimethoxytetraglycol.

N,N'-bis(1-methylheptyl)-para-phenylenediamine
 $C_6H_4[NHCH(CH_3)C_6H_{13}]_2$
 Properties: Dark reddish brown liquid; sp. gr. approx. 0.90 (80°F); wt/gal, 7.5 lb. Combustible.
 Use: Antiozonant in polyunsaturated elastomers.

1,4-bis[2-(4-methyl-5-phenyloxazolyl)]benzene
 (dimethyl-POPOP) $C_6H_4[C_2NO(CH_3)C_6H_5]_2$. Yellow needles with a bluish fluorescence; m.p. 231–234°C. Used as a scintillation phosphor.

bismite. See bismuth trioxide.

bismuth Bi Metallic element of atomic number 83, Group VA of the periodic system. Atomic weight 208.9804. Valences 2, 3, 4. No stable isotopes; 5 naturally radioactive isotopes.

Properties: Crystalline, brittle metal, with reddish tinge. Soluble in nitric and hydrochloric acids. Highly diamagnetic (mass susceptibility -1.35×10^6). Expands 3.3% on solidification. Electrical resistivity higher in solid than in liquid state. Extrudable at 437°F; not fabricable at room temperature. Sp. gr. 9.8 at 20°C; m.p. 271°C; b.p. 1560°C; Brinell hardness 7. Thermal conductivity (0.018 cal/sec/cc at 250°C) is lowest of all metals except mercury. On heating it burns to form the oxide.

Source: (1) Metallurgical by-products (often lead bullion) obtained chiefly from smelting ores of lead, silver, copper and gold; (2) ores used chiefly for their bismuth and one or two other metals, as tin and tungsten. See also bismuthinite, and cosalite.

Derivation: Debismuthizing of lead bullion by (a) fractional crystallization, (b) electrolytic (Betts) refining, or (c) addition of calcium or magnesium (Betterton-Kroll process) which removes bismuth.

Purification: By addition of molten caustic, zinc, and finally chlorine (to make removable chlorides of the impurities).

Impurities. Lead, iron, copper, arsenic, antimony, selenium.

Forms: Rods, wire, lump, powder.

Grades: 99.5 + % pure; high purity (less than 10 ppm impurities) (single crystals).

Hazard: Flammable in powder form.

Uses: Pharmaceuticals and medicine; cosmetics (eye polish, lipstick, etc.); component of low-melting (fusible) alloys; catalyst in making acrylonitrile; additive to improve machinability of steels and other metals; coating selenium; thermoelectric materials; permanent magnets; semiconductors.

bismuth ammonium citrate

Properties: Pearly, shining, transparent scales or white powder; slightly acid, metallic taste; composition varies. Soluble in water; slightly soluble in alcohol.

Derivation: Interaction of bismuth subnitrate, citric acid and ammonium hydroxide.

Use: Medicine.

bismuth antimonide BiSb. Single crystals used as semiconductors.

bismuth bromide (bismuth tribromide) BiBr₃.

Properties: Yellow, crystalline powder. Hygroscopic. Decomposed by water with formation of bismuth

oxybromide. Soluble in ether, hydrochloric acid (dilute), solutions of potassium iodide, potassium bromide and potassium chloride; insoluble in alcohol. Sp. gr. 5.7; b.p. 453°C; m.p. 218°C.

bismuth carbonate, basic. See bismuth subcarbonate.

bismuth chloride (bismuth trichloride) BiCl₃.

Properties: White, very deliquescent crystals; volatilized by heat. Soluble in acids; insoluble in alcohol; decomposes in water to the oxychloride. Sp. gr. 4.56; m.p. 227°C; b.p. decomposes at 300°C.

Derivation: Action of hydrochloric acid on bismuth.

Containers: Bottles; drums.

Use: Bismuth salts.

bismuth chloride, basic. See bismuth oxychloride.

bismuth chromate (basic dichromate) Bi₂O₃ · 2CrO₃.

Properties: Orange-red amorphous powder; soluble in alkalis and acids; insoluble in water.

Derivation: Interaction of bismuth nitrate and potassium chromate.

Hazard: Toxic by ingestion and inhalation. Tolerance (as CrO₃), 0.1 mg per cubic meter of air.

Use: Pigment.

bismuth citrate BiC₆H₅O₇

Properties: White powder; sp. gr. 3.458; soluble in ammonia or alkali citrates; insoluble in water; slightly soluble in alcohol; m.p. decomposes.

Derivation: Boiling bismuth subnitrate with citric acid.

Use: Medicine.

bismuth dimethyldithiocarbamate Bi[(CH₃)₂NC(S)S]₃.

Properties: Lemon yellow powder; sp. gr. 2.04; melts above 230°C with decomposition; soluble in chloroform; slightly soluble in benzene, carbon disulfide; insoluble in water.

Use: Accelerator for natural rubber and SBR, especially in cable covers and mechanical items.

bismuth ditannate. See bismuth tannate.

bismuth ethyl camphorate C₃H₅BiO₁₂.

Properties: Solid; faint aromatic odor; m.p. 61–67°C. Insoluble in water; soluble in ether, chloroform and oils.

Use: Medicine.

bismuth ethyl chloride BiHC₂H₃Cl. White powder.

Hazard: Ignites spontaneously in air; dangerous fire risk.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

bismuth gallate, basic. See bismuth subgallate.

bismuth glance. See bismuthinite.

bismuth hydrate. See bismuth hydroxide.

bismuth hydroxide (bismuth hydrate; bismuth oxyhydrate; bismuth trihydroxide; bismuth trihydrate; hydrated bismuth oxide) Bi(OH)₃.

Properties: White amorphous powder. Soluble in acids; insoluble in water. Sp. gr. 4.36.

Derivation: Action of sodium hydroxide on a solution of bismuth nitrate.

Containers: Glass bottles; tins; drums.

Use: Bismuth salts.

bismuthinite (bismuth glance) Bi₂S₃, may contain copper or iron.

Properties: Lead-gray mineral, often with yellow tarnish, metallic luster. Contains 81.2% bismuth, 18.8% sulfur. Soluble in nitric acid. Sp. gr. 6.4–6.5; Mohs hardness 2.

Occurrence: Utah; Bolivia; Mexico.

Use: Ore of bismuth.

bismuth iodide (bismuth triiodide) BiI_3 .

Properties: Grayish-black, metallic, glistening crystals. Soluble in alcohol, hydriodic acid and potassium iodide; insoluble in water; decomposes in hot water; sp. gr. 5.778 (15°C); m.p. 408°C .

Derivation: By the interaction of bismuth and iodine.

Hazard: Moderately toxic by ingestion.

Uses: Analytical chemistry; bismuth oxyiodide.

bismuth beta-naphthol $\text{Bi}_2\text{O}_3(\text{OH}) \cdot \text{C}_{10}\text{H}_7\text{O}$.

Properties: Brown to gray powder, almost insoluble in water or other solvents.

Derivation: By treating a solution of sodium beta-naphtholate with acetic acid solution of bismuth nitrate, and adding caustic soda solution to neutralize excess acid.

Use: Medicine.

bismuth nitrate (bismuth ternitrate: bismuth trinitrate) $\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Lustrous, clear, colorless, hygroscopic crystals; acid taste. Soluble in dilute nitric acid, alcohol and acetone; slowly decomposed by water to the subnitrate. Sp. gr. 2.83; b.p., decomposes 75 – 80°C .

Derivation: Action of nitric acid on bismuth with subsequent recovery by evaporation and crystallization.

Containers: Bottles; tins; drums; multiwall paper sacks.

Hazard: Oxidizing material; fire risk near organic materials.

Uses: Preparation of other bismuth salts; bismuth luster on tin; luminous paints and enamels; medicine.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Nitrates, n.o.s., Oxidizer label.

bismuth nitrate, basic. See bismuth subnitrate.**bismuth oleate.**

Properties: Yellowish-brown, soft, granular mass. Soluble in ether; insoluble in water.

Derivation: A mixture of bismuth trioxide and oleic acid.

Use: Medicine.

bismuth oxide. See bismuth trioxide; bismuth tetraoxide.**bismuth oxide, hydrated. See bismuth hydroxide.****bismuth oxycarbonate. See bismuth subcarbonate.****bismuth oxychloride (bismuth chloride, basic; bismuth subchloride) BiOCl .**

Properties: White, lustrous crystalline powder. Sp. gr. 7.717. Soluble in acid; insoluble in water.

Derivation: By action of water on bismuth chloride; interaction of dilute nitric acid solution of bismuth nitrate with sodium chloride.

Containers: Drums.

Uses: Medicine; cosmetics; pigment.

bismuth oxyhydrate. See bismuth hydroxide.**bismuth oxynitrate. See bismuth subnitrate.****bismuth pentafluoride BiF_5 .**

Properties: Crystals; sublimes at 550°C .

Hazard: Reacts violently with water and petrolatum above 50°C . Toxic; strong irritant to eyes and skin. Tolerance, 2.5 mg per cubic meter of air.

Uses: Fluorinating agent.

bismuth pentoxide Bi_2O_5 . An acid anhydride; its salts have not been prepared in pure state. Made by oxidation of bismuth trioxide, giving a scarlet precipitate.**bismuth phenate (bismuth phenolate; bismuth phenylate) $\text{C}_6\text{H}_5\text{O} \cdot \text{Bi}(\text{OH})_2$.**

Properties: Grayish-white powder; odorless and tasteless. Insoluble in water, alcohol and ether.

Derivation: Interaction of bismuth nitrate and sodium phenolate.

Grades: Technical, 80% Bi_2O_3 .

Use: Medicine.

bismuth phenosulfonate (bismuth sulfocarbolate).

Properties: Pale, reddish powder. Slightly soluble in water.

Derivation: By the interaction of bismuth hydroxide and phenolsulfonic acid.

Uses: Medicine; antiseptic.

bismuth phenylate. See bismuth phenate.**bismuth potassium iodide $\text{BiI}_3 \cdot 4\text{KI}$.**

Properties: Red crystals. Decomposed by water. Soluble in potassium iodide solution.

Use: Medicine.

bismuth-potassium tartrate. See potassium-bismuth tartrate.**bismuth pyrogallate (basic bismuth pyrogallate)**

$\text{C}_6\text{H}_3(\text{OH})_2\text{OBiOH}$.

Properties: Yellowish-green amorphous powder; odorless; tasteless. Soluble in dilute acid and alkaline solutions; insoluble in water and alcohol. Decomposed by acids.

Derivation: Action of pyrogalllic acid on bismuth carbonate.

Grades: Technical, 60% Bi_2O_3 .

Use: Medicine.

bismuth salicylate, basic. See bismuth subsalicylate.**bismuth stannate $\text{Bi}_2(\text{SnO}_3)_3 \cdot 5\text{H}_2\text{O}$.**

Properties: Light colored crystalline powder. Insoluble in water. Approximate temperature of dehydration is 140°C .

Hazard: Tolerance (as Sn) 2 mg/cu m of air.

Uses: Component of ceramic capacitors, especially useful with barium titanate.

bismuth subcarbonate (bismuth oxycarbonate; bismuth carbonate, basic) $(\text{BiO})_2\text{CO}_3$ or $\text{Bi}_2\text{O}_3 \cdot \text{CO}_2$, with one-half H_2O .

Properties: White, odorless powder; tasteless; insoluble in water and alcohol; soluble in nitric or hydrochloric acid with effervescence. Sp. gr. 6.86. Stable in air, but slowly affected by light.

Derivation: By adding ammonium carbonate to a solution of a bismuth salt.

Grades: Technical; C.P.; U.S.P. (90% Bi_2O_3 min).

Uses: Bismuth compounds; cosmetics; treatment of gastric ulcer; opacifier in x-ray diagnosis; enamel fluxes and ceramic glazes.

bismuth subchloride. See bismuth oxychloride.**bismuth subgallate (basic bismuth gallate)**

$\text{C}_6\text{H}_2(\text{OH})_3\text{COOBi}(\text{OH})_2$.

Properties: Saffron-yellow powder; odorless and tasteless. Soluble in dilute alkalies; insoluble in water, alcohol and ether. Stable in air, but affected by light.

Derivation: Interaction of bismuth nitrate, glacial acetic acid, and gallic acid in aqueous solution.

Use: Medicine (treatment of alimentary canal).

bismuth subnitrate (basic bismuth nitrate; bismuth oxynitrate) $4\text{BiNO}_3(\text{OH})_2 \cdot \text{BiO}(\text{OH})$.

Properties: White, heavy, slightly hygroscopic powder, which shows acid to moistened litmus paper.

Soluble in acids; insoluble in water and alcohol. Sp. gr. 4.928; m.p. decomposes at 260°C.
 Derivation: Hydrolysis of bismuth nitrate, filtering and drying.
 Grades: Technical; C.P.; N.F.
 Containers: Multiwall paper bags; 5- to 250-lb drums.
 Hazard: See bismuth nitrate.
 Uses: See bismuth subcarbonate.

bismuth subsalicylate (basic bismuth salicylate)

Properties: White, bulky crystalline powder; tasteless; odorless; soluble in acids and alkalies; insoluble in water, alcohol and ether. Stable in air but affected by light.
 Derivation: By treating freshly prepared bismuth hydroxide with salicylic acid.
 Use: Medicine.

bismuth sulfate $\text{Bi}_2(\text{SO}_4)_3$

Properties: White needles or powder. Contains 68.5% (approx.) bismuth. Sp. gr. 5.08; decomposes at 405°C. Soluble in hydrochloric acid (dilute), nitric acid (dilute); insoluble in alcohol, water.
 Use: Medicine.

bismuth sulfide (bismuth trisulfide) Bi_2S_3

Properties: Blackish-brown powder. Soluble in nitric acid; insoluble in water. Sp. gr. 7.6-7.8; m.p., decomposes.
 Derivation: (a) By melting bismuth and sulfur together. (b) By passing hydrogen sulfide into a solution of a bismuth salt. (c) Occurs as the mineral bismuthinite.
 Use: Bismuth compounds.

bismuth sulfocarbolate. See bismuth phenolsulfonate.

bismuth tannate (bismuth ditannate).

Properties: Light brownish-yellow powder containing about 36% bismuth. Insoluble in water and alcohol; soluble in mineral acids.
 Derivation: From freshly prepared bismuth hydroxide and tannin.
 Use: Medicine.

bismuth tartrate $\text{Bi}_2(\text{C}_4\text{H}_4\text{O}_6)_3 \cdot 6\text{H}_2\text{O}$

Properties: White powder. Decomposes with loss of water at 105°C. Sp. gr. 2.59 at 20°C. Soluble in water.
 Use: Medicine (treatment of syphilis), often with potassium or sodium as part of compound.

bismuth telluride (bismuth tritelluride) Bi_2Te_3

Properties: Gray hexagonal platelets. M.p. 573°C; sp. gr. 7.642.
 Derivation: Stoichiometric combination of the elements.

Grades: Ingots, single crystals.

Hazard: Toxic; tolerance, 10 mg per cubic meter of air; (if selenium-doped, 5 mg per cubic meter of air).

Use: Semiconductors for thermoelectric cooling and power generation applications.

bismuth tetroxide Bi_2O_4

Properties: Heavy, yellowish-brown powder. Soluble in acids; insoluble in water. Sp. gr. 5.6; m.p. 305°C.
 Derivation: By further oxidation of bismuth trioxide.
 Use: Bismuth salts.

bismuth tribromide. See bismuth bromide.

bismuth trichloride. See bismuth chloride.

bismuth trihydrate. See bismuth hydroxide.

bismuth trihydroxide. See bismuth hydroxide.

bismuth triiodide. See bismuth iodide.

bismuth trinitrate. See bismuth nitrate.

bismuth trioxide (bismuth oxide; bismuth yellow; bismite). Bi_2O_3

Properties: Heavy, yellow powder. Soluble in acids; insoluble in water. Sp. gr. 8.8; m.p. 820°C.

Derivation: Heating bismuth nitrate in air; ignition of bismuth hydroxide.

Uses: Enameling cast iron; ceramic and porcelain colors.

bismuth trisulfide. See bismuth sulfide.

bismuth tritelluride. See bismuth telluride.

bismuth yellow. See bismuth trioxide.

bismuth zirconate Bi_2ZrO_5 . Used in electronics.

parabis[2-5(5-alpha-naphthyloxazolyl)]benzene (NOPON) $\text{C}_{32}\text{H}_{20}\text{O}_2\text{N}_2$

Properties: Crystals; m.p. 215-217°C.

Grade: Purified.

Use: Scintillation counter.

bis(3-nitrophenyl) disulfide. See nitrophenide.

bisphenol A (4,4'-isopropylidenediphenol; 2,2-bis(4-hydroxyphenyl)propane). $(\text{CH}_3)_2\text{C}(\text{C}_6\text{H}_4\text{OH})_2$

Properties: White flakes with a mild phenolic odor. B.p. 220°C (4 mm); freezing point 153°C; sp. gr. 1.195 (25/25°C); flash point 175°F; insoluble in water; soluble in alcohol and dilute alkalies; slightly soluble in carbon tetrachloride. Combustible.

Derivation: Condensation reaction of phenol and acetone catalyzed by HCl at 150°F.

Containers: 50-lb bags; 400-lb metal drums.

Hazard: May be toxic by ingestion.

Uses: Intermediate in manufacture of epoxy, polycarbonate, phenoxy, polysulfone and certain polyester resins; flame retardants; rubber chemicals.

1,4-bis-2-(5-phenyloxazolyl)benzene (POPOP).

Properties: Light yellow, cottony needles; m.p. 245-246°C; fluorescence max. 4200 Å; solubilities g/100 g at 25°C: water 0.00; 95% ethanol 0.00; toluene 0.12; hexane 0.02. Combustible.

Grade: Purified.

Containers: Glass bottles.

Use: Band-shifter in scintillation counting.

bis(tetrachloroethyl) disulfide $\text{C}_4\text{H}_2\text{Cl}_8\text{S}_2$

Properties: Liquid; sp. gr. (23.3°C) 1.785; b.p. 185°C (3 mm). Soluble in benzene, hexane, ethanol. Combustible.

Hazard: May be toxic by ingestion and inhalation.

Uses: Agricultural chemicals; additives.

bis(tri-n-butyltin) oxide $(\text{C}_4\text{H}_9)_3\text{SnOSn}(\text{C}_4\text{H}_9)_3$

Properties: Slightly yellow liquid; b.p. 180°C (2 mm); f.p. less than -45°C; sp. gr. 1.17 (25°C); flash point, above 212°F (TCC); viscosity 4.8 centistokes at 25°C; practically insoluble in water; miscible with organic solvents. Forms compounds with cellulosic and lignin-containing materials not easily decomposed or dissolved in water. Combustible.

Derivation: Hydrolysis of tributyl tin chloride.

Hazard: Toxic by ingestion and inhalation. Tolerance (as Sn), 0.1 mg per cubic meter of air.

Uses: Fungicide and bactericide, especially in underwater and antifouling paints (q.v.); pesticide.

bis(trichlorosilyl)ethane (1,1,1,4,4,4-hexachloro-1,4-disilabutane). $\text{Cl}_3\text{SiCH}_2\text{CH}_2\text{SiCl}_3$

Properties: Colorless liquid. B.p. 202.9°C; flash point (COC) 190°F. Readily hydrolyzed with liberation of hydrochloric acid. Combustible.

Derivation: Reaction of acetylene and trichlorosilane in presence of a peroxide catalyst.

Grades: Technical.

Hazard: Corrosive when exposed to moisture.

Use: Intermediate for silicones.

bis(2-decyl phthalate) $C_{6}H_{4}(COOC_{10}H_{21})_2$.

Properties: Liquid; sp. gr. 0.9497 (25°C); boiling range 280–290°C (4 mm); f.p. –35°C; flash point 485°F; refractive index 1.483 (25°C). Combustible.

Use: Primary plasticizer for most PVC resins.

bithionol [bis(2-hydroxy-3,5-dichlorophenyl) sulfide; 2,2'-thiobis(4,6-dichlorophenol)] $HOCl_2C_6H_2SC_6H_2Cl_2OH$.

Properties: White or grayish-white crystalline powder, m.p. 187°C. Odorless or with slight aromatic or phenolic odor. Insoluble in water; freely soluble in acetone, alcohol and in ether; soluble in chloroform and dilute solutions of fixed alkali hydroxides.

Grade: N.F.

Containers: 50-, 200-lb drums.

Hazard: Skin irritant; may not be used in cosmetics (FDA).

Uses: Medicine; acaricide; germicide; fungicide; pharmaceuticals.

4,4'-bi-ortho-tolylene diisocyanate. See 3,3'-dimethyl-4,4'-biphenylene diisocyanate.

bitter almond oil. See oil of bitter almond.

bittern. The solution of bromides, magnesium, and calcium salts that remains after sodium chloride has been crystallized by concentration of sea water or brines.

"Bitumastic."¹¹ Trademark for refined coal tar-based water-resistant protective coatings including hot-applied impermeable enamels and industrial coatings.

bitumen. A mixture of hydrocarbons occurring both in the native state and as residue from California petroleum distillation. Soluble in carbon disulfide. Solid to viscous, semisolid liquids. Used in hot-melt adhesives, coatings, paints, sealants, roofing and road-coating. Bitumens are found in asphalt, mineral waxes and in lower grades of coal. Combustible. See also asphalt, gilsonite, glance pitch.

bituminous coal. See coal.

biuret (allophanamide; carbamylurea) $NH_2CONHCONH_2 \cdot H_2O$.

Properties: White needles; odorless; m.p. 190°C with decomposition; soluble in water and alcohol; very slightly soluble in ether. Loses water of crystallization at about 110°C.

Derivation: From urea by heat.

Methods of purification: Crystallization.

Use: Analytical chemistry.

bixin. See annatto.

Bk Symbol for berkelium.

"B-K Chlorine-Bearing Powder."²⁰⁴ Trademark. Calcium hypochlorite powder containing 50% available chlorine.

Use: Dairy bactericide in plants and on farms, restaurants; disinfectant and deodorant.

"B-Kleer."²⁰⁴ Trademark for a heavy-duty caustic alkali; contains polyphosphate and wetting agent in fused flake form.

Uses: Machine bottle washing; H.T.S.T. Pasteurizer; vacuum pan cleaning.

"BL-60."¹ Trademark for a modified form of sodium aluminum phosphate specifically designed for use in cakes made with lactylated type shortening.

Grade: Technical; F.C.C.

Uses: Leavening agent in prepared cake mixes.

black. Any of several forms of finely divided carbon, either pure or admixed with oils, fats, or waxes. See acetylene black, animal black, bone black, carbon black, etc.

black, aniline. See aniline black.

black antimony. See antimony trisulfide.

black ash. (1) (papermaking) The product obtained by heating black liquor in furnaces. The organic material is reduced to carbon. The alkaline components are leached out and used again in papermaking. The carbon may be treated to obtain activated carbon. (2) See barium sulfide.

blackbody. In radiation physics, an ideal blackbody is a theoretical object that absorbs all the radiant energy falling upon it and emits it in the form of thermal radiation. The power radiated by a unit area of a blackbody is given by Planck's radiation law, and the total power radiated is expressed by the Stefan-Boltzmann law.

black, bone. See bone black.

black cyanide. A mixture containing 45% calcium cyanide, made from calcium cyanamid by heating it with salt and carbon.

Hazard: Highly toxic.

Shipping regulations: See calcium cyanide.

black lead. See graphite.

black liquor. (1) The liquor resulting from cooking pulpwood in an alkaline solution in the soda or sulfate (kraft) papermaking process. It is a source of lignin and tall oil, and is said to be effective in removal of mercury from industrial effluents (USDA). (2) Iron acetate liquor (black mordant).

black oil. See residual oil.

black phosphorus. See phosphorus.

black plate. Thin sheet steel obtained by rolling and usually used for containers. It is not coated with any metal but a special lacquer or baked enamel finish is usually applied by the manufacturer.

black, platinum. See platinum black.

black powder (blasting powder). A low explosive composed of potassium nitrate, charcoal and sulfur. In some cases sodium nitrate is substituted for potassium nitrate. Typical proportions are 75, 15 and 10%. Gunpowder is probably the oldest variety.

Hazard: Sensitive to heat, and deflagrates rapidly. Does not detonate, but is a dangerous fire and explosion hazard.

Uses: Time fuses for blasting and shell; in igniter and primer assemblies for propellants; pyrotechnics; mining and blasting.

Shipping regulations: (Rail) Not accepted by rail express. Consult regulations. (Air) Not accepted.

black rouge. See iron oxide, black.

black sand. A deposit of dark minerals with a high specific gravity found in stream beds and on beaches. Magnetite and ilmenite are usually present, as also monazite and other minerals.

blackstrap. See molasses.

blanc fixe. Precipitated barium sulfate (q.v.).

"Blancol."³⁰⁷ Trademark for an anionic dispersing agent, composed of the sodium salt of a sulfonated naphthalene condensate; 90% active.

Uses: Dispersing agent for pigments, earths, and solids in water; peptizing agent in insecticide formulations; in the paper industry for slime control, preventing coagulation of pitch, reducing two-sidedness, to improve sizing, etc.; in the leather industry as a bleaching, dispersing, leveling, and neutralizing agent.

"Blancophor."³⁰⁷ Trademark for optical whitening agents.

FFG. A coumarin derivative. Used as whitening agent for wool, nylon, acetate rayon and mixed fibers.

HS Brands. Stilbene derivatives; used on cellulosic fibers, cotton and rayon fabrics, paper, and in household and industrial detergents.

"Blandol."⁴⁵ Trademark for white mineral oil, N.F.

Uses: Pharmaceutical and cosmetic formulations; plasticizers; paper penetrants; foam depressants.

"Blankit I."³⁰⁷ Trademark for a bleaching and reducing agent composed of a stabilized, buffered hydro-sulfite product; 67% active.

Containers: Must be stored in air-tight, dry containers protected from heat and moisture.

Uses: Bleaching agent for wool, jute, linen and hemp; textile stripping agent.

blast-furnace dust. Dust deposited by or recovered from blast-furnace gases. It contains a variable amount of potash which renders it valuable.

blast-furnace gas. By-product gas from smelting iron ore, obtained by the passage of hot air over the coke in the blast furnaces. A typical gas will analyze 12.9% carbon dioxide, 26.3% carbon monoxide, 3.7% hydrogen, 57.1% nitrogen.

Hazard: Dangerous by inhalation. See carbon monoxide.

Uses: Heating blast-furnace stoves; boiler- or gas-engine fuel.

blasting agent. See black powder; ammonium nitrate; explosive, high, permissible, and low.

blasting gelatin. (SNG) A type of dynamite containing about 7% of nitrocellulose.

Hazard: High explosive.

Shipping regulations: (Air) Not accepted. (Rail) Consult regulations.

blasting powder. See black powder.

"B-L-E."²⁴⁵ Trademark for high-temperature reaction product of diphenylamine and acetone.

Properties: Dark-brown viscous liquid; sp. gr. 1.087; soluble in acetone, benzene, and ethylene dichloride; insoluble in gasoline and water. Combustible.

Uses: General-purpose rubber antioxidant.

bleach. To whiten a textile or paper by chemical action; also the agent itself. Bleaching agents include hydrogen peroxide (the most common), sodium hypochlorite, sodium peroxide, sodium chlorite, calcium hypochloride, hypochlorous acid, and many organic chlorine derivatives. Chlorinated lime is a bleaching powder used on an industrial scale; household bleaching powders are sodium perborate and dichlorodimethylhydantoin.

Hazard: Some bleaching agents are toxic and strong oxidizing agents. See calcium hypochlorite; lime, chlorinated.

bleaching assistant. A material added to bleaching baths to secure more rapid and complete penetration of the bleach or improved regulation of the bleaching action, e.g., compounds of sulfonated oils and solvents, soluble pine oils, fatty alcohol salts, sodium silicate, sodium phosphate, magnesium sulfate, and borax.

bleach liquor. Calcium hypochlorite solution.

bleed. (1) Of a dye, to run. (2) To release pressure gradually, as from a valve.

"Blendene."⁷³ Trademark for a terpene-soap composition.

Properties: Oily liquid having a pine odor; dispersible in water, in toluene, mineral spirits, and mineral oil. Soluble (hot) in methyl alcohol, ethyl alcohol, and naphtha; partly soluble in cottonseed oil. Sp. gr. (25°C) 0.947; titer below 6°C; pH (10% dispersion) 9.2. Combustible.

Uses: Manufacture of fluid emulsions, oils, solvents, etc., for water paint base, emulsion sprays, furniture and automobile polishes.

"Blendex."⁵²⁵ Trademark for synthetic resinous products prepared from a variety of copolymer combinations. They are used to modify other polymers to attain a wide range of properties.

"Blendtex."²²⁸ Trademark for a flame-retardant, water-resistant nonwoven fabric composed of nylon, rayon, and cellulose fibers mechanically compacted into a single sheet or layer. Used chiefly for disposable hospital sheeting, clothing items, etc. See also nonwoven fabric.

blister copper. Copper (96-99% purity) produced by the reduction and smelting of copper ores. It has a blistered appearance probably caused by gas pockets. It is usually further refined electrolytically.

blister packaging. A type of packaging used widely in the food and pharmaceutical industries consisting of a hollow cavity of various shapes and capacities in which the material is enclosed. Polyester and polyethylene resins are often used.

"BLO."³⁰⁷ Trademark for a solvent, gamma-butyrolactone.

block polymer. A high polymer whose molecule is made up of alternating sections of one chemical composition separated by sections of a different chemical nature, or by a coupling group of low molecular weight. An example might be blocks of polyvinyl chloride interspersed with blocks of polyvinyl acetate. Such polymer combinations are made synthetically; they depend on the presence of an active site on the polymer chain which initiates the necessary reactions. See also graft polymer; stereoblock polymer.

block polymers

blood. A complex, liquid tissue of sp. gr. 1.056 and pH of 7.35-7.45. It is comprised of erythrocytes (red cells), leucocytes (white cells), platelets, plasma proteins and serum. The plasma fraction (55-70%) is whole blood from which the red and white cells and

the platelets have been removed by centrifuging. Hemoglobin (q.v.) is a protein found in the erythrocytes; it contains the essential iron atom, and functions as the transport agent for oxygen to the heart (artery) and of carbon dioxide from the heart (vein). Experimental work has been reported on the effectiveness of fluorocarbon compounds in carrying out the essential transport functions of blood, especially of the red cells.

Uses: Plasma is used to restore liquid volume and thus osmotic pressure in the body where blood loss has been extensive. Animal blood is used as a component of adhesive mixtures; in dried or powder form it is a component of fertilizers, poultry feeds, and deer repellents.

See also hemoglobin; plasma; platelet.

bloom. (1) A thin coating of an ingredient of a rubber or plastic mixture that migrates to the surface, usually within a few hours after curing or setting. Sulfur bloom in vulcanized rubber products is most common; it is harmless, but impairs the eye appeal of the product. Paraffin wax is often included purposely; when it migrates to the surface it provides an efficient barrier to sunchecking and oxidation.

(2) A piece of steel made from an ingot.

(3) An arbitrary scale for rating the strength of gelatin gels. When so used the word is capitalized.

blowing agent. A substance incorporated in a mixture for the purpose of producing a foam. One type decomposes when heated to processing temperature to evolve a gas, usually carbon dioxide, which is suspended in small globules in the mixture. Typical blowing agents of this kind are baking powder (bread and cake); sodium bicarbonate or ammonium carbonate (cellular or sponge rubber); halocarbons and methylene chloride in urethane, pentane in expanded polystyrene, and hydrazine in various types of foamed plastics. Another type is air used at room temperature as a blowing agent for rubber latex; it is introduced mechanically by whipping, after which the latex is coagulated with acid. Air is also used for this purpose in ice cream, whipped cream, and other food products, as well as in blown asphalt, and blown vegetable oils. See also foam.

blow molding. A technique originally developed in the 1950's for production of hollow thermoplastic products. It involves placing an extruded tube of the thermoplastic in a mold and applying sufficient air pressure to the inside of the tube to cause it to take on the conformation of the mold. Polyethylene is usually used, but a number of other materials are adaptable to this method, e.g., cellulose, nylons, polypropylene and polycarbonates. It is an economically efficient process and is especially suitable for production of toys, bottles and other containers, as well as air-conditioning ducts and various industrial items. The method is not limited to hollow products; for example, housings can be made by blowing a unit and sawing it along the parting line to make two housings.

blown asphalt. See asphalt, blown.

blown oil (oxidized oil; base oil; thickened oil; polymerized oil). Vegetable and animal oils which have been heated and agitated by a current of air or oxygen. They are partially oxidized, deodorized and polymerized by the treatment, and are increased in

density, viscosity and drying power. Common blown oils are castor, linseed, rape, whale, and fish oils.

Uses: Paints, varnishes, lubricants, and plasticizers.

blue copperas. See copper sulfate.

blue gas. See water gas.

blue lead. See lead sulfate, blue basic.

blueprint. See Turnbull's Blue.

blue verdigris. See copper acetate, basic.

blue vitriol. See copper sulfate.

blush. Precipitation of water vapor in the form of colloidal droplets on the surface of a varnish or lacquer film, caused by lowering of the temperature immediately above the coated surface due to solvent evaporation. This results in unsightly graying of the dried film and can be avoided by use of a less volatile solvent.

"B-Nine."²⁴⁸ Trademark for succinic acid, 2,2-dimethylhydrazide; used as a growth retardant.

B.O.D. See biochemical oxygen demand.

boghead coal. A variety of bituminous or subbituminous coal resembling cannel coal in appearance and behavior during combustion. It is characterized by a high percentage of algal remains and volatile matter. Upon distillation it gives exceptionally high yields of tar and oil (ASTM).

"Bogol."⁴⁸ Trademark for a crude tall oil (q.v.).

boiled oil. See linseed oil, boiled.

boiler scale. A rocklike deposit occurring on boiler walls and tubes in which hard water has been heated or evaporated. Consists largely of calcium carbonate, calcium sulfate or similar materials, depending on the mineral content of the water. Boiler scale decreases the rate of heat transfer through the boiler and tube walls resulting in increased heating costs and shortening of boiler life. Most boiler feed water is softened (treated to remove calcium and magnesium ions) before being used. See also water, hard; zeolite.

boiling point. The temperature of a liquid at which its vapor pressure is equal to or very slightly greater than the atmospheric pressure of the environment. For water at sea level it is 212°F (100°C).

bois de rose oil. See oil bois de rose.

Boltzmann, Ludwig (1844-1906). Born in Vienna, Boltzmann was interested primarily in physical chemistry and thermodynamics. His work has importance for chemistry because of his development of the kinetic theory of gases and the rules governing their viscosity and diffusion. His mathematical expression of his most important generalizations is known as Boltzmann's Law, still regarded as one of the cornerstones of physical science.

bombardment. Impingement upon an atomic nucleus of accelerated particles such as neutrons or deuterons for the purpose of inducing fission or of creating unstable nuclei which will thus become radioactive. This operation was first accomplished with positively charged particles in the cyclotron in the early 1940's, and subsequently in nuclear reactors. Neutrons are commonly used in reactors because their lack of

electrical charge permits easier penetration of the target nucleus. See also radioisotope; fission.

"Bomyl."⁵⁰ Trademark for dimethyl 3-hydroxyglutamate dimethyl phosphate ($C_5H_{15}O_8P$); used as an insecticide in control of flies.

Properties: Insoluble in water and kerosine. Corrosive to iron, steel, and brass. Stable when stored in glass. Nonflammable.

Grades: Granular, technical, and concentrated.

BON. Abbreviation for beta-oxynaphthoic acid. See 3-hydroxy-2-naphthoic acid.

"Bonaril."²³³ Trademark for a hydrolyzed polyacrylamide for use in foundry sands.

bond, chemical. An attractive force between atoms strong enough to permit the combined aggregate to function as a unit. A more exact definition is not possible because attractive forces ranging upward from zero to those involving more than 250 kcal per mole of bonds are known. A practical lower limit may be taken as 2-3 kcal per mole of bonds, the work necessary to break about 1.5×10^{24} bonds by separating their component atoms to infinite distance.

All bonds appear to originate with the electrostatic charges on electrons and atomic nuclei. Bonds result when the net coulombic interactions are sufficiently attractive. Different principal types of bonds recognized include metallic, covalent, ionic, and bridge.

Metallic bonding is the attraction of all the atomic nuclei in a crystal for the outer shell electrons which are shared in a delocalized manner among all available orbitals. Metal atoms characteristically provide more orbital vacancies than electrons, for sharing with other atoms.

Covalent bonding results most commonly when electrons are shared by two atomic nuclei. Here the bonding electrons are relatively localized in the region of the two nuclei, although frequently a degree of delocalization occurs when the shared electrons have a choice of orbitals. The conventional *single* covalent bond involves the sharing of 2 electrons. There may also be *double* bonds with 4 shared electrons, *triple* bonds, with 6 shared electrons, and bonds of intermediate multiplicity.

Covalent bonds may range from *nonpolar*, involving electrons evenly shared by the two atoms, to extremely *polar*, where the bonding electrons are very unevenly shared. The limit of uneven sharing occurs when the bonding electron(s) spends full time with one of the atoms. This makes this atom into a negative ion and leaves the other atom in the form of a positive ion. Ionic bonding is the electrostatic attraction among oppositely charged ions.

Bridge bonds involve compounds of hydrogen in which the hydrogen bears either a positive or negative charge. When hydrogen is attached by a polar covalent bond to one molecule, it may attract another molecule, bridging the two molecules together. If the hydrogen is positive, it may attract an electron pair of the other molecule. This is called a *protonic bridge*. If the hydrogen is negative, it may attract, through a vacant orbital, the nucleus of an atom of a second molecule. This called a *hydridic bridge*. Such bridges are at the lower range of bond strength, but may be very significant in their effect on the physical properties of condensed states of those substances in which they are possible. (See also hydrogen bond).

R. T. Sanderson

"Bonderite."⁶² Trademark for chemical compositions for producing a corrosion-inhibiting finish on metals, preparing metal surfaces for the subsequent application of finish coats, conditioning metal surfaces to facilitate metal deformation operations.

"Bonderizing."³⁴³ Trademark for a process for furnishing a corrosion-resisting base for paint finishes on steel, aluminum, zinc, and their alloys and diecastings. Also used as an aid in deep drawing steel and aluminum.

"Bonderlube."⁶² Trademark for soap-like chemical composition for treating metal surfaces which have been pretreated with phosphatizing coating chemicals, to form a lubricant layer adapted to cold forming and to retard the formation of rust.

"Bondogen."⁶⁹⁻⁴⁹⁶ Trademark for oil soluble sulfonic acid of high, molecular weight with a high-boiling hydrophilic alcohol and a paraffin oil.

Properties: Dark mahogany liquid; sp. gr. 0.93; acid number 40-42. Combustible.

Uses: Plasticizer and processing aid for elastomers.

bone ash. An ash composed principally of tribasic calcium phosphate, but containing minor amounts of magnesium phosphate, calcium carbonate and calcium fluoride. Noncombustible.

Derivation: By calcining bones. A synthetic product is also available.

Uses: Cleaning and polishing; ceramics; animal feeds. The better grades are used in coating molds for copper wire, bar, slabs, and other metals.

bone black (bone char; bone charcoal). Black pigment made by carbonizing bones. Carbon content is usually about 10%. Nonflammable in bulk; nontoxic.

Containers: Multiwall paper sacks; fiber drums.

Hazard: Flammable as suspended dust.

Uses: Manufacturing activated carbon; decolorizing agent and filtering medium; cementation reagent; adsorptive medium in gas masks; paint and varnish pigment; clarifying shellac; water purification.

bone china. Ceramic tableware of high quality in which a small percentage of bone ash is incorporated. Made chiefly in England.

bone meal. A product made by grinding animal bones. Raw meal is made from bones that have not been previously steamed; if pressure-steaming has been used, the meal is called "steamed." The fertilizer grade contains from 43-55% tricalcium phosphate, 20-25% phosphoric acid, and 4-5% ammonia. The feed grade, according to Bureau of Animal Industry specifications, must contain from 65-75% tricalcium phosphate and only about 2% ammonia. Much of the latter grade is imported.

Uses: Fertilizer (raw); animal feeds (steamed).

bone oil (animal oil; Dippel's oil; hartshorn oil).

Properties: Dark brown, fixed oil; repulsive odor. Soluble in water. Sp. gr. 0.900-0.980. Combustible.

Chief constituents: Hydrocarbons, pyridine bases, and amines.

Derivation: Destructive distillation of bones or other animal substance. Note distinction from bone tallow. Grades: Technical.

Containers: Drums; tank cars.

Hazard: Evolves ammonium cyanide when heated to 180°C.

Uses: Organic preparations; source of pyrrole; denaturant for alcohol.

bone phosphate (BPL) Phosphoric acid occurring in bones in the form of tribasic calcium phosphate (q.v.).

bone seeker. An element or radioisotope that tends to lodge in the bones when introduced into the body. Examples are fluorine, calcium, and strontium 90.

bone tallow (bone fat). Fat obtained from animal bones by boiling in water, by treating with steam under pressure, or by solvent extraction. It is a glyceryl ester.

"Bonine."⁷⁹⁹ Trademark for meclizine hydrochloride.

BON maroon. A calcium or manganese precipitated compound of 3-hydroxy-2-naphthoic acid and 2-naphthylamine-1-sulfonic acid. See BON red.

BON red. Class name for a group of organic azo pigments made by coupling 3-hydroxy-2-naphthoic acid to various amines and forming the barium, calcium, strontium or manganese salts. They have bright shades ranging from yellow red to deep maroon; good light and heat resistance, non-bleeding in vehicles and solvents, and good opacity. They are widely used in printing inks, paints, enamels, lacquers, rubber, plastics, wall paper, textiles, floor coverings, and crayons.

boort (bort). See diamond, industrial.

BOPOB. See para-bis[2-(5-para-biphenyloxazoly)]-benzene.

boracic acid. See boric acid.

boral. A composite material consisting of boron carbide crystals in aluminum, with a cladding of commercially pure aluminum. Concentrations of up to 50% boron carbide can be obtained.

Uses: Reactor shields; neutron curtains; shutters for thermal curtains; safety rods; containers for fissionable material.

See also composite.

"Boralloy."⁵²¹ Trademark for boron nitride in the form of a polycrystalline material produced by a proprietary vapor deposition process.

"Boran."¹⁶⁹ Trademark for diaminochrysazin used in the colorimetric determination of boron.

borane. One of a series of boron hydrides (compounds of boron and hydrogen). The simplest of these, BH_3 , is unstable at atmospheric pressure and becomes diborane (B_2H_6) (q.v.), a gas at normal pressures. This is converted to higher boranes (penta-, deca-, etc.) by condensation; this series progresses through a number of well-characterized crystalline compounds. Hydrides up to $\text{B}_{10}\text{H}_{12}$ exist. Most are not very stable and readily react with water to yield hydrogen; many react violently with air. As a rule, they are highly toxic. Their properties have suggested investigation for rocket propulsion, but they have not proved satisfactory for this purpose. There are also a number of organoboranes used as reducing agents in electroless nickel-plating of metals and plastics. Some of the compounds used are di- and triethylamine borane and pyridine borane. See also carborane, diborane, pentaborane, hydride.

borax (tincal; borax decahydrate) $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$. A natural hydrated sodium borate, found in salt lakes and alkali soils; also the commercial name for sodium borate (q.v.).

borax, anhydrous (borax, dehydrated; sodium borate, anhydrous) $\text{Na}_2\text{B}_4\text{O}_7$.

Properties: White, free-flowing crystals; hygroscopic;

forms partial hydrate in damp air; m.p. 741°C ; sp. gr. 2.367; slightly soluble in cold water; noncombustible; low toxicity.

Grades: Technical (99% $\text{Na}_2\text{B}_4\text{O}_7$); standard; fine granular form; glass, or fused.

Containers: 100-lb paper bags; boxcars.

Uses: Manufacture of glass, enamels, and other ceramic products; herbicide.

borax pentahydrate $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: Free-flowing powder; begins to lose water of hydration at 122°C ; sp. gr. 1.815. Noncombustible; low toxicity.

Grades: Crude; technical (99.5% $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$).

Containers: 100-lb bags; bulk.

Uses: Weed killer and soil sterilant; fungus control on citrus fruits (FDA tolerance 8 ppm of boron residue).

borazole (borazine) $\text{B}_3\text{N}_3\text{H}_6$. Inorganic analog of benzene.

Properties: Colorless liquid; m.p. -58°C ; b.p. 53°C ; sp. gr. 0.824 at 0°C . Hydrolyzes to evolve boron hydrides.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue. Dangerous fire risk.

borazon. A boron nitride (q.v.) formed at very high pressures (85,000 atm) and temperatures (1800°C) from mixtures of boron and nitrogen, or from ordinary hexagonal boron nitride in the presence of catalysts such as lithium, calcium, magnesium, or their nitrides. Mohs hardness 10; density 3.48 g/cc. Reacts extremely slowly with water; dissolves in fused sodium carbonate. For uses, see under boron nitride.

Borcher's metal. A group of alloys of chromium with nickel and cobalt, or of chromium and iron with a small proportion of molybdenum and/or silver or gold. Heat- and corrosion-resistant.

Uses: Chemical apparatus; crucibles; pyrometer tubes; heat treating or annealing pots.

Bordeaux mixture. A fungicide and insecticide mixture made by adding slaked lime to a copper sulfate solution. It is either made by the user or bought as a powder ready for dissolving. Stabilizing agents are sometimes added to delay settling. Used especially for potato bugs and similar garden pests.

Hazard: Irritant and corrosive by ingestion.

Borden's "38."⁶⁵ Trademark for ureaform, a plant nutrient containing 38% nitrogen.

"Borester."⁴⁴¹ Trademark for a series of boric acid esters.

"Bor-guard."¹ Trademark for a borax-propylene glycol-butynediol condensate. A corrosion inhibitor particularly suited for brake fluids of high boiling point; also for antifreeze and hydraulic fluids.

boric acid (boracic acid; orthoboric acid) H_3BO_3 .

Properties: Colorless, odorless scales or white powder; stable in air. Sp. gr. 1.4347 (15°C); m.p., indeterminate, since it loses water in stages, through metaboric acid, HBO_2 , pyroboric acid, $\text{H}_2\text{B}_4\text{O}_7$, and to the oxide, B_2O_3 . Soluble in boiling water, alcohol and glycerin. Noncombustible.

Derivation: (a) By adding hydrochloric acid or sulfuric acid to a solution of borax and crystallizing; (b) From weak borax brines, by extraction with a kerosine solution of a chelating agent such as 2-ethyl-1,3-hexanediol, or other polyols. Borates are stripped from the chelate by sulfuric acid.

Method of purification: Recrystallization.

Hazard: Toxic by ingestion. Use only in weak solution. Irritant to skin in dry form.

Grades: Technical, 99.9%; C.P.; U.S.P.

Uses: Heat-resistant glass (borosilicate glass); glass fibers; porcelain enamels; boron chemicals; metallurgy (welding flux, brazing copper); fireproofing compositions for textile products such as cotton batting in mattresses; fungus control on citrus fruits (FDA tolerance 8 ppm boron residue); ointment and eye wash (water solution only); nickel electroplating baths.

boric acid ester (borate ester). Trimethyl, tri-*n*-butyl, tricyclohexyl, tridodecyl, tri-*p*-cresyl borates; trihexylene glycol borate; compounds which are readily hydrolyzed to boric acid and the respective alcohols. Properties: Colorless to yellow liquids; b.p. 230–350°C. Low toxicity. Combustible.

Uses: Dehydrating agents; catalysts; sources of boric oxide; special solvents; stabilizers; plasticizers or adhesion additives to latex paints; ingredients of soldering and brazing fluxes.

boric acid, ortho-. See boric acid.

boric anhydride. See boric oxide.

boric oxide (boric anhydride; boron oxide) B₂O₃.

Properties: Colorless powder or vitreous crystals; slightly bitter to taste. Soluble in alcohol and hot water; slightly soluble in cold water. Sp. gr. 1.85; m.p. approx. 450°C; b.p. 1500°C. Noncombustible.

Derivation: By heating boric acid.

Grades: Glass or fused form; powder, technical or high purity 99.99+%.

Hazard: Toxic. Tolerance, 10 mg per cubic meter of air.

Uses: Production of boron; heat-resistant glassware; fire-resistant additive for paints; electronics; liquid encapsulation techniques; herbicide.

boride. An interstitial compound of boron and another metal (transition, alkaline-earth, or rare-earth); such compounds are not stoichiometric, the boron atoms being linked together in zigzag chains, two-dimensional nets, or three-dimensional structures throughout the crystal.

Properties: Highly refractory, with m.p. from 2000 to 3000°C; Mohs hardness from 8 to 10; thermally and electrically conductive; high chemical stability; do not react with HCl or HF but are attacked by hot alkali hydroxides; color varies from gray (transition-metal) to black (alkaline-earth) to blue (rare-earth).

Derivation: (1) Sintering mixtures of metal powder and boron at 2000°C; (2) reduction of mixture of the metal oxide and boric oxide with aluminum, silicon, or carbon; (3) fused salt electrolysis; (4) vapor-phase deposition.

Uses: High-temperature service as rocket nozzles, turbines, etc.

borneol (bornyl alcohol; 2-camphanol; 2-hydroxycamphane). C₁₀H₁₇OH.

Properties: White, translucent lumps; sharp, camphor-like odor; burning taste; soluble in alcohol and ether; insoluble in water. Optically active in natural form; racemic form made synthetically. Sp. gr. 1.011; m.p. 208°C; b.p. 212°C. Low toxicity.

Derivation: Natural form from a species of tree in Borneo, Sumatra, etc. Synthesized from camphor by hydrogen reduction, or from alpha-pinene.

Trades: Technical.

Containers: Cans; boxes.

Hazard: Fire risk in presence of open flame.

Uses: Perfumery; esters.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

bornyl acetate C₁₀H₁₇OOCCH₃.

Properties: Colorless liquid, solidifying to crystals at about 50°F; piny-camphoraceous odor. Soluble in 3 volumes of 70% alcohol; miscible with 95% alcohol and with ether. Sp. gr. 0.980–0.984; refractive index 1.463–1.465; m.p. 29°C. Combustible.

Derivation: Interaction of borneol and acetic anhydride in the presence of formic acid.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring; nitrocellulose solvent.

bornyl alcohol. See borneol.

bornyl formate C₁₀H₁₇OOCH.

Properties: Colorless liquid, having a piny odor. Sp. gr. 1.007–1.009. Combustible.

Grades: Technical.

Uses: Perfuming of soaps, disinfectants, and sanitary products; flavoring.

bornyl isovalerate C₁₀H₁₇OOC₃H₇. A constituent of valerian oil.

Properties: Limpid fluid, aromatic, valerian-like odor.

Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.951 at 20°C; b.p. 255–260°C. Combustible.

Use: Medicine; essential oil intermediate; flavoring.

boroethane. See diborane.

boron. B Nonmetallic element of atomic number 5; Group IIIA of the Periodic Table. Atomic weight 10.81. Valence 3; 2 stable isotopes, 11 (about 81%) and 10 (about 19%). See also boron 10.

Properties: Black, hard solid; brown, amorphous powder; crystals. Highly reactive. Soluble in concentrated nitric acid and sulfuric acid; insoluble in water, alcohol, and ether. High neutron absorption capacity. Low toxicity. Amphoteric. A plant micronutrient. Sp. gr. 2.45; m.p. 2300°C; Mohs hardness 9.3.

Sources: Borax; kernite; colemanite; ulexite.

Derivation: (a) by heating boric oxide with powdered magnesium or aluminum; (b) by vapor-phase reduction of boron trichloride with hydrogen over hot filaments (800–2000°C); (c) electrolysis of fused salts.

Forms: Filament, powder, whiskers, single crystals. Grades: Technical (90–92%); 99% pure; high-purity crystals.

Hazard: Dust ignites spontaneously in air; severe fire and explosion hazard. Reacts exothermally with metals over 900°C; explodes with hydrogen iodide.

Uses: Special-purpose alloys; cementation of iron; neutron absorber in reactor controls; oxygen scavenger for copper and other metals; fibers and filaments in composites with metals or ceramics; semiconductors; boron-coated tungsten wires; rocket propellant mixtures; high-temperature brazing alloys. See also boron alloy; boron fiber.

boron 10. Nonradioactive isotope of boron of mass number 10.

Properties: Has marked capacity for absorbing slow neutrons, emitting a high-energy alpha particle in the process.

Derivation: Constitutes about 19% of natural boron.

Forms available: Crystalline powder; dry amorphous powder; colloidal suspension of dry amorphous powder in oil; in boron trifluoride-calcium fluoride; in potassium borofluoride; in boron trifluoride ethyl etherate; in boric acid.

Uses: Neutron counter; radiation shielding (in the form of boral, q.v.); medicine.

boron alloy. A uniformly dispersed mixture of boron with another metal or metals. Ferrobore (q.v.) usu-

ally contains 15–25% boron; manganese boron usually 60–65% manganese.

Uses: Degasifying and deoxidizing agents; to harden steel (in trace quantities); to increase conductivity of copper; turbojet engines.

boron bromide. See boron tribromide.

boron carbide B_4C .

Properties: Hard black crystals; sp. gr. 2.6; Mohs hardness 9.3; m.p. 2350°C; b.p. 3500°C. Soluble in fused alkali; insoluble in water and acids. High capture cross-section for thermal neutrons.

Derivation: Heating boron oxide with carbon in an electric furnace.

Forms: Powder, crystals, rods, fibers, whiskers.

Hazard: Avoid inhalation of dust or particles.

Uses: Abrasive powder; abrasion resister and refractory; control rods in nuclear reactors; reinforcing agent in composites for military aircraft and other special applications. See also boral.

boron chloride. See boron trichloride.

boron fiber. A vapor-deposited filament made by deposition of boron on a heated tungsten wire. Filament is 0.004 inch in diameter, while the wire is only 0.0005 inch. Tensile strength 350,000 to 450,000 psi; elastic modulus 55 million psi; upper temperature limit in oxidizing atmosphere 250°C. Used in composites with epoxy resins for aircraft and space applications. They can be woven into fabrics.

boron fluoride. See boron trifluoride.

boron fuel. See rocket fuel.

boron hydride. See borane, diborane, pentaborane.

boron nitride BN .

Properties: White powder, particle size about 1 micron. M.p. 3000°C (sublimes). Graphite-like hexagonal plate structure. High electrical resistance. Compressed at a million psi, it becomes hard as diamond. Excellent heat-shock resistance; low mechanical strength; hygroscopic. Noncombustible. Low toxicity. Derivation: Heating a mixture of boric acid and tricalcium phosphate in ammonia atmosphere in an electric furnace. See also borazon.

Forms: Powder; compressed solid; fibers; whiskers.

Uses: Refractory; furnace insulation; crucibles; rectifying tubes; dielectric; chemical equipment; self-lubricating bushings; molten metal pump parts; transistor and rectifier mounting wafers; heatshield for plasma; nose-cone windows; heat-resistant fibers stable to 1600°F in oxidizing atmosphere for military composites; metalworking abrasive; high-temperature insulator; high-strength fibers.

boron nitride, pyrolytic. See "Boralloy."

boron oxide. See boric oxide.

boron phosphate (sometimes called borophosphoric acid) BPO_4 .

Properties: White, non-hygroscopic crystals; sp. gr. 1.873. Soluble in water; pH (1% solution) 2.0.

Containers: 400-lb barrels.

Use: Special glasses; ceramics; acid cleaner; dehydration catalyst.

boron phosphide BP . A refractory maroon powder; noncorrosive; Mohs hardness 9.5. Inert to corrosion. Derivation: Direct union of boron and phosphorus at about 1000°C in a reducing atmosphere.

Hazard: Ignites spontaneously at 390°F. Evolves toxic fumes in contact with water and acids.

boron steel. See ferroboron.

boron tribromide (boron bromide) BBr_3 .

Properties: Colorless, fuming liquid. Decomposed by alcohol and by water. Sp. gr. 2.69 at 15°C; b.p. 90°C; m.p. -46°C.

Derivation: (high purity). Direct bromination of boron, followed by rectification in quartz columns.

Grades: Technical; high purity.

Hazard: May explode when heated. Corrosive to tissue. Fumes are highly toxic. Tolerance, 1 ppm in air.

Use: Catalyst in organic syntheses.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label. Not acceptable on passenger planes.

boron trichloride (boron chloride) BCl_3 .

Properties: Colorless, fuming liquid. Decomposed by alcohol and by water. Sp. gr. 1.35 (15°C); b.p. 12.5°C; m.p. -107°C. Reacts with hydrogen at 1200°C.

Derivation: (a) Heating boric oxide and carbon with chlorine; (b) combining boric oxide with phosphorus pentachloride.

Grades: Technical (99%); C.P. (99.5%).

Containers: Up to 50-lb pressure cylinders; tank cars.

Hazard: Strong irritant to tissue. Fumes are corrosive and highly toxic.

Uses: Catalyst in organic syntheses; source of many boron compounds; refining of alloys; soldering flux; making electrical resistors; extinguishing magnesium fires in heat-treating furnaces.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

boron trifluoride (boron fluoride) BF_3 .

Properties: Colorless gas; 2.3 times as dense as air; m.p. -126.8°C; b.p. -101°C; does not support combustion; soluble in cold water; hydrolyzes in hot water; soluble in concentrated sulfuric acid; decomposes in alcohol. Easily forms double compounds such as that with ether, known as boron trifluoride etherate, or BF_3 -ether complex.

Derivation: From borax and hydrofluoric acid or from boric acid and ammonium bifluoride. The complex formed is then treated with cold fuming sulfuric acid.

Grades: Pure (99% min.).

Containers: Steel cylinders.

Hazard: Toxic by inhalation; corrosive to skin and tissue. Tolerance, 1 ppm in air.

Uses: Catalyst in organic synthesis; instruments for measuring neutron intensity; silver soldering fluxes; gas brazing.

Shipping regulations: (Rail) Green label. (Air) Nonflammable gas label. Not acceptable on passenger planes.

boron trifluoride etherate (BF_3 -ether complex).

$CH_3CH_2O(BF_3)CH_2CH_3$. A relatively stable coordination complex formed by the combination of diethyl ether with boron trifluoride, in which the boron atom is bonded to the oxygen of the ether. Colorless liquid. B.p. 259°F; flash point 147°F (open cup). Combustible.

Hazard: Toxic by inhalation; corrosive to skin and tissue.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

boron trifluoride-methanol ($\text{BF}_3\text{-MeOH}$). A solution of boron trifluoride in methanol; sp. gr. 0.90 (20°C); concentration 14 grams/ 100 cc. Used as an esterification reagent for fats and oils. Combustible. Hazard: Highly toxic; moderate fire risk. Shipping regulations: (Rail, Air) Poisonous liquid, n.o.s., Poison label.

boron trifluoride monoethylamine (boron fluoride monoethylamine; $\text{BF}_3\text{-MEA}$) $\text{BF}_3\text{-C}_2\text{H}_5\text{NH}_2$. Properties: White to pale tan flakes. Sp. gr. 1.38; m.p. $88\text{--}90^\circ\text{C}$. Soluble in furfuryl alcohol, polyglycol, acetone. Releases boron trifluoride above 110°C . Combustible. Hazard: Highly toxic; moderate fire risk. Use: Elevated temperature cure of epoxy resins. Shipping regulations: (Rail, Air) Not listed. Consult authorities.

borophosphoric acid. See boron phosphate.

borosilicate glass. See glass, heat-resistant.

"Boro-Spray."⁸⁸ Trademark for a crystalline product consisting chiefly of sodium pentaborate. Used for spray applications to tree fruit and truck crops where boron deficiency is indicated.

borotungstic acid (borowolframic acid) Various formulas and properties given. Grades: Technical. Containers: Glass bottles. Use: Mineralogic assay.

"Botran."⁵¹⁹ Trademark for an agricultural fungicide, 2,6-dichloro-4-nitroaniline. Hazard: Probably toxic.

bound water. Water molecules that are tightly held by various chemical groups in a larger molecule. Carboxyl, hydroxyl and amino groups are usually involved; hydrogen-bonding is often a factor. Proteins tend to bind water in this way, and in meats it will remain unfrozen as low as -40°F .

Boyle's Law. The volume of a sample of gas varies inversely with the pressure, if the temperature remains constant. The relation is strictly true only for an imaginary perfect or ideal gas, but the law is satisfactory for practical calculations except when pressures are high, or temperatures are approaching the liquefaction point. Van der Waal's equation is a refinement to take care of the inherent inaccuracy of Boyle's Law.

"BPIC."¹¹ Trademark for technical grade of tert-butyl peroxy isopropyl carbonate, a polymerization initiator for acrylic, ethylene, styrene and other monomers, and a cross-linking agent for silicone and ethylene propylene elastomers.

BPL. (1) Abbreviation for bone phosphate of lime. See bone phosphate

(2) Abbreviation for beta-propiolactone.

BPN."⁷² Trademark for phenyl-beta-naphthylamine (q.v.).

P Pyro No. 5."⁷¹ Trademark for a grade of sodium acid pyrophosphate possessing a controlled slow rate of reaction.

Derivation: Dehydration of sodium phosphate, monobasic.

Grade: F.C.C.

Uses: Leavening agent in prepared biscuit doughs; baking powder.

"BPR."⁷⁴ Trademark for insecticidal mixture containing varying proportions of pyrethrin, piperonyl butoxide and rotenone; in liquid or dust base.

Br Symbol for bromine.

BRA. Abbreviation for beta-resorcylic acid.

"Bradosol" Bromide.³⁰⁵ Trademark for domiphen bromide.

brake fluid. See hydraulic fluid.

branched chain. See chain.

bran oil. See furfural.

brasilin (brazilin; Brazilwood extract) $\text{C}_{16}\text{H}_{14}\text{O}_5$. The crystalline colorizing principle of Brazilwood. Properties: White or pale yellow rhombic needles from alcohol; turns orange in air or light. Soluble in water, alcohol, ether and in alkali hydroxide solution with a carmine-red color. Decomposes above 130°C . Uses: Dyeing red and purple shades of wood, ink, textiles, etc.; acid-base indicator, turning yellow in acid and carmine red in alkali; biological stain.

brass. Copper-zinc alloys of varying composition. Low-zinc brasses (20% or less) are resistant to stress-corrosion cracking and are easily formed. Red Brass (15% zinc) is highly corrosion-resistant. Yellow brasses contain from 34 to 37% zinc and have good ductility and high strength, and can withstand severe cold-working. Cartridge brass contains 30–33% zinc. Muntz metal (40% zinc) is primarily a hot-working alloy, used where cold-forming operations are unnecessary. Some brasses also contain low percentages of other elements, e.g., manganese, aluminum, silicon, lead, and tin (admiralty metal, naval brass).

Hazard: Flammable in powder or finely divided form. Uses: Condenser tube plates; piping; hose nozzles and couplings; marine equipment; jewelry; fine arts; stamping dies.

See also admiralty metal, aluminum brass, naval brass, red brass, yellow brass, Muntz metal, cartridge brass. For additional information refer to Copper and Brass Fabricators Council, 225 Park Ave., New York.

brassidic acid $\text{CH}_3(\text{CH}_2)_7\text{CHCH}(\text{CH}_2)_{11}\text{COOH}$. (*trans*-13-Docosenoic acid). An isomer of erucic acid.

Properties: White crystals. M.p. $61\text{--}62^\circ\text{C}$; b.p. 282°C (30 mm); sp. gr. 0.859; refractive index (n_D^{20}) 1.448. Insoluble in water; slightly soluble in alcohol; soluble in ether. Combustible.

Derivation: By treating erucic acid with nitrous acid (catalyst).

"Brazo Bonding Agent."⁶⁹ Trademark for halogenated rubber derivatives and selected modifiers in solvent.

Properties: Deep red liquid; sp. gr. 1.01 ± 0.02 ; total solids 20–22%; flash point 93°F .

Hazard: Flammable; moderate fire risk.

Uses: Cement to bond natural rubber, SBR or neoprene to steel.

Brazil wax. See carnauba wax.

brazing. A method of joining metals that involves the use of a filler metal or alloy, at above 800°F . It is an irreversible process, as the filler cannot be remelted. The filler alloys may be silver/copper/zinc ($1200\text{--}1600^\circ\text{F}$) or nickel/boron/silicon/chromium, suitable for superalloys in the range above 2000°F ; silver-cadmium alloy is also used. The filler forms an intermetallic solution with the metal being joined. See also soldering.

breeder. A particularly efficient type of nuclear reactor, now undergoing development both in the U.S. and abroad, which is able to utilize the tremendous energy latent in U-238. This cannot be exploited in

conventional nuclear reactors, which are fueled with enriched uranium or plutonium, for these eventually become depleted and must be replaced. The fuel used for the breeder reactor is a mixture of nonfissionable U-238 and plutonium-239 sealed in long, thin hexagonal metal tubes, which are in turn contained in cans called subassemblies. These constitute the reactor core. Around it are placed several layers of U-238, also in subassemblies. When criticality is reached, the neutron flux from the core permeates the entire system, and thus "breeds" fissionable U-239 (plutonium) in the surrounding U-238. The amount of fissionable material thus made available is about 100 times as great as that obtainable with a conventional reactor, since all the energy potential of the U-238 can be released. Twenty pounds of uranium has the potential of delivering about 52 million kilowatt hours of electricity; only a small fraction of this would be extractable without breeding.

The breeder utilizes fast neutrons, which are much more efficient than the slow (thermal) neutrons used in conventional reactors. Liquid sodium is the coolant in breeder reactors, as it has no retarding effect on the neutrons; 2.9 neutrons per fission are produced in the breeder, compared with only 2.4 in water-moderated reactors. It is this excess of neutrons that makes it possible for the fast breeder to produce more fuel than it consumes. A large-scale demonstration breeder is under construction at Oak Ridge, but it will be some years before breeders will produce commercial power in the U.S., though France achieved this in 1973.

breeze. Coke particles less than one-half inch in diameter. This occurs to the extent of about 100 pounds per ton of coal processed.

"Brellin."³⁴² Trademark for gibberellic acids as plant growth-stimulating compounds.

"Bretol."⁴³⁰ Trademark for cetyldimethylethyl ammonium bromide, a quaternary ammonium compound used in dental preparations and soldering fluxes.

"Brevon."⁴⁴⁸ Trademark for vinyl resin films; used for cocoon-type storage coatings.

brewing. The production of beer, ale, and malt liquors by a process involving a complex series of enzymatic reactions. The most important of these is the conversion of starch to a malt extract (wort), which in turn is fermented with yeast. Mashing is the preparation of wort from malt and cereals by enzymatic hydrolysis, after which the product is boiled with hops, which impart the characteristic taste and aroma of beer. The malt extract must contain the nutrients required for yeast growth. Mashing involves a complex interplay of chemical and enzymatic reactions that are not fully understood. Few changes have been made in the basic brewing processes for over a century; increased automatic operation and quality control techniques ensure a consistently good product. See also fermentation, yeast, wort.

Brewster process. A method for the extraction of acetic acid from the acid distillate of the destructive distillation of wood. Isopropyl ether is used as the solvent for the acetic acid. See Coahran process.

"BRH" 2 Rubber Softener.⁵⁰ Trademark for an asphaltic product.

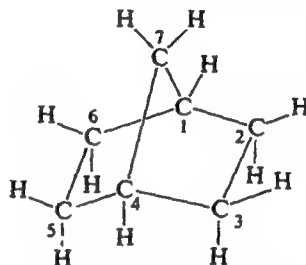

Properties: Viscous fluid; sp. gr. 1.0 (25/25°C); flash

point, 400°F; max. evaporation loss of 1% in 5 hours on heating 50 g at 163°C. Combustible.

Uses: Friction, adhesive, and electrical tapes because of excellent aging and tack characteristics; reclaiming oil for rubber scrap, especially in pan process.

brick, refractory. A highly heat-resistant and nonconductive material used for furnace linings, as in the glass and steel industries, and other applications where temperatures above 1600°C are involved. Some types are made of quartzite or high-silica clays (see firebrick), others of metallic ores such as chromite, magnesite, and zirconia. See also refractory.

bridged system. A cyclic organic compound in which more than two atoms are common to two rings. In the structure illustrated, the carbon atoms that connect the rings (1 and 4) are called bridgehead atoms. The groups of atoms that span the bridgeheads are called bridging groups, or bridges (2, 3, 5, 6, and 7).

brightener. A compound which, when added to a nickel plating formulation of the Watts type (nickel sulfate and nickel chloride in a 6 to 1 ratio, plus boric acid) will yield a bright, reflective finish. There are two types: (1) naphthalene disulfonic acids, diphenyl sulfonates, aryl sulfonamides, etc., which give bright deposits on polished surfaces; and (2) metal ions having high hydrogen overvoltage in acid solution (zinc, cadmium, selenium, etc., and unsaturated organic compounds such as thiourea, acetylene derivatives, azo dyes, etc.) which give mirror brightness as a result of their "leveling" action. Usually both types are used for maximum effectiveness. See also leveling (2); optical brightener.

bright stock. Lubricating oil of high viscosity, obtained from residues of petroleum distillation by dewaxing and treatment with fuller's earth or similar material. Sometimes also applied to viscous petroleum distillates.

Use: For blending with neutral oils in preparing automotive engine lubricating oils.

"Brij."²⁰⁶ Trademark for a series of emulsifiers and wetting agents developed for use in emulsions of high alkalinity or acidity. They are polyoxyethylene ethers of higher aliphatic alcohols. Soluble in water and lower alcohols. Insoluble in coal-tar hydrocarbons.

Brilliant Crocein (Crocein Scarlet MOO)

$C_6H_5N_2C_6H_4N_2C_{10}H_4OH(SO_3Na)_2$

Properties: Light brown powder; cherry red solution in water. C.I. 27290.

Use: To dye wool and silk red from acid solution, and cotton and paper with aid of a mordant; also used for red lakes; biological stain.

"Brilliant Toning Red."¹⁴¹ Trademark for Permanent Red 2B azo pigments derived from betahydroxynaphthoic acid.

Uses: Printing inks; paints; enamels; lacquers; rubber; plastics; wallpaper; textiles; floor coverings; crayons; paper coatings.

Brilliant Toning Red Amine. See 4-amino-2-chlorotoluene-5-sulfonic acid.

brine. Any solution of sodium chloride and water, usually containing other salts also. The most industrially important brines are (1) in subterranean wells, as in Michigan; (2) in desert lakes, such as Great Salt, Searles, Salton Sea, and Dead Sea; and (3) the ocean. These are the sources of many inorganic chemicals such as soda ash, sodium sulfate, potassium chloride, bromine, chlorine, borax, etc. Concentration range from 3% (ocean) to 20% or more.

Large areas of sand and shale containing brines under high pressure exist along the Gulf Coast; these are reported to be an important undeveloped source of natural gas and other hydrocarbons suitable for fuel or petrochemical feedstocks.

See also desalination; demineralization.

Brinell hardness. See hardness.

brisance. The shattering power of an explosive measured by the ratio of the weight of graded sand shattered when a charge of the test explosive is detonated in a standard manner to the weight of sand shattered by TNT detonated in the same manner.

britannia metal. See pewter and white metal

"Britecarb."¹⁵⁵ Trademark for carbonized nickel with the carbon completely removed from one side.

"BriteSil."⁵³¹ Trademark for a series of soluble, clarified sodium silicates, with controlled Na_2O and SiO_2 contents and densities. Available in nine grades.

"BriteSorb."⁵³¹ Trademark for a synthetic, precipitated magnesium silicate having the empirical formula $\text{MgO} \cdot 2.5\text{SiO}_2 \cdot 1.5\text{H}_2\text{O}$. A white, finely divided, free flowing powder with large surface area; insoluble in water and most organic solvents; pH (10% slurry) 9.5. Available in various particle sizes.

Uses: Purification; clarification; adsorption; catalyst base.

British Anti-Lewisite. See 2,3-dimercaptopropanol.

British thermal unit. See Btu.

"Britone Reds."¹⁴¹ Trademark for resinated type lithol reds. See "Graphic Red."

Brix degree. A measure of the density or concentration of sugar solutions. The degrees Brix equals percent by weight of sucrose in the solution and is related empirically to the specific gravity.

Broenner's acid. See 2-naphthylamine-6-sulfonic acid.

"Brom 55."²²⁵ Trademark for dibromodimethylhydantoin (q.v.).

bromacil. Generic name for 5-Bromo-3-sec-butyl-6-methyluracil, an herbicide. Substitute for some uses of 2,4,5-T, approved by EPA.

bromal. See tribromoacetaldehyde.

"Bromat."⁴³⁰ Trademark for cetyl trimethyl ammonium bromide, a quaternary ammonium compound with high germicidal activity.

bromocresol green. Tetrabromo-meta-cresolsulfonphthalein, an acid base indicator, showing color change from yellow to blue over the range pH 3.8-5.4. Yellow crystals; m.p. 218°C ; slightly soluble in water, soluble in alcohol. See also indicator.

bromocresol purple. Dibromo-ortho-cresolsulfonphthalein, an acid base indicator, changes from yellow to purple between pH 5.2-6.8. Yellow crystals; m.p. 241°C ; insoluble in water, soluble in alcohol. See also indicator.

bromelin (bromelain). A milk-clotting, protein-digesting enzyme. It is precipitated from pineapple juice with alcohol or ammonium sulfate.

Use: Biochemical research; meat-tenderizing formulations; texturizer in baking.

bromeosin. See eosin.

bromic acid HBrO_3 .

Properties: Colorless or slightly yellow liquid; turns yellow on exposure; unstable except in very dilute solution; soluble in water. Sp. gr. 3.18; b.p. decomposes at 100°C .

Derivation: Sulfuric acid is added to a solution of barium bromate and the product recovered by subsequent distillation and absorption in water.

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

Uses: Dyes; intermediates; pharmaceuticals.

brominated camphor. See camphor bromate.

bromine. Nonmetallic, halogen element of atomic number 35, group VIIA of the Periodic Table. Atomic weight 79.904. Valences 1, 3, 5 (valence of 7 also reported). There are two stable isotopes.

Properties: Dark, reddish-brown liquid; irritating fumes. Soluble in common organic solvents; very slightly soluble in water. Attacks most metals, including platinum and palladium; aluminum reacts vigorously, and potassium explosively. Dry bromine does not attack lead, nickel, magnesium, tantalum, iron, zinc, and sodium (the latter below 300°C). B.p. 58.8°C ; m.p. -7.3°C ; sp. gr. (20/4°) 3.11; vapor density (air = 1) 3.5; wt. per gal 25.7 lb; specific heat 0.107 cal/gram; refractive index 1.647; dielectric constant 3.2.

Derivation: From sea water and natural brines by oxidation of bromine salts with chlorine; solar evaporation (Great Salt Lake); from salt beds at Stassfurt; Dead Sea.

Method of purification: Distillation.

Grades: Technical; C.P.; 99.8%; 99.95%.

Containers: Bottles; drums; tank cars; tank trucks.

Hazard: Highly toxic; severe skin irritant. Tolerance, 0.1 ppm in air; 0.7 mg per cubic meter of air. Strong oxidizing agent; may ignite combustible materials on contact. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of ethylene dibromide (antiknock gasoline); organic synthesis; bleaching; water purification; solvent; intermediate for fumigants (methyl bromide); fire-extinguishing fluid; analytical reagent; fire-retardant for plastics; dyes; pharmaceuticals; photography; shrink-proofing wool.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

bromine azide (bromoazide). BrN_3 .

Properties: Crystals or red liquid. M.p. approx. 45°C ; b.p. explodes! A strong oxidizing agent.

Hazard: Toxic; explosive when heated or shocked. Will ignite combustible materials on contact.

Uses: Detonators and other explosive devices.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

bromine-chloride (chlorine-bromide) BrCl .

Properties: Reddish-yellow, mobile liquid. M.p. -66°C ; decomposes with evolution of chlorine at 10°C . Soluble in carbon disulfide, ether, water.

Hazard: Highly toxic; irritant. A powerful oxidizer; reacts vigorously with combustible materials.
Use: Industrial disinfectant.

bromine cyanide. See cyanogen bromide.

bromine iodide. See iodine monobromide.

bromine pentafluoride BrF_5 .

Properties: Colorless liquid; sp. gr. 2.466 (25°C); m.p. -51°C; b.p. 40.5°C; vapor pressure (70°F) 7 psia; decomposes in water. Reacts with every known element except inert gases, nitrogen and oxygen.

Derivation: By reacting bromine diluted with nitrogen with fluorine in a copper vessel at 200°C.

Grade: 98% min.

Containers: Cylinders.

Hazard: Highly toxic; corrosive to skin and tissue. Tolerance, 0.1 ppm in air. Explodes on contact with water.

Uses: Synthesis; oxidizer in liquid rocket propellants. **Shipping regulations:** (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

bromine trifluoride BrF_3 .

Properties: Colorless liquid; sp. gr. (135°C) 2.49; m.p. 9°C; b.p. 135°C; vapor pressure (70°F) 0.15 psia; decomposed violently by water.

Derivation: See bromine pentafluoride.

Grade: 98% min.

Containers: Cylinders.

Hazard: Highly toxic; corrosive to skin. Extremely reactive and dangerous. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Fluorinating agent; electrolytic solvent.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Brominex."¹⁵² Trademark for a series of technical grade brominated oils. Bromine content ranges from 20 to 45%.

"Brominol"¹⁵³ Trademark for a brominated olive oil used to adjust specific gravity of citrus oils to provide cloud in beverages.

bromisovalum. See bromoisovaleryl urea.

N-bromoacetamide (NBA) CH_3CONHBr .

Properties: White powder with bromine odor. M.p. 105-108°C. Contains about 57% active bromine; decomposes appreciably above 80°F.

Containers: Glass bottles; polyethylene-lined fiber drums.

Hazard: Emits toxic fumes of bromine on heating.

Uses: Brominating and oxidizing agent in organic synthesis.

bromoacetic acid CH_2BrCOOH .

Properties: Colorless, deliquescent crystals. Keep from air and moisture. Soluble in water, alcohol and ether. M.p. 51°C; b.p. 208°C; sp. gr. 1.93.

Derivation: By heating acetic acid and bromine.

Hazard: Strong irritant to skin and tissue.

Uses: Organic synthesis; abscission of citrus fruit in harvesting.

Shipping regulations: (Air) Corrosive label (solid and solution).

bromoacetone $\text{CH}_3\text{BrCOCH}_3$.

Properties: Colorless liquid when pure; rapidly becomes violet even in absence of air. Soluble in acetone, alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 1.631 at 0°C; b.p. 136°C (partial de-

composition); m.p. -54°C; vapor density 4.75; vapor tension 9 mm (20°C).

Derivation: By treating aqueous acetone with bromine and sodium chlorate at 30-40°C.

Grades: Technical.

Containers: Lead-lined cylinders.

Hazard: Highly toxic by inhalation and skin contact.

A lachrymating gas; strong irritant.

Uses: Organic synthesis; tear gas.

Shipping regulations: (Rail) Poison gas label; not accepted by rail express. (Air) Not acceptable.

bromoacetone cyanohydrin $\text{CH}_2\text{BrC(OH)(CN)CH}_3$.

Properties: Colorless liquid. Soluble in alcohol, ether, and water. Sp. gr. 1.584 at 13°C; b.p. 94.5°C (5 mm).

Derivation: Interaction of bromoacetone and hydrocyanic acid at (approximate) 0°C.

Hazard: May be toxic.

Use: Organic synthesis.

5-(2-bromoallyl)-5-sec-butylbarbituric acid. See butalylonal.

bromoallylene. See allyl bromide.

bromauric acid (gold tribromide, acid)

$\text{HAuBr}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Dark, red-brown needle crystals or granular masses; odorless; metallic and acid taste. Stable in air if pure but deliquescent if chloride is present. Soluble in water and alcohol. M.p. 27°C.

Derivation: By dissolving auric bromide in hydrobromic acid, concentrating and crystallizing.

para-bromobenzaldehyde $\text{BrC}_6\text{H}_4\text{CHO}$. Solid; m.p. 58°C. Used as a chemical intermediate.

bromobenzene (phenyl bromide) $\text{C}_6\text{H}_5\text{Br}$.

Properties: Heavy, mobile, colorless liquid. Pungent odor. Sp. gr. 1.499 (15°C); wt/gal 12.51 lb; b.p. 156.6°C; freezing point -30.5°C, flash point 124°F; refractive index 1.5625. Miscible with most organic solvents; insoluble in water. Autoignition temp. 1051°F. Combustible.

Derivation: Bromination of benzene in presence of iron.

Grades: Technical; pure.

Hazard: Moderate fire risk. Skin irritant.

Uses: Solvent; motor fuels; top-cylinder compounds; crystallizing solvent; organic synthesis.

para-bromobenzenesulfonic acid $\text{BrC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: Crystallizes in needles. M.p. 102-103°C; b.p. 155°C (25 mm); soluble in hot water and hot alcohol.

para-bromobenzoic acid $\text{C}_6\text{H}_4\text{BrCOOH}$.

Properties: Colorless or reddish crystals. Soluble in alcohol and ether; very slightly soluble in water. M.p. 254°C.

Derivation: From para-bromotoluene by oxidation.

Use: Organic synthesis; detection of strontium.

ortho-bromobenzyl cyanide (ortho-bromophenylacetonitrile; 2-bromo-alpha-cyanotoluene) $\text{BrC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless liquid; sp. gr. 1.519; m.p. 25.5°C; b.p. 242°C (decomposes). Nonflammable.

Hazard: Strong lachrymator; irritant to tissue.

Shipping regulations: (Rail) Tear gas label. (Air) Poison label. Not acceptable on passenger planes.

1-bromobutane. See n-butyl bromide.

2-bromobutane. See sec-butyl bromide.

5-bromo-3-sec-butyl-6-methyluracil. See bromacil.

Uses: Printing inks; paints; enamels; lacquers; rubber; plastics; wallpaper; textiles; floor coverings; crayons; paper coatings.

Brilliant Toning Red Amine. See 4-amino-2-chlorotoluene-5-sulfonic acid.

brine. Any solution of sodium chloride and water, usually containing other salts also. The most industrially important brines are (1) in subterranean wells, as in Michigan; (2) in desert lakes, such as Great Salt, Searles, Salton Sea, and Dead Sea; and (3) the ocean. These are the sources of many inorganic chemicals such as soda ash, sodium sulfate, potassium chloride, bromine, chlorine, borax, etc. Concentration range from 3% (ocean) to 20% or more.

Large areas of sand and shale containing brines under high pressure exist along the Gulf Coast; these are reported to be an important undeveloped source of natural gas and other hydrocarbons suitable for fuel or petrochemical feedstocks.

See also desalination; demineralization.

Brinell hardness. See hardness.

brisance. The shattering power of an explosive measured by the ratio of the weight of graded sand shattered when a charge of the test explosive is detonated in a standard manner to the weight of sand shattered by TNT detonated in the same manner.

britannia metal. See pewter and white metal

"Britecarb."¹⁵⁵ Trademark for carbonized nickel with the carbon completely removed from one side.

"BriteSil."⁵³¹ Trademark for a series of soluble, clarified sodium silicates, with controlled Na₂O and SiO₂ contents and densities. Available in nine grades.

"BriteSorb."⁵³¹ Trademark for a synthetic, precipitated magnesium silicate having the empirical formula MgO · 2.5SiO₂ · 1.5H₂O. A white, finely divided, free flowing powder with large surface area; insoluble in water and most organic solvents; pH (10% slurry) 9.5. Available in various particle sizes.

Uses: Purification; clarification; adsorption; catalyst base.

British Anti-Lewisite. See 2,3-dimercaptopropanol.

British thermal unit. See Btu.

"Britone Reds."¹⁴¹ Trademark for resinated type lithol reds. See "Graphic Red."

Brix degree. A measure of the density or concentration of sugar solutions. The degrees Brix equals percent by weight of sucrose in the solution and is related empirically to the specific gravity.

Broenner's acid. See 2-naphthylamine-6-sulfonic acid.

"Brom 55."²²⁵ Trademark for dibromodimethylhydantoin (q.v.).

bromacil. Generic name for 5-Bromo-3-sec-butyl-6-methyluracil, an herbicide. Substitute for some uses of 2,4,5-T, approved by EPA.

bromal. See tribromoacetaldehyde.

"Bromat."⁴³⁰ Trademark for cetyl trimethyl ammonium bromide, a quaternary ammonium compound with high germicidal activity.

bromocresol green. Tetrabromo-meta-cresolsulfonphthalein, an acid base indicator, showing color change from yellow to blue over the range pH 3.8-5.4. Yellow crystals; m.p. 218°C; slightly soluble in water, soluble in alcohol. See also indicator.

bromocresol purple. Dibromo-ortho-cresolsulfonphthalein, an acid base indicator, changes from yellow to purple between pH 5.2-6.8. Yellow crystals; m.p. 241°C; insoluble in water, soluble in alcohol. See also indicator.

bromelin (bromelain). A milk-clotting, protein-digesting enzyme. It is precipitated from pineapple juice with alcohol or ammonium sulfate.

Use: Biochemical research; meat-tenderizing formulations; texturizer in baking.

bromeosin. See eosin.

bromic acid HBrO₃.

Properties: Colorless or slightly yellow liquid; turns yellow on exposure; unstable except in very dilute solution; soluble in water. Sp. gr. 3.18; b.p. decomposes at 100°C.

Derivation: Sulfuric acid is added to a solution of barium bromate and the product recovered by subsequent distillation and absorption in water.

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

Uses: Dyes; intermediates; pharmaceuticals.

brominated camphor. See camphor bromate.

bromine. Nonmetallic, halogen element of atomic number 35, group VIIA of the Periodic Table. Atomic weight 79.904. Valences 1, 3, 5 (valence of 7 also reported). There are two stable isotopes.

Properties: Dark, reddish-brown liquid; irritating fumes. Soluble in common organic solvents; very slightly soluble in water. Attacks most metals, including platinum and palladium; aluminum reacts vigorously, and potassium explosively. Dry bromine does not attack lead, nickel, magnesium, tantalum, iron, zinc, and sodium (the latter below 300°C). B.p. 58.8°C; m.p. -7.3°C; sp. gr. (20/4°) 3.11; vapor density (air = 1) 3.5; wt. per gal 25.7 lb; specific heat 0.107 cal/gram; refractive index 1.647; dielectric constant 3.2.

Derivation: From sea water and natural brines by oxidation of bromine salts with chlorine; solar evaporation (Great Salt Lake); from salt beds at Stassfurt; Dead Sea.

Method of purification: Distillation.

Grades: Technical; C.P.; 99.8%; 99.95%.

Containers: Bottles; drums; tank cars; tank trucks.

Hazard: Highly toxic; severe skin irritant. Tolerance, 0.1 ppm in air; 0.7 mg per cubic meter of air. Strong oxidizing agent; may ignite combustible materials on contact. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of ethylene dibromide (antiknock gasoline); organic synthesis; bleaching; water purification; solvent; intermediate for fumigants (methyl bromide); fire-extinguishing fluid; analytical reagent; fire-retardant for plastics; dyes; pharmaceuticals; photography; shrink-proofing wool.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

bromine azide (bromoazide). BrN₃.

Properties: Crystals or red liquid. M.p. approx. 45°C; b.p. explodes! A strong oxidizing agent.

Hazard: Toxic; explosive when heated or shocked. Will ignite combustible materials on contact.

Uses: Detonators and other explosive devices.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

bromine-chloride (chlorine-bromide) BrCl.

Properties: Reddish-yellow, mobile liquid. M.p. -66°C; decomposes with evolution of chlorine at 10°C. Soluble in carbon disulfide, ether, water

Hazard: Highly toxic; irritant. A powerful oxidizer; reacts vigorously with combustible materials.

Use: Industrial disinfectant.

bromine cyanide. See cyanogen bromide.

bromine iodide. See iodine monobromide.

bromine pentafluoride BrF_5 .

Properties: Colorless liquid; sp. gr. 2.466 (25°C); m.p. -51°C; b.p. 40.5°C; vapor pressure (70°F) 7 psia; decomposes in water. Reacts with every known element except inert gases, nitrogen and oxygen.

Derivation: By reacting bromine diluted with nitrogen with fluorine in a copper vessel at 200°C.

Grade: 98% min.

Containers: Cylinders.

Hazard: Highly toxic; corrosive to skin and tissue. Tolerance, 0.1 ppm in air. Explodes on contact with water.

Uses: Synthesis; oxidizer in liquid rocket propellants.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

bromine trifluoride BrF_3 .

Properties: Colorless liquid; sp. gr. (135°C) 2.49; m.p. 9°C; b.p. 135°C; vapor pressure (70°F) 0.15 psia; decomposed violently by water.

Derivation: See bromine pentafluoride.

Grade: 98% min.

Containers: Cylinders.

Hazard: Highly toxic; corrosive to skin. Extremely reactive and dangerous. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Fluorinating agent; electrolytic solvent.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Brominex."¹⁵² Trademark for a series of technical grade brominated oils. Bromine content ranges from 20 to 45%.

"Brominol"³ Trademark for a brominated olive oil used to adjust specific gravity of citrus oils to provide cloud in beverages.

bromisovalum. See bromoisovaleryl urea.

N-bromoacetamide (NBA) CH_3CONHBr .

Properties: White powder with bromine odor. M.p. 105-108°C. Contains about 57% active bromine; decomposes appreciably above 80°F.

Containers: Glass bottles; polyethylene-lined fiber drums.

Hazard: Emits toxic fumes of bromine on heating.

Uses: Brominating and oxidizing agent in organic synthesis.

bromoacetic acid CH_2BrCOOH .

Properties: Colorless, deliquescent crystals. Keep from air and moisture. Soluble in water, alcohol and ether. M.p. 51°C; b.p. 208°C; sp. gr. 1.93.

Derivation: By heating acetic acid and bromine.

Hazard: Strong irritant to skin and tissue.

Uses: Organic synthesis; abscission of citrus fruit in harvesting.

Shipping regulations: (Air) Corrosive label (solid and solution).

bromoacetone $\text{CH}_2\text{BrCOCH}_3$.

Properties: Colorless liquid when pure; rapidly becomes violet even in absence of air. Soluble in acetone, alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 1.631 at 0°C; b.p. 136°C (partial de-

composition); m.p. -54°C; vapor density 4.75; vapor tension 9 mm (20°C).

Derivation: By treating aqueous acetone with bromine and sodium chlorate at 30-40°C.

Grades: Technical.

Containers: Lead-lined cylinders.

Hazard: Highly toxic by inhalation and skin contact.

A lachrymating gas; strong irritant.

Uses: Organic synthesis; tear gas.

Shipping regulations: (Rail) Poison gas label; not accepted by rail express. (Air) Not acceptable.

bromoacetone cyanohydrin $\text{CH}_2\text{BrC(OH)(CN)CH}_3$.

Properties: Colorless liquid. Soluble in alcohol, ether, and water. Sp. gr. 1.584 at 13°C; b.p. 94.5°C (5 mm).

Derivation: Interaction of bromoacetone and hydrocyanic acid at (approximate) 0°C.

Hazard: May be toxic.

Use: Organic synthesis.

5-(2-bromoallyl)-5-sec-butylbarbituric acid. See butalylonal.

bromoallylene. See allyl bromide.

bromauric acid (gold tribromide, acid)

$\text{HAuBr}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Dark, red-brown needle crystals or granular masses; odorless; metallic and acid taste. Stable in air if pure but deliquescent if chloride is present. Soluble in water and alcohol. M.p. 27°C.

Derivation: By dissolving auric bromide in hydrobromic acid, concentrating and crystallizing.

para-bromobenzaldehyde $\text{BrC}_6\text{H}_4\text{CHO}$. Solid; m.p. 58°C. Used as a chemical intermediate.

bromobenzene (phenyl bromide) $\text{C}_6\text{H}_5\text{Br}$.

Properties: Heavy, mobile, colorless liquid. Pungent odor. Sp. gr. 1.499 (15°C); wt/gal 12.51 lb; b.p. 156.6°C; freezing point -30.5°C, flash point 124°F; refractive index 1.5625. Miscible with most organic solvents; insoluble in water. Autoignition temp. 1051°F. Combustible.

Derivation: Bromination of benzene in presence of iron.

Grades: Technical; pure.

Hazard: Moderate fire risk. Skin irritant.

Uses: Solvent; motor fuels; top-cylinder compounds; crystallizing solvent; organic synthesis.

para-bromobenzenesulfonic acid $\text{BrC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: Crystallizes in needles. M.p. 102-103°C; b.p. 155°C (25 mm); soluble in hot water and hot alcohol.

para-bromobenzoic acid $\text{C}_6\text{H}_4\text{BrCOOH}$.

Properties: Colorless or reddish crystals. Soluble in alcohol and ether; very slightly soluble in water. M.p. 254°C.

Derivation: From para-bromotoluene by oxidation.

Use: Organic synthesis; detection of strontium.

ortho-bromobenzyl cyanide (ortho-bromophenylacetone nitrile; 2-bromo-alpha-cyanotoluene) $\text{BrC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless liquid; sp. gr. 1.519; m.p. 25.5°C; b.p. 242°C (decomposes). Nonflammable.

Hazard: Strong lachrymator; irritant to tissue.

Shipping regulations: (Rail) Tear gas label. (Air) Poison label. Not acceptable on passenger planes.

1-bromobutane. See n-butyl bromide.

2-bromobutane. See sec-butyl bromide.

5-bromo-3-sec-butyl-6-methyluracil. See bromacil.

alpha-bromobutyric acid $\text{CH}_3\text{CH}_2\text{CHBrCOOH}$.

Properties: Clear, colorless, oily liquid. Soluble in alcohol and ether; sparingly soluble in water. Sp. gr. 1.54; b.p. 181°C at 250 mm, $214\text{--}217^\circ\text{C}$ with decomposition; m.p. -4°C . Combustible.

Derivation: By heating bromine and butyric acid.

Use: Organic synthesis.

bromocarnallite. An artificial carnallite (q.v.) in which chlorine is replaced by bromine.

3-bromo-1-chloro-5,5-dimethylhydantoin

$\text{BrCl}(\text{CH}_3)_2\text{C}_3\text{N}_2\text{O}_2$.

Properties: Free-flowing white powder; faint halogen odor; m.p. $163\text{--}164^\circ\text{C}$; soluble in benzene, methylene dichloride, chloroform. Active bromine, 33% min; active chlorine, 14% min.

Hazard: May be toxic. See bromine, chlorine.

Uses: Germicide and fungicide in treatment of water; disinfectant; halogenating agent; catalyst of ionic type; selective oxidant.

sym-bromochloroethane (ethylene chlorobromide)

$\text{CH}_2\text{BrCH}_2\text{Cl}$.

Properties: Colorless, volatile liquid. Chloroform-like odor; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.70; b.p. $107\text{--}108^\circ\text{C}$; wt/gal 14.9 lb (0°C); f.p. -16.6°C . Nonflammable.

Derivation: By action of bromine and chlorine on ethylene gas.

Hazard: Avoid inhalation of fumes.

Uses: Solvent, especially for cellulose esters and ethers; organic synthesis; fumigant for fruits and vegetables.

bromochloromethane (methylene chlorobromide)

BrCH_2Cl .

Properties: Clear, colorless, volatile liquid with chloroform-like odor; sp. gr. 1.93 (25°C); b.p. 67°C ; m.p. -86.5°C ; refractive index (n 25/D) 1.48. Nonflammable. Soluble in organic solvents; insoluble in water.

Containers: Drums; tankcars.

Hazard: Avoid inhalation of fumes.

Uses: Fire extinguishers; organic synthesis.

1-bromo-3-chloropropane (trimethylene chlorobromide)

$\text{BrCH}_2\text{CH}_2\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. Freezing point below -50°C ; b.p. $143\text{--}145^\circ\text{C}$; sp. gr. 1.594 ($25/25^\circ\text{C}$); lb/gal 13.27 (25°C); refractive index 1.484 (n 25/D). Insoluble in water. Soluble in methanol and ether. Nonflammable.

Hazard: Avoid inhalation of fumes.

Uses: Organic synthesis; pharmaceuticals.

2-bromo-2-chloro-1,1,1-trifluoroethane. See halothane.**2-bromo-alpha-cyanotoluene.** See bromobenzyl cyanide.**bromocyclopentane.** See cyclopentyl bromide.**bromodiethylacetylurea** (carbromal)

$\text{C}(\text{C}_2\text{H}_5)_2\text{BrCONHCONH}_2$.

Properties: White, crystalline powder; odorless; tasteless. Soluble in chloroform, ether, alcohol, concentrated mineral acids and alkali hydroxide solutions; almost insoluble in cold water; slightly soluble in hot water. M.p. $116\text{--}117^\circ\text{C}$.

Use: Medicine.

1-bromododecane. See lauryl bromide.**bromoethane.** See ethyl bromide.**2-bromoethyl alcohol.** See ethylene bromohydrin.**2-bromoethylamine hydrobromide**

$\text{BrCH}_2\text{CH}_2\text{NH}_2 \cdot \text{HBr}$.

Uses: Intermediate; suggested as a soldering flux.

bromoethyl chlorosulfonate $\text{BrCH}_2\text{CH}_2\text{OSO}_2\text{Cl}$.

Properties: Liquid. B.p. $100\text{--}105^\circ\text{C}$ (18 mm).

Derivation: Interaction of sulfonyl chloride and glycol bromohydrin.

Hazard: Irritant to skin and tissue.

para-bromofluorobenzene $\text{C}_6\text{H}_4\text{BrF}$.

Properties: Colorless liquid; b.p. $151\text{--}152^\circ\text{C}$; freezing point -17.4°C ; sp. gr. (15°C) 1.593; refractive index (n 25/D) 1.5245; insoluble in water.

Uses: Intermediate; production of para-fluorophenol.

bromoform (tribromomethane; methyl tribromide) CHBr_3 .

Properties: Colorless, heavy liquid; odor and taste similar to those of chloroform. Soluble in alcohol, ether, chloroform, benzene, solvent naphtha, fixed and volatile oils; slightly soluble in water. Sp. gr. 2.887; m.p. 9°C ; b.p. 151.2°C ; wt/gal 24 lb; boiling range $150.3\text{--}151.2^\circ\text{C}$; freezing point 9°C ; surface tension 41.53 dynes/cm (20°C); dielectric constant 4.5 (20°C). Refractive index 1.6005. Nonflammable.

Derivation: By heating acetone or ethyl alcohol with bromine and alkali hydroxide, and recovery by distillation. (Similar to acetone process for chloroform.)

Grades: Technical; pharmaceutical; spectrophotometric.

Hazard: Toxic by ingestion, inhalation and skin absorption. Tolerance, 0.5 ppm in air.

Uses: Intermediate in organic synthesis; geological assaying; solvent for waxes, greases, and oils.

"Bromofume."⁸⁸ Trademark for a soil fumigant composition, consisting of ethylene dibromide in volatile solvent.

Use: Control of wireworms and rootknot nematodes.

1-bromohexane. See n-hexyl bromide.**2-bromoisovaleryl urea** (bromisovalum)

$(\text{CH}_3)_2\text{CHCHBrCONHCONH}_2$.

Properties: White needles; slightly bitter in taste. Soluble in hot water, alcohol, and ether. M.p. $147\text{--}149^\circ\text{C}$.

Use: Medicine.

bromol (2,4,6-tribromophenol) $\text{C}_6\text{H}_2\text{Br}_3\text{OH}$.

Properties: Soft, white needles; sweet taste; penetrating bromine odor. Soluble in alcohol, chloroform, ether, and caustic alkaline solutions; almost insoluble in water. M.p. 96°C , sublimes; sp. gr. 2.55 ($20/20^\circ\text{C}$); b.p. 244°C .

Derivation: Action of bromine on phenol.

Hazard: May be toxic.

bromomethane. See methyl bromide.**bromomethylethyl ketone** $\text{BrCH}_2\text{COC}_2\text{H}_5$.

Properties: Colorless to pale-yellowish liquid. Affected by light. Soluble in alcohol, benzene, ether; insoluble in water. Sp. gr. 1.43; b.p. $145\text{--}146^\circ\text{C}$ (decomposes).

Derivation: Interaction of sodium bromide and methyl ethyl ketone in the presence of sodium chlorate.

Hazard: May be irritant to skin and eyes.

Uses: Organic synthesis.

alpha-bromonaphthalene $\text{C}_{10}\text{H}_7\text{Br}$.

Properties: Colorless, thick liquid; pungent odor; sp. gr. 1.4870; m.p. 6.2°C ; b.p. 279°C ; refractive index 1.6601; soluble in alcohol, ether, and benzene; slightly soluble in water.

Derivation: Bromination of naphthalene.

Uses: Organic synthesis; microscopy; refractometry.

1-bromo-2-naphthol $\text{BrC}_{10}\text{H}_6\text{OH}$. Solid; m.p. 121–125°C. Used as a dye intermediate.

2-bromopentane $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHBrCH}_3$.

Properties: Colorless to yellow liquid; strong odor. Sp. gr. 1.1850 (25/25°C).

para-bromophenol $\text{HO}(\text{C}_6\text{H}_4)\text{Br}$.

Properties: Crystals; sp. gr. 1.840 (15°C), 1.5875 (80°C); m.p. 64°C; b.p. 238°C, slightly soluble in water; soluble in alcohol, chloroform, ether, and glacial acetic acid. Used as a disinfectant.

bromophenol blue. Tetrabromophenolsulfonphthalein, an acid-base indicator, showing color change from yellow to purple over the range pH 3.0 to 4.6.

ortho-bromophenylacetonitrile. See bromobenzyl cyanide.

2-bromo-4-phenylphenol $\text{C}_6\text{H}_5\text{C}_6\text{H}_3\text{BrOH}$.

Properties: Light-colored solid with faint characteristic odor; sp. gr. (25/4°C) 1.536; m.p. 93.6–95.6°C; flash point 207°C; b.p. with decomposition (18 mm) 195–200°C. Soluble in alkalis, most organic solvents; insoluble in water. Combustible.

Hazard: May be toxic by ingestion and inhalation.

Use: Germicide.

bromophosgene (carbonyl bromide; carbon oxybromide) COBr_2 .

Properties: Heavy, colorless liquid. Strong odor. Hydrolyzed by water and is decomposed by light and heat. Sp. gr. 2.5 (approx.) (15°C); b.p. 64–65°C.

Derivation: Action of sulfuric acid on carbon tetrabromide.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Military poison gas (toxic suffocant); making crystal violet-type coloring agents.

Shipping regulations: (Rail) Poison gas label. Not accepted by express. (Air) Not acceptable.

bromopicrin (nitrobromoform; tribromonitromethane) CBr_3NO_2 .

Properties: Prismatic crystals; decomposes with explosive violence if heated rapidly. Soluble in alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 2.79 at 18°C; b.p. 127°C (118 mm Hg); m.p. 103°C.

Derivation: Action of picric acid on an aqueous solution of bromine and calcium oxide, followed by distillation under reduced pressure.

Hazard: Highly toxic; powerful irritant. Severe explosion hazard when heated.

Uses: Organic synthesis; military poison gas.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

3-bromopropene. See allyl bromide.

alpha-bromopropionic acid (2-bromopropionic acid) $\text{CH}_3\text{CHBrCOOH}$.

Properties: Colorless liquid. Sp. gr. 1.69; m.p. 24.5°C; b.p. 203°C, with decomposition; soluble in water, alcohol, and ether. Probably low toxicity.

Derivation: By heating propionic acid with bromine.

Method of purification: Distillation.

3-bromo-1-propyne. See propargyl bromide.

2-bromopyridine $\text{C}_5\text{H}_4\text{NBr}$.

Properties: Liquid; b.p. 195°C; sp. gr. 1.627 (20°C); refractive index 1.5714 (n 20/D); solubility in 100 g water 2.08 (20°C). Probably low toxicity.

Use: Synthesis of pyridine compounds.

3-bromopyridine $\text{C}_5\text{H}_4\text{NBr}$.

Properties: Needles; b.p. 174.4°C; sp. gr. 1.628 (20/20°C); refractive index 1.5710 (n 20/D). Difficulty soluble in water, readily soluble in common organic solvents. Probably low toxicity.

5-bromosalicylhydroxamic acid

$\text{BrC}_6\text{H}_3(\text{OH})\text{CONHOH}$. Crystals; decomposes at 232°C. Very sparingly soluble in water; forms a water-soluble sodium salt. Used in medicine.

beta-bromostyrene (bromostyrol) $\text{C}_6\text{H}_5\text{CHCHBr}$.

Properties: Yellowish liquid; strong floral odor. Soluble in 4 volumes of 90% alcohol. Sp. gr. 1.395–1.424; refractive index 1.602–1.608; m.p., min –2°C.

Use: Perfumery.

bromosuccinic acid $\text{HOOCCH}_2\text{CHBrCOOH}$.

Properties: Colorless crystals; sp. gr. 2.073; m.p. 159–161°C; soluble in water and alcohol; insoluble in ether.

Derivation: By heating bromine and succinic acid.

Use: Organic synthesis.

Note: The above are the properties of the *dl* form. Optically active forms are also known.

N-bromosuccinimide (NBS) $(\text{CH}_2\text{CO})_2\text{NBr}$.

Properties: Fine crystals, white to cream in color; melting range 172–178°C (decomposes). Soluble in carbon tetrachloride; 44.5% min. active bromine.

Hazard: Respirators should be used in handling dry material, which evolves toxic fumes of bromine.

Use: For controlled low-energy bromination.

4-bromothiophenol $\text{BrC}_4\text{H}_4\text{SH}$.

Properties: White solid; f.p. 73°C; b.p. 239°C; almost insoluble in water; soluble in methanol, alkaline solutions (with which it reacts).

Hazard: May be toxic by ingestion.

Use: Intermediate.

bromothymol blue. Dibromothymolsulfonphthalein, an acid-base indicator, showing color change from yellow to blue over the range pH 6.0–7.6.

alpha-bromotoluene. See benzyl bromide.

para-bromotoluene (*p*-tolyl bromide). $\text{BrC}_6\text{H}_4\text{CH}_3$.

Properties: Crystals; m.p. 28.5°C; b.p. 184–185°C; sp. gr. 1.3898 (20°C); refractive index 1.5490; flash point 185°F. Combustible. Insoluble in water, soluble in alcohol, ether and benzene.

Hazard: May be toxic by ingestion.

Use: Intermediate.

bromotrichloromethane (trichlorobromomethane)

CCl_3Br .

Properties: Colorless heavy liquid with chloroform-like odor. Miscible with many organic liquids; sp. gr. 2.0; b.p. 104°C; n 20/D 1.5051.

Hazard: Moderately toxic by ingestion and inhalation of fumes.

Use: Organic synthesis.

bromotrifluoroethylene (BFE) BrFC:CF_2 . Gas (monomer) or liquid (polymer). The latter are usually clear oils at room temperature and noncracking solids at –65°F. Viscosities and densities vary widely.

Monomer: High purity gas (97%). Shipped in cylinders.

Hazard: Flammable (gas or liquid); dangerous fire risk.

Uses (BFE polymers): Flotation fluids for gyros or accelerometers used in inertial guidance systems. BFE polymers can also be used like CFE polymers.

Shipping regulations: (Rail) Compressed gases, n.o.s., Red label. (Air) Flammable Gas label. Not acceptable on passenger planes.

bromotrifluoromethane CBrF_3 .

Properties: Colorless gas; noncorrosive, nontoxic, non-flammable; f.p. -168°C ; b.p. -58°C ; density at b.p. 8.71 grams/liter.

Derivation: Bromination of fluoroform or perfluoropropane in nonmetallic reactor.

Uses: Chemical intermediate; refrigerant; metal hardening; fire extinguishment.

Shipping regulations: (Air) Nonflammable compressed gas label. (Rail) Compressed gases, n.o.s., Green label.

bromopheniramine maleate (2-[para-bromo-alpha-(2-dimethylaminoethyl)benzyl]pyridine bimalate)
 $\text{C}_{16}\text{H}_{19}\text{BrN}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$.

Properties: Crystals. Rather soluble in water; less soluble in alcohol; m.p. $130\text{--}135^\circ\text{C}$.

Grade: N.F.

Use: Medicine.

"Bromsulphalein."³⁴⁸ Trademark for sodium sulfobromophthalein (q.v.).

"Bromural."⁹ Trademark for bromoisovalerylurea (bromisovalum).

"Bromvegol."³⁴² Trademark for brominated vegetable oils used for weighting soft-drink emulsions.

bronze. An alloy of copper and tin, usually containing from 1 to 10% tin; special types contain from 5 to 10% aluminum (aluminum bronze); fractional percentages of phosphorus (phosphor bronze) as deoxidizer; or low percentages of silicon (silicon bronze).

Hazard: Powder is flammable.

Uses: Spark-resistant tools; springs; fourdrinier wire; paint; cosmetics (as powder); electrical hardware; architecture; fine arts.

See also brass; phosphor bronze.

bronze blue. Any of a number of varieties of iron-blue pigments (q.v.).

bronze orange. See red lake C.

bronzing liquid.

(1) A solution of pyroxylin in amyl acetate together with a bronze powder, usually aluminum bronze.

(2) Gloss oils and aluminum bronze.

(3) Spirit varnishes and aluminum bronze.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

brosylate ester. An ester of para-bromobenzenesulfonic acid.

Brownian movement. The continuous zigzag motion of the particles in a colloidal suspension, visible in an optical microscope. The motion is caused by impact of the molecules of the liquid upon the colloidal particles. Named after the British botanist Robert Brown who first noted this phenomenon.

browning reaction (Maillard reaction). A complicated and not completely evaluated sequence of chemical changes occurring without the involvement of enzymes during heat exposure of foods containing carbohydrates (usually sugars) and proteins, as well as during storage. It is responsible for the surface color change of bakery products and meats. It begins with an aldol condensation reaction involving the carbonyl groups of the carbohydrates and the amino groups of the proteins, and ends with formation of furfural, which produces the dark brown coloration.

Besides color change, the reaction is accompanied by alterations in flavor and texture, as well as in nutritive value. It was first noted by the French chemist Maillard.

"Brozone."²³³ Trademark for a liquid formulation of methyl bromide in solvent; used as soil fumigant to control weeds, nematodes and fungi.
Hazard: See methyl bromide.

brucine (dimethoxystyrychnine) $\text{C}_{23}\text{H}_{26}\text{O}_4\text{N}_2 \cdot 2\text{H}_2\text{O}$ or $4\text{H}_2\text{O}$.

Properties: White crystalline alkaloid. Very bitter taste; loses water at 100°C ; m.p. 178°C . Soluble in alcohol, chloroform, and benzene; slightly soluble in water, ether, glycerin, and ethyl acetate. Forms brucine sulfate, hydrochloride, and nitrate (m.p. 230°C). Also available as the sulfate.

Derivation: By extraction and subsequent crystallization from nux vomica or ignatia seeds.

Hazard: Highly toxic by ingestion and inhalation.

Use: Medicine; denaturing alcohol; lubricant additive; separation of racemic mixtures.

Shipping regulations: (Rail, Air) Poison label.

brucite $\text{Mg}(\text{OH})_2$. Natural magnesium hydroxide.

Properties: Color white, gray, greenish; luster pearly or waxy. Sp. gr. 2.39; Mohs hardness 2.5.

Occurrence: Nevada, Washington; Canada.

Uses: Refractories.

"Brush-Blitz."⁵⁸ Trademark for a highly concentrated formulation of 88% isooctyl ester of 2,4,5-trichlorophenoxyacetic acid; used as a brush killer.

"Brush-Rhap."²⁶⁶ Trademark for butyl and 2-ethylhexyl esters or amine salts of 2,4,5-trichlorophenoxyacetic acid. Available in various concentrations of active ingredient and in combination with esters of 2,4-dichlorophenoxyacetic acid. Used as a herbicide.

"BRV."⁵⁰ Trademark for a heavy, high-boiling coal-tar distillate.

Properties: Dark, coal-tar oil; sp. gr. 1.14–1.18 ($25/25^\circ\text{C}$); Engler specific viscosity, 5–10 (50°C); distillation, 26% max at 355°C . Combustible.

Containers: 55-gal steel drums; tank trucks; tank cars.

Uses: Rubber plasticizer, softener, and reclaiming oil; dispersing agent.

"Brymul."⁵¹ Trademark for an emulsifiable grade of cleaner for general use on metals, etc. Contains Stoddard-type solvent.

Hazard: Moderate fire risk.

"Bryton."⁵⁴⁴ Trademark for a series of oil-soluble petroleum sulfonates used as additives to motor oils and diesel fuels.

Uses: Detergent dispersants, rust-inhibiting agents, and alkaline carriers.

"BS."¹ Trademark for a series of seven trimethylolpropane ester base stocks for custom formulating of high-temperature lubricants. Also used as additives in lubricating oils and greases.

B-stage resin (resitol). A thermosetting phenolformaldehyde type resin which has been thermally reacted beyond the A-stage so that the product has only partial solubility in common solvents (alcohols, ketones), and is not fully fusible even at $150\text{--}180^\circ\text{C}$. The B-stage resin has limited commercial use.

BT (*Bacillus thuringiensis*). A species of bacteria used as a pesticide for agricultural crops. It is of the stomach-poison type, and has been approved for commercial use.

"BTC."³²⁸ Trademark for a series of cationic quaternary ammonium chlorides, generally alkyl dimethylbenzylammonium chloride.

Uses: Disinfectant; deodorant; germicide; fungicide; algacide; slimicide.

BTDA. See 3,3',4,4'-benzophenone tetracarboxylic dianhydride.

Btu (British thermal unit). The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit (usually from 39 to 40°F). This is the accepted standard for the comparison of heating values of fuels. For example, fuel gases range from 100 (low producer gas) to 3200 (pure butane) Btu per cu ft. The usual standard for a city gas is about 500 Btu.

BTX. Commercial abbreviation for benzene, toluene, xylene, the three major aromatic compounds.

Bu Informal abbreviation for butyl.

buciluzine hydrochloride $C_{28}H_{33}ClN_2 \cdot 2HCl$. 1-para-chlorobenzhydryl-4-(para-(tert)-butylbenzyl) piperazine dihydrochloride.

Uses: Medicine (antihistamine).

"Budene."²⁶⁵ Trademark for a cis-1,4-polybutadiene synthetic dry rubber manufactured by solution polymerization utilizing a stereospecific catalyst. This elastomer has a relatively high cis content, and is protected with a non-staining, non-discoloring antioxidant.

"Budium."²⁸ Trademark for a polybutadiene finish for application to tin plate.

buffer. A solution containing both a weak acid and its conjugate weak base whose pH changes only slightly on the addition of acid or alkali. The weak acid becomes a buffer when alkali is added, and the weak base becomes a buffer on addition of acid. This action is explained by the reaction

in which the base B is formed by the loss of a proton from the corresponding acid A. The acid may be a cation such as NH_4^+ , a neutral molecule such as CH_3COOH , or an anion such as $H_2PO_4^-$. When alkali is added, hydrogen ions are removed to form water; but, as long as the added alkali is not in excess of the buffer acid, many of the hydrogen ions are replaced by further ionization of A to maintain the equilibrium. When acid is added, this reaction is reversed as hydrogen ions combine with B to form A.

The pH of a buffer solution may be calculated by the mass law equation

$$pH = pK' + \log \frac{C_B}{C_A}$$

in which pK' is the negative logarithm of the apparent ionization constant of the buffer acid and the concentrations are those of the buffer base and its conjugate acid.

bufotene [3-(2-dimethylaminoethyl)-5-indolol]

Properties: Colorless prisms; insoluble in water; soluble in alcohol; slightly soluble in ether; soluble in dilute acids and alkalies.

Derivation: From toads and toadstools; also made synthetically.

Hazard: A hallucinogenic agent.

Use: Medicine (experimental).

See also hallucinogen.

builder, detergent. A substance that increases the effectiveness of a soap or synthetic surfactant by adding to its detergent power. Builders act as water softeners and as sequestering and buffering agents. Phosphate-containing compounds were formerly used, but their use has been prohibited because of their tendency to eutrophy lakes and rivers. Replacing phosphates, though less effective, are sodium carbonate, sodium silicate and ethylenediamine-tetraacetic acid. Pilot plant production of a product containing trisodium 2-oxy-1,1,3-propane tricarboxylate has been reported. Nitrilotriacetic acid is an effective builder, but its use has been avoided because of possible carcinogenicity.

bunamiodyl $C_3H_7CONHC_6H_4CH_2C(C_2H_5)COONa$ 3(3-Butyrylamino-2,4,6-tri-iodophenyl)-2-ethyl sodium acrylate. Used in medicine (radiopaque contrast media, diagnostic aid).

bunker fuel oil. A heavy residual oil used as fuel by ships, industry, and for large-scale heating installations. Combustible.

"Bunnatol-G."³⁵⁴ Trademark for a plasticizer for synthetic and reclaimed rubber. Insoluble in mineral and vegetable oils; imparts to rubber a high resistance to greases and oils.

Bunsen, Robert Wilhelm (1811-1899). Born in Germany, Bunsen is remembered chiefly for his invention of the laboratory burner named after him. He engaged in a wide range of industrial and chemical research, including blast-furnace firing, electrolytic cells, separation of metals by electric current, and production of light metals by electric decomposition of their molten chlorides. He also discovered two new elements—rubidium and cesium.

Burgundy pitch. A resin obtained from Norway spruce or European silver fir. Other types, e.g., that from various species of pines, are also offered under this name. Characterized by extreme tackiness; soluble in acetone and alcohol. Used to some extent in surgeon's tape and various special adhesive compositions.

burnable poison. A neutron absorber (or poison), such as boron, which, when purposely incorporated in the fuel or fuel cladding of a nuclear reactor, gradually "burns up" (is changed into nonabsorbing material) under neutron irradiation. This process compensates for the loss of reactivity that occurs as fuel is consumed and fission-product poisons accumulate, and keeps the overall characteristics of the reactor nearly constant during use. (Atomic Energy Commission).

burnt lime. See calcium oxide.

burnt sienna. See iron oxide red.

burnt umber. See umber.

"Buromin."¹⁰⁸ Trademark for sodium hexametaphosphate in glass plate form for boiler water conditioning.

"Burosil."¹⁰⁸ Trademark for a granular, alkaline, phosphate-silicate compound used in boiler water conditioning to precipitate calcium and magnesium as a loose sludge.

"Burundum."³²⁶ Trademark for wear- and corrosion-resistant high-alumina ceramic bodies used in cylindrical form as grinding media for particle size reduction.

bushy stunt virus. A viral protein present in tomato plant infections; pH 4.1; molecular weight 7,600,000. See virus.

"Butacite."²⁸ Trademark for polyvinyl butyral resin; available as soft pliable sheeting, in 750-ft rolls, 10-84 in. wide. See polyvinyl acetal resins.

1,3-butadiene (vinylethylene; erythrene; bivinyl; divinyl) $H_2C:CHCH:CH_2$. 31st in order of high-volume chemicals produced in U.S. (1975).

Properties: Colorless gas with mild aromatic odor; easily liquefied; b.p. $-4.41^\circ C$; sp. gr. 0.6211 (liquid at $20^\circ C$); f.p. $-108.9^\circ C$; flash point $-105^\circ F$; specific volume 6.9 cu ft/lb ($700^\circ F$); autoignition temp. $804^\circ F$; vapor pressure 17.65 psia ($0^\circ C$). Soluble in alcohol and ether; insoluble in water. The material polymerizes readily, particularly if oxygen is present, and the commercial material contains an inhibitor to prevent spontaneous polymerization during shipment or storage.

Derivation: (a) Catalytic dehydrogenation of butenes or butane; (b) oxidative dehydrogenation of butenes. Methods of purification: Extractive distillation in the presence of furfural, absorption in aqueous cuprous ammonium acetate, or use of acetonitrile.

Grades: Technical, 98.0%; C.P. 99.0%; instrument 99.4%; research 99.8%.

Containers: Cylinders; pressure tank trucks and tank cars; ocean tankers.

Hazard: Highly flammable gas or liquid; flammable limits in air 2-11.5%; may form explosive peroxides on exposure to air. Must be kept inhibited during storage and in shipment; inhibitors often used are di-n-butylamine or phenyl-beta-naphthylamine. Storage is usually under pressure or in insulated tanks below $35^\circ F$. Moderately toxic; irritant to eyes. Tolerance, 1000 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Synthetic elastomers (styrene-butadiene, polybutadiene, neoprene; nitriles); ABS resins; chemical intermediate.

Shipping regulations: (inhibited) (Rail) Red gas label; (Air) Flammable Gas label; not acceptable on passenger planes; (uninhibited) (Rail) Consult authorities; (Air) Not acceptable.

butadiene-acrylonitrile copolymer. See nitrile rubber.

butadiyne. See diacetylene.

butaldehyde. See butyraldehyde.

butallylonal (5-(2-bromoallyl)-5-sec-butylbarbituric acid) $C_{11}H_{13}BrN_2O_3$.

Properties: Fine, white crystals or crystalline powder; slightly bitter taste; m.p. $130-134^\circ C$; soluble in alcohol or ether; slightly soluble in cold water; insoluble in paraffin hydrocarbons.

Use: Medicine.

"Butamer."⁴¹⁶ Trademark for a process for the isomerization of normal butane to isobutane in the presence of hydrogen and a solid, noble metal catalyst of undisclosed composition. By recycling unconverted normal butane, ultimate yield of isobutane on a volumetric basis exceeds 100%.

butanal. See butyraldehyde.

butane (*n*-butane) C_4H_{10} .

Properties: Colorless gas; natural-gas odor; extremely stable; has no corrosive action on metals; does not react with moisture; very soluble in water; soluble in alcohol and chloroform; b.p. $-0.5^\circ C$; f.p. $-33^\circ C$; condensing pressure (approx.) 30 lb at $90^\circ F$; sp. gr. of liquid at $0^\circ C$, 0.599; sp. gr. of vapor at $0^\circ C$ (air = 1) 2.07; critical temperature $153.2^\circ C$; critical pressure (absolute) 525 psi; heating value ($77^\circ F$) 3266 Btu/cu ft; specific volume ($70^\circ F$) 6.4 cu ft/lb; flash point $-76^\circ F$; autoignition temp. $761^\circ F$. An asphyxiant gas.

Derivation: A by-product in petroleum refining or natural gasoline manufacture.

Grades: Research, 99.99 mole %; pure, 99 mole %; technical 95 mole %; also available in various mixtures with isobutane, propane, pentanes, etc.

Containers: Steel cylinders; tank cars; tank trucks; ocean tankers.

Hazard: Highly flammable, dangerous fire and explosion risk. Explosive limits in air 1.9 to 8.5%. Tolerance, 500 ppm in air.

Uses: Organic synthesis; raw material for synthetic rubber and high-octane liquid fuels; fuel for household and for many industrial purposes; manufacture of ethylene; solvent; refrigerant; standby and enricher gas; propellant in aerosols; pure grades used in calibrating instruments; food additive.

Shipping regulations: (Rail) Liquefied petroleum gas, Red gas label; (Air) Flammable Gas label. Not accepted on passenger planes.

Note: Butane in liquid form may be stored both above and below ground. Besides storage in liquefied form under its vapor pressure at normal atmospheric temperatures, refrigerated liquid storage at atmospheric pressure may be used. Such systems are closed and insulated, and the LP gas vapor is circulated through pumps and compressors to serve as the refrigerant for the system. Butane may be stored in pits in the earth capped by metal domes, and in underground chambers. (Compressed Gas Association). The foregoing also applies to propane (q.v.).

butanedial. See succinaldehyde.

1,4-butanedicarboxylic acid. See adipic acid.

butanedioic anhydride. See succinic anhydride.

1,3-butanediol. See 1,3-butylene glycol.

1,4-butanediol. See 1,4-butylene glycol.

2,3-butanediol. See 2,3-butylene glycol.

butanediolamine. See 2-amino-2-methyl-1,3-propanediol.

butanedione. See diacetyl.

2,3-butanedione oxime thiosemicarbazone

$CH_3C(OH)C(CH_3)_2N_2HCSNH_2$. A test reagent for manganese in very dilute solutions made from dimethylglyoxime and thiosemicarbazide.

butane dioxime. See dimethylglyoxime.

butanenitrile. See butyronitrile.

1-butanethiol (*n*-butyl mercaptan) C_4H_9SH .

Properties: Colorless liquid; sp. gr. 0.8412 ($20/4^\circ C$); refractive index 1.4427 ($20/D$); flash point $35^\circ F$; b.p. $97.2-101.7^\circ C$; strong, obnoxious odor. Slightly soluble in water; very soluble in alcohol and ether.

Grades: 95%.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation. Tolerance, 0.5 ppm in air.

Uses: Intermediate; solvent.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

2-butanethiol (*sec*-butyl mercaptan) $C_2H_5CH(SH)CH_3$. Properties: Colorless liquid; obnoxious odor. Boiling range 73–89°C; sp. gr. (20/4°C) 0.8288; refractive index (20/D) 1.4363; flash point –10°F.

Grades: 95%.

Containers: Cars and drums.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation. Tolerance, 0.5 ppm in air.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

1,2,4-butanetriol $HOCH_2CHOHCH_2CH_2OH$.

Properties: Almost colorless, odorless liquid; completely miscible in water and ethyl alcohol; hygroscopic. B.p. 312°C (extrap); sp. gr. 1.184; refractive index 1.473; flash point 332°F; combustible; non-toxic.

Derivation: Reaction of 2-butyne-1,4-diol with water, followed by reduction.

Grades: Technical; nitration.

Containers: Drums.

Uses: Intermediate for alkyd resins and explosives; cellulose plasticizer; emulsifier for cosmetics, inks, finishes, paper, cork, textiles.

butanoic acid. See butyric acid.

1-butanol. See *n*-butyl alcohol.

2-butanol acetate. See *sec*-butyl acetate.

2-butanone. See methyl ethyl ketone.

butanoyl chloride. See butyryl chloride.

"Butaprene."⁵ Trademark for synthetic rubbers, latexes, and resins comprising copolymers of butadiene with other monomers except those copolymers of butadiene with styrene which are classified as general purpose synthetic rubbers. See "FR-S."

"Butaprene PL."³⁵ Trademark for a complete series of latexes comprising copolymers of butadiene with styrene, acrylonitrile, acrylate esters, etc.

Properties: Air dries; forms continuous films capable of carrying high pigment and/or filler loadings. Keep from freezing.

Containers: 55-gal drums; tank trucks; tank cars.

Uses: Interior and exterior water-based paints; metal primers; adhesives; paper coating; grease-resistant coatings and saturants.

"Butaprene SL."⁵ Trademark for a series of high styrene-butadiene copolymer resins used as reinforcing agents for rubber.

Grades: "Butaprene SL," "Butaprene SL/AB," "Butaprene SL-I" covering a range of hardness and dispersibility. All grades are supplied as white, friable, resinous crumbs.

Containers: 50-lb paper bags or suitably sized fiber drums.

Use: For imparting stiffness, strength, and abrasion resistance to rubber and synthetic rubber compounds, especially shoe soles, floor tile and similar compounds.

"Butarez" CTL.³⁰³ Trademark for a liquid polybutadiene.

"Butasan."⁵⁸ Trademark for zinc dibutyldithiocarbamate (q.v.).

"Butazate."²⁴⁸ Trademark for zinc dibutyldithiocarbamate (q.v.).

"Butazolidin."²¹⁹ Trademark for phenylbutazone (q.v.).

2-butenal. See crotonaldehyde.

butene-1 (ethylethylene; α -butylene)

$CH_2=CHCH_2CH_3$. A liquefied petroleum gas.

Properties: Colorless gas; b.p. –6.3°C; sp. gr. 0.5951 (20/4°C); f.p. about –185°C. Specific volume 6.7 cu ft/lb (70°F); flash point –110°F; soluble in most organic solvents; insoluble in water. Autoignition temperature near 700°F.

Derivation: (a) Gases containing appreciable content of butene-1, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas. (b) Can be produced directly from ethylene.

Grades: Technical, 95%; C.P. 99.0%; research 99.4%.

Containers: Cylinders, tanks.

Hazard: Highly flammable; flammable limits in air 1.6–9.3% by volume; dangerous fire and explosion risk. Asphyxiant gas.

Uses: Polymer and alkylate gasoline; polybutenes; butadiene; intermediate for C_4 and C_5 aldehydes, alcohols, and other derivatives; production of maleic anhydride by catalytic oxidation.

Shipping regulations: (Rail) Liquefied petroleum gas, Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

cis-butene-2 (dimethylethylene; β -butylene; also called the "high-boiling" butene-2).

$CH_3CH=CHCH_3$. Cis- and trans-butene-2 are geometric structural isomers. A liquefied petroleum gas. Properties: Colorless gas; b.p. 3.7°C; sp. gr. 0.6213 (20/4°C); freezing point –139°C; specific volume 6.7 cu ft/lb (70°F); flash point –100°F; soluble in most organic solvents. Insoluble in water. Autoignition temp. 615°F.

Derivation: Gases containing appreciable content of cis-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grades: Technical 95%; C.P. 99%; research 99.8%.

Containers: Cylinders; tanks.

Hazard: Highly flammable. Flammable limits in air 1.8–9.7% by volume. Dangerous fire and explosion risk. Asphyxiant gas.

Uses: Solvent; cross-linking agent; polymer gasoline; butadiene synthesis; synthesis of C_4 and C_5 derivatives.

Shipping regulations: Same as butene-1.

trans-butene-2 (dimethylethylene; β -butylene; also called the "low-boiling" butene-2) $CH_3CH=CHCH_3$. Cis- and trans-butene-2 are geometrical structural isomers. A liquefied petroleum gas.

Physical properties: Colorless gas; b.p. 0.88°C; freezing point –105.8°C; sp. gr. 0.6042 (20/4°C); specific volume 6.7 cu ft/lb (70°F); flash point –100°F; soluble in organic solvents. Insoluble in water. Autoignition temp. 615°F.

Derivation: Gases containing appreciable content of trans-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grades: Technical, 95%; C.P. 99.0%; research 99.9%.

Hazard: Highly flammable. Flammable limits in air 1.8–9% by volume. Dangerous fire and explosion risk. Asphyxiant gas.

Uses: Same as for cis-butene-2.

Shipping regulations: Same as butene-1.

trans-butenedioic acid. See fumaric acid.

2-butene-1, 4-diol $\text{HOCH}_2\text{CH}=\text{CHCH}_2\text{OH}$.

Properties: Almost colorless, odorless liquid; very soluble in water, ethyl alcohol and acetone, sparingly soluble in benzene. Technical butenediol is predominantly the cis isomer. F.p. range 4.0–7.0°C; b.p. range 232–235°C; sp. gr. 1.067–1.074; refractive index (n_D²⁵) 1.476–1.478; flash point 263°F; combustible.

Derivation: By reduction of 2-butyne-1,4-diol; by high pressure synthesis from acetylene and formaldehyde.

Containers: Lined steel drums.

Hazard: Primary skin irritant.

Uses: Intermediate for alkyd resins, plasticizers, nylon, pharmaceuticals; cross linking agent for synthetic resins; fungicides.

3-butenitrile. See allyl cyanide.

butenoic acid. See crotonic acid.

3-buten-2-one. See vinyl methyl ketone.

butethal (5-butyl-5-ethylbarbituric acid) $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White crystals or powder; odorless; bitter taste; m.p. 124–127°C; fairly soluble in alcohol or ether; practically insoluble in water.

Use: Medicine.

See also barbiturate.

butethamine hydrochloride [2-(Isobutylamino)ethyl para-aminobenzoate hydrochloride]

$\text{NH}_2\text{C}_6\text{H}_4\text{COOCH}_2\text{CH}_2\text{NHCH}_2\text{CH}(\text{CH}_3)_2 \cdot \text{HCl}$.

Properties: White, odorless, crystals or crystalline powder with bitter taste and local anesthetizing effects on tongue. M.p. 192–196°C; sparingly soluble in water; slightly soluble in alcohol and chloroform; very slightly soluble in benzene; practically insoluble in ether. pH (1% solution) about 4.7; stable in air.

Grade: N.F.

Use: Medicine.

“**Buton**.”²⁹ Trademark for butadiene-styrene copolymers for surface coatings and thermosetting plastics. Characteristics include chemical resistance, hardness, flexibility, adhesion, abrasion resistance, and gloss range. Cure temperatures range from 70° to 1100°F.

Grades and Uses:

100—Basic all-hydrocarbon resin for can coatings, metal sheet primers, and chemical intermediates.

200—Polar modification for baked metal primers, tank, and drum linings.

300—Higher polarity gives greater compatibility and reactivity for resistant lacquers and lowbake coatings.

A-500—High molecular weight resin. Excellent for laminating, potting and encapsulation.

butonate $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{CH}(\text{CCl}_3)\text{OCCCH}_3$. Generic name for O,O-dimethyl-2,2,2-trichloro-1-n-butyl-oxoethyl phosphonate.

Properties: Colorless, somewhat oily liquid with slight ester odor; miscible with most organic solvents; stable in neutral or acid aqueous solutions; unstable in aqueous alkali. Sp. gr. 1.3742; refractive index 1.4707; wt/gal 11.5 lb.

Hazard: Toxic. Use may be restricted. Cholinesterase inhibitor.

Use: Insecticide.

butopyronoxyl (butyl mesityl oxide) $\text{C}_{12}\text{H}_{18}\text{O}_4$. n-Butyl 3,4-dihydro-2,2-dimethyl-4-oxo-1,2H-pyran-6-carboxylate.

Properties: Yellow to pale reddish-brown liquid with aromatic odor. Reasonably stable in air; slowly affected by light. Insoluble in water; miscible with alcohol, chloroform, ether, glacial acetic acid. Sp. gr. 1.052–1.060 (25/25°C); refractive index (n_D²⁵) 1.4745–1.4755. Distilling range 256–270°C. Low toxicity.

Derivation: Condensation of mesityl oxide and dibutyl oxalate in the presence of sodium ethoxide.

Grade: Technical.

Use: Insect repellent.

“**Butoxone**.”¹⁴⁷ Trademark for a selective hormone-type weedkiller based on 2,4-dichlorophenoxybutyric acid (2,4-DB). Available as the isooctyl ester and dimethylamine salt.

2-butoxyethanol. See ethylene glycol monobutyl ether.

2-(2-butoxyethoxy)ethyl thiocyanate. See beta-butoxy-beta'-thiocyanodiethyl ether.

1-butoxyethoxy-2-propanol

$\text{CH}_3\text{CHOHCH}_2\text{OC}_2\text{H}_4\text{OC}_3\text{H}_7$.

Properties: Colorless liquid; sp. gr. 0.9310 (20/20°C); b.p. 230.3°C; freezing point –90°C. Soluble in water; wt/gal 7.8 lb; flash point 250°F; combustible.

Uses: Solvent; hydraulic fluid components; anti-stall additive for automotive fuels; plasticizer intermediate.

butoxyethyl laurate. See ethylene glycol monobutyl ether laurate.

butoxyethyl oleate. See ethylene glycol monobutyl ether oleate.

butoxyethyl stearate. See ethylene glycol monobutyl ether stearate.

“**Butoxyn**.”³⁰⁷ Trademark for a series of specialty chemicals.

Properties: Nonionic, ashless, 100% active materials differing in alkyl substituent. Effective at high temperatures and in concentrated electrolyte solutions. Stable to acids and alkalis.

Uses: Emulsifiers for water-in-oil systems; corrosion and rust inhibitors, gelling and thickening agents for a wide variety of organic liquids.

para-butoxyphenol $\text{HOC}_6\text{H}_4\text{OC}_4\text{H}_9$.

Properties: White to faint yellow crystalline powder; m.p. 61–65°C. Soluble in alcohol, acetone, ether, benzene, aqueous alkali; insoluble in water. Combustible.

Grades: 93% pure.

Containers: Fiber drums.

Use: Synthesis.

butoxy polypropylene glycol. Generic name for polypropylene glycol monobutyl ether, probably $\text{CH}_3\text{CHOH}(\text{CH}_2\text{OCHCH}_3)_n\text{CH}_2\text{OC}_4\text{H}_9$. Colorless liquid; used as an insect repellent. Low toxicity.

n-butoxypropanol.

Properties: Colorless liquid; sp. gr. 0.8801 (20/20°C); b.p. 170.2°C; f.p. –80°C (sets to glass); soluble in water. Flash point 154°F. Combustible.

Uses: Solvent for water-based enamels.

beta-butoxy-beta'-thiocyanodiethyl ether [2-(2-butoxyethoxy)ethyl thiocyanate]

$\text{CH}_3(\text{CH}_2)_3\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{SCN}$.

Hazard: Moderately toxic. Skin irritant.

Use: Insecticide.

butoxytriglycol (triethylene glycol monobutyl ether)

$\text{C}_4\text{H}_9\text{O}(\text{C}_2\text{H}_4\text{O})_3\text{H}$.

Properties: Liquid; sp. gr. 1.0021 (20/20°C); b.p. de-

composes; f.p. -47.6°C . Completely soluble in water. Flash point 290°F . Combustible. Low toxicity.

Uses: Plasticizer intermediate.

buttercup yellow. See zinc yellow.

butter. (1) A colloidal system (emulsion) in which the continuous phase is composed of liquid fat from fat globules disintegrated by mechanical agitation, and the disperse phase is comprised of finely divided water droplets and undamaged fat globules. (2) Outmoded term for hygroscopic metallic chlorides of viscous consistency, e.g., butter of zinc, etc.

butter fat. The oily portions of the milk of mammals. Composition is largely glycerides of oleic, stearic, and palmitic acids with smaller amounts of the glycerides of butyric, caproic, caprylic and capric acids. Sp. gr. range 0.910–0.914. Cow's milk contains about 4% butter fat. See also milk.

butter yellow. See dimethylaminoazobenzene.

"Butvar." Trademark for polyvinyl butyral resins. See polyvinyl acetal resin.

Uses: Coatings (metal, textile, wood, etc.); film; adhesives; sealers; molded materials; insulation and safety glass.

butyl. (1) The group C_4H_9 . (2) butyl rubber.

n-butyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; fruity odor. Soluble in alcohol, ether, and hydrocarbons; slightly soluble in water. Vapor is heavier than air. Sp. gr. 0.8826 ($20/20^{\circ}\text{C}$); b.p. 126.3°C ; vapor pressure 8.7 mm Hg (20°C); freezing point -75°C ; refractive index 1.3951 (20°C); wt/gal 7.35 lb (20°C); flash point 98°F . (TOC). Autoignition temp. 790°F .

Derivation: Esterification and then distillation, after contact of butyl alcohol with acetic acid in the presence of a catalyst such as sulfuric acid.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Flammable; moderate fire risk. Moderately toxic; skin irritant. Tolerance, 150 ppm in air.

Uses: Solvent in nitrocellulose lacquers, leather dressings, perfumes, flavoring extracts; solvent for natural gums and synthetic resins; dehydrating agent.

Shipping regulations: (Air) Flammable Liquid label.

sec-butyl acetate $\text{CH}_3\text{COOCH}(\text{CH}_3)(\text{C}_2\text{H}_5)$. (2-butanol acetate.)

Properties: Colorless liquid; b.p. 112.2°C ; sp. gr. 0.8905 at $0/4^{\circ}\text{C}$, 0.870 at $20/4^{\circ}\text{C}$; refractive index 1.389 (20°C); wt/gal 7.21 lb; flash point (open cup) 88°F . Miscible with alcohol and ether; insoluble in water.

Derivation: Esterification of sec-butyl alcohol.

Containers: 1-gal cans; 55-gal drums; tank cars.

Hazard: Flammable, moderate fire risk. Moderately toxic. Tolerance, 200 ppm in air.

Uses: Solvent for nitrocellulose lacquers; thinners; nail enamels; leather finishes.

Shipping regulations: (Air) Flammable Liquid label.

tert-butyl acetate $\text{CH}_3\text{COOC}(\text{CH}_3)_2$.

Properties: Colorless liquid, b.p. 96°C ; sp. gr. 0.896 (20°C). Insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, moderate fire risk. Moderately toxic. Tolerance, 200 ppm in air.

Uses: Solvent.

butyl acetoacetate $\text{CH}_3\text{COCH}_2\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; insoluble in water; soluble in alcohol and ether. Sp. gr. 0.9694 ($20/20^{\circ}\text{C}$); b.p. 213.9°C ; vapor pressure 0.19 mm (20°C); flash point 185°F ; wt/gal 8.1 lb (20°C). Combustible.

Grades: Technical.

Use: Intermediate in synthesis of metal derivatives, dyestuffs, pharmaceuticals; flavoring.

butyl acetoxysearate

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{CH}_3\text{COO})(\text{CH}_2)_{10}\text{COOC}_4\text{H}_9$.

Properties: See butyl acetyl ricinoleate.

Derivation: From castor oil, butyl alcohol, and acetic anhydride, with hydrogenation.

Uses: Plasticizer; textile oils; adhesives.

butyl acetylene. See 1-hexyne.

butyl acetyl ricinoleate

$\text{CH}_3(\text{CH}_2)_5\text{CH}(\text{CH}_3\text{CO}_2)\text{CH}_2(\text{CH})_2(\text{CH}_2)_7\text{CO}_2\text{C}_4\text{H}_9$.

Properties: Yellow, oily liquid; mild odor; miscible with most organic solvents. Sp. gr. 0.940 ($20/20^{\circ}\text{C}$); saponification number 235; f.p., indefinite, becomes cloudy at -32°C , solidifies at -65°C ; flash point 230°F (open cup); refractive index 1.4614 (20°C); Saybolt viscosity 123 secs at 100°F ; wt/gal 7.8 lb (68°F); practically insoluble in water. Combustible. Autoignition temp. 725°F .

Derivation: From castor oil, butyl alcohol and acetic anhydride.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal steel drums; tank cars.

Uses: Plasticizer; emulsifier; lubricant; detergent; protective coatings; special cleansing compounds; quick-breaking emulsions.

n-butyl acid phosphate (n-butylphosphoric acid; acid butyl phosphate).

Properties: Water-white liquid; sp. gr. 1.120–1.125 ($25/4^{\circ}\text{C}$); refractive index (n $25/D$) 1.429; flash point (COC) 230°F . Soluble in alcohol, acetone, and toluene. Insoluble in water and petroleum naphtha. Combustible.

Containers: Up to 55-gal drums.

Hazard: Strong irritant to skin and tissue.

Uses: Esterification catalyst and polymerizing agent; curing catalyst and accelerator in resins and coatings; special detergents.

Shipping regulations: (Air) Corrosive label.

N-tert-butylacrylamide $\text{H}_2\text{C}:\text{CHCONHC}(\text{CH}_3)_3$.

Properties: White crystalline solid; m.p. $128\text{--}130^{\circ}\text{C}$; sp. gr. 1.015 (30°C). Soluble in methanol, ethyl alcohol, chloroform, and acetone. Combustible.

Hazard: Moderately toxic by ingestion and inhalation. Moderately irritant to skin.

Uses: Monomer; organic intermediate.

n-butyl acrylate $\text{CH}_2:\text{CHCOOC}_4\text{H}_9$.

Properties: Colorless liquid; m.p. -64°C ; boiling range $145.7\text{--}148.0^{\circ}\text{C}$ (760 mm); polymerizes readily on heating; vapor pressure (20°C) 3.2 mm; sp. gr. 0.9015 ($20/20^{\circ}\text{C}$); wt/gal 7.5 lb (20°C); flash point 120°F (open cup); nearly insoluble in water. Combustible.

Derivation: Reaction of acrylic acid or methyl acrylate with butyl alcohol.

Grades: Technical (inhibited).

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Moderate fire risk; moderately toxic and irritant.

Uses: Intermediate in organic synthesis; polymers and copolymers for solvent coatings, adhesives, paints, binders; emulsifier.
See also acrylic resin.

tert-butyl acrylate $\text{CH}_2=\text{CHCOOC}(\text{CH}_3)_3$.

Properties: Liquid; b.p. 120°C ; sp. gr. 0.879 (25°C); refractive index $n_{25/\text{D}}$ 1.4080; flash point 66°F (TOC). Commercial grade contains 100 ppm hydroquinone monomethyl ether as stabilizer.

Hazard: Flammable, dangerous fire risk.

Use: Monomer for acrylic resins.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid, n.o.s., Flammable Liquid label.

n-butyl alcohol (1-butanol; butyric alcohol)

$\text{CH}_3(\text{CH}_2)_3\text{CH}_2\text{OH}$.

Properties: Colorless liquid; vinous odor. B.p. 117.7°C ; f.p. -89.0°C ; sp. gr. ($20/20^\circ\text{C}$) 0.8109; wt/gal (20°C) 6.76 lb; refractive index ($n_{20/\text{D}}$) 1.3993; flash point 95°F . Solubility in water (20°C) 7.7 wt %; solubility of water in n-butyl alcohol 20.1%. Miscible with alcohol and ether. Autoignition temp. 689°F .

Derivation: (a) hydrogenation of butyraldehyde, obtained in the Oxo process; (b) condensation of acetaldehyde to form crotonaldehyde, which is then hydrogenated (aldol condensation).

Containers: 1-, 5-, 55-gal drums; tank cars; tank trucks.

Hazard: Toxic on prolonged inhalation; irritant to eyes and skin. Tolerance, 100 ppm in air. Flammable, moderate fire risk.

Uses: Preparation of esters, especially butyl acetate; solvent for resins and coatings; plasticizers; dyeing assistant; hydraulic fluids; detergent formulations; dehydrating agent (by azeotropic distillation); intermediate; "butylated" melamine resins; glycol ethers; butyl acrylate.

Shipping regulations: (Air) Flammable Liquid label.

sec-butyl alcohol (SBA; 2-butanol; methylethylcarbinol) $\text{CH}_3\text{CH}_2\text{CHOHCH}_3$.

Properties: Colorless liquid; strong odor. B.p. 99.5°C ; f.p. -114.7°C ; sp. gr. ($20/4^\circ\text{C}$) 0.808; wt/gal (20°C) 66.74 lb; refractive index ($n_{25/\text{D}}$) 1.3949; flash point (closed cup) 75°F . Autoignition temp. 763°F . Moderately soluble in water; miscible with alcohol and ether.

Derivation: Absorption of butene, from cracking petroleum or natural gas, in sulfuric acid with subsequent hydrolysis by steam.

Grades: Technical.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic on prolonged inhalation; irritant to eyes and skin. Flammable, dangerous fire risk. Tolerance, 150 ppm in air.

Uses: Preparation of methyl ethyl ketone; solvent; organic synthesis.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

tert-butyl alcohol (2-methyl-2-propanol; trimethyl carbinol) $(\text{CH}_3)_3\text{COH}$.

Properties: Colorless liquid or crystals; camphor odor. f.p. 25.5°C ; b.p. 82.9°C ; sp. gr. (liquid, 26°C) 0.779; refractive index ($n_{20/\text{D}}$) 1.3878; flash point (closed cup) 52°F . Autoignition temp. 892°F . Miscible with water, alcohol and ether.

Derivation: Absorption of isobutene, from cracking petroleum or natural gas, in sulfuric acid with subsequent hydrolysis by steam.

Grades: Technical.

Containers: Drums; tanks.

Hazard: Irritant to eyes and skin. Flammable, dan-

gerous fire risk. Tolerance, 100 ppm in air. Toxic on prolonged inhalation.

Uses: Alcohol denaturant; solvent for pharmaceuticals; dehydration agent; perfumery; chemical intermediate.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

n-butyl aldehyde. See butyraldehyde.

n-butylamine (1-aminobutane) $\text{C}_4\text{H}_9\text{NH}_2$.

Properties: Colorless, volatile liquid with amine odor. B.p. 77.1°C ; f.p. -49.1°C ; sp. gr. ($20/20^\circ\text{C}$) 0.7385; wt/gal (20°C) 6.2 lb; refractive index ($n_{20/\text{D}}$) 1.401; flash point (open cup) 30°F . Miscible with water, alcohol, and ether.

Derivation: Reaction of butanol or butyl chloride with ammonia.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Flammable, dangerous fire risk. Skin irritant. Toxic; tolerance, 5 ppm in air.

Uses: Intermediate for emulsifying agents, pharmaceuticals, insecticides, rubber chemicals, dyes, tanning agents.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

sec-butylamine (2-aminobutane) $\text{CH}_3\text{CHNH}_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid; sp. gr. (20°C) 0.725; boiling range $63\text{--}68^\circ\text{C}$; refractive index (20°C) 1.395; solidification point -104.5°C ; odor, amine; flash point 15°F ; wt/gal (20°C) 6.0 lb.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Shipping regulations: See n-butylamine.

tert-butylamine $(\text{CH}_3)_3\text{CNH}_2$.

Properties: Colorless liquid; b.p. $44\text{--}46^\circ\text{C}$; sp. gr. 0.700 (15°C); refractive index ($n_{18/\text{D}}$) 1.3794; flash point about 50°F . Miscible with water; soluble in common organic solvents.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Moderately toxic; skin irritant. Flammable, dangerous fire risk.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs, pharmaceuticals.

Shipping regulations: See n-butylamine.

butyl ortho-aminobenzoate. See butyl anthranilate.

n-butyl para-aminobenzoate $\text{H}_2\text{NC}_6\text{H}_4\text{COOC}_4\text{H}_9$.

Properties: White, crystalline powder, odorless, tasteless; m.p. $57\text{--}59^\circ\text{C}$; b.p. 174°C (8 mm). Soluble in dilute acids, alcohol, chloroform, ether, and fatty oils. Almost insoluble in water.

Grade: N.F.

Containers: Polyethylene-lined fiber drums.

Use: Medicine (local anesthetic); treatment of burns; ointments; UV absorber in suntan preparations.

N-n-butylaminoethanol $\text{C}_4\text{H}_9\text{NHC}_2\text{H}_4\text{OH}$.

Properties: Liquid; sp. gr. $0.88\text{--}0.99$ ($20/20^\circ\text{C}$); distillation range $192\text{--}210^\circ\text{C}$; wt/gal 7.4 lb; flash point 170°F . Combustible.

tert-butylaminoethyl methacrylate

$\text{CH}_2=\text{C}(\text{CH}_3)\text{COOCH}_2\text{CH}_2\text{NHC}(\text{CH}_3)_3$.

Properties: Liquid; b.p. $100\text{--}105^\circ\text{C}$ (12 mm); density 0.914 g/ml (25°C); 7.61 lb/gal; refractive index 1.4440 (25°C); flash point 205°F (COC). Combustible.

Uses: Coatings; textile chemicals; dispersing agent for nonaqueous systems; antistatic agent; stabilizer for chlorinated polymers; ion exchange resins; emulsifying agent; cationic precipitating agent.

N'-n-butyl-3-amino-4-methoxybenzenesulfonamide

$\text{CH}_3\text{OC}_6\text{H}_3(\text{NH}_2)\text{SO}_2\text{NHC}_4\text{H}_9$. Pink powder; m.p. 96–100°C; insoluble in water. Partially soluble in alcohol and acetone. Used as an intermediate.

butyl-para-aminophenol. See Gasoline Antioxidant No. 5.**N-n-butylaniline** $\text{C}_6\text{H}_5\text{NHC}_4\text{H}_9$.

Properties: Amber liquid. Sp. gr. (20°C) 0.932; boiling range 236–242°C; refractive index 1.534 (20°C); odor aniline; very soluble in alcohol and ether; insoluble in water. Flash point 225°F. Combustible.

Uses: Organic synthesis; dyes.

Hazard: Probably toxic.

butyl anthranilate (butyl ortho-aminobenzoate)

$\text{C}_4\text{H}_9\text{OOCCH}_6\text{H}_4\text{NH}_2$. Used in flavoring.

2-tert-butylanthraquinone $\text{C}_{18}\text{H}_{16}\text{O}_2$.

Properties: Yellow powder. M.p. 102–104°C; soluble in alcohol and acetone. Combustible; low toxicity.

Grades: Technical (98%).

Use: Organic synthesis.

butylated hydroxyanisole (BHA)

$(\text{CH}_3)_2\text{CC}_6\text{H}_3\text{OH}(\text{OCH}_3)$. A mixture of 2- and 3-tert-butyl-4-methoxyphenol.

Properties: White or slightly yellow, waxy solid having a faint characteristic odor; melting range 48–63°C. Not naturally water-soluble, but can be made so by special treatment. Freely soluble in alcohol and propylene glycol. Combustible.

Grade: F.C.C.; water-soluble.

Hazard: Moderately toxic by ingestion. Use in foods restricted; consult FDA regulations.

Uses: Antioxidant for fats and oils; food packaging.

butylated hydroxytoluene. See 2,6-di-tert-butyl-para-cresol.**n-butylbenzene** (1-phenylbutane) $\text{C}_6\text{H}_5\text{C}_4\text{H}_9$.

Properties: Colorless liquid; b.p. 183.2°C; f.p. –87.9°C; sp. gr. 0.860 (20°C); refractive index (n_D²⁰) 1.489; flash point 160°F (open cup). Combustible. Autoignition temp. 774°F.

Grades: Technical; pure; research.

Hazard: Moderately toxic by ingestion.

Uses: Organic synthesis, especially of insecticides.

sec-butylbenzene (2-phenylbutane) $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)\text{C}_2\text{H}_5$.

Properties: Colorless liquid; b.p. 170.65°C; vapor pressure 15 mm Hg (60°C); f.p. –75.68°C; sp. gr. 0.8618 (204°C); wt/gal 7.2 lb (20°C); refractive index (n_D²⁰) 1.4901; flash point 145°F (open cup). Combustible. Autoignition temp. 784°F.

Grades: Technical, 95%; pure; research.

Containers: Drums; tank trucks and tank cars.

Hazard: Moderately toxic by ingestion.

Use: Solvent for coating compositions and organic synthesis; plasticizer; surface-active agents.

tert-butylbenzene (2-methyl-2-phenylpropane)

$\text{C}_6\text{H}_5\text{C}(\text{CH}_3)_3$.

Properties: Colorless liquid; insoluble in water; soluble in alcohol; b.p. 169.1°C; f.p. –57.8°C; sp. gr. 0.866 (20°C); refractive index (n_D²⁰) 1.492; flash point 140°F (open cup). Combustible. Autoignition temp. 842°F.

Grades: Technical; pure; research.

Hazard: Moderately toxic by ingestion.

Use: Organic synthesis; polymerization solvent; polymer linking agent.

butylbenzenesulfonamide (N-n-butyl benzenesulfonamide) $\text{C}_6\text{H}_5\text{SO}_2\text{NHC}_4\text{H}_9$.

Properties: Liquid; pleasant odor; amber to straw color; sp. gr. 1.148 (25/25°C); refractive index 1.5235 (25°C); b.p. 189–190°C (4.5 mm).

Hazard: Moderately toxic by ingestion.

Uses: Synthesis of dyes, pharmaceuticals, and other organic chemicals; in resin manufacturing; and as plasticizer for some synthetic polymers.

butyl benzoate (n-butyl benzoate) $\text{C}_6\text{H}_5\text{COOC}_4\text{H}_9$.

Properties: Colorless oily liquid; insoluble in water; miscible with alcohol or ether. Sp. gr. 1.00 (20°C); b.p. 247.3°C; m.p. –22°C; flash point 225°F (open cup). Combustible. Low toxicity.

Grades: Technical.

Uses: Solvent for cellulose ether; plasticizer; perfume ingredient; dyeing of textiles.

N-tert-butyl-2-benzothiazolesulfenamide

$\text{C}_6\text{H}_4\text{NCS}(\text{SNHC}_4\text{H}_9)$.

Properties: Light buff powder or flakes; (sometimes colored blue); m.p. 104°C min; sp. gr. 1.29 at 25°C.

Soluble in most organic solvents. Combustible.

Use: Rubber accelerator.

butyl benzyl phthalate (BBP)

$\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_4\text{COOC}_4\text{H}_9$.

Properties: Clear, oily liquid. Slight odor. Sp. gr. 1.113–1.121 (25/25°C). Flash point 390°F. Combustible. Low toxicity.

Grades: Technical.

Containers: 5- and 55-gal drums; tank cars.

Uses: Plasticizer for polyvinyl and cellulosic resins; organic intermediate.

butyl benzyl sebacate $\text{C}_4\text{H}_9\text{OOC}(\text{CH}_2)_8\text{COOC}_4\text{H}_9$. Ester used as plasticizer.

Properties: Light straw colored liquid. B.p. (10 mm) 245–285°C; sp. gr. 1.023 (25°C); wt/gal 8.6 lb; flash point 395°F. Combustible; low toxicity.

Uses: Plasticizer for resins.

butyl borate. See tributyl borate.**n-butyl bromide** (1-bromobutane) $\text{C}_4\text{H}_9\text{Br}$.

Properties: Colorless liquid; sp. gr. (20/20°C) 1.279; b.p. 101.6°C; f.p. –112.4°C. Flash point 75°F (open cup). Autoignition temp. 509°F. Insoluble in water; soluble in alcohol and ether.

Grade: 99.7%.

Hazard: Probably toxic. Flammable; dangerous fire risk.

Use: Alkylating agent.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

sec-butyl bromide (2-bromobutane) $\text{CH}_3\text{CHBrCH}_2\text{CH}_3$.

Properties: Clear, colorless liquid with pleasant odor; boiling point 91.2°C; sp. gr. 1.2425 (25/25°C); refractive index at 25°C 1.4320–1.4344; flash point 70°F (open cup); soluble in alcohol and ether; insoluble in water.

Containers: Steel drums.

Hazard: Narcotic in high concentrations. Flammable; dangerous fire risk.

Use: Synthesis; alkylating agent.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid, n.o.s., Flammable Liquid label.

butyl butanoate. See n-butyl butyrate.

n-butyl butyrate (butyl butanoate)

Properties: Colorless liquid; sp. gr. 0.8721 (20/20°C); refractive index (n_D²⁰) 1.4059; f.p. -91.5°C; b.p. 165.7°C (736 mm); flash point 128°F. (o.c.); insoluble in water; soluble in alcohol and ether. Combustible.

Grade: F.C.C.

Hazard: Moderately toxic; irritant and narcotic; moderate fire risk.

Use: Flavoring.

butylcarbamoylsulfanilamide. See 1-butyl-3-sulfanilyl-urea.

n-butyl carbinol. See n-amyl alcohol, primary.

sec-butyl carbinol. See 2-methyl-1-butanol.

butyl "Carbitol."²¹⁴ Trademark for diethylene glycol monobutyl ether (q.v.).

butyl "Carbitol" acetate.²¹⁴ Trademark for diethylene glycol monobutyl ether acetate.

para-tert-butylcatechol (4-tert-butyl-1,2-dihydroxybenzene) $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{OH})_2$

Properties: Colorless crystals; m.p. 56-57°C; sp. gr. 1.049 (60/25°C); b.p. 285°C; flash point 265°F. Combustible; soluble in ether, alcohol, and acetone; slightly soluble in water at 80°C.

Containers: Glass bottles; lined drums.

Hazard: Skin irritant.

Use: Polymerization inhibitor for styrene-butadiene and other olefins.

butyl "Cellosolve."²¹⁴ Trademark for ethylene glycol monobutyl ether (q.v.).

butyl "Cellosolve" acetate.²¹⁴ Trademark for ethylene glycol monobutyl ether acetate (q.v.).

butyl chloral hydrate (trichlorobutylaldehyde hydrate) $\text{CH}_3\text{CHClCCl}_2\text{CH}(\text{OH})_2$

Properties: Colorless leaflets; sp. gr. 1.693 (20/4°C); m.p. 78°C. Slightly soluble in water; soluble in alcohol and ether.

Derivation: Action of chlorine on paraldehyde.

Use: Medicine (hypnotic, anticonvulsant)

n-butyl chloride (1-chlorobutane) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{Cl}$ or $\text{C}_4\text{H}_9\text{Cl}$

Properties: Colorless liquid. Insoluble in water. Miscible with alcohol and ether. Sp. gr. 0.8875 (20/20°C); b.p. 78.6°C; wt/gal 7.35 lb (20°C); refractive index 1.4015 (20°C); vapor pressure 80.1 mm (20°C); f.p. -122.8°C; viscosity 0.0045 poise (20°C); flash point 15°F (open cup). Autoignition temp. 860°F.

Grades: N.F.; technical.

Containers: Drums; tanks.

Hazard: Flammable; dangerous fire risk. Toxic on prolonged inhalation.

Uses: Organic synthesis (alkylating agent); solvent; anesthetic.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

sec-butyl chloride $\text{CH}_3\text{CHClCH}_2\text{CH}_3$. Clear liquid; sp. gr. 0.875 (20/4°C); refractive index 1.3963 (20°C); 99% pure.

Hazard: May be flammable.

Uses: Organic synthesis.

butyl citrate. See tributyl citrate.

6-tert-butyl-meta-cresol (MBMC; 6-tert-butyl-3-methylphenol) $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{OH})(\text{CH}_3)$

Properties: Clear liquid; solidifies slightly below room temperature; f.p. 23.1°C; b.p. 244°C; sp. gr. 0.922

(80°C). Soluble in organic solvents and aqueous potassium hydroxide. Flash point 116°F. Combustible.

Containers: 5- and 55-gal drums; tank cars.

Hazard: Moderate fire risk. May be toxic and irritant to skin.

Uses: Germicide; disinfectant; synthesis of antioxidants and rubber-processing chemicals; additives to lubricating oils; synthetic resins; perfumes (fixative).

butyl crotonate $\text{CH}_3\text{CH}=\text{CHCOOC}_4\text{H}_9$

Properties: Water-white liquid; persistent odor. Sp. gr. 0.9037 (20/20°C); b.p. 180.5°C; wt/gal 7.52 lb (20°C); soluble in alcohol and ether; insoluble in water. Combustible.

butyl cyclohexyl phthalate $\text{C}_4\text{H}_9\text{OOC}\text{C}_6\text{H}_4\text{COOC}_6\text{H}_{11}$

Properties: Clear liquid; very mild odor; sp. gr. 1.078; saponification number 369; acidity (as phthalic acid), 0.01% max.; miscible with most organic solvents. Probably low toxicity. Combustible.

Containers: Drums; tank trucks; tank cars.

Use: Plasticizer for polymers and elastomers; nitro-cellulose lacquers.

butyl decyl phthalate $\text{C}_4\text{H}_9\text{OOC}\text{C}_6\text{H}_4\text{COOC}_{10}\text{H}_{21}$

Properties: Clear, oily liquid; sp. gr. 0.977 to 0.987 (25/25°C). Probably low toxicity. Combustible.

Containers: Drums; tank cars and trucks.

Uses: Primary plasticizer for polyvinyl chloride and copolymer resins.

n-butyldiamylamine $\text{C}_4\text{H}_9\text{N}(\text{C}_5\text{H}_{11})_2$

Properties: Straw-colored liquid. Sp. gr. (20°C) 0.788; boiling range 229-241°C; odor amine; flash point 200°F. Combustible.

n-butyldichloroarsine $\text{C}_4\text{H}_9\text{AsCl}_2$

Properties: Oily liquid. Somewhat agreeable odor. Decomposed by water. B.p. 192-194°C.

Hazard: Highly toxic by inhalation and ingestion.

Uses: Military poison gas.

Shipping regulations: (Rail) Poison gas label. Not accepted by rail express. (Air) Poisonous gases, n.o.s. Not acceptable.

butyl dichlorophenoxyacetate. See 2,4-D.

1-n-butyl-3-(3,4-dichlorophenyl)-1-methylurea (nebu-ron) $\text{Cl}_2\text{C}_6\text{H}_3\text{NHCONCH}_3(\text{C}_4\text{H}_9)$

Properties: White crystalline solid; m.p. 102°C; very low solubility in water and hydrocarbon solvents. Stable towards oxidation and moisture.

Use: Weed killer.

n-butyl diethanolamine $\text{C}_4\text{H}_9\text{N}(\text{CH}_2\text{CH}_2\text{OH})_2$

Properties: Liquid; sp. gr. (20°C) 0.97; b.p. 272°C; color very light straw; odor faint amine; wt/gal 8.08 lb (20°C); flash point 245°F. Combustible; low toxicity.

n-butyl diethyl malonate $\text{C}_4\text{H}_9\text{CH}(\text{COOC}_2\text{H}_5)_2$

Properties: Colorless liquid with a fruity odor; sp. gr. 0.972-0.974 (25/25°C); refractive index 1.420-1.422 (n_D²⁵); soluble in alcohols, ketones and esters. Combustible.

Containers: Bottles; tins; drums.

Use: Intermediate.

butyl diglycol carbonate (diethylene glycol bis(n-butylcarbonate)) $(\text{C}_4\text{H}_9\text{OCO}_2\text{CH}_2\text{CH}_2)_2\text{O}$

Properties: Colorless liquid of low volatility; insoluble in water (very stable to hydrolysis); widely soluble in organic solvents; compatible with many resins and plastics. Sp. gr. 1.07 (20/4°C); boiling range 164-166°C (2 mm); flash point 372°F; Saybolt viscosity 21 cps (20°C); refractive index 1.435 (20°C);

evaporation rate 0.59 mg/sq cm/hr (100°C). Combustible.

Uses: Plasticizer; high-boiling-point solvent and softening agent; manufacture of pharmaceuticals and lubricant compositions.

4-tert-butyl-1,2-dihydroxybenzene. See para-tert-butyl-catechol.

Butyl "Dioxitol."¹²⁵ Trademark for diethylene glycol monobutyl ether (q.v.).

4-butyl-1,2-diphenyl-3,5-pyrazolidinedione. See phenyl-butazone.

butyldithiocarbonic acid. See butylxanthic acid.

butyl dodecanoate. See butyl laurate.

"Butyl Eight."⁶⁹ Trademark for an ultra-accelerator for rubber of the dithiocarbamate type.

Properties: Dark red liquid; odor distinct; sp. gr. 1.01; low toxicity. Partly soluble in water; soluble in acetone, benzene, carbon disulfide, chloroform, and gasoline.

butylene (butene). One of the liquefied petroleum gases butene-1, *cis*-butene-2, *trans*-butene-2, and isobutene. See specific entry for details.

butylene dimethacrylate

Properties: Liquid; boiling range 110°C (3 mm); density 1.011 g/ml (25/15.6°C); refractive index 1.4502 (25°C); flash point > 150°F. Combustible.

Use: Monomer for resins.

1,3-butylene glycol (1,3-butanediol)

Properties: Practically colorless, viscous liquid; hygroscopic; sp. gr. 1.0059 (20/20°C); 8.4 lb/gal (20°C); b.p. 207.5°C; vapor pressure 0.06 mm (20°C); refractive index 1.4401 (20°C); flash point (COC) 250°F; completely soluble in water and alcohol; slightly soluble in ether. Combustible. Autoignition temp. 741°F. Low toxicity.

Derivation: Reduction of aldol.

Containers: Drums; tank cars.

Uses: Polyesters; polyurethanes; surface active agents; plasticizers; humectant; coupling agent; solvent; food additive and flavoring.

1,4-butylene glycol (1,4-butanediol; tetramethylene glycol) $\text{HOCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$.

Properties: Colorless, oily liquid. B.p. 230°C; m.p. 16°C; sp. gr. 1.020 (20/4°C). Flash point over 250°F. Miscible with water; soluble in alcohol; slightly soluble in ether. Combustible.

Derivation: From acetylene and formaldehyde by high-pressure synthesis.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Solvents; humectant; intermediate for plasticizers, pharmaceuticals; cross-linking agent in polyurethane elastomers; manufacture of tetrahydrofuran; terephthalate plastics.

2,3-butylene glycol (2,3-dihydroxybutane; 2,3-butanediol; pseudobutylene glycol; sym-dimethylethylene glycol). Can exist in optical isomeric forms.

Properties: Nearly colorless crystalline solid or liquid; hygroscopic; sp. gr. 1.045 (20/20°C); m.p. 23–

27°C; b.p. 179–182°C; refractive index 1.438 (20°C); flash point 185°F (open cup); soluble in alcohol and ether; miscible with water in all proportions. Combustible; low toxicity.

Derivation: From corn sugar by acid hydrolysis; also from fermentation of sugar beet molasses.

Grades: 99%.

Uses: Resins; solvent for dyes; intermediate; blending agent.

1,2-butylene oxide (1,2-epoxybutane)

Properties: Colorless liquid; sp. gr. 0.8312 (20/20°C); b.p. 63°C; sets to a glass below –150°C; flash point (closed cup) near 0°F. Soluble in water and miscible with most organic solvents.

Grades: About 97.5% purity.

Hazard: Highly flammable, dangerous fire risk. Toxic concentrations occur at room temperature.

Uses: Intermediate, especially for various polymers; stabilizer for chlorinated solvents.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable liquid, n.o.s., Flammable Liquid label.

2,3-butylene oxide (2,3-epoxybutane)

Two forms, *cis* and *trans*, are known.

Properties: *Cis*: f.p. –80°C; b.p. 59.7°C (742 mm); sp. gr. 0.8266 (25/4°C). *Trans*: f.p. –85°C; b.p. 53.5°C (742 mm); sp. gr. 0.8010 (25/4°C). Flash point near 0°F. Very soluble in ether, benzene and organic solvents; decomposes in water.

Hazard: Highly flammable; dangerous fire risk. Toxic concentrations occur at room temperature.

Use: Intermediate.

Shipping regulations: See 1,2-butylene oxide.

butyl 9,10-epoxyoctadecanoate. See butyl epoxystearate.

butyl epoxystearate (butyl 9,10-epoxyoctadecanoate)

Properties: Colorless liquid with mild slightly fatty, slightly fruity odor; sp. gr. (20°C) 0.910; wt/gal 7.59 lb. Combustible.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Use: Plasticizer for low-temperature flexibility improvement of vinyl resins.

n-butylethanolamine $\text{C}_4\text{H}_9\text{NHCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. (20°C) 0.892; boiling range 194–204°C; odor, very faint amine type; flash point 170°F. Combustible. Low toxicity.

butyl ether (n-dibutyl ether) $\text{C}_4\text{H}_9\text{OC}_4\text{H}_9$.

Properties: Colorless liquid; stable; mild, ethereal odor; sp. gr. 0.7694 (20/20°C); b.p. 142.2°C; vapor pressure 4.8 mm (20°C); flash point (TOC) 92°F; f.p. –95.2°C; latent heat of vaporization 67.8 cal/g at 140.9°C; refractive index 1.3992 (20°C); wt/gal 6.4 lb (20°C); viscosity 0.0069 poise (20°C). Autoignition temp. 382°F. Miscible with most common organic solvents; immiscible in water.

Grades: Technical; spectrophotometric.

Containers: 1-gal cans; 5- and 55-gal drums; tankcars.

Hazard: Flammable, moderate fire risk. May form explosive peroxides, especially in anhydrous form.

Toxic on prolonged inhalation.

Uses: Solvent for hydrocarbons, fatty materials; ex-

tracting agent, used especially for separating metals; solvent purification; organic synthesis (reaction medium).

butylethylacetaldehyde. See 2-ethylhexaldehyde.

5-butyl-5-ethylbarbituric acid. See butethal.

n-butyl ethyl ether. See ethyl n-butyl ether

butyl ethyl ketene (BEK) $(C_4H_9)(C_2H_5)CCO$.

Properties: Yellow liquid with pungent odor; sp. gr. 0.8266 (20/4°C); b.p. 36°C (12 mm); f.p. below -80°C; refractive index 1.4224 (n 20/D); flash point (TOC) 64°F.

Grade: Available as 20% solution in hexane.

Hazard: Flammable, dangerous fire risk; fumes are toxic and irritant. Store solution under nitrogen.

Use: Reactive chemical intermediate.

Shipping regulations: Same as 1,2-butylene oxide.

2-butyl-2-ethylpropanediol-1,3. See 2-ethyl-2-butylpropanediol-1,3.

tert-butylformamide $(CH_3)_3CNHCOH$. Colorless, highboiling liquid; soluble in water and common hydrocarbon solvents; used as a solvent and in petroleum additives.

butyl formate $HCOOC_4H_9$.

Properties: Colorless liquid. Sp. gr. 0.885-0.9108; b.p. 107°C; f.p. -90°C; flash point 64°F (closed cup); autoignition temp. 612°F; miscible with alcohols, ethers, oils, hydrocarbons; slightly soluble in water.

Grades: Technical.

Hazard: Flammable, dangerous fire risk. Narcotic and irritant in high concentrations.

Uses: Solvent for nitrocellulose, some types of cellulose acetate, many cellulose ethers, many natural and synthetic resins; lacquers; perfumes; organic synthesis (intermediate); flavoring.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

n-butyl furfuryl ether $C_4H_9OCH_2C_4H_3O$.

Properties: Colorless liquid, turning dark on exposure to air; extremely hygroscopic, unstable in presence of moisture. Sp. gr. 0.955 (20/0°C); b.p. 189-190°C (765 mm); refractive index (n 20/D) 1.4522.

n-butyl furoate $C_4H_7OCO_2C_4H_9$.

Properties: Colorless oil; decomposes on standing. Sp. gr. 1.055 (20/1°C); b.p. 83-84°C (1 mm), 118-120°C at 25 mm. Insoluble in water; soluble in alcohol and ether.

n-butyl glycol phthalate. See dibutoxyethyl phthalate.

tert-butyl hydroperoxide $(CH_3)_3COOH$. A highly reactive peroxy compound.

Properties: Water-white liquid; m.p. -8°C; decomposes at 75°C; sp. gr. 0.896 (20/4°C); refractive index 1.396 (25°C) (90% pure); flash point (90%) 130°F. Moderately soluble in water; very soluble in organic solvents and alkali metal hydroxide solutions. Combustible.

Grades: 70%, 90% pure.

Containers: Polyethylene bottles.

Hazard: Moderate fire risk. Oxidizing agent. Moderately toxic.

Uses: Polymerization, oxidation, and sulfonation catalyst; bleaching; deodorizing.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Solution exceeding 70%, Not acceptable; solution not exceeding 70% in nonvolatile solvent, Organic Peroxide label.

tert-butylhydroquinone $C_6H_3(OH)_2C(CH_3)_3$. Intermediate; m.p. 125°C; insoluble in water; soluble in alcohol, acetone and ethyl acetate.

4,4'-butylidenebis (6-tert-butyl-meta-cresol)

$[(CH_3)_3CC_6H_2(OH)(CH_3)]_2CHC_3H_7$.

Properties: White powder; m.p. 209°C min; sp. gr. 1.03 (25°C).

Use: Antioxidant for rubber, dry or latex.

butyl isocyanate C_4H_9NCO . Colorless liquid; b.p. 115°C; sp. gr. 0.88 at 20°/4°C. Intermediate for pesticides; herbicides, pharmaceuticals.

Hazard: Toxic. Strong irritant to eyes and skin.

Shipping regulations: (Air) Poison label; not acceptable on passenger planes. (Rail) Poisonous liquids, n.o.s., Tear gas label.

butyl isodecyl phthalate.

Properties: Clear liquid; mild odor; color (Hazen) 50 max; sp. gr. 0.9 (20/20°C); saponification number 310; acidity (as phthalic acid) 0.01% max.

Containers: Drums; tankcars; tank trucks.

Use: Plasticizer; especially for polyvinyls.

tert-butylisopropylbenzene hydroperoxide. White crystalline solid.

Hazard: Dangerous fire risk; reacts strongly with reducing materials. Oxidizing agent.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Solution exceeding 60%, Not acceptable; solution not exceeding 60% in a nonvolatile solvent, Organic Peroxide label.

"Butyl Kamate."⁶⁹ Trademark for an aqueous solution of potassium di-n-butyl dithiocarbamate; 50% minimum assay.

Uses: Ultra-accelerator for natural and synthetic latexes.

n-butyl lactate $CH_3CHOHCOOC_4H_9$.

Properties: Water-white, stable, liquid. Mild odor.

Miscible with many lacquer solvents, diluents, and oils; slightly soluble in water; hydrolyzed in presence of acids and alkalis. Sp. gr. 0.974-0.984 (20/20°C); flash point 168°F (TOC); m.p. -43°C; wt per U.S. gal 8.15 lb (68°F); b.p. 188°C; refractive index 1.4216 (20°); vapor pressure 0.4 mm Hg (20°C); latent heat of vaporization 77.4 cal/g (20°C). Autoignition point 720°F; combustible; low toxicity.

Grades: Technical, 95% min.

Containers: 1-gal cans; 5- and 55-gal steel drums; tank trucks; tankcars.

Uses: Solvent for nitrocellulose, ethyl cellulose, oils, dyes, natural gums and many synthetic polymers; lacquers; varnishes; inks; stencil pastes; antiskinning agent; chemical (intermediate); perfumes; drycleaning fluids; adhesives.

N-n-butyl lauramide $C_{11}H_{23}CONHC_4H_9$.

Properties: White solid. Boiling range 200-225°C at 2 mm; odor lauric acid; flash point 375°F. Combustible. Low toxicity.

butyl laurate (butyl dodecanoate) $C_{11}H_{23}COOC_4H_9$.

Properties: Liquid with sp. gr. (25°C) 0.855; b.p. (5 mm) 130-180°C; m.p. -10°C; insoluble in water. Combustible; nontoxic.

Derivation: Alcoholysis of coconut oil with butyl alcohol followed by fractional distillation.

Containers: Drums.

Use: Plasticizer; flavoring.

butyllithium. n-Butyllithium $CH_3CH_2CH_2CH_2Li$, sec-butyllithium $CH_3CHLiCH_2CH_3$, and tert-butyllithium $(CH_3)_3CLi$, are available, usually in solution in one of the C_5 to C_7 hydrocarbons, in which

they are quite stable. sec-Butyllithium solutions must be kept at or below 60°F.

Derivation: Reaction of lithium ribbon and one of the butyl chlorides in pentane or hexane.

Grades: Sold by percentage butyllithium in the solution.

Hazard: Solid and solutions highly flammable, ignite on contact with moist air. Toxic and irritant. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polymerization of isoprene and butadiene; intermediate in preparation of lithium hydride; rocket fuel component; metalating agent.

Shipping regulations: (Rail, Air) Not specified. Consult authorities.

n-butylmagnesium chloride C_4H_9MgCl .

Properties: Liquid; sp. gr. 0.88.

Derivation: From magnesium and butyl chloride.

Grade: Available in solution in ethyl ether, or in tetrahydrofuran.

Containers: Glass bottles; 5-gal drums.

Hazard: Flammable, dangerous fire risk. Probably toxic.

Use: Grignard reagent, as an alkylating agent.

Shipping regulations: (Rail, Air) Not specified. Consult authorities.

n- and sec-butyl mercaptan. See 1- and 2-butanethiol.

tert-butyl mercaptan. See 2-methyl-2-propanethiol.

butyl mesityl oxide. See butopyronoxyl.

n-butyl methacrylate $H_2C:C(CH_3)COOC_4H_9$.

Properties: Colorless liquid; b.p. 163.5–170.5°C; f.p. below -75°C; sp. gr. 0.895 (25/25°C); flash point 130°F (open cup); refractive index 1.4220; readily polymerized; insoluble in water. Combustible.

Derivation: Reaction of methacrylic acid or methyl methacrylate with butyl alcohol.

Grades: Technical (inhibited).

Containers: Drums; tanks.

Hazard: Toxic by ingestion. Moderate fire risk.

Uses: Monomer for resins, solvent coatings, adhesives, oil additives; emulsions for textiles, leather and paper finishing. See also acrylic resin.

tert-butyl methacrylate $H_2C:C(CH_3)COOC(CH_3)_3$.

Properties: Colorless liquid; b.p. 66°C (57 mm); sp. gr. 0.877 (25°C); refractive index 1.4124 (n_D 25/D); flash point 92°F (TOC).

Grade: Technical, containing 100 ppm hydroquinone monomethyl ether as inhibitor.

Hazard: Flammable, moderate fire risk. Toxic by ingestion.

Use: Monomer for resins. See also acrylic resin.

tert-butyl-4-methoxyphenol. See butylated hydroxyanisole.

sec-butyl 6-methyl-3-cyclohexene-1-carboxylate. See siglure.

para-tert-butyl-alpha-methylhydrocinnamaldehyde

(alpha-methyl-beta-(para-tert-butylphenyl)-propionaldehyde) $(CH_3)_3CC_6H_4CH_2CH(CH_3)CHO$.

Properties: Light-yellow liquid; strong floral odor; sp. gr. 0.942–0.949 (25/25°C); refractive index 1.503–1.510 (20°C); flash point (TCC) 204°F. Soluble in 1 part 90% alcohol. Stable, non-discoloring. Combustible. Low toxicity.

Grades: 93%, 85% purity.

Use: Perfume.

2-tert-butyl-4-methylphenol. See 2-tert-butyl-para-cresol.

6-tert-butyl-3-methylphenol. See 6-tert-butyl-meta-cresol.

n-butyl myristate $CH_3(CH_2)_{12}COOC_4H_9$. The butyl ester of myristic acid.

Properties: Water-white oily liquid; saponification number 193–203; f.p. 1–7°C; boiling range 167–197°C at 5 mm; sp. gr. (25°C) 0.850–0.858; insoluble in water; soluble in acetone, castor oil, chloroform, methanol, mineral oil, and toluene. Combustible; nontoxic.

Derivation: Alcoholysis of coconut oil with butyl alcohol followed by fractional distillation.

Containers: Tins; drums.

Uses: Plasticizer; lubricant for textiles, paper stencils; cosmetic preparations.

"Butyl Namate."⁶⁹ Trademark for an aqueous solution of sodium di-n-butylthiocarbamate; 47% minimum assay.

Uses: Ultra-accelerator for natural and synthetic latexes.

n-butyl nitrate $C_4H_9NO_3$.

Properties: Liquid. Sp. gr. (20°C) 1.103; b.p. 123°C; water-white; odor ethereal. Insoluble in water; soluble in alcohol and ether; flash point 97°F.

Hazard: Flammable, moderate fire risk in contact with reducing materials. Oxidizing agent; may explode on shock or heating.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Nitrates, n.o.s., Oxidizer label.

butyl nonanoate. See butyl pelargonate.

butyl octadecanoate. See butyl stearate.

butyl octyl phthalate $C_4H_9OOC C_6H_4COOC_8H_{17}$.

Properties: Water-white liquid; mild characteristic odor; sp. gr. 0.991–0.997 (20/20°C); saponification number 298–308. Miscible with most organic solvents. Combustible; low toxicity.

Containers: Drums; tank trucks; tankcars.

Uses: Plasticizer for vinyl resins.

butyl octadecanoate. See butyl stearate.

butyl oleate $CH_3(CH_2)_7CH:CH(CH_2)_7COOC_4H_9$.

Properties: Light-colored, oleaginous liquid; mild odor; insoluble in water; miscible with alcohol, ether, vegetable and mineral oils. Sp. gr. 0.873 (20/20°C); iodine value 76.8; f.p. opaque at 12°C, solid at -26.4°C; wt/gal 7.26 lb (20°C); boiling range 173–227°C (2 mm). Flash point 356°F. Combustible; low toxicity.

Derivation: Alcoholysis of olein or esterification of oleic acid with butyl alcohol.

Containers: 7-, 35-lb tins; 380-lb drums.

Uses: Plasticizer, particularly for PVC; solvent; lubricant; water-resisting agent; coating compositions; polishes; water-proofing compounds.

Butyl "Oxitol."¹²⁵ Trademark for ethylene glycol monobutyl ether (q.v.).

Containers: 1-, 5-, 55-gal pails or drums; tank cars and tank trucks.

Hazard: Slightly irritating to skin and eyes.

Uses: Solvent in various types of surface coating formulations, to improve gloss and leveling; component of hydraulic fluids; coupling agent in various types of cleaning and cutting oils.

n-butyl pelargonate (n-butyl nonanoate)
 $C_4H_9OOCCH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_3$. Liquid with fruity odor; combustible; sp. gr. 0.865 (15.5/15.5°C); b.p. 270°C. Used in flavors and perfumes; as chemical intermediate.

sec-butyl pelargonate $C_2H_5CH(CH_3)OOCCH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_3$. Liquid; sp. gr. 0.8608 (20/4°C); b.p. 123°C (15 mm); combustible; refractive index 1.4220. Shows optical activity. Used as chemical intermediate.

tert-butyl peracetate. See tert-butyl peroxyacetate.

tert-butyl perbenzoate. See tert-butyl peroxybenzoate.

tert-butyl perisobutyrate. See tert-butyl peroxyisobutyrate.

tert-butyl permaleic acid. See tert-butyl peroxypermaleic acid.

tert-butyl peroxoate. See tert-butyl peroxy(2-ethylhexanoate).

tert-butyl peroxide. See di-tert-butyl peroxide.

tert-butyl peroxyacetate (tert-butyl peracetate)
 $(CH_3)_3COOOCCH_3$. Available as a 72–76% solution in benzene. Flash point below 80°F (COC); sp. gr. 0.923.

Hazard: Flammable, dangerous fire risk. Oxidizing material.

Uses: Polymerization initiator for vinyl monomers; in manufacture of polyethylene and polystyrene.

Shipping regulations: Peroxides, organic, (liquid or solution), n.o.s., (Rail) Yellow label. (Air) Not acceptable.

tert-butyl peroxybenzoate (tert-butyl perbenzoate)
 $(CH_3)_3COOOCCH_2CH_5$.

Properties: Colorless liquid with mild aromatic odor; sp. gr. 1.04 (25/25°C); f.p. 8.5°C; vapor pressure 0.33 mm (50°C); flash point 200°F. Soluble in alcohols, esters, ethers, ketones; insoluble in water.

Grade: 98% min.

Hazard: Oxidizing material; do not store near combustible materials.

Uses: Polymerization initiator for polyethylene; polystyrene, polyacrylates and polyesters; chemical intermediate.

Shipping regulations: (Rail) Peroxides, organic, liquid, n.o.s., (Rail) Not acceptable.

tert-butyl peroxy-2-ethylhexanoate (tert-butyl peroxoate) $(CH_3)_3COOOCCH(CH_2CH_2CH_2CH_2CH_2CH_2CH_2CH_3)$.

Properties: Colorless liquid with a faint odor; sp. gr. 0.895 (25/25°C); f.p. below -30°C; refractive index 1.426 (25°C) decomposes at 89°C; flash point 190°F. Insoluble in water; miscible with most organic solvents.

Hazard: Oxidizing material. Do not store near combustible materials.

Use: Polymerization catalyst.

Shipping regulations: Peroxides, organic (liquid or solution), n.o.s., (Rail) Yellow label; (Air) Not acceptable.

tert-butyl peroxyisobutyrate (tert-butyl perisobutyrate)
 $(CH_3)_3COOOCCH(CH_3)CH_3$. Available as a 72–75% solution in benzene. Flash point below 80°F.

Hazard: Flammable, dangerous fire risk. Oxidizing agent.

Use: Polymerization catalyst.

Shipping regulations: Peroxides, organic (liquid or solution), n.o.s., (Rail) Red label; (Air) Not acceptable.

tert-butylperoxy isopropyl carbonate (BPIC)
 $(CH_3)_3COOOCCH(CH_3)_2$.

Properties: Liquid; f.p. -3°C; sp. gr. 0.945 g/cc; refractive index (n_D 20/D) 1.4050; flash point (TOC) 112–118°F. Almost insoluble in water; miscible with hydrocarbons, esters and ethers. Relatively stable under ordinary conditions. Combustible.

Grade: Technical (8.6% active oxygen).

Hazard: Moderate fire risk. Oxidizing agent.

Uses: Polymerization initiator; cross-linking agent.

Shipping regulations: Peroxides, organic, liquid, n.o.s., (Rail) Yellow label; (Air) Not acceptable.

tert-butyl peroxypermaleic acid (tert-butyl permaleic acid)
 $(CH_3)_3COOOCCH:CHCOOH$. An unsaturated peroxide.

Properties: White crystalline solid; m.p. 114–116°C (dec); slightly soluble in water, cool 5% alkaline solutions and alcohols; moderately soluble in oxygenated organic solvents, polyester monomers; slightly soluble in petroleum ether, carbon tetrachloride, and chloroform; insoluble in benzene.

Grade: 95% pure.

Hazard: Oxidizing agent. Do not store near combustible materials.

Uses: Polymerization catalyst; bleaching; pharmaceuticals.

Shipping regulations: (Rail) Oxidizing materials, n.o.s., Yellow label. (Air) Peroxides, organic, solid, n.o.s., Organic Peroxide label.

tert-butyl peroxyphthalic acid (tert-butyl perphthalic acid) $(CH_3)_3COOOCCH_2CH_2COOH$.

Properties: White crystalline solid; m.p. 96–99°C; insoluble in water; soluble in cool 5% alkaline solutions and in alcohols; moderately soluble in oxygenated organic solvents, chlorinated hydrocarbons, polyester monomers; slightly soluble in petroleum hydrocarbons.

Grades: 95% pure.

Hazard: Oxidizing agent. Do not store near combustible materials.

Uses: Polymerization catalyst and oxidizing agent.

Shipping regulations: (Rail) Oxidizing materials, n.o.s., Yellow label. (Air) Peroxides, organic, solid, n.o.s., Organic Peroxide label.

tert-butyl peroxyvalate $(CH_3)_3COOOCCH_2CH_2CH_2CH_3$.

Properties: Colorless liquid; sp. gr. 0.854 (25/25°C); f.p. below -19°C; refractive index 1.410 (25°C); decomposes at 70°C; flash point 155–160°F. Insoluble in water and ethylene glycol; soluble in most organic solvents.

Grade: Available as 75% solution in mineral spirits.

Hazard: (solution) Flammable, dangerous risk. Oxidizing agent. May explode on heating.

Use: Polymerization initiator.

Shipping regulations: (Rail) Peroxide, organic, liquid, n.o.s., Yellow label; (solution) Red label. (Air) Not acceptable.

tert-butyl perphthalic acid. See tert-butyl peroxyphthalic acid.

ortho-tert-butylphenol $(CH_3)_3CC_6H_4OH$.

Properties: Light yellow liquid; freezing point -7°C; sp. gr. 0.982 (20°C); b.p. 224°C; flash point (open cup) 230°F. Soluble in isopentane, toluene, and ethyl alcohol; insoluble in water. Combustible.

Hazard: Moderate irritant to eyes and skin.

Uses: Chemical intermediate for synthetic resins, plasticizers, surface-active agents, perfumes, and other products; a permissible antioxidant for aviation gasoline (A.S.T.M. D910-64T).

para-tert-butylphenol $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OH}$.

Properties: White crystalline solid, with a distinctive odor; sp. gr. (crystals) 1.03; sp. gr. (molten) 0.908 (114/4°C); b.p. 239°C; m.p. 100°C. Combustible.

Derivation: Catalytic alkylation of phenol with olefins. Grades and Containers: Flake in 50-lb bags; molten in insulated tank cars and tank trucks.

Hazard: Moderate irritant to eyes and skin.

Uses: Plasticizer for cellulose acetate; intermediate for antioxidants, special starches, oil soluble phenolic resins; pour-point depressors and emulsion breakers for petroleum oils and some plastics; synthetic lubricants; insecticides; industrial odorants.

2(para-tert-butylphenoxy)isopropyl 2-chloroethyl sulfite. See "Aramite."

n-butyl phenylacetate $\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_5$.

Properties: Colorless liquid with rose-honey odor; sp. gr. 0.991–0.994 (25/25°C); b.p. 135–141°C (18 mm) refractive index 1.488–1.490 (20°C). Soluble in 2 volumes 80% alcohol. Combustible. Low toxicity. Made synthetically.

Grade: 98% min.

Uses: Perfumes; flavoring.

n-butyl phenyl ether $\text{C}_4\text{H}_9\text{OC}_6\text{H}_5$.

Properties: Liquid. Sp. gr. (20°C) 0.929; boiling range 202–212°C; color water-white; odor aromatic; flash point 180°F. Combustible. Low toxicity.

4-tert-butylphenyl salicylate
 $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OOCCH}_2\text{C}_6\text{H}_4\text{OH}$.

Properties: Off-white, odorless crystals; m.p. 62–64°C; soluble in alcohol, ethyl acetate, toluene; insoluble in water.

Use: Light absorber, best at 290–330 μ .

n-butylphosphoric acid. See n-butyl acid phosphate.

butyl phthalylbutyl glycolate

$\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_4\text{COOCH}_2\text{COOC}_4\text{H}_9$.

Properties: Colorless, odorless liquid; sp. gr. 1.093–1.103 (25/25°C); b.p. 219°C (5 mm); f.p. below –35°C; darkens on heating above 290°C. Flash point 390°F (open cup). Combustible. Low toxicity. Insoluble in water; extremely light-stable.

Uses: Plasticizer for polyvinyl chloride. FDA-approved for use in vinyl food wrappings.

n-butyl propionate $\text{C}_2\text{H}_5\text{CO}_2\text{C}_4\text{H}_9$.

Properties: Water-white liquid. Apple-like odor. Soluble in alcohol and ether; miscible with all coal tar and petroleum distillates; very slightly soluble in water. Sp. gr. 0.875 (20°C); 0.874 (15.5°C); wt/gal 7.3 lb; b.p. 146°C (commercial grades boil over a range of 130–150°C due to presence of butyl alcohol and esters); f.p. –89°C; flash point 90°F; dilution ratio (nitrocellulose solution method) with toluene 2.1, with petroleum naphtha 1.2. Autoignition temp. 800°F.

Derivation: Esterification of propionic acid with butyl alcohol, with sulfuric acid catalyst.

Grades: Technical (85–90% to 95% ester content).

Containers: Cans; steel drums; tank cars.

Hazard: Flammable, moderate fire risk. Skin and eye irritant.

Uses: Solvent for nitrocellulose; retarder in lacquer thinner; lacquers; ingredient of perfumes, flavors.

butyl ricinoleate $\text{C}_{17}\text{H}_{32}(\text{OH})\text{COOC}_4\text{H}_9$.

Properties: Yellow to colorless oleaginous liquid; soluble in alcohol and ether; insoluble in water. Sp. gr.

0.916 (20/20°C); b.p. approximately 275°C (13 mm); flash point 220°F. Saybolt viscosity 112 (100° F); freezing point indefinite, slightly opaque at –30°C, and very viscous at –50°C; wt/gal 7.62 lb (20°C). Combustible. Low toxicity.

Derivation: Castor oil and butyl alcohol.

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer; lubricant.

butyl rubber. A copolymer of isobutylene (97%) and isoprene (3%). Polymerized below –140°F, with aluminum chloride catalyst.

Properties: Sp. gr. 0.92. Vulcanizates have tensile strength up to 2000 psi (unreinforced) and 3000 psi (reinforced). Service temperature range –70 to +400°F. Good abrasion resistance; excellent impermeability to gases; high dielectric constant; excellent resistance to aging and sunlight; superior shock absorbing and vibration damping qualities. Resistance to oils and greases only fair. Will support combustion.

Grades: Stabilized; latex; chlorine-containing elastomer; low molecular weight (liquid).

Containers: 55-lb blocks or bales, with or without polyethylene film wrapper.

Uses: Tire carcasses and linings, especially for tractors and other out-size vehicles; electric wire insulation; encapsulating compounds; steam hose and other mechanical rubber goods; pond and reservoir sealant. Latex is used for paper coating, textile and leather finishing, and adhesive formulations; air bags for tire vulcanization; self-curing cements; pressure-sensitive adhesives; tire cord dips; sealants.

butyl sebacate. See dibutyl sebacate.

butyl sorbate $\text{C}_4\text{H}_9\text{OOCCH}_2\text{C}_6\text{H}_7$. An insect attractant for the European chafer.

n-butylstannous acid $[(\text{C}_4\text{H}_9)_3\text{Sn}(\text{OH})_3]$ or $[(\text{C}_4\text{H}_9)_3\text{SnOOH}]_n$.

Properties: White, infusible and insoluble free-flowing powder. Exists as a polymer of undetermined chemical structure. Further dehydration results in polymers having molecular weights of 1000–5000 which are soluble in organic solvents.

Hazard: May be toxic by ingestion and skin absorption.

Uses: Polymerization catalyst, antioxidant, and heat stabilizer for PVC (not approved by FDA for food containers); electrically conducting tin oxide coatings on glass, vitreous and metal surfaces; activator for alkaline earth metal phosphates in fluorescent light bulbs; intermediate for silicones.

butyl stearamide. $\text{C}_{17}\text{H}_{35}\text{CONHC}_4\text{H}_9$.

Properties: Light straw-colored liquid; sp. gr. (20/20°C) 0.869; boiling range 195–200°C (2 mm); flash point 430°F; amide odor. Combustible. Low toxicity.

Uses: Plasticizer and intermediate for the synthesis of insecticides, surface-active agents, pharmaceuticals, and textile assistants.

butyl stearate (butyl octadecanoate) $\text{C}_{17}\text{H}_{33}\text{COOC}_4\text{H}_9$.

Properties: Colorless, stable, oleaginous liquid solidifying at about 19°C. Practically odorless, sometimes with faint fatty odor. Sp. gr. 0.855–0.860 (25/25°C); m.p. 19.5–20°C; flash point 320°F (closed cup); combustible. Low toxicity. wt/gal 7.14 lb (68°F); refractive index 1.4430 (20°C); b.p. 350°C. Miscible

with mineral and vegetable oils; soluble in alcohol and ether; insoluble in water.

Derivation: Alcoholysis of stearin or esterification of stearic acid with butyl alcohol.

Grades: Technical; cosmetic; chemically pure.

Containers: Vinyl-coated drums.

Uses: Ingredient of polishes, special lubricants and coatings; lubricants for metals, and in textile and molding industries; in wax polishes as dye solvent; plasticizer for laminated fiber products, rubber hydrochloride, chlorinated rubber, and cable lacquers; carbon paper and inks; emollient in cosmetic and pharmaceutical products; lipsticks; damp-proofer for concrete; flavoring.

1-butyl-3-sulfanyllurea (N-)(butylcarbomoyl) sulfanilamide; N-sulfanyll-N-butylurea; carbutamide)
 $\text{H}_2\text{NC}_6\text{H}_4\text{SO}_2\text{NHCONH}(\text{CH}_2)_3\text{CH}_3$.

Properties: Crystals; m.p. 144–145°C. Soluble in water (pH 5–8).

Derivation: Prepared from butylurea and sulfanilamide.

Use: Medicine.

butyl sulfide. See dibutyl sulfide.

4-tert-butyl-ortho-thiocresol (2-methyl-4-tert-butylthiophenol) $(\text{CH}_3)_3\text{CC}_6\text{H}_3(\text{CH}_3)\text{SH}$.

Properties: Colorless liquid with mild (non-mercaptan) odor; sp. gr. 0.983 (25°C); f.p. -4°C; b.p. 250°C; refractive index (n_{25/D}) 1.546. Insoluble in water; soluble in hydrocarbons. Combustible.

Grades: Available as 98% pure, supplied under nitrogen atmosphere; as 55% solution in hydrocarbon.

Hazard: May be toxic. Solution probably flammable.

Uses: Peptizer for rubbers; polymer modifier; lube oil additive.

4-tert-butylthiophenol $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{SH}$.

Properties: Colorless liquid with mild (non-mercaptan) odor; sp. gr. 0.986 (25°C); f.p. -11°C; b.p. 238°C; refractive index (n_{25/D}) 1.546. Insoluble in water; soluble in hydrocarbons.

Grade: 98%, supplied under nitrogen atmosphere.

Hazard: May be toxic.

Uses: Lube oil additives; polymer modifiers; antioxidants; dyes.

n-butyltin trichloride $\text{C}_4\text{H}_9\text{SnCl}_3$.

Properties: Colorless liquid; fumes in contact with air; sp. gr. 1.71 (25/4°C); b.p. 102°C (12 mm); refractive index (n_{25/D}) 1.5190. Soluble in organic solvents; sparingly soluble in water with partial hydrolysis.

Hazard: Toxic by ingestion. Strong irritant to skin. Do not expose to liquids or vapors. Tolerance, (as Sn), 0.1 mg per cubic meter of air.

Uses: Intermediate; catalyst; stabilizer.

butyl titanate. See tetrabutyl titanate.

para-tert-butyltoluene 1-methyl-4-tert-butylbenzene)
 $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{CH}_3$.

Properties: Colorless liquid. Sp. gr. (20/20°C), 0.857–0.863; b.p. 192.8°C. Combustible. Insoluble in water.

Grade: Technical.

Containers: Tank cars; drums.

Hazard: Toxic by inhalation, ingestion, and skin absorption. Tolerance, 10 ppm in air.

Uses: Solvent; intermediate.

n-butyltrichlorosilane $\text{C}_4\text{H}_9\text{SiCl}_3$.

Properties: Colorless liquid; b.p. 142°C; sp. gr. 1.1608 (25/25°C); refractive index (n_{25/D}), 1.4363; flash point (COC) 126°F. Readily hydrolyzed, with liberation of hydrochloric acid. Soluble in benzene, ether, heptane.

Derivation: Grignard reaction of silicon tetrachloride and n-butylmagnesium chloride.

Grades: Technical, 95%.

Containers: Drums.

Hazard: Moderate fire risk; corrosive to skin and tissue.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not accepted on passenger planes.

tert-butyltrimethylmethane. See hexamethylethane.

N-n-butylurea $\text{C}_4\text{H}_9\text{HNCONH}_2$.

Properties: White solid; decomposes on heating; odorless; m.p. 96°C; soluble in water, alcohol, and ether.

n-butyl vinyl ether. See vinyl n-butyl ether.

butyl xanthate. See butylxanthic acid.

butylxanthic acid (butyl xanthate; butyldithiocarbonic acid) $\text{CH}_3(\text{CH}_2)_3\text{O} \cdot \text{CS} \cdot \text{SH}$. See xanthic acids.

"Butyl Zimate."⁶⁹ Trademark for zinc dibutyldithiocarbamate. (q.v.).

1-butyne. See ethylacetylene.

2-butyne. See crotonylene.

butynediol $\text{HOCH}_2\text{C} \equiv \text{CCH}_2\text{OH}$.

Properties: White orthorhombic crystals; m.p. 58°C; b.p. 238°C; refractive index 1.450 (n_{25/D}); soluble in water, aqueous acids, alcohol and acetone. Insoluble in ether and benzene. Combustible.

Derivation: High-pressure synthesis from acetylene and formaldehyde.

Grades: Crystalline solid, 97%; aqueous solution 35%.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic; strong irritant. May explode on contamination with mercury salts, strong acids and alkali earth hydroxides and halides at high temperatures.

Uses: Intermediate; corrosion inhibitor; electroplating brightener; defoliant; polymerization accelerator; stabilizer for chlorinated hydrocarbons; cosolvent for paint and varnish removal.

3-butyne-1-ol (beta-ethynyl ethanol) $\text{HC} \equiv \text{CCH}_2\text{CH}_2\text{OH}$.

Properties: Water-white liquid with characteristic odor; sp. gr. 0.9257 (20/4°C); refractive index 1.4409 (20°C); b.p. 128.9°C; f.p. -63.6°C. Combustible.

Uses: Preparation of perfume bases, acetylenic esters, plastics, plasticizers, pharmaceuticals, wetting agents, medicinals, and organic synthesis.

butyraldehyde (butaldehyde; n-butanal; n-butyl aldehyde; butyric aldehyde) $\text{CH}_3(\text{CH}_2)_2\text{CHO}$.

Properties: Water-white liquid; characteristic, pungent, aldehyde odor. Sp. gr. 0.8048 (20/20°C); b.p. 75.7°C; vapor pressure 91.5 mm (20°C); flash point 20°F; wt/gal 6.7 lb (20°C); coefficient of expansion 0.00114 (20°C); freezing point -99°C; viscosity 0.0043 poise (20°C). Autoignition temp. 446°F. Slightly soluble in water; soluble in alcohol and ether.

Derivation: (a) Oxo process (q.v.); (b) dehydrogenation of butanol vapors over a catalyst, the butyraldehyde being separated by distillation; (c) partial reduction of crotonaldehyde.

Grades: Technical (93% min.).

Containers: Drums; tank cars.

Hazard: Flammable; dangerous fire risk. Moderately toxic. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

butyric acid (n-butyric acid; butanoic acid; ethylacetic acid; propylformic acid). $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOH}$.

Properties: Colorless liquid; penetrating and obnoxious.

ious odor; refractive index 1.3981 (20°C); sp. gr. 0.9583 (20/4°C); m.p. -5.0 to -8°C; b.p. 163.5°C (757 mm), 75°C (25 mm); vapor pressure 0.84 mm (20°C); flash point 170°F; viscosity 1.61 cps (20°C); autoignition temp. 846°F. Completely soluble in water; miscible with alcohol and ether. Combustible. Derivation: Occurs as glyceride in animal milk fats. Produced as a by-product in hydrocarbon synthesis, by oxidation of butyraldehyde, and by butyric fermentation of molasses or starch.

Grades: 90%; 95%; 99%; edible; synthetic; reagent; technical; F.C.C.

Containers: Drums; tank cars.

Hazard: Strong irritant to skin and tissue.

Uses: Synthesis of butyrate ester perfume and flavor ingredients; pharmaceuticals; deliming agent; disinfectants; emulsifying agents; sweetening gasoline.

Shipping regulations: (Air) Corrosive label.

butyric alcohol. See *n*-butyl alcohol.

butyric aldehyde. See butyraldehyde.

butyric anhydride (CH₃CH₂CH₂CO)₂O.

Properties: Water-white liquid. Hydrolyzes to butyric acid. Sp. gr. 0.9681 (20/20°C); m.p. -75°C; b.p. 199.5°C; vapor pressure 0.3 mm (20°C); flash point 190°F; wt/gal 8.1 lb (20°C). Combustible. Low toxicity.

Grades: Technical; 98%.

Containers: Drums; tanks.

Uses: Manufacture of butyrates, drugs, and tanning agents.

butyrin. See glyceryl tributyrate.

butyrolactam. See 2-pyrrolidone.

butyrolactone (gamma-butyrolactone)

CH₃CH₂CH₂CO.

Properties: Colorless liquid with pleasant odor. B.p. 204°C; m.p. -44°C; sp. gr. 1.144; flash point 209°F (open cup). Miscible with water, alcohol and ether. Combustible.

Derivation: High-pressure synthesis from acetylene and formaldehyde.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion.

Uses: Intermediate for butyric and succinic acids;

solvent for resins; paint removers; petroleum processing.

butyryl. See dipropyl ketone.

butyronitrile (propyl cyanide; butanenitrile)

CH₃(CH₂)₂CN.

Properties: Colorless liquid; sp. gr. (15°C) 0.796; f.p. -112.6°C; b.p. 116-117.7°C. Flash point 79°F (open cup). Slightly soluble in water; soluble in alcohol and ether.

Containers: Drums and tank cars.

Hazard: Toxic. Flammable, dangerous fire risk.

Uses: Basic material in industrial, chemical and pharmaceutical intermediates and products; poultry medicines.

butyryl chloride (butyryl chloride; butanoyl chloride)
C₃H₇COCl.

Properties: Colorless liquid with pungent acid chloride odor. Reacts with alcohol and water; infinitely miscible with ether. Freezing point -89°C; distillation range 100-110°C; sp. gr. 1.028 (15°C); refractive index 1.4121 (n_D 20/D).

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

Use: Organic synthesis.

N-butyryl-para-aminophenol. See "Suconox."

butyryl chloride. See butyryl chloride.

"Buxine."²²⁷ Trademark for amylcinnamic aldehyde.

"Buxinol."²²⁷ Trademark for *n*-amylcinnamic alcohol.

BVE. Abbreviation for butyl vinyl ether. See vinyl *n*-butyl ether.

"B-X-A."²⁴⁸ Trademark for a diarylamine-ketone-aldehyde reaction product.

Properties: Brown powder; sp. gr. 1.10; melting range, 85-95°C; store in a cool place. Soluble in acetone, benzene and ethylene dichloride; insoluble in water and gasoline.

Use: Antioxidant for rubber and nylon.

"BxDC."¹⁷⁷ Trademark for butoxyethyl diglycol carbonate.

"B.Y."³¹⁹ Trademark for riboflavin feed supplement.

BZ. A nonlethal gas which causes temporary disability. It is a derivative of lysergic acid.

- C** Symbol for carbon.
- C¹⁴** (carbon-14). The naturally occurring radioactive isotope of carbon, used in chemical dating, tracer studies, etc.
- Ca** Symbol for calcium.
- CA.** Abbreviation for cellulose acetate and cortisone acetate; also for controlled atmosphere.
- C₃A.** Abbreviation for tricalcium aluminate, as used in cement. See cement, Portland.
- CAB.** Abbreviation for cellulose acetate butyrate.
- "Cab-O-Brade."**²⁷⁵ Trademark for garnet material in granular form for use as an abrasive.
- "Cab-O-Cure."**²⁷⁵ Trademark for cross-linking peroxide agents for elastomers and polyolefins.
Hazard: May be fire risk. See peroxide.
- "Cab-O-Lime."**²⁷⁵ Trademark for granular oxide, primarily of calcium and magnesium, for reacting with or fluxing certain undesirable impurities in molten steel or iron.
- "Cab-O-Sil."**²⁷⁵ Trademark for colloidal silica particles sintered together in chain-like formations. Surface area ranges from 50 to 400 square meters per gram, depending on grade.
Grades: Standard; M-5; L-5; SD-20.
Uses: Thickening and emulsifying agent for oil/water systems; drilling muds; cattle-feed supplements; tile cleaners; dispersion of oil slicks on sea water; plastics.
- "Cab-O-Sperse."**²⁷⁵ Trademark for aqueous dispersions of pyrogenic silica for use in the paper and textile industries.
- cacao butter** (cocoa butter). See theobroma oil.
- C acid.** See 2-naphthylamine-4,8-disulfonic acid.
- cacodylic acid** (dimethylarsinic acid) (CH₃)₂AsOOH.
Properties: Colorless, odorless, deliquescent crystals. M.p. 200°C; soluble in water, alcohol, and acetic acid; insoluble in ether.
Derivation: By distilling a mixture of arsenic trioxide and potassium acetate and oxidizing the resulting product with mercuric oxide.
Hazard: Highly toxic.
Uses: Herbicide, especially for control of Johnson grass on cotton; soil sterilant; chemical warfare; timber thinning.
Shipping regulations: (Rail, Air) Poison label.
- dactinomycin.** USAN name for an antibiotic produced from *Streptomyces* which is 10% dactinomycin and 90% two kinds of actinomycin C.
- "Cadalume"** L.²⁸⁸ Trademark for a bright cadmium electroplating process for a protective coating on iron and steel. Materials used are cadmium oxide, sodium cyanide, and addition agents.
- "Cadalyte."**²⁸ Trademark for a series of compound for cadmium electroplating.
- cadaverine** (1,5-diaminopentane; pentamethylenediamine) NH₂(CH₂)₃NH₂. A ptomaine formed in the decay of animal proteins after death; also made synthetically.
Properties: Syrupy, colorless, fuming liquid; m.p. +9°C; b.p. 178-179°C; soluble in water and alcohol; slightly soluble in ether.
Hazard: Highly toxic by ingestion; absorbed by skin; irritant.
Uses: Preparation of high polymers; intermediate; biological research.
- "Caddy."**⁴⁸ Trademark for a liquid cadmium fungicide used on turf grass.
Hazard: See under cadmium.
- cadinene** C₁₅H₂₄. See sesquiterpene.
- "Cadmate."**⁶⁹ Trademark for cadmium diethyldithiocarbamate.
Hazard: See under cadmium.
- "Cadminate."**³²⁹ Trademark for a turf fungicide containing 60% cadmium succinate and 40% inert matter.
Hazard: See under cadmium.
- cadmium** Cd Metallic element of atomic number 48, group IIB of the periodic table. Atomic weight 112.4. Valence 2. There are eight stable isotopes.
Properties: Soft, blue-white, malleable metal or grayish-white powder. Tarnishes in moist air; corrosion resistance poor in industrial atmospheres. Becomes brittle at 80°C. Resistant to alkalis; high neutron absorber. Sp. gr. 8.642; m.p. 320.9°C; b.p. 767°C; refractive index 1.13; Mohs hardness 2.0. Soluble in acids, especially nitric, and in ammonium nitrate solutions. Lowers melting point of certain alloys when used in low percentage. Combustible.
Occurrence: As greenockite (CdS) ore containing zinc sulfide; also with lead and copper ores containing zinc. Canada, central and western U.S., Peru, Australia, Mexico, Congo.
Derivation: (1) Dust or fume from roasting zinc ores is collected, mixed with coal or coke and NaCl or ZnCl₂ and sintered; the cadmium volatilized is collected in an electrostatic precipitator, leached, fractionally precipitated, and distilled. (2) By direct distillation from cadmium-bearing zinc. (3) By recovery from electrolytic zinc process (about 40%).
Hazard: Highly toxic, especially by inhalation of dust or fume. May be fatal. Cadmium plating of food and beverage containers has resulted in a number of outbreaks of gastroenteritis (food poisoning). Flammable in powder form. Tolerance (dust and soluble compounds), 0.2 mg per cubic meter of air; (oxide fume, as Cd), 0.1 mg per cubic meter of air. Soluble compounds of cadmium are highly toxic; however, ingestion usually induces a strong emetic action which minimizes the risk of fatal or severe poisoning. Use as fungicide may be restricted.
Grades: Technical; powder; pure sticks; ingots; slabs; high-purity crystals (less than 10 ppm impurities).
Uses: Electrodeposited and dipped coatings on metals; bearing and low-melting alloys; electrical equipment; brazing alloys; fire-protection systems; nickel-

cadmium storage batteries; power transmission wire; TV phosphors; basis of pigments used in ceramic glazes, machinery enamels, baking enamels; Weston standard cell; control of atomic fission in nuclear reactors; fungicide; photography and lithography; selenium rectifiers.

Shipping regulations: (metal and soluble compounds) (Rail, Air) Not listed. Consult current regulations.

cadmium acetate (a) $\text{Cd}(\text{OOCCH}_3)_2 \cdot 3\text{H}_2\text{O}$;

(b) $\text{Cd}(\text{OOCCH}_3)_2$.

Properties: Colorless crystals; soluble in water and alcohols. (a) Sp. gr. 2.01; m.p., loses water at 130°C. (b) Sp. gr. 2.341; m.p. 256°C.

Derivation: Interaction of acetic acid and cadmium oxide.

Hazard: Highly toxic. See under cadmium.

Uses: Ceramics (iridescent glazes); manufacture of acetates; assistant in dyeing and printing textiles; laboratory reagent.

Shipping regulations: See under cadmium.

cadmium ammonium bromide (ammonium-cadmium bromide) $\text{CdBr}_2 \cdot 4\text{NH}_4\text{Br}$.

Properties: Colorless crystals. Soluble in alcohol and water.

Hazard: Highly toxic. See under cadmium.

Shipping regulations: See under cadmium.

cadmium antimonide. A semiconductor used in thermoelectric devices.

Hazard: Highly toxic. See under cadmium.

Shipping regulations: See under cadmium.

cadmium-base Babbitt. See Babbitt metal.

cadmium borotungstate $\text{Cd}_5(\text{BW}_{12}\text{O}_{40}) \cdot 18\text{H}_2\text{O}$.

Properties: Yellow, heavy crystals; m.p. 75°C. Soluble in water. Solution yellow or light brown.

Grades: Technical.

Hazard: Highly toxic. See under cadmium.

Use: Separating minerals.

cadmium bromate $\text{Cd}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: White crystals or crystalline powder; sp. gr. 3.758; m.p., decomposes. Soluble in water; insoluble in alcohol.

Derivation: By adding cadmium sulfate to a solution of barium bromate.

Hazard: Highly toxic. Strong oxidizing agent; dangerous in contact with organic materials.

Uses: Analytical reagent.

Shipping regulations: Oxidizing material, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cadmium bromide CdBr_2 or $\text{CdBr}_2 \cdot 4\text{H}_2\text{O}$.

Properties: White to yellowish, efflorescent crystalline powder; sp. gr. 5.192; m.p. (anhydrous) 568°C; b.p. 863°C; soluble in water, acetone, alcohol, and acids.

Derivation: By heating cadmium in bromine vapor.

Grades: Technical; reagent.

Containers: Bottles; cans; cases.

Hazard: Highly toxic. See under cadmium.

Uses: Photography; process engraving; lithography.

Shipping regulations: See under cadmium.

cadmium carbonate CdCO_3 .

Properties: White, amorphous powder; sp. gr. 4.258; decomposes below 500°C. Soluble in acids (dilute) and in concentrated solutions of ammonium salts; insoluble in water.

Hazard: Highly toxic. See under cadmium.

Grades: Reagent.

Shipping regulations: See under cadmium.

cadmium chlorate $\text{Cd}(\text{ClO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, prismatic crystals. Hygroscopic. Sp. gr. 2.28 (18°C); m.p. 80°C. Soluble in alcohol, water, and acetone.

Grades: Technical.

Hazard: Highly toxic. Dangerous in contact with organic materials.

Shipping regulations: Chlorates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cadmium chloride (a) CdCl_2 ; (b) $\text{CdCl}_2 \cdot 2\frac{1}{2}\text{H}_2\text{O}$.

Properties: Small white crystals, odorless; sp. gr. (a) 4.05, (b) 3.327; m.p. (a) 568°C; b.p. (a) 960°C. Soluble in water, alcohol, and acids.

Derivation: Action of hydrochloric acid on cadmium with subsequent crystallization.

Grades: Technical; reagent.

Containers: Bottles; tins; drums.

Hazard: Highly toxic. See under cadmium.

Uses: Preparation of cadmium sulfide; analytical chemistry; photography; dyeing and calico printing; ingredient of electroplating baths; addition to tinning solutions; manufacture of special mirrors; vacuum tube industry.

Shipping regulations: See under cadmium.

cadmium cyanide $\text{Cd}(\text{CN})_2$. Obtained as a white precipitate when potassium or sodium cyanide is added to a strong solution of a cadmium salt. A complex ion is formed when it is dissolved in an excess of the precipitating agent, and a solution of this complex ion is used as an electrolyte for electrodeposition of cadmium.

Hazard: Highly toxic. See under cadmium.

Shipping regulations: (Rail, Air) Cyanides or cyanide mixtures, n.o.s., Poison label.

cadmium diethyldithiocarbamate $\text{Cd}[\text{SC}(\text{S})\text{N}(\text{C}_2\text{H}_5)_2]_2$.

Properties: White to cream colored rods; sp. gr. 1.39; melting range 68–76°C; mostly soluble in benzene, carbon disulfide, chloroform; insoluble in water and gasoline.

Hazard: Highly toxic. See under cadmium.

Uses: Accelerator for butyl rubber.

Shipping regulations: See under cadmium.

cadmium fluoride CdF_2 . Available as pure crystals.

99.89%; density 6.6 g./cc; m.p. approx. 1110°C. Soluble in water and acids; insoluble in alkalis.

Hazard: Highly toxic. See under cadmium.

Uses: Electronic and optical applications; high-temperature dry-film lubricants; starting material for crystals for lasers.

Shipping regulations: See under cadmium.

cadmium hydroxide (cadmium hydrate) $\text{Cd}(\text{OH})_2$.

Properties: White, amorphous powder; sp. gr. 4.79; m.p., loses H_2O (300°C); soluble in ammonium hydroxide and in dilute acids; insoluble in water and alkalis; absorbs carbon dioxide from air.

Derivation: By the action of sodium hydroxide on a cadmium salt solution.

Grades: Technical; C.P.

Containers: Glass bottles; boxes.

Hazard: Highly toxic, see under cadmium.

Use: Cadmium salts; cadmium plating.

Shipping regulations: See under cadmium.

cadmium iodate $\text{Cd}(\text{IO}_3)_2$.

Properties: Fine, white powder; sp. gr. 6.48; m.p., decomposes; slightly soluble in water; soluble in nitric acid or ammonium hydroxide.

Grades: Technical.

Hazard: Highly toxic; fire risk in contact with organic materials.

Use: Oxidizing agent.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Oxidizing material, n.o.s., Oxidizer label.

cadmium iodide CdI_2 .

Properties: White, flaky, crystals; odorless; becomes yellow on exposure to air and light. Occurs in two allotropic forms. Sp. gr. 5.67 (alpha), and 5.30 (beta); m.p. (alpha) 388°C, m.p. (beta) 404°C; b.p. (alpha) 796°C; soluble in water, alcohol, ether, acetone, ammonia, and acids.

Derivation: By the action of hydriodic acid on cadmium oxide.

Hazard: Highly toxic. See under cadmium.

Uses: Photography; medicine; process engraving and lithography; analytical chemistry.

Shipping regulations: See under cadmium.

cadmium molybdate CdMoO_4 .

Properties: Yellow crystals; sp. gr. 5.347; m.p. approx. 1250°C. Slightly soluble in water; soluble in acids.

Grades: Technical; crystals 99.98% pure.

Hazard: Highly toxic. See under cadmium.

Uses: Electronic and optical applications.

Shipping regulations: See under cadmium.

cadmium nitrate (a) $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$; (b) $\text{Cd}(\text{NO}_3)_2$.

Properties: White, amorphous pieces or hygroscopic needles. Soluble in water, ammonia, and alcohol; (a) sp. gr. 2.455; m.p. 59.5°C; b.p. 132°C; (b) m.p. 350°C.

Derivation: Action of nitric acid on cadmium or cadmium oxide and crystallization.

Grades: Technical; reagent.

Containers: Tins; glass bottles, 400-lb drums.

Uses: Coloring glass and porcelain; laboratory reagent; cadmium salts.

Hazard: Highly toxic. Dangerous fire and explosion hazard.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cadmium oxalate $\text{Cd}(\text{COO})_2 \cdot 3\text{H}_2\text{O}$.

Properties: White, amorphous powder; soluble in dilute acids, ammonium hydroxide; insoluble in alcohol and water; sp. gr. 3.32 (dehydrated); m.p., decomposes at 340°C.

Hazard: Highly toxic.

Shipping regulations: See under cadmium.

cadmium oxide CdO .

Properties: (a) Colorless, amorphous powder; sp. gr. 6.95. (b) brown or red crystals; sp. gr. 8.15. Both decompose on heating at 900°C; the crystals are soluble in acids and alkalies and insoluble in water.

Derivation: Cadmium metal is distilled in a retort, the vapor reacted with air, and the oxide collected in a baghouse.

Hazard: Highly toxic; inhalation of vapor or fume may be fatal. Tolerance (fume, as Cd): 0.1 mg per cubic meter of air.

Uses: Cadmium plating baths; electrodes for storage batteries; cadmium salts.

Shipping regulations: See under cadmium.

cadmium pigment. A family of pigments based on cadmium sulfide or cadmium selenide, used chiefly where

high color retention is required. They are light-fast and have good alkali resistance. Red shades are obtained with cadmium selenide, yellow with cadmium sulfide. Used in paints and high-gloss baking enamels; often extended with barium sulfate, and are then called cadmium lithopone.

Hazard: Highly toxic.

Shipping regulations: See under cadmium.

cadmium potassium iodide $\text{CdI}_2 \cdot 2\text{KI} \cdot 2\text{H}_2\text{O}$.

Properties: White powder, becomes yellowish with age; deliquescent; soluble in water, alcohol, ether, and acid; sp. gr. 3.359; m.p. 76°C, with decomposition.

Derivation: By combining cadmium iodide and potassium iodide in solution, in proportion of their combining weights, and subsequent crystallization.

Hazard: Highly toxic. See under cadmium.

Uses: Analytical chemistry; medicine.

Shipping regulations: See under cadmium.

cadmium propionate $\text{Cd}(\text{OOCCH}_2\text{H}_5)_2$. A solid; used in scintillation counters.

Shipping regulations: See under cadmium.

cadmium ricinoleate

$\text{Cd}[\text{CH}_3(\text{CH}_2)_7\text{CHOHCH}_2\text{CH}(\text{CH}_2)_7\text{CO}_2]_2$.

Properties: Odorless, fine, white powder derived from castor oil. M.p. 104°C; sp. gr. 1.11.

Hazard: Highly toxic. See under cadmium.

Uses: Solutions used to stabilize polyvinyl chloride and copolymers against light and heat.

Shipping regulations: See under cadmium.

cadmium selenide CdSe . Red powder. Sp. gr. 5.81 (15/4°C); m.p. above 1350°C; insoluble in water; stable at high temperatures. The red powder form is used as a paint pigment. Pure cadmium selenide is used as a semiconductor.

Shipping regulations: See under cadmium.

cadmium selenide lithopone. See cadmium pigments.

cadmium stearate. Used as a lubricant and stabilizer in plastics.

Hazard: Highly toxic. See under cadmium.

Shipping regulations: See under cadmium.

cadmium succinate $\text{Cd}(\text{OOCCH}_2)_2$. A white powder; slightly soluble in water; soluble in alcohol. Used in insecticides; turf fungicide.

Hazard: Highly toxic. See under cadmium.

Shipping regulations: See under cadmium.

cadmium sulfate (a) CdSO_4 ; (b) $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O}$; (c) $\text{CdSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless, odorless crystals. Sp. gr. (a) 4.69; (b) 3.09; (c) 3.05; m.p. (a) 1000°C. Soluble in water; insoluble in alcohol.

Derivation: By the action of dilute sulfuric acid on cadmium or cadmium oxide.

Grades: Technical; C.P.

Hazard: Highly toxic. See under cadmium.

Uses: Pigments; medicine; vacuum tubes; fluorescent screens; electrolyte in Weston standard cell.

Shipping regulations: See under cadmium.

cadmium sulfide (orange cadmium; see also cadmium pigment) CdS .

Properties: Yellow or brown powder. Sp. gr. 4.82; m.p. 1750°C (100 atm.); sublimes in nitrogen 980°C. Insoluble in cold water; forms a colloid in hot water; soluble in acids and ammonia. Can be polished like a metal. It is an *n*-type semiconductor.

Derivation: (a) By passing hydrogen sulfide gas into a solution of a cadmium salt acidified with hydrochloric acid. The precipitate is filtered and dried. (b) Occurs naturally as greenockite.

Grades: Technical; N.D.; high purity (single crystals).
 Hazard: Highly toxic. See under cadmium.
 Uses: Pigments and inks; ceramic glazes; pyrotechnics; phosphors; fluorescent screens; scintillation counters; rectifiers; photoconductor in xerography; transistors; photovoltaic cells; solar cells.
 Shipping regulations: See under cadmium.

cadmium telluride CdTe.

Properties: Brownish-black, cubic crystals. Oxidizes on prolonged exposure to moist air. Insoluble in water and mineral acids, except nitric, in which it is soluble with decomposition. M.p. 1090°C; sp. gr. 6.2 (15/4°C).

Derivation: Fusion of the elements; reaction of hydrogen telluride and cadmium chloride.

Grades: High purity crystals, 99.99+%.

Hazard: Toxic by inhalation.

Use: Semiconductors.

Shipping regulations: See under cadmium.

cadmium tungstate CdWO₄.

Properties: White or yellow crystals or powder. Soluble in ammonium hydroxide, alkali cyanides; very slightly soluble in water.

Derivation: By the interaction of cadmium nitrate and ammonium tungstate.

Forms: Single crystal rods; broken crystals (crackle).

Hazard: Toxic by inhalation.

Uses: Fluorescent paint; x-ray screens; scintillation counters; catalyst.

Shipping regulations: See under cadmium.

"Cadmofixe."⁴⁷⁰ Trademark for co-precipitated red, orange and yellow cadmium pigments containing barium sulfate.

Hazard: May be toxic. See under cadmium.

"Cadmolith."²⁹⁶ Trademark for a series of yellow and red cadmium-lithopone pigments.

Hazard: May be toxic. See under cadmium.

Uses: Automotive finishes, textile coatings, printing inks, lacquer and rubber.

"Cadmpur."⁴⁷⁰ Trademark for pure red, orange and yellow cadmium pigments.

Hazard: May be toxic. See under cadmium.

"Cadox."⁴¹⁹ Trademark for a series of organic peroxide catalysts.

Hazard: May be fire risk in contact with organic materials.

"Cadoxen."⁵⁰ Brand name for cadmium ethylenediamine hydroxide complex; a colorless, stable cellulose solvent.

Hazard: May be toxic. See under cadmium.

caesium. See cesium.

C₄AF. Abbreviation for tetracalcium aluminoferrate, as used in cement. See cement. Portland.

caffeine (theine; methyltheobromine; 1,3,7-trimethylxanthine) C₈H₁₀N₄O₂ · H₂O (bicyclic compound).

Properties: White, fleecy masses or long, flexible, silky crystals; an alkaloid; loses H₂O at 80°C. Efflorescent in air. M.p. 236.8°C; soluble in chloroform, slightly soluble in water and alcohol, very slightly soluble in ether. Odorless; bitter taste; solutions neutral to litmus.

Derivation: By extraction of coffee beans, tea leaves, or kola nuts; also synthetically. Much of the caffeine of commerce is a by-product of decaffeinated coffee manufacture.

Method of purification: Recrystallization.

Grades: Technical; U.S.P.; F.C.C.

Containers: 1-lb bottles; 5-, 10-, 25-lb cans; 100-150-lb drums.

Hazard: Moderately toxic in dosage of 1 grain or more. Concentration of 200 micrograms per ml has been found to inhibit activity of the enzyme DNA polymerase. Use in soft drinks not to exceed 0.02%.

Uses: Beverages; medicine.

caffeine bromide. See caffeine hydrobromide.

caffeine hydrobromide (caffeine bromide)

C₈H₁₀O₂N₄ · HBr · 2H₂O.

Properties: Colorless, efflorescent crystals; become brownish on exposure to air; decompose at 80-100°C. Soluble in water or alcohol (with decomposition).

Hazard: Moderately toxic.

Use: Medicine.

caffeine sodium benzoate. A mixture of caffeine and sodium benzoate containing 47-50% anhydrous caffeine and 50-53% sodium benzoate. More water-soluble than caffeine.

Properties: White, odorless powder with slightly bitter taste. Slightly soluble in chloroform; soluble in alcohol and water.

Grades: U.S.P.

Uses: See caffeine.

cage compound. See inclusion complex; clathrate compound.

"Cairox."⁴⁵⁹ Trademark for potassium permanganate (q.v.).

cake alum. See aluminum sulfate.

calabarine. See physostigmine.

"CAL"³²³ Trademark for a decolorizing carbon designed for use in fixed or moving beds. Total surface area (N₂, BET Method) 1000-1100 sq m/g; particle size 12 × 40 mesh; apparent density 27.5 lb/cu ft. Used especially in beet sugar refining.

"Calade."¹⁰⁸ Trademark for a powdered, alkaline sodium hexametaphosphate compound containing wetting agents and an aluminum corrosion inhibitor.

Uses: Detergent for dishwashing and general cleaning.

calamine. (1) A hydrated zinc silicate containing 67.5% zinc oxide. Sp. gr. 3.5; Mohs hardness 4.5 to 5. Pyroelectric. Occurs in U.S. and Europe. Source of metallic zinc.

(2) Zinc oxide with low percentage of ferric oxide; ZnO must be 98%. Soluble in mineral acids; insoluble in water. Pharmaceutical preparation (U.S.P.).

calamus oil.

Properties: Yellow to brownish-yellow essential oil. Sp. gr. 0.959-0.970 (15°C); refractive index 1.503-1.510; saponification value 6-20. Slightly soluble in water.

Derivation: By steam distillation of calamus, the stem or root of the sweet flag. Chief known constituents: asarone (see 2,4,5-trimethoxy-1-propenylbenzene) and eugenol.

Containers: Bottles.

Uses: Perfumery; flavoring agent.

"Calatac 1250."¹²⁵ Trademark for a polyvinyl acetate emulsion. Produces durable, stiff finish on textiles. Used for backfilling, bodying, binding.

"Calatac" S.³²⁵ Trademark for a borated resin used as a water-soluble resin binder and plasticizer for textile sizing.

calaverite AuTe₂. One of the gold telluride group of minerals. Corresponds to the same general formula as sylvanite and krennerite. Pale bronze-yellow color or tin-white, tarnishing to bronze yellow on exposure. Metallic luster. Contains 40-43% gold, 1-3% silver. Sp. gr. 9.0; Mohs hardness 2.5. Occurrence: United States (California, Colorado); Australia; Canada. Use: Important source of gold.

"Calcene."¹⁷⁷ Trademark for a specially prepared precipitated calcium carbonate for use in compounding rubber, paints, and plastics. The particles of TM-grade are coated with stearic acid to aid in dispersion. Grade NC is not coated.

calciferol. See ergocalciferol.

calcimine (kalsomine). Essentially chalk and glue in powdered form ready to mix with water. Used as temporary decoration for interior plastic walls. Will not withstand washing.

calcination. Heating of a solid to a temperature below its melting point to bring about a state of thermal decomposition or a phase transition other than melting. Included are the following types of reactions: (1) thermal dissociation, including destructive distillation of organic compounds, e.g., concentration of aluminum by ignition of bauxite; (2) polymorphic phase transitions, e.g., conversion of anatase to rutile form of TiO₂; (3) thermal recrystallization; e.g., devitrification of glass. Calcination is often used in the beneficiation of ores. See also destructive distillation; pyrolysis.

calcite CaCO₃. The most common form of natural calcium carbonate. Dogtooth spar, Iceland spar, nail-head spar, and satin spar are varieties of calcite. Essential ingredient of limestone, marble, and chalk (q.v.).

Properties: Colorless, white, and various colored crystals; vitreous to earthy luster; good cleavage in 3 directions. May contain small amounts of magnesium, iron, manganese and zinc. Reacts with acids to evolve carbon dioxide. Sp. gr. 2.72; Mohs hardness 2.

Uses: Phosphor; Iceland spar is used in optical instruments.

calcitonin. A thyroid hormone controlling the proportion of calcium in circulating blood; may be used in calcium balance control and possibly also in treatment of bone fractures, hypervitaminosis, and other calcium-related diseases. It is obtained in purified form from pig thyroid, and research on synthesis is active.

calcium Ca Alkaline-earth element of atomic number 20, group IIA of the periodic system. Atomic weight 40.08. Valence 2. Six stable isotopes.

Properties: Moderately soft, silver-white, crystalline metal; oxidizes in air to form adherent protective film; can be machined, extruded, or drawn. Soluble in acid; decomposes water to liberate hydrogen. Sp. gr. 1.57; m.p. 845°C; sublimes below its m.p. in vacuum; b.p. 1480°C.

Derivation: Electrolysis of fused CaCl₂; by thermal process under high vacuum from lime reduced with aluminum. Does not occur free in nature.

Forms: Crowns, nodules, ingots; crystals up to 99.9% pure.

Containers: Air-tight tins; well-stoppered glass bottles. Hazard: Evolves hydrogen on contact with moisture. Flammable in finely divided state; fire and explosion hazard when heated or on contact with strong oxidizing agents. Nontoxic.

Uses: Alloying agent for aluminum, copper, and lead; reducing agent for beryllium; deoxidizer for alloys; dehydrating oils; decarburization and desulfurization of iron and its alloys; getter in vacuum tubes; separation of nitrogen from argon; reducing agent in preparation of chromium metal powder, thorium, zirconium, and uranium; fertilizer ingredient.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Crystalline form not accepted on passenger planes.

Note: Calcium is an essential component of bones, teeth, shells and plant structures. It occurs in milk in trace percentages, and is necessary in animal and human nutrition. Vitamin D aids in the deposition of calcium in bones.

calcium 45. Radioactive calcium of mass number 45. Properties: Half-life 164 days; radiation, beta.

Derivation: By reactor irradiation of calcium carbonate, by neutron bombardment of scandium, or as a by-product of the irradiation of calcium nitrate for the preparation of carbon 14.

Forms available: Calcium chloride in hydrochloric acid solution and solid calcium carbonate.

Hazard: Dangerous radiation hazard; allowable concentration in air 3×10^{-8} microcurie per ml. This isotope is a bone-seeker, and may cause damage to the blood-forming organs.

Uses: Research aid for studying water purification, calcium exchange in clays, detergency, surface wetting and other surface phenomena, calcium uptake and deposition in bone, soil characteristics as related to soil utilization of fertilizer and crop yield, diffusion of calcium in glass, etc.

Shipping regulations: (Rail, Air) Consult regulations.

calcium abietate (C₂₀H₂₉O₂)₂Ca. Product of the action of lime on rosin or resin acids. See calcium resinate.

calcium acetate (vinegar salts; gray acetate; lime acetate; calcium diacetate) Ca(CH₃COO)₂ · H₂O.

Properties: Brown, gray or white (when pure) powder; amorphous or crystalline; slightly bitter taste; slight odor of acetic acid; decomposes on heating. Soluble in water; slightly soluble in alcohol. Combustible. Nontoxic.

Derivation: Action of pyroligneous acid on calcium hydroxide; the solution being filtered and evaporated to dryness; yielding gray acetate of lime.

Grades: Technical (80% basis); reagent; C.P.; pure; brown; gray; F.C.C.

Containers: 100-lb Fiberpak; 350-lb Leverpak drums.

Uses: Manufacture of acetone, acetic acid, acetates; mordant in dyeing and printing of textiles; stabilizer in resins; additive to calcium soap lubricants; food additive, as antimold agent in bakery goods, in sausage casings; catalyst manufacture; medicine.

calcium acetylsalicylate (aspirin, soluble) Ca(CH₃COOC₆H₄COO)₂ · 2H₂O.

Properties: White powder. Aqueous solutions are unstable. Soluble in water.

Derivation: (a) Action of acetylsalicylic acid upon calcium carbonate in the presence of a small amount of water. (b) By passing carbon dioxide into an aqueous solution of calcium carbonate and acetylsalicylic acid.

Use: Medicine.

calcium acid sulfite. See calcium hydrogen sulfite.

calcium acrylate ($\text{H}_2\text{C}=\text{CHCOO}$)₂Ca.

Properties: Free-flowing white powder; soluble in water; deliquescent. Solutions polymerize to form hydrophilic resin.

Uses: Ion-exchange clay soil stabilizer, binder and sealer. (laboratory scale only).

calcium alginate.

Properties: White or cream-colored powder, or filaments, grains or granules. Slight odor and taste. Insoluble in water; insoluble in acids, but soluble in alkaline solutions. Nontoxic.

Grade: F.C.C.

Hazard: Flammable, but self-extinguishing.

Uses: Pharmaceutical products; food additive; thickening agent and stabilizer in ice cream, cheese products, canned fruits and sausage casings; synthetic fibers.

See also algin; alginic acid.

calcium aluminate (tricalcium aluminate) $3\text{CaO} \cdot \text{Al}_2\text{O}_3$.

Crystals or powder; sp. gr. (25°C) 3.038; m.p., decomposes 1535°C; soluble in acids. A refractory, and an important ingredient of cements, especially of aluminous cement. Fused calcium aluminate (a glass) can be used for infrared transmission and detection. Noncombustible.

calcium ammonium nitrate. A uniform mixture of about 60% ammonium nitrate and 40% limestone and/or dolomite. A fertilizer containing about 20% nitrogen.

Hazard: Oxidizing material; fire risk in contact with organic materials.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

calcium arsenate (tricalcium ortho-arsenate)

$\text{Ca}_3(\text{AsO}_4)_2$.

Properties: White powder. Slightly soluble in water, soluble in dilute acids. Decomposes on heating.

Derivation: Interaction of calcium chloride and sodium arsenate.

Grades: Technical; C.P.

Hazard: Highly toxic by ingestion and inhalation.

Tolerance, 1 mg per cubic meter of air.

Uses: Insecticide; germicide.

Shipping regulations: (Rail, Air) Poison label.

calcium arsenite CaAsO_3H .

Properties: White, granular powder. Insoluble in water; soluble in acids.

Grades: Technical.

Hazard: Highly toxic.

Uses: Germicides; insecticides.

Shipping regulations: (Rail, Air) Poison label.

calcium ascorbate $\text{Ca}(\text{C}_6\text{H}_7\text{O}_6)_2 \cdot 2\text{H}_2\text{O}$.

Properties: A white to slightly yellow, odorless, crystalline powder. Soluble in water; slightly soluble in alcohol; insoluble in ether. The pH of a 10% solution is between 6.8 and 7.4. Nontoxic.

Grade: F.C.C.

Uses: Food preservative.

calcium biphosphate. See calcium phosphate, monobasic.**calcium bisulfide.** See calcium hydrosulfide.**calcium bisulfite.** See calcium hydrogen sulfite**calcium bromate** $\text{Ca}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder; sp. gr. 3.329;

loses water at 180°C. Very soluble in water. Low toxicity.

Grade: F.C.C.

Hazard: Oxidizing agent. Fire risk in contact with organic materials.

Uses: Maturing agent; dough conditioner.

Shipping regulations: Oxidizing material, n.o.s., (Rail)

Yellow label. (Air) Oxidizer label.

calcium bromide (a) $\text{CaBr}_2 \cdot 6\text{H}_2\text{O}$; (b) CaBr_2 .

Properties: White powder or crystals; odorless; sharp saline taste; very deliquescent; very soluble in water. Also soluble in alcohol and acetone. (a) Sp. gr. 2.295 (25°C); m.p. 38°C; b.p. 149°C (decomposes). (b) Sp. gr. 3.353 (25°C); m.p. 730°C, with slight decomposition; b.p. 806–812°C.

Derivation: By the action of hydrobromic acid on calcium oxide, carbonate, or hydroxide and subsequent crystallization.

Grades: Technical: C.P.

Uses: Photography; medicine; dehydrating agent; food preservative; road treatment; freezing mixtures; sizing compounds; wood preservative.

calcium carbide CaC_2 .

Properties: Grayish-black, irregular hard solid; must be kept dry. Sp. gr. 2.22; m.p. about 2300°C. Garlic-like odor. Decomposes in water, with formation of acetylene and calcium hydroxide and evolution of heat.

Derivation: Interaction of pulverized limestone or quicklime with crushed coke or anthracite in an electric furnace.

Grades: Technical; lumps; powder.

Containers: 2 lb to 5 tons; metal packages, water- and airtight.

Hazard: Forms flammable and explosive gas and corrosive solid on exposure to moisture. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Generation of acetylene gas for welding; manufacture of neoprene; chloroethylenes; vinyl acetate monomer; acetylene chemicals.

Note: Rapidly being replaced by hydrocarbons for most chemical uses.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

calcium carbonate CaCO_3 .

Properties: White powder or colorless crystals, odorless, tasteless; sp. gr. 2.7–2.95; decomposes at 825°C; noncombustible; nontoxic; very slightly soluble in water; soluble in acids with evolution of carbon dioxide.

Occurrence: Calcium carbonate is one of the most stable, common, and widely dispersed materials. It occurs in nature as aragonite, oyster shells, calcite, chalk, limestone, marble, marl, and travertine; especially in Indiana (structural limestone), Vermont (marble), Italy (travertine), and England (chalk).

Derivation: (a) Mined from natural surface deposits. (2) Precipitated (made synthetically) by reaction of calcium chloride and sodium carbonate in water solution, or by passing carbon dioxide through a suspension of hydrated lime ($\text{Ca}(\text{OH})_2$) in water.

Uses: Source of lime; neutralizing agent; filler and extender in rubber, plastics, paints; opacifying agent in paper; fortification of bread; putty; tooth powders; antacid; whitewash; Portland cement; SO₂ re-

removal from stack gases; metallurgical flux; analytical chemistry; CO₂ generation (laboratory).
See also chalk; calcite; marble; limestone; whiting.
Note: Calcium carbonate is a major cause of boiler scale when hard water is used in heating systems.

calcium caseinate.

Properties: White or slightly yellow, nearly odorless powder. Insoluble in cold water; forms a milky solution when suspended in water, stirred and heated.
Nontoxic.
Containers: 100-lb bags.
Uses: Medicine; special foods.
See also casein.

calcium chlorate Ca(ClO₃)₂ · 2H₂O.

Properties: White to yellowish crystals. Keep well stoppered. Melts when rapidly heated at 100°C; m.p. (anhydrous) 340°C. Soluble in water and alcohol. Hygroscopic. Sp. gr. 2.711.
Derivation: By the action of chlorine on hot calcium hydroxide slurry.
Hazard: Oxidizing agent; dangerous fire risk; forms explosive mixtures with combustible materials.
Uses: Photography, pyrotechnics; dusting powder to kill poison ivy.
Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

calcium chloride (a) CaCl₂; (b) CaCl₂ · H₂O; (c) CaCl₂ · 2H₂O; (d) CaCl₂ · 6H₂O.

Properties: White, deliquescent crystals, granules, lumps or flakes. (a) Sp. gr. 2.15 (25°C); m.p. 772°C; b.p. > 1600°C. (b) melt. p. 260°C. (c) U.S.P. grade; sp. gr. 0.835 (25°C). (d) Sp. gr. 1.71 (25°C); b.p., loses 4H₂O at 30°C and 6H₂O at 200°C. All forms soluble in water and alcohol. Water solution is neutral or slightly alkaline. Low toxicity.
Derivation: (1) Action of hydrochloric acid on calcium carbonate and subsequent crystallization. (2) Commercially obtained as a by-product in the Solvay soda and other processes. (3) Recovery from brines.
Grades: Technical; C.P.; F.C.C.; U.S.P. (the dihydrate); various forms and purities; solutions.
Uses: De-icing and dust control of roads; drilling muds; dustproofing, freezeproofing, and thawing coal, coke, stone, sand, ore; concrete conditioning; paper and pulp industry; fungicides; refrigeration brines; drying and desiccating agent; sequestrant in foods; firming agent in tomato canning; tire weight-in; pharmaceuticals; electrolytic cells. For further information refer to Calcium Chloride Institute, Ring Bldg., Washington, D.C.

calcium chlorite. Ca(ClO₂)₂. White crystals; sp. gr. 2.71; decomposes in water.

Hazard: Strong oxidizing agent; fire risk in contact with organic materials.
Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label. Not acceptable on passenger planes.

calcium chromate CaCrO₄; CaCrO₄ · 2H₂O. Bright yellow powder; hydrate loses water at 200°C. Anhydrous; sp. gr. 2.89. Soluble in dilute acids and alcohols; slightly soluble in water.

Containers: Bags; drums.
Grades: Technical.
Hazard: May be toxic; a suspected carcinogen.
Uses: Pigment; corrosion inhibitor; oxidizing agent; depolarizer for batteries; coating for light metal alloys.

calcium citrate (lime citrate; tricalcium citrate) Ca₃(C₆H₅O₇)₂ · 4H₂O. A by-product in the manufacture of citric acid.

Properties: White odorless powder; loses most of its water at 100°C and all of it at 120°C. Almost insoluble in water; insoluble in alcohol.

Grades: Reagent; technical; F.C.C.
Use: Dietary supplement; sequestrant, buffer and firming agent in foods; medicine.

calcium cyanamide (lime nitrogen; calcium carbimide) CaCN₂.

Properties: Colorless crystals or powder; sp. gr. 1.083; m.p. 1300°C; sublimes > 1150°C. Decomposes in water, liberating ammonia and acetylene.

Derivation: Calcium carbide powder is heated in an electric oven, into which nitrogen is passed (24 to 26 hrs.). Any uncombined calcium carbide is leached out after removal.

Grades: Fertilizer, 21% N; industrial.
Containers: 200-lb bags; drums; bulk in cars.
Hazard: Moderately toxic. Skin irritant. Fire risk if exposed to moisture or combined with calcium carbide.
Uses: Fertilizer; nitrogen products; hardening iron and steel.

Shipping regulations: (Air) Containing more than 0.5% calcium carbide: Flammable Solid label.

calcium cyanide Ca(CN)₂.

Properties: Colorless crystals or white powder; gray-black (technical); decomposes in moist air liberating hydrogen cyanide. Dissolves in water and very weak acid, with evolution of hydrogen cyanide. Decomposes above 350°C.

Containers: 4-oz to 100-lb metal boxes or drums.
Hazard: Highly toxic. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Rodenticide; fumigant for greenhouses, flour mills, grain, seed, citrus trees under tents for control of scale insects; leaching of gold and silver ores; other cyanides.

Shipping regulations: (Rail, Air) Poison label.

calcium cyclamate (calcium cyclohexylsulfamate; calcium cyclohexanesulfamate) (C₆H₁₁NHSO₃)₂Ca · 2H₂O.

Properties: White, crystalline, practically odorless powder with very sweet taste. Freely soluble in water (solutions are neutral to litmus); practically insoluble in alcohol, benzene, chloroform and ether; pH (10% solution) 5.5–7.5. Sweetening power approximately, 30 times that of sucrose.

Grades: N.F.; F.C.C.
Containers: 100-lb drums.
Hazard: Not permitted for use in foods and soft drinks due to suspected carcinogenicity.
Uses: Nonnutritive sweetener.
See also cyclamate.

calcium cyclobarbiturate (calcium cyclohexenylethylbarbiturate) Ca(C₁₂H₁₃N₂O₃)₂.

Properties: Whitish powder. Soluble in water; insoluble in alcohol, chloroform, and ether.
Grade: N.F.
Hazard: May be toxic. See barbiturate.
Use: Medicine.

calcium cyclohexanesulfamate. See calcium cyclamate.

calcium cyclohexylsulfamate. See calcium cyclamate.

calcium dehydroacetate (C₈H₇O₄)₂Ca. See also dehydroacetic acid.

Properties: White to cream powder. Almost insoluble in water and organic solvents.
Grades: 96% minimum.
Use: Fungicide.

calcium diacetate. See calcium acetate.

calcium dibromobehenate ($C_{22}H_{41}O_2Br_2$)₂Ca.

Properties: White to yellow powder; odorless; tasteless. Protect from light. Soluble in ether, chloroform, acetone, carbon tetrachloride, and benzene; insoluble in water or alcohol.

Use: Medicine.

calcium dichromate $CaCr_2O_7 \cdot 3H_2O$, or $4.5 H_2O$.

Properties: Brownish-red crystals; deliquescent; sp. gr. (4.5 H_2O variety) 2.136. Soluble in water.

Grades: Technical; C.P.

Hazard: May be toxic.

Use: Corrosion inhibitor.

calcium dihydrogen sulfite. See calcium hydrogen sulfite.

calcium dioxide. See calcium peroxide.

calcium disodium edetate (USAN) (calcium disodium EDTA; edathamil calcium disodium; calcium disodium *ethylenediaminetetraacetate*)

$CaNa_2C_{10}H_{12}N_2O_8 \cdot xH_2O$. For other variations of the name see ethylenediaminetetraacetic acid. The calcium disodium salt is a mixture of the dihydrate and trihydrate.

Properties: White, odorless powder or flakes; slightly hygroscopic; faint saline taste. Stable in air. Soluble in water; insoluble in organic solvents. It acts as a chelating agent for heavy metals.

Grades: U.S.P.; F.C.C.

Uses: Medicine (antidote in heavy-metal poisoning); in foods to "complex" trace heavy metals, as a preservative, and to retain color and flavor; antigushing agent in fermented malt beverages. (For restrictions on food uses see FDA regulations.)

calcium disodium ethylenediaminetetraacetate. See calcium disodium edetate.

calcium ethylhexoate. See soaps (2).

calcium ferrocyanide $Ca_2Fe(CN)_6 \cdot 12H_2O$.

Properties: Yellow crystals; decomposes on heating. Soluble in water; insoluble in alcohol; sp. gr. 1.68. Low toxicity.

Use: Removal of metallic impurities in the manufacture of citric, tartaric, and other acids.

calcium fluoride CaF_2 .

Properties: White powder, occurring in nature as fluorite (pure form) or fluorspar (mineral). M.p. $1402^\circ C$, b.p. $2500^\circ C$ (approx.); sp. gr. 3.18. Reacts with hot concentrated sulfuric acid to liberate hydrofluoric acid. Insoluble in water; soluble in ammonium salts.

Derivation: (a) By powdering pure fluorite or fluorspar; (b) by the interaction of a soluble calcium salt and sodium fluoride.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Grades and Uses: See fluorspar. Single pure (99.93%) crystals of calcium fluoride are also produced for use in spectroscopy and electronics, lasers, high-temperature dry-film lubricants.

calcium fluorophosphate (fluoroapatite, FAP). Recently developed laser crystal said to have lowest energy threshold of any room-temperature crystal.

calcium fluosilicate (calcium silicofluoride) (a) $CaSiF_6$; (b) $CaSiF_6 \cdot 2H_2O$.

Properties: White, crystalline powder. Sp. gr. (a) 2.662 ($17.5^\circ C$), (b) 2.254. Very slightly soluble in water.

Derivation: By the action of fluosilicic acid on calcium carbonate and subsequent crystallization.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Ceramics.

calcium folinate (calcium leucovorin)

$C_{20}H_{21}CaN_7O_7 \cdot 5H_2O$. The calcium salt of folinic acid, formerly called the citrovorum factor.

Properties: Yellowish-white or yellow, odorless microcrystalline powder. Very soluble in water. Practically insoluble in alcohol.

Use: Medicine.

calcium formate $Ca(OOCH)_2$. White powder; m.p. $> 300^\circ C$; sp. gr. 2.015. Soluble in water; insoluble in alcohol. Used in the chrome tanning of leather.

calcium gluconate $Ca(C_6H_{11}O_7)_2 \cdot H_2O$.

Properties: White, odorless, practically tasteless, fluffy powder or granules. Stable in air. Loses H_2O at $120^\circ C$. Soluble in hot water; less soluble in cold water; insoluble in alcohol, acetic acid, and other organic solvents; specific rotation (20/D) about $+6^\circ$. Solutions neutral to litmus. Nontoxic.

Derivation: Neutralization of gluconic acid with lime or calcium carbonate.

Grades: Technical; U.S.P.; F.C.C.; special for ampules.

Containers: Cans; fiber drums; barrels.

Uses: Medicine and veterinary medicine; food additive, buffer and sequestering agent; vitamin tablets.

calcium glutamate. Similar to sodium glutamate (q.v.).

calcium glycerophosphate (calcium glycerinophosphate) $Ca_3H_7O_2PO_4$.

Properties: White, crystalline powder; odorless; almost tasteless; slightly hygroscopic; decomposes above $170^\circ C$; slightly soluble in water; insoluble in alcohol. Nontoxic.

Derivation: By esterification of phosphoric acid with glycerol and conversion of glycerophosphoric acid to the calcium salt.

Grades: Technical; pure; F.C.C.

Uses: Medicine and veterinary medicine; stabilizer for plastics; nutrient and dietary supplement.

calcium glycolate $(CH_2OHCOO)_2Ca$.

Properties: White solid.

Grades: Technical.

Use: Source of glycolic acid and of the glycolic acid radical in chemical synthesis.

calcium hydrate. See calcium hydroxide.

calcium hydride CaH_2 .

Properties: Grayish-white lumps or crystals. Acted upon by moist air with formation of calcium hydroxide and evolution of hydrogen. Sp. gr. 1.7; decomposes at $675^\circ C$. Decomposed by water, acids, and lower alcohols.

Grades: Technical; 94% pure.

Containers: Drums.

Hazard: Evolves highly flammable hydrogen when wet; solid product is slaked lime, irritating to skin.

Uses: Reducing agent; drying agent; analytical reagent in organic chemistry; easily portable source of hydrogen; cleaner for blocked-up oil wells.

Shipping regulations: (Air) Flammable Solid label.

Not acceptable on passenger planes. (Rail) Flammable solids, n.o.s., Yellow label.

calcium hydrogen sulfite (calcium bisulfite; calcium dihydrogen sulfite; calcium acid sulfite) $\text{Ca}(\text{HSO}_3)_2$. Exists only in solution and is really a solution of calcium sulfite in an aqueous sulfur dioxide solution. Properties: Yellowish liquid with strong sulfur-dioxide odor; sp. gr. 1.06; corrosive to metals. Soluble in water and acids.

Derivation: Action of sulfur dioxide on calcium hydroxide solution.

Hazard: Irritant and corrosive to skin and tissue.

Uses: Antichlor in bleaching textiles; paper pulp (dissolving lignin); preservative; bleaching sponges; hydroxylamine salts; germicide; disinfectant.

Shipping regulations: (Air) Corrosive label. (Rail) Corrosive materials, n.o.s., White label.

calcium hydrosulfide (calcium bisulfide; calcium sulfhydrate) $\text{Ca}(\text{HS})_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless, transparent crystals. Soluble in alcohol and water. Decomposes in air ($15-18^\circ\text{C}$).

Use: Leather industry.

calcium hydroxide (calcium hydrate; hydrated lime; caustic lime; slaked lime) $\text{Ca}(\text{OH})_2$.

Properties: Soft, white crystalline powder with alkaline, slightly bitter taste. Sp. gr. 2.34; m.p., loses water at 580°C ; pH of water solution (25°C) 12.4. Very slightly soluble in water; soluble in glycerin, syrup, and acids; insoluble in alcohol. Absorbs carbon dioxide from air.

Derivation: Action of water on calcium oxide.

Impurities: Calcium carbonate, magnesium salts, iron.

Grades: Technical; chemical lime (insoluble matter under 2%, Mg under 3%); building lime; U.S.P., C.P., F.C.C.

Containers: Wooden barrels; multiwall paper sacks; bulk.

Hazard: Skin irritant; avoid inhalation.

Uses: Mortar; plasters; cements; calcium salts; causticizing soda; hydrogen; depilatory; unhairing of hides (leather industry); lime paints; medicine; agriculture (to "sweeten" acid soil); ammonia recovery in gas manufacture; disinfectant; water softening; purification of sugar juices; accelerator for low-grade rubber compounds; water paints; soil stabilizers, petrochemicals; food additive, as buffer and neutralizing agent.

calcium hypochlorite (calcium oxychloride) $\text{Ca}(\text{OCl})_2$. See also lime, chlorinated.

Properties: White crystalline solid; sp. gr. 2.35; decomposes at 100°C ; practically clear in water solution. Stable chlorine carrier. An oxidizing material.

Derivation: Chlorination of a slurry of lime and caustic soda with subsequent precipitation of calcium hypochlorite dihydrate, dried under vacuum.

Grades: Commercial (70%); high purity (99.2% available chlorine as calcium hypochlorite).

Containers: Steel drums and cans; plastic and glass bottles.

Hazard: Toxic by ingestion, skin contact and inhalation. Dangerous fire risk in contact with organic materials.

Uses: Algicide; bactericide; deodorant; potable water purification; disinfectant for swimming pools; fungicide; bleaching agent (paper, textiles).

Shipping regulations: (Dry, containing more than 39% available chlorine) (Rail) Yellow label. (Air) Oxidizer label.

calcium hyposulfite. See calcium thiosulfate.

calcium iodate $\text{Ca}(\text{IO}_3)_2$.

Properties: White crystals or powder; odorless; sp. gr. 4.5 (15°C); decomposes 540°C . Soluble in water and nitric acid; insoluble in alcohol. Oxidizing material.

Grades: Technical; C.P.; F.C.C.

Hazard: Fire risk in contact with organic materials.

Uses: Deodorant; medicine; mouth washes; feed additive; food additive; dough conditioner (up to 0.0075 part per 100 lb flour used).

calcium iodide $\text{CaI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Yellowish-white crystals; deliquescent; decomposes in air by absorption of carbon dioxide. Soluble in water, ethyl alcohol, and amyl alcohol; sp. gr. 2.55 (anhydrous 4.0 at 25°C); loses 6 H_2O at 42°C ; m.p. 783°C ; b.p. ca. 1100°C .

Derivation: Action of hydriodic acid on calcium carbonate.

Hazard: Moderately toxic by ingestion and inhalation.

Use: Photography; medicine.

calcium iodobenzenate $\text{Ca}(\text{OOCCH}_2\text{H}_4\text{I})_2$.

Properties: White or yellowish powder containing approximately 24% iodine; unctuous to the touch; odorless, or slight fatty odor. Soluble in warm chloroform; only slightly soluble in alcohol and ether; insoluble in water.

Hazard: Moderately toxic.

Uses: Medicine; feed additive.

calcium ipodate (calcium 3-dimethylaminomethyleneamino)-2,4,6-triiodohydrocinnamate) $\text{Ca}[\text{OOCCH}_2\text{CH}_2\text{C}_6\text{H}(\text{I})_3\text{N}:\text{CHN}(\text{CH}_3)_2]_2$. Listed in N.D. Used as a radiopaque agent in medicine.

calcium lactate $\text{Ca}(\text{C}_3\text{H}_5\text{O}_2)_2 \cdot 5\text{H}_2\text{O}$.

Properties: White, almost tasteless powder; almost odorless. Somewhat efflorescent. Soluble in water, practically insoluble in alcohol. Loses H_2O at 120°C . Nontoxic.

Derivation: By neutralizing dilute lactic acid with calcium carbonate and evaporating the solution.

Grades: N.F.; F.C.C.

Uses: Medicine, veterinary medicine; manufacture of foods; beverages.

calcium laurate $\text{Ca}(\text{OOC}_{11}\text{H}_{23})_2 \cdot \text{H}_2\text{O}$. A soap (crystals when pure) produced by precipitation of a soluble laurate with calcium chloride. For uses, see soap (2).

calcium leucovorin. See calcium folinate.

calcium levulinate $\text{Ca}[\text{CH}_3\text{CO}(\text{CH}_2)_2\text{COO}]_2 \cdot 2\text{H}_2\text{O}$.

Properties: White powder; faint odor like burnt sugar; bitter salty taste. Freely soluble in water; slightly soluble in alcohol; insoluble in ether and chloroform; m.p. $119-125^\circ\text{C}$.

calcium lignosulfonate.

Uses: Binder for nonmagnetic ores; retards setting rate of Portland cement in oil-well casings. See also lignin sulfonate.

calcium linoleate $\text{Ca}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: White powder. Soluble in alcohol and ether; insoluble in water.

Derivation: Interaction of solutions of calcium chloride and a soluble linoleate.

Containers: 100-, 200-, 400-lb drums.

Uses: Waterproofing compounds; emulsifying agent and stabilizer for flat paints, fillers, and enamels.

calcium magnesium aconitate. See dicalcium magnesium aconitate.

calcium magnesium carbonate. See dolomite.

calcium magnesium chloride (magnesium calcium chloride) $\text{CaCl}_2 \cdot \text{MgCl}_2$.

Properties: White, deliquescent crystals; soluble in water and acids; insoluble in alcohol and ether. Nonflammable. Low toxicity.

Derivation: (a) A by-product in the salt industry; (b) by the action of hydrochloric acid on dolomite.

Use: Manufacture of intermediates, dyes, fireproof paints, paper and textile sizing; preservative; laboratory reagent; dehydrating starch.

calcium mandelate $\text{Ca}(\text{C}_8\text{H}_7\text{O}_3)_2$.

Properties: White, odorless powder. Insoluble in alcohol; slightly soluble in cold water.

Use: Medicine and pharmaceuticals.

calcium metasilicate. CaSiO_3 .

Properties: White powder; sp. gr. 2.9. Insoluble in water.

Containers: Bags.

Hazard: Irritant dust. Use in foods restricted to 5% in baking powder, 2% in table salt.

Uses: Absorbent; antacid; adhesives; filler for paper and paper coatings; cosmetics; food additive (anti-caking agent).

See also dicalcium silicate.

calcium molybdate CaMoO_4 .

Properties: White, crystalline powder; m.p. ca. 1250°C ; sp. gr. 4.35; soluble in mineral acids; insoluble in alcohol, ether, or water. Noncombustible.

Derivation: Fusion of calcium oxide and a molybdenum ore.

Grades: Technical; single crystals, 99.97%.

Use: Molybdic acid; alloying agent in production of iron and steel; crystals in optical and electronic applications.

calcium naphthenate.

Properties: Sticky, tenacious mass. Insoluble in water; soluble in ethyl acetate, carbon tetrachloride, gasoline, benzene and ether. Combustible.

Derivation: Precipitation from aqueous solution of calcium salts and sodium naphthenate.

Uses: Waterproofing compositions; adhesives; driers; wood fillers; grafting waxes; cements; varnishes; color lakes.

See also soap (2).

calcium nitrate (lime nitrate; nitrocalcite; lime salt-peter; Norwegian salt-peter)

(a) $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$; (b) $\text{Ca}(\text{NO}_3)_2$.

Properties: White, deliquescent mass. Soluble in water, alcohol and acetone. Sp. gr. (a) 1.82, (b) 2.36; m.p. (a) 42°C , (b) 561°C .

Hazard: Strong oxidizer; dangerous fire risk in contact with organic materials; may explode if shocked or heated.

Grades: Technical; pure; C.P.; reagent.

Uses: Pyrotechnics; explosives; matches; fertilizers; other nitrates; source of carbon 14 by nuclear irradiation.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

calcium nitride Ca_3N_2 .

Properties: Brown crystals; sp. gr. 2.63 (17°C); m.p. 1195°C . Soluble in water with evolution of ammonia, an irritant gas; soluble in dilute acids; insoluble in absolute alcohol.

calcium nitrite $\text{Ca}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless or yellowish crystals. Hygroscopic. Soluble in water; slightly soluble in alcohol. Sp. gr. 2.23 (34°C , anhydrous); m.p., loses water at 100°C .

Grades: Technical.

calcium novobiocin. See novobiocin.

calcium octoate. See soap (2).

calcium orthophosphate. See calcium phosphate, tribasic.

calcium orthotungstate. See calcium tungstate.

calcium oxalate CaC_2O_4 .

Properties: White, crystalline powder; soluble in dilute hydrochloric acid, dilute nitric acid; insoluble in acetic acid and water. Sp. gr. 2.2.

Grades: Technical; C.P.

Hazard: Toxic and irritant.

Use: Making oxalic acid and organic oxalates.

calcium oxide (lime; quicklime; burnt lime; calx; unslaked lime; fluxing lime) CaO . Second in order of high-volume chemicals produced in U.S. (1975).

Properties: White, or grayish-white hard lumps, sometimes with a yellowish or brownish tint, due to iron; odorless. Crumbles on exposure to moist air; sp. gr. 3.40; m.p. 2570°C ; b.p. 2850°C . Soluble in acid; reacts with water to form calcium hydroxide, with evolution of heat.

Derivation: Calcium carbonate (limestone) is roasted in kilns until all the carbon dioxide is driven off.

Impurities: Calcium carbonate; magnesium, iron, and aluminum oxides.

Grades: N.F.; technical; chemical lime; agricultural lime; building lime; F.C.C.; single crystals.

Containers: Wooden barrels; bags; freight cars; multi-wall paper sacks.

Hazard: Strong irritant; evolves heat on exposure to water. Dangerous near organic materials. Tolerance, 5 mg per cubic meter of air.

Uses: Refractory; flux in steel manufacture; pulp and paper; mfg. of calcium carbide; SO_2 removal from stack gases; sewage treatment (phosphate removal, pH control); poultry feeds; neutralization of acid waste effluents; insecticides and fungicides; dehairing of hides; food processing; sugar refining.

calcium oxychloride. See calcium hypochlorite.

calcium palmitate $\text{Ca}(\text{C}_{15}\text{H}_{31}\text{CO}_2)_2$. White or pale-yellow powder produced by reacting a soluble palmitate with a soluble calcium salt. Insoluble in water; slightly soluble in alcohol or ether. Combustible.

Uses: Waterproofing agent; thickener for lubricating oils; manufacture of solidified oils. Available only as technical grade. See also soap (2).

calcium pantothenate $(\text{C}_8\text{H}_{17}\text{NO}_5)_2\text{Ca}$. The calcium salt of pantothenic acid, available in either the dextro- or racemic forms; only the dextro- form has vitamin activity.

Properties: (both forms identical) White, slightly hygroscopic, odorless powder; sweetish taste; stable in air; solutions have a pH of 7-9; soluble in water and glycerol; insoluble in alcohol, chloroform, and ether. M.p. 170 - 172°C ; dec. 195 - 196°C ; specific rotation (5% aqueous solution) $+28.2^\circ$ (25°C). Nontoxic.

Source: Same as pantothenic acid.

Grades: U.S.P. (both forms); F.C.C.

Uses: Medicine; animal feeds; dietary supplement.
See also pantothenic acid.

calcium pectate. A material developed in plants such as beans, peas, potatoes, which enables them to seal off fungus-infected areas. See pectic acid; pectins.

calcium perborate $\text{Ca}(\text{BO}_3)_2 \cdot 7\text{H}_2\text{O}$.

Properties: Gray-white lumps or powder. Soluble in acids; also in water with evolution of oxygen.

Uses: Medicine; bleach; tooth powders.

calcium perchlorate $\text{Ca}(\text{ClO}_4)_2$. White crystals; sp. gr. 2.651; decomposes at 270°C . Soluble in water and alcohol.

Hazard: Strong oxidizer; dangerous fire risk in contact with organic materials.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Oxidizer label.

calcium permanganate $\text{Ca}(\text{MnO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Violet crystals, deliquescent; sp. gr. 2.4. Soluble in water and ammonia; decomposed by alcohol.

Grades: Technical; pure.

Hazard: Moderately toxic. Strong oxidizer; dangerous fire risk in contact with organic materials.

Uses: Textile industry; sterilizing water; dentistry; disinfectant; deodorizer; an additive (with hydrogen peroxide) in liquid rocket propellants.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

calcium peroxide (calcium superoxide; calcium dioxide) CaO_2 .

Properties: White or yellowish, odorless, almost tasteless powder. Decomposes about 200°C . Practically insoluble in water; soluble in acids with formation of hydrogen peroxide. Available oxygen 22.2% (min. 13.3% in technical grade).

Derivation: Interaction of solutions of a calcium salt and sodium peroxide, with subsequent crystallization.

Grades: 60-75%; F.C.C.

Hazard: Strong oxidizing agent. Dangerous fire risk in contact with organic materials. Irritant in concentrated form.

Uses: Seed disinfectant; dentrifices; dough conditioners; medicine; bleaching of oils; modification of starches; high-temperature oxidations.

Shipping regulations: (Rail) Yellow label. (Air) Oxidizer label.

calcium phenolsulfonate (calcium sulfocarbolate) $\text{Ca}(\text{C}_6\text{H}_4\text{OHSO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder; odorless. Soluble in water and alcohol.

Derivation: Action of phenolsulfonic acid on calcium hydroxide.

Uses: Disinfectant; medicine.

calcium phosphate. See calcium phosphate, dibasic; calcium phosphate, monobasic; or calcium phosphate, tribasic.

calcium phosphate, dibasic (dicalcium orthophosphate; bicalcium phosphate; secondary calcium phosphate) $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ and CaHPO_4 .

Properties: White, tasteless, crystalline powder; odorless; soluble in dilute hydrochloric, nitric, and acetic acids; insoluble in alcohol; slightly soluble in water. (Hydrate) sp. gr. 2.306; loses water at 109°C . Non-toxic. Nonflammable.

Derivation: Interaction of fluorine-free phosphoric acid with milk of lime.

Grades: U.S.P.; F.C.C.; dentrifice grade; feed grade, $18\frac{1}{2}$ or 21% P.

Uses: Animal feed supplement; food supplement; dentrifice; medicine; glass; fertilizer; stabilizer for plastics; dough conditioner; yeast food.

calcium phosphate, monobasic (calcium biphosphate; acid calcium phosphate; calcium phosphate, primary; monocalcium phosphate) $\text{CaH}_2(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$. See also superphosphate.

Properties: Colorless, pearly scales or powder, deliquescent in air. Soluble in water and acids. Aqueous solutions are acid. M.p., loses H_2O at 100°C , decomposes at 200°C ; sp. gr. 2.20. Nontoxic. Nonflammable.

Derivation: By dissolving either dicalcium or tricalcium phosphates in phosphoric acid and allowing the solution to evaporate spontaneously.

Grades: F.C.C.; ceramic; anhydrous; hydrated.

Uses: Baking powders; fertilizers; mineral supplement; stabilizer for plastics; to control pH in malt; glass manufacture; buffer in foods; firming agent.

calcium phosphate, precipitated. See calcium phosphate, tribasic.

calcium phosphate, primary. See calcium phosphate, monobasic.

calcium phosphate, secondary. See calcium phosphate, dibasic.

calcium phosphate, tertiary. See calcium phosphate, tribasic.

calcium phosphate, tribasic (calcium orthophosphate; tricalcium phosphate; precipitated calcium phosphate; tricalcium orthophosphate; tertiary calcium phosphate) $\text{Ca}_3(\text{PO}_4)_2$. True $\text{Ca}_3(\text{PO}_4)_2$ can be prepared thermally but is rare. Precipitated 'tricalcium phosphate' is a hydroxyapatite (q.v.) with the approximate formula $\text{Ca}_5\text{OH}(\text{PO}_4)_3$. (See also bone ash).

Properties: White, odorless, tasteless crystalline powder. Sp. gr. 3.18; m.p. 1670°C ; refractive index 1.63. Soluble in acids; insoluble in water, alcohol, and acetic acid. Nontoxic, nonflammable.

Derivation: (a) Phosphate rock, apatite, and phosphorite (q.v.). (b) By the interaction of solutions of calcium chloride and sodium triphosphate with excess of ammonia. (c) By interaction of hydrated lime and phosphoric acid.

Grades: Granular; technical; C.P.; N.F.; pure precipitated; F.C.C.

Uses: Ceramics; calcium acid phosphate; phosphorus and phosphoric acid; polishing powder; cattle foods; clarifying sugar syrups; medicine; mordant (dyeing textiles with Turkey red); fertilizers; dentrifices; stabilizer for plastics; in meat tenderizers; in foods as anticaking agent, buffer, nutrient supplement; can remove strontium-90 from milk.

calcium phosphide (photophor) Ca_3P_2 (or Ca_2P_2).

Properties: Red-brown crystals or gray granular masses; sp. gr. 2.51 (15°C); m.p. about 1600°C ; insoluble in alcohol and ether.

Derivation: By heating calcium phosphate with aluminum or carbon; by passing phosphorus vapors over metallic calcium.

Grades: Technical.

Hazard: Dangerous fire risk; decomposed by water to phosphine, which is highly toxic and flammable.

Uses: Signal fires; torpedoes; pyrotechnics.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

calcium phosphite (dicalcium orthophosphite)

Properties: White powder; loses its water at 200–300°C (with decomposition). Slightly soluble in water; insoluble in alcohol.

calcium phytate (hexacalcium phytate) $\text{C}_6\text{H}_6(\text{CaPO}_3)_6$

Properties: Free-flowing white powder; slightly soluble in water. pH of saturated solution is neutral. Low toxicity.

Derivation: Corn steep liquor.

Containers: 50-lb bags.

Uses: To remove excess metals from wine and vinegar; source of calcium in pharmaceuticals and nutrition; source of phytic acid and its salts.

calcium plumbate Ca_2PbO_4

Properties: Orange to brown crystalline powder; decomposed by hot water or carbon dioxide; sp. gr. 5.71. Soluble in acids (with decomposition); insoluble in cold water.

Hazard: Fire risk in contact with organic materials. May be toxic by ingestion.

Uses: Oxidizing agent; pyrotechnics and safety matches; glass; storage batteries.

calcium polysilicate $\text{CaO} \cdot 12\text{SiO}_2$. A powder, used as an anticaking agent.**calcium propionate $\text{Ca}(\text{OOCCH}_2\text{CH}_3)_2$** . (Occurs also with one H_2O .) White powder, soluble in water; slightly soluble in alcohol. Low toxicity.

Grade: F.C.C.

Uses: Mold-inhibiting additive in bread, other foods, tobacco, pharmaceuticals.

calcium propyl arsenate $\text{C}_3\text{H}_7\text{AsO}_3\text{Ca}$. Crystals, soluble in water. Used for preemergence control of crab grass.

Hazard: Highly toxic by ingestion.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

calcium pyrophosphate $\text{Ca}_2\text{P}_2\text{O}_7$

Properties: White powder. Soluble in dilute hydrochloric and nitric acids; insoluble in water. Sp. gr. 3.09; m.p. 1230°C. Nontoxic.

Grade: F.C.C.

Uses: Polishing agent in dentrifices; mild abrasive for metal polishing; nutrient and dietary supplement.

calcium resinate

Properties: Yellowish-white, amorphous powder or lumps. Rosin odor. Soluble in acid; insoluble in water; soluble in amyl acetate, butyl acetate, ether amyl alcohol.

Derivation: By boiling calcium hydroxide with rosin and filtering; fusion of hydrated lime and melted rosin.

Grades: Technical; fused.

Hazard: Flammable; dangerous fire risk; spontaneous heating.

Uses: Waterproofing; manufacturing paint driers, porcelains, perfumes, cosmetics, enamels; coating for fabrics, wood, paper; tanning leather. See also soap (2).

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

calcium ricinoleate

Properties: White powder with a slight odor of fatty

acids. Derived from castor oil. M.p. 84°C; sp. gr. 1.04. Combustible; low toxicity.

Uses: Greases and lubricants; stabilizer for polyvinyl chloride.

calcium D-saccharate $\text{CaC}_6\text{H}_8\text{O}_6 \cdot 4\text{H}_2\text{O}$

Properties: White, crystalline powder; odorless; tasteless; insoluble in water and alcohol; soluble in calcium gluconate solutions. Nontoxic.

Derivation: Oxidation of D-gluconic acid and neutralization with lime.

Use: Medicine.

calcium saccharin $\text{Ca}(\text{C}_6\text{H}_4\text{COSO}_2\text{N})_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$

Properties: White, crystalline powder. Odorless or faint, aromatic odor; intensely sweet taste even in dilute solutions. 10 mg is equivalent in sweetening power to approximately 5 g of sucrose. Soluble in water. Nontoxic.

Grade: N.F.; F.C.C.

Use: Non-nutritive sweetener in medicine and foods.

See also saccharin.

calcium salicylate $\text{Ca}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$

Properties: White powder; odorless, tasteless. Loses all water at 120°C. Soluble in water and alcohol. Nontoxic.

Grades: Purity 99+%.

Use: Medicine.

calcium silicate. See calcium metasilicate; wollastonite; cement, Portland.**calcium silicide CaSi_2**

Properties: Solid; sp. gr. 2.5. Insoluble in cold water; decomposes in hot water; soluble in acids and alkalis.

Hazard: Flammable; may ignite spontaneously in air. Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

calcium silicofluoride. See calcium fluosilicate.**calcium-silicon alloy**. Contains 30% calcium.

Hazard: Flammable; may ignite spontaneously in air.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label.

calcium sorbate $\text{Ca}(\text{OOCCH}_2\text{CH}_3)_2$. Used as a chemical preservative in foods. Nontoxic.**calcium stannate $\text{CaSnO}_3 \cdot 3\text{H}_2\text{O}$** . White crystalline powder; insoluble in water; approximate temperature of dehydration 350°C.

Hazard: Toxic by ingestion and inhalation. Tolerance, 2 mg per cubic meter of air.

Uses: Additive in ceramic capacitors; production of ceramic colors.

calcium stearate $\text{Ca}(\text{C}_{17}\text{H}_{33}\text{O}_2)_2$

Properties: White powder; m.p. 179°C. Insoluble in water; slightly soluble in hot alcohol. Decomposed by many acids and alkalis. Low toxicity.

Derivation: Interaction of sodium stearate and calcium chloride; then filtration.

Grades: Technical; F.C.C.

Containers: Fiber drums; cartons; multiwall paper sacks

Uses: Water repellent; flattening agent in paints; lubricant in making tablets, emulsions, cements; wax crayons, stabilizer for vinyl resins, anticaking agent in foods, cosmetics

calcium strontium sulfide CaSrS ; or $\text{CaS} \cdot \text{SrS}$. Used as a phosphorescent pigment, a phosphor

calcium succinate $\text{CaC}_4\text{H}_4\text{O}_4 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals. Slightly soluble in water; soluble in dilute acids.
Use: Medicine.

calcium sulfamate $\text{Ca}(\text{SO}_3\text{NH}_2)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline solid. Soluble in water. Aqueous solution is stable on boiling. Nonflammable; low toxicity.

Grades: Technical.

Use: Flameproofing agent for textiles and certain grades of paper.

calcium sulfate CaSO_4 or $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Occurs in nature as anhydrite, and in hydrated form as gypsum (plaster of paris).

Properties (pure anhydrous): White odorless powder or crystals; sp. gr. 2.964; m.p. 1450°C . Slightly soluble in water. (Dihydrate, pure precipitated) sp. gr. 2.32; loses $1\frac{1}{2}\text{H}_2\text{O}$ at 128°C ; becomes anhydrous at 163°C . Noncombustible; nontoxic. Neither the anhydrous nor the dehydrate forms can set with water.

Derivation: From natural sources and as a by-product in many chemical operations.

Grades: Technical; pure precipitated (as the dihydrate); F.C.C.

Containers: Bags; bulk shipments in freight cars.

Uses: Portland cement retarder; tile and plaster; source of sulfur and sulfuric acid; polishing powders; paints (white pigment, filler, drier); paper (size, filler, surface-coating); dyeing and calico printing; metal-lurgy (reduction of zinc minerals); drying industrial gases, solids, and many organic liquids; nutrient supplement; in granulated form as soil conditioner; quick-setting cements, molds and surgical casts; wallboard.

calcium sulfhydrate. See calcium hydrosulfide.

calcium sulfide CaS .

Properties: Yellow to light-gray powder with odor of hydrogen sulfide in moist air; unpleasant alkaline taste. Gradually decomposes in moist air or in weak acids. Soluble in acids; slightly soluble in water with partial decomposition; insoluble in alcohol. Sp. gr. 2.8. Low toxicity.

Derivation: Strong heating of pulverized calcium sulfate and charcoal.

Hazard: Irritant to skin and mucous membranes.

Uses: Luminous paint; depilatory; preparation of arsenic-free hydrogen sulfide; veterinary medicine; ore dressing and flotation agent.

calcium sulfite $\text{CaSO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White powder; loses water at 100°C . Soluble in sulfurous acid; slightly soluble in water. Low toxicity.

Derivation: Action of sulfurous acid on calcium carbonate.

Uses: Textiles (antichlor); disinfectant in sugar industry, brewing; biological cleansing; food preservative and discoloration retarder; paper manufacture.

calcium sulfocarbonate. See calcium phenolsulfonate.

calcium sulfocyanate. See calcium thiocyanate.

calcium superoxide. See calcium peroxide.

calcium tannate.

Properties: Yellowish-gray powder. Soluble in dilute acids; slightly soluble in water.

Uses: Pharmaceuticals; adhesives.

calcium tartrate $\text{CaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in dilute acids; slightly soluble in water or alcohol. Low toxicity.

Derivation: Interaction of a calcium salt and crude cream of tartar.

Grades: Technical; C.P.

Use: Tartaric acid.

calcium thiocyanate (calcium sulfocyanate) $\text{Ca}(\text{SCN})_2 \cdot 3\text{H}_2\text{O}$.

Properties: White hygroscopic crystals or powder. Soluble in water and alcohol. Low toxicity.

Uses: Solvent for cellulose and polyacrylate; for parchmentizing; stiffening and swelling of textiles.

calcium thioglycolate $\text{Ca}(\text{SCH}_2\text{COO})_2 \cdot 3\text{H}_2\text{O}$. Stable white powder; loses water at 100°C ; decomposes 250°C . Slightly soluble in water; insoluble in alcohol. Used in cosmetic depilatories.

calcium thiosulfate (calcium hyposulfite) $\text{CaS}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; effloresces at 40°C ; sp. gr. 1.872. Soluble in water and alcohol.

Use: Medicine.

calcium titanate CaTiO_3 .

Properties: Powder; sp. gr. 3.98; m.p. 1800°C . Low toxicity.

Use: Electronics.

calcium trisodium pentetate (USAN) (calcium trisodium[[[carboxymethyl]imino]bis(ethylenenitrolo)] tetracetate) $\text{CaNa}_3\text{C}_{14}\text{H}_{18}\text{N}_3\text{O}_{10}$. A chelating agent; antidote for lead poisoning.

calcium tungstate (calcium orthotungstate; calcium wolframate, normal) CaWO_4 .

Properties: White crystalline powder; sp. gr. 6.062. Soluble in ammonium chloride; slightly soluble in water; decomposed by hot acids.

Derivation: (a) Interaction of calcium chloride and sodium tungstate. (b) Occurs in nature as scheelite; Nevada, California, Arizona, Utah, Colorado; New Zealand; Europe.

Method of purification: A slurry of powdered scheelite is treated with soda ash to form the soluble sodium tungstate. Insoluble impurities are filtered off and calcium tungstate is precipitated with lime.

Uses: Luminous paints; fluorescent lamps; photography; x-ray pictures; medicine.

Note: Synthetic crystals are available for use as scintillation counters, and possible application in lasers.

calcium undecylenate $(\text{CH}_2\text{CH}(\text{CH}_2)_9\text{COO})_2\text{Ca}$. A fine, white powder of limited solubility. M.p. 155°C . Nontoxic.

Uses: Bacteriostat and fungistat in cosmetics and pharmaceuticals.

calcium zirconate CaZrO_3 .

Properties: Solid; m.p. 2550°C ; sp. gr. 4.78. Soluble in nitric and other acids. Noncombustible.

Uses: Refractory metal.

calcium zirconium silicate CaZrSiO_3 or CaO , ZrO_2 , SiO_2 .

Properties: White solid; m.p. 2900°F ; insoluble in water, alkalis; slightly soluble in acids; soluble in hydrofluoric acid. Noncombustible.

Uses: Electrical resistor ceramics; glaze opacifier.

"**Calcochrome**."⁵⁷ Trademark for a series of chrome colors applied in the dyeing of finished goods.

"**Calcocid**."⁵⁷ Trademark for a series of acid dye-stuffs used in the dyeing of wool and worsted goods, natural silk, jute, and in coloring diversified materials.

"**Calcodur**."⁵⁷ Trademark for a series of direct colors applied in the dyeing of cotton, rayon, and miscellaneous vegetable fibers.

"Calcofast."⁵⁷ Trademark for a series of metallized dyes containing chemically combined chromium used for dyeing wool. They can also be applied to leather, nylon, etc.

"Calcofluor."⁵⁷ Trademark for a series of direct dyeing dyes which possess fluorescent properties. Used for dyeing cotton, linen, viscose, acetate, nylon, wool and certain synthetics. Used also in soaps as a brightener for textile use.

"Calconyl."⁵⁷ Trademark for a series of coloring matters which are in substance stabilized combinations of a diazotized color base and a naphthol. They are used for dyeing or printing of fast shades on cotton and rayon.

"Calcophen."⁵⁷ Trademark for a series of oil dyes with non-subliming properties.

Uses: Varnish stains, foil coating, plastics.

"Calcosyn."⁵⁷ Trademark for a series of direct dyes for the dyeing of certain synthetic fibers such as cellulose acetates and nylon.

"Calcotone."⁵⁷ Trademark for a series of highly dispersed pigment pastes used whenever water suspensions of pigments are indicated.

calcspar. See calcite.

calendering. Passing a material between revolving metal rolls for any of several purposes: (1) to convert it into a sheet of uniform thickness, (2) to cause it to impregnate a textile fabric, or (3) to increase its surface gloss and hardness. Calenders (i.e., cylinders) are composed of from three to as many as 10 or 12 hollow, cast-iron rolls up to 84 inches in width, set vertically in a frame. The standard rubber or plastics calender has three steam-heated rolls which turn in opposing directions, either at the same speed or at different speeds. When moving at the same speed, they deliver the mixture fed between the top and center rolls in a smooth sheet, which can be as thin as 0.005 inch, from between the center and bottom rolls. The sheet is usually adhered to a fabric fed from the rear between the center and bottom rolls. If fabric impregnation is desired, the center roll runs faster than the other two, thus pressing the soft and tacky mixture into the textile material (tire carcasses, electrical tape, etc.). In paper manufacturing, a high-speed calender "stack" or supercalender imparts a smooth finish to the sheet as it leaves the drying unit. Laboratory sizes are available.

"Calginate."¹²² Trademark for calcium alginate (q.v.).

"Calgolac."¹⁰⁸ Trademark for a powdered alkaline, sodium hexametaphosphate detergent.

Uses: Cleaning bars, fountains, and laboratory glassware and equipment.

"Calgon."¹⁰⁸ Trademark for a sodium phosphate glass, commonly called sodium hexametaphosphate. It has a molecular ratio of 1.1 Na₂O: 1 P₂O₅ with a guaranteed minimum of 67% P₂O₅.

Derivation: From food-grade phosphoric acid and commercial soda ash by a thermal process.

Forms: Powder, agglomerated particles, and broken glassy plates, either pure or adjusted with mild alkalies.

Properties: Completely soluble in water in all proportions but is insoluble in organic solvents. It possesses sequestering, dispersing and deflocculating properties and precipitates proteins. In very low

concentrations, it inhibits corrosion of steel and prevents the precipitation of slightly soluble, scale-forming compounds such as calcium carbonate and calcium sulfate.

Uses: Softening water without precipitate formation as in dyeing, laundering, textile processing and washing operations; corrosion inhibitor in deicing salt preparations; frozen desserts; pretanning hides in the manufacture of leather; dispersing clays and pigments; threshold treatment for scale and corrosion prevention.

"Calgon, Composition T."¹⁰⁸ Trademark for a complex glassy phosphate produced by a thermal process. White powder passing an 80 mesh sieve. Differs from "Calgon" sodium hexametaphosphate as part of the sodium has been replaced by other cations, predominantly zinc.

Containers: 100-lb bags; 100-lb drums.

Uses: Dispersing calcium carbonates, titanium dioxide, and other pigments used in the pulp and paper mill for coating and filling.

"Calgon, Composition TG."¹⁰⁸ Trademark for colorless glass platelets of sodium zinc hexametaphosphate.

Uses: Corrosion protection in recirculating cooling water and municipal water systems, and after mechanical cleaning of water mains where rapid film formation is important.

"Calgonite."¹⁰⁸ Trademark for alkaline detergent compositions containing complex phosphate as a principal ingredient. Generally recommended for spray-type washing operations where an alkaline cleaner is necessary and superior detergency with freedom from lime deposits is required.

"Calgosil."¹⁰⁸ Trademark for a metaphosphate-silicate compound; used to provide corrosion reduction in low hardness waters.

caliche. See sodium nitrate.

"Califlux."⁵⁰⁰ Trademark for a series of oils composed principally of nitrogen bases and acidaffins. Used in plasticizers, extenders, as reclaiming agents for dark colored compounds.

californium Cf A synthetic radioactive element of the actinide group, with atomic number 98 and atomic weight 252. It has several isotopes, two of which (Cf 252 and Cf 249) are available in milligram amounts. The pure metal has not yet been obtained. Several compounds are known: the trioxide, the trifluoride the trichloride, and the sesquioxide. The 252 isotope has potential uses in neutron activation analysis for continuous materials testing, mineral prospecting, oil-well logging, etc. Biologically, it is a bone-seeking element, and has specialized applications in medicine.

"Calktite."¹²⁴ Trademark for an acid- and alkali-proof caulking compound. Used in protective coating for masonry, acid tanks and floors.

"Calo-Clor."¹²⁹ Trademark for a mercurial turf fungicide containing 73% mercury in chemical combination (principally mercuric and mercurous chlorides). Hazard: Highly toxic by ingestion.

"Calocure."¹²⁹ Trademark for a mercurial turf fungicide having a mercury content of 36%; principally mercuric and mercurous chlorides. Hazard: Highly toxic by ingestion.

"Calodorant."¹⁵¹ Trademark for a group of gas odorants for use in odorization of natural gas.

"Calogreen."³²⁹ Trademark for a turf fungicide composed of extremely finely divided form of mercurous chloride. Contains 85% mercury (insoluble in water). Hazard: Highly toxic by ingestion.

calomel. See mercurous chloride.

caloric. The amount of heat necessary to raise one gram of water one degree centigrade (at 1 atm); a kilogram caloric is the amount of heat required to raise a kilogram of water one degree centigrade. In the latter case, the word Calorie is capitalized when used alone, or the abbreviation kcal may be used. In connection with foods and beverages, kilogram calories are referred to.

calorizing. The process by which steel is coated with aluminum by heating it in aluminum powder. The aluminum forms an alloy with the steel surface and produces a thin, tightly adherent coating. See also cementation.

"Calsolene Oil HSA."³²⁵ Trademark for a sulfated ester; anionic wetting and dispersing agent. Used primarily for wet processing of hydrophobic fibers.

"Cambrelle."²⁰⁶ Trademark for a nonwoven melded fabric used for carpet backing, road reinforcement, upholstery, interlinings, tablecloths and other household applications. It is said to be composed of two different polymers, one lying within the other. Upon heating to the melting point of the external polymer, the fibers soften and unite to form a fabric. The term "melded" refers to this type of fusion. See also nonwoven fabric.

"Camoform."³³⁰ Trademark for bialamcol hydrochloride.

camomile oil. See chamomile oil.

"Camoquin."³³⁰ Trademark for amodiaquine hydrochloride.

cAMP. Biochemical designation for cyclic adenosine-3',5'-monophosphate, an activator of hormones and initiator of prostaglandin synthesis.

2-camphanol. See borneol.

2-camphanone. See camphor.

camphene $C_{10}H_{16}$. A terpene.

Properties: Colorless crystals. Soluble in ether; slightly soluble in alcohol; insoluble in water. M.p. 48–51°C; b.p. 159–162°C.

Derivation: (a) By heating pinene hydrochloride with alkalis, aniline, or alkali salts, such as sodium acetate. (b) A constituent of certain essential oils.

Grades: Technical (46°C m.p.).

Containers: Tins; drums; tanks.

Hazard: Gives off flammable vapors when heated.

Uses: Medicine; manufacture of synthetic camphor; camphor substitute.

camphor (gum camphor; 2-camphanone) $C_{10}H_{16}O$. A ketone occurring naturally in the wood of the camphor tree (*Cinnamomum camphora*).

Properties: Colorless or white crystals, granules or easily broken masses; penetrating aromatic odor; sp. gr. 0.99; m.p. 174–179°C; sublimes slowly at room temperature; slightly soluble in water; soluble in alcohol, ether, chloroform, carbon disulfide, solvent naphtha, and fixed and volatile oils. Flash point 150°F (closed cup); autoignition temp. 871°F. Combustible.

Derivation: Steam distillation of the camphor-tree

wood and crystallization. This product is called natural camphor and is dextrorotatory. Synthetic camphor, most of which is optically inactive, may be made from pinene, which is converted into camphene, (q.v.), which by treatment with acetic acid and nitrobenzene becomes camphor; turpentine oil is also used.

Containers: Tins; drums.

Grades: Technical (synthetic, m.p. 163–168°C; U.S.P. (m.p. 174–179°C).

Hazard: Evolves flammable and explosive vapors when heated; explosive range 0.6 to 3.5% in air; moderately toxic. Tolerance, 2 mg per cubic meter of air.

Uses: Medicine (internal and external); plasticizer for cellulose nitrate, other explosives, and lacquers; insecticides, moth and mildew preventives; tooth powders; flavoring; embalming; pyrotechnics; intermediate.

Note: A liquid form (camphor oil) is produced almost exclusively in Taiwan; formerly used in the manufacture of sassafras oil, the available supply is now used chiefly as a fragrance or flavoring material, and to some extent as a pharmaceutical product.

camphor bromate (alpha-bromo-1-camphor; brominated camphor) $C_{10}H_{15}BrO$.

Properties: Colorless crystals with slight camphor odor and taste. Also available as powder. Discolors in light and should be stored in cool, dark place. M.p. 76°C; b.p. 274°C; sp. gr. 1.449. Soluble in alcohol, ether, chloroform, and oils; insoluble in water.

Derivation: By heating camphor with bromine.

Use: Medicine; camphor derivatives.

camphoric acid $C_{10}H_{14}(COOH)_2$.

Properties: Colorless, odorless needles or scales. Soluble in alcohol, ether, fatty oils, and water; insoluble in chloroform. Sp. gr. 1.186 (20/4°C); m.p. 186–188°C.

Derivation: By oxidizing camphor with nitric acid.

Uses: Pharmaceuticals; medicine.

camphor, Malayan. See borneol.

camphor, peppermint. See menthol.

Canada balsam. See balsam.

cananga oil.

Properties: Yellowish essential oil; floral odor similar to ylang ylang (q.v.). Sp. gr. 0.908–0.925; optical rotation -15° to -30° ; refractive index, 1.495–1.503.

Combustible. Low toxicity.

Grades: Regular (native); rectified (the latter being lighter in color, has better solubility in alcohol, and is more stable); F.C.C.

Derivation: By distillation from the flowers of the Javanese variety of *Cananga odorata*.

Containers: Cans.

Use: Perfumery, particularly for floral types; flavoring agent in foods.

canavanine $NH_2CNHNHOCH_2CH_2CHNH_2COOH$. A non-protein amino acid obtained from jackbean meal. It is found naturally in the L(+) form.

Properties: Crystals, from dilute alcohol; m.p. 184°C (dec); soluble in water; nearly insoluble in alcohol.

Sulfate: Crystals from dilute alcohol; m.p. 172°C (dec); soluble in water.

Use: Biochemical research.

candelilla wax.

Properties: Yellowish-brown, opaque to translucent solid. Soluble in chloroform, turpentine, carbon tetrachloride, trichloroethylene, toluene, hot petroleum ether and alkalis; insoluble in water. Sp. gr.

- 0.983; m.p. 67–68°C; saponification value 65; iodine number 37; refractive index 1.4555. Combustible; nontoxic.
 Occurrence: Mexico, Texas.
 Grades: Crude; refined; powdered.
 Containers: Bags; boxes.
 Uses: Leather dressing; polishes; cements; varnishes; candles; electric insulating composition; sealing wax; waterproofing and insect-proofing containers; paint removers; dentistry; paper sizes; rubber and rubber substitutes; stiffener for soft waxes.
- candidin** (USAN). An antifungal antibiotic produced by *Streptomyces griseus*.
- candidin**. An antifungal antibiotic produced by *Streptomyces viridoflavus*.
- canescine**. See *deserpidine*.
- cane sugar**. See *sucrose*.
- cannabis** (marijuana). Its principle, tetrahydrocannabinol, can be made synthetically.
 Derivation: Dried flowering tops of pistillate plants of *Cannabis sativa*.
 Habitat: Iran, India; cultivated in Mexico and Europe.
 Hazard: Controversial. Hallucinatory and possibly habit-forming by ingestion and inhalation.
 Uses: Formerly as sedative. No present legitimate use.
- cannel coal**. A variety of bituminous or subbituminous coal of uniform and compact fine-grained texture. Dark gray to black, has a greasy luster. It is non-caking; yields a high percentage of volatile matter; and burns with a luminous, smoky flame. (ASTM definition, ASTM D493-39.) Combustible.
 Hazard: Explosion risk in form of dust.
- Cannizzaro, Stanislao** (1826–1910). Born in Italy, he extended the research of Avogadro on the molecular concentrations of gases, and thus was able to prove the distinction of between atoms and molecules. His investigations of atomic weights helped to make possible the discovery of the Periodic Law by Mendeleev. His research in organic chemistry led to the establishment of the Cannizzaro reaction involving the oxidation-reduction of an aldehyde in the presence of concentrated alkali.
- "Cantaxin."**¹⁶² Trademark for ascorbic acid.
- "Cantrece."**¹⁶³ Trademark for a self-crimping nylon yarn; designed specifically for hosiery.
- CAP**. Abbreviation for chloramphenicol.
- capillarity**. The attraction between molecules, similar to surface tension (q.v.), which results in the rise of a liquid in small tubes or fibers, or in the wetting of a solid by a liquid. It also accounts for the rise of sap in plant fibers and of blood in capillary (hair-like) vessels.
- "Capracyl."**¹⁶⁴ Trademark for a group of neutral-dyeing, premetalized acid colors that produce the highest possible degree of light fastness on nylon. Also suitable for dyeing wool, particularly in blends with cellulosic fibers.
- capraldehyde**. See *decanal*.
- "Capran."**¹⁶⁵ Trademark for a transparent, nylon 6 thermoplastic film used for food packaging.
- capreomycin** (USAN). Antibiotic produced by *Streptomyces capreolus*. Used in medicine.
- capric acid** (decanoic acid; decoic acid; decylic acid) $\text{CH}_3(\text{CH}_2)_8\text{COOH}$. Occurs as a glyceride in natural oils.
 Properties: White crystals. Unpleasant odor; soluble in most organic solvents, and dilute nitric acid; insoluble in water. Sp. gr. 0.8858 (40°C); b.p. 270°C. 172.6°C (30 mm); m.p. 31.5°C; refractive index 1.4288 (40°C); acid number 308–315. Combustible; nontoxic.
 Derivation: Fractional distillation of coconut oil fatty acids.
 Grades: Technical; 90%; F.C.C.
 Containers: Drums; tanks; carload lots.
 Uses: Esters for perfumes and fruit flavors; base for wetting agents; intermediates; plasticizer; resins; intermediate for food-grade additives.
- caproic acid** (hexanoic acid; hexylic acid; hexoic acid) $\text{CH}_3(\text{CH}_2)_4\text{COOH}$. Present in milk fats to extent of about 2%.
 Properties: Oily, colorless or slightly yellow liquid; odor of limburger cheese. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.9276 (20/4°C); f.p. –4.0°C; b.p. 205°C; 119°C (30 mm); refractive index 1.4168 (20°C); wt/gal 7.7 lb; viscosity 0.031 poise (20°C). Flash point 215°F (open cup). Combustible.
 Derivation: From crude fermentation of butyric acid; fractional distillation of natural fatty acids.
 Grades: Technical; reagent to 99.8%; F.C.C.
 Containers: Drums; carload lots.
 Hazard: Strong irritant to tissue.
 Uses: Analytical chemistry; flavors; manufacture of rubber chemicals, varnish driers, resins and pharmaceuticals.
 Shipping regulations: (Air) Corrosive label. Legal label name hexanoic acid.
- caproic aldehyde**. See *n-hexaldehyde*.
- caprolactam** (aminocaproic lactam; 2-oxohexamethylencimine)
 $\text{CH}_2(\text{CH}_2)_4\text{NHCO}$.
 Properties: White flakes or fused; m.p. 68–69°C; sp. gr. 70% solution 1.05; refractive index (40°C) 1.4935, (31°C) 1.4965; soluble in water, chlorinated solvents, petroleum distillates and cyclohexene; heat of fusion 29 cal/g; heat of vaporization 116 cal/g; viscosity 9 cps at 78°C; vapor pressure 3 mm Hg at 100°C, 50 mm Hg at 180°C.
 Derivation: (1) Catalytic oxidation of cyclohexane to cyclohexanol, reacting with peracetic acid to form caprolactone, and further reaction with ammonia; (2) catalytic hydrogenation of phenol to cyclohexanone, reaction with ammonia to cyclohexanone oxime, with Beckmann rearrangement with sulfuric acid catalyst; (3) catalytic oxidation of cyclohexane to cyclohexanone, reaction with hydroxylamine sulfate and ammonia to cyclohexanone oxime, followed by sulfuric-acid catalyzed Beckmann rearrangement; (4) UV-catalyzed reaction of cyclohexane with nitrosyl chloride to cyclohexanone oxime hydrochloride, followed by Beckmann rearrangement. Method (1) was never used commercially. Recent modifications of method (3) have been made in order to minimize formation of by-product ammonium sulfate.
 Forms: Flake; molten.
 Containers: 50-lb paper bags, 30-lb fiber drums, tanks (molten).
 Hazard: Toxic by inhalation. Tolerance, 5 ppm in air.
 Uses: Manufacture of synthetic fibers (especially

nylon 6), plastics, bristles, film, coatings, synthetic leather, plasticizers, and paint vehicles; cross-linking agent for curing polyurethanes; synthesis of amino acid lysine.

caprolactone.

Derivation: Reaction product of peracetic acid and cyclohexanone; an intermediate product in manufacture of caprolactam (q.v.).

Containers: Tank cars; tank trucks.

Uses: Intermediate in adhesives, urethane coatings and elastomers; solvent; diluent for epoxy resins; synthetic fibers; organic synthesis.

"Caprolan."⁵²³ Trademark for a polyamide fiber made from polymerized caprolactam. Has excellent dyeability and a wide variety of end-uses; maintains a superior level of dimensional stability after heat setting and has outstanding mechanical qualities. See also caprolactam; nylon.

capryl compounds. The term "capryl" is generally but erroneously used in the trade to refer to octyl compounds. Thus the definition of capryl and caprylic compounds will be found under the corresponding octyl entry, e.g., for capryl alcohol, see 2-n-octanol; for caprylic halides see corresponding octyl halide; for caprylic acid see octanoic acid.

caprylyl peroxide. Legal label name for octyl peroxide (q.v.).

"Captan."¹⁸³ Trademark for a gas odorant built on a mercaptan base. Clear liquid, lighter than water, similar in odor to butyl mercaptan.

Use: To add odor to odorless gases both for safety and for the detection of leaks.

captan (N-trichloromethylmercapto-tetrahydrophthalimide) $C_9H_8Cl_3NO_2S$.

Properties: White to cream powder; m.p. 158–164°C; sp. gr. 1.5. Practically insoluble in water; partially soluble in acetone, benzene and toluene; slightly soluble in ethylene dichloride and chloroform.

Derivation: Reaction product of tetrahydrophthalimide and trichloromethylmercaptan.

Containers: 50-lb fiber drums; 5-lb bags.

Hazard: Toxic and irritant. Avoid contamination of feed and foodstuffs. Avoid inhalation of dust or spray mist. Avoid prolonged or repeated contact with skin.

Uses: Seed treatment; fungicide in paints, plastics, leather, fabrics, and fruit preservation.

"Captax."²⁶⁵ Trademark for 2-mercaptobenzothiazole. Cream-colored to buff powder; characteristic odor. An acid accelerator of vulcanization in tire treads, mechanical rubber goods, wire insulation, footwear, clothing, drug sundries; requires stearic acid as activator. Imparts excellent ageing and heat resistance.

capture. The process in which an atomic or nuclear system acquires an additional particle; for example, the capture of electrons by positive ions, or capture of electrons or neutrons by nuclei. (AEC). See also cross-section (1); neutron; fission.

"Capyco."⁴⁸¹ Trademark for pyrophyllite.

caramel. A sugar-based food colorant made from liquid corn syrup by heating in the presence of catalysts to about 250°F for several hours, cooling to 200°F, and filtering. The brown color results from either Maillard reactions, true caramelization, or oxidative reactions. Caramels are colloidal in nature, the particles being held in solution by either positive or

negative electric charges. See also caramelization; browning reaction.

caramelization. A type of nonenzymic browning reaction occurring during exposure of food products to heat when the products contain no nitrogen compounds, e.g., sugars. See also browning reaction.

carbachol (carbamylcholine chloride; choline chloride carbamate) $NH_2COOCH_2CH_2 \cdot N(CH_3)_3Cl$.

Properties: White or faintly yellow crystals or as crystalline powder, odorless, or with faint amine odor, and hygroscopic. Soluble in water and alcohol; almost insoluble in chloroform and ether. M.p. 201–205°C (with decomposition).

Grade: U.S.P.

Use: Medicine.

carbamate. A compound based on carbamic acid, NH_2COOH , which is used only in the form of its numerous derivatives and salts.

carbamide. See urea.

carbamide peroxide. See urea peroxide.

carbamide phosphoric acid (urea phosphoric acid)

$CO(NH_2)_2 \cdot H_3PO_4$.

Properties: White rhombic crystals. Very soluble in water and alcohol.

Containers: 350-lb drums.

Hazard: Evolves toxic fumes when heated.

Uses: Catalyst for acid-setting resins; flameproofing compositions; cleaning compounds; acidulant.

carbamidine. See guanidine.

carbamite. See sym-diethyldiphenylurea.

carbamylcholine chloride. See carbachol.

carbamylguanidine sulfate. See guanylurea sulfate.

carbamylhydrazine hydrochloride. See semicarbazide hydrochloride.

carbamylmethylcholine chloride. See bethanechol chloride.

carbamylurea. See biuret.

carbanil. See phenyl isocyanate.

carbanilide. See diphenylurea.

carbanion. A negatively charged organic ion such as H_3C^- , RC^- , having one more electron than the corresponding free radical. Carbanions are short-lived but important intermediates in base-catalyzed polymerization and alkylation reactions. See carbanion ion; carbene; free radical.

"Carbanthrene."²⁴³ Trademark for anthraquinone vat dyes.

carbaryl. Generic name for 1-naphthyl-N-methylcarbamate. $C_{10}H_7OOCNHCH_3$.

Properties: Solid; m.p. 142°C.

Derivation: Synthesized directly from 1-naphthol and methyl isocyanate or from naphthyl chloroformate (1-naphthol and phosgene) plus methylamine.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Irritant. A reversible cholinesterase inhibitor. Tolerance, 5 mg per cubic meter of air. Use may be restricted.

Use: Insecticide.

"Carbasols."²²³ Trademark for products consisting of natural resin esters condensed with modifying agents of the polyhydric alcohol-polybasic acid type. Available in wide variation as to physical properties such as color, softening point, and acid number.

Uses: Cellulose-ester lacquers; oleoresinous varnishes; printing ink vehicles.

carbazine. See carbodihydrazide.

carbazole (dibenzopyrrole; diphenylenimine)

(C_6H_4)₂NH (tricyclic).

Properties: White crystals with characteristic odor; m.p. 244–246°C; b.p. 352–354°C; soluble in alcohol and ether; insoluble in water. Low toxicity.

Derivation: (a) From crude anthracene cake by selective solution of the phenanthrene with crude solvent naphtha, removal of the anthracene by conversion into a sulfonic derivative and extraction by means of water. (b) Synthetically, from ortho-aminobiphenyl.

Grades: Technical, 97%.

Containers: Barrels; fiber drums.

Uses: Manufacture of dyes; reagent; explosives; insecticides; lubricants; rubber antioxidants; odor inhibitor in detergents.

carbazotic acid. See picric acid.

carbene (methylene). An organic radical containing divalent carbon. Some divalent carbon derivatives where the carbon is multiple-bonded to oxygen or nitrogen are stable compounds (carbon monoxide); most are highly reactive units that are known only as reaction intermediates. Carbenes, carbonium ions, carbanions, and free radicals are the four most important classes of organic reaction intermediates containing carbon in an unstable valence state. A typical synthesis involving a carbene is that of cyclopropanes by the addition of carbenes to olefins.

2-carbethoxycyclohexanone $OC_6H_9COOC_2H_5$.

Properties: Colorless liquid with a characteristic ester odor; b.p. 106–107°C (11 mm); sp. gr. 1.074 (25°C); refractive index $n_D^{17.5}$ 1.4750. Soluble in dilute alkali; insoluble in water. Combustible.

Use: Intermediate.

2-carbethoxycyclopentanone (ethyl cyclopentanone-2-carboxylate; ethyl-2-oxocyclopentanecarboxylate) $OC_5H_7COOC_2H_5$.

Properties: Colorless liquid with characteristic ester odor; b.p. 122–124°C (25 mm); flash point 191°F; refractive index 1.451 (25°C); sp. gr. 1.0976 (0°C); soluble in equimolecular amounts of dilute alcohol; insoluble in water. Combustible.

Hazard: Avoid inhalation of vapors and contact with skin.

Uses: Intermediate; pharmaceutical intermediate.

beta-carbethoxyethyltriethoxysilane

$C_2H_5OOC(CH_2)_2Si(OC_2H_5)_3$.

Properties: Colorless liquid. B.p. 246°C. Combustible. Hazard: May be toxic and irritant.

Use: Intermediate.

N-carbethoxypiperazine $C_7H_{14}N_2O_2$.

Properties: Colorless, somewhat viscous liquid; slight odor; b.p. 116–117°C (12 mm); 237°C (760 mm); refractive index 1.4756 (25°C). Miscible with water and common organic solvents.

Containers: 55-gal drums.

Use: Intermediate.

beta-carbethoxypropylmethyldiethoxysilane

$C_2H_5OOC(C_3H_6)CH_3Si(OC_2H_5)_2$.

Properties: Colorless liquid. B.p. 228°C. Combustible.

Hazard: May be toxic and irritant.

Use: Intermediate.

carbide. A binary solid compound of carbon and another element. The most familiar carbides are those of calcium tungsten, silicon, boron, and iron (cementite). Two factors have an important bearing on the properties of carbides: (1) the difference in electronegativity between carbon and the second element, and (2) whether or not the second element is a transition metal. Salt-like carbides of alkali metals are obtained by reaction with acetylene; those obtained from silver, copper and mercury salts are explosive. See acetylide. See also carbide, refractory and carbide, cemented.

carbide, cemented. A powdered form of refractory carbide (q.v.) united by compression with a bonding material (usually iron, nickel, or cobalt), followed by sintering. Tungsten carbide (q.v.) is bonded with cobalt at 1400°C; from 3 to 25% of cobalt is used depending on the properties desired. Used chiefly in metal cutting tools, which are hard enough to permit cutting speeds in rock or metal up to 100 times that obtained with alloy steel tools.

carbide, refractory. A carbide (q.v.) characterized by great hardness, thermal stability, high melting point, and chemical resistance. Decomposed by fusion with alkali, and attacked by mixtures of nitric and hydrofluoric acids. The best known refractory carbides are those of silicon, boron, tungsten, molybdenum, and tantalum. Used as abrasives, furnace linings, and other high-temperature applications. Some types are bonded.

carbinol

(1) Synonym for methyl alcohol, CH_3OH .

(2) Hence, any compound of similar structure retaining the COH radical, and in which hydrocarbon radicals may be substituted for the hydrogen originally attached to the carbon. Thus isopropyl alcohol (CH_3)₂CHOH, and benzyl alcohol, $C_6H_5CH_2OH$, may be named dimethylcarbinol and phenylcarbinol respectively.

carbinoxamine maleate

$ClC_6H_4CH(C_3H_4N)OCH_2CH_2N(CH_3)_2 \cdot C_4H_4O_4$.

(2-[para-chloro-alpha-(2-dimethyl-amino-ethoxy)-benzyl]pyridinemaleate.

Properties: White, odorless, bitter crystalline powder; m.p. 116–121°C. Very soluble in water; freely soluble in alcohol and chloroform; very slightly soluble in ether; pH (1% solution) 4.6–5.1.

Grade: N.F.

Use: Medicine.

"Carbitol."²¹⁴ Trademark for a group of mono- and dialkyl ethers of diethylene glycol and their derivatives; specialized solvents with a wide variety of properties and uses. Specific types are as follows:

butyl "Carbitol"

See diethylene glycol monobutyl ether.

butyl "Carbitol" acetate

See diethylene glycol monobutyl ether acetate.

"Carbitol" acetate

See diethylene glycol monoethyl ether acetate.

"Carbitol" solvent

See diethylene glycol monoethyl ether.

dibutyl "Carbitol"

See diethylene glycol dibutyl ether.

diethyl "Carbitol"

See diethylene glycol diethyl ether.

N-hexyl "Carbitol"

See diethylene glycol monohexyl ether.

methyl "Carbitol"

See diethylene glycol monomethyl ether.

methyl "Carbitol" acetate

See diethylene glycol monomethyl ether acetate.

"Carbium."²⁴⁴ Trademark for a precipitated calcium carbonate filler for PVC resins. Used in extruded stocks, calendered stocks, floor tile, plastisols and organosols.

"Carbocaine" Hydrochloride.¹⁶² Trademark for mepivacaine hydrochloride.

carbocyclic. Any organic compound whose "skeleton" is in the form of a closed ring of carbon atoms. This includes both alicyclic and aromatic structures.

carbodihydrazide (carbazide) $\text{CO}(\text{NHNH}_2)_2$.

Properties: Colorless crystals; m.p. 154°C ; sp. gr. 1.1616 (-5°C). Very soluble in water and alcohol.

Uses: Organic intermediate and photographic chemical.

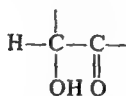

carbodiimide. See cyanamide (1).

"Carbo-Dur."¹⁸⁴ Trademark for an adsorbent of granular activated carbon used in taste, color, and odor removal.

"Carbofrax."²⁸⁰ Trademark for bonded refractory bricks for furnace linings, muffle walls, etc.; also the cement or mortar used to install them. Contains 85% or more silicon carbide. Porosity about 13%. See also refractory; silicon carbide.

carbohydrase. An enzyme whose catalytic activity is directed toward the breaking down of complex carbohydrates to simpler units. Illustrations are amylase; invertase; maltase (q.v.).

carbohydrate. A compound of carbon, hydrogen and oxygen that contains the saccharose grouping

or its first reaction product, and in which the ratio of hydrogen to oxygen is the same as in water. Carbohydrates are the most abundant class of organic compounds, constituting three-fourths of the dry weight of all vegetation. They are also widely distributed in animals and lower forms of life. They comprise (1) monosaccharides: simple sugars, such as fructose (levulose) and its isomer glucose (dextrose), both having the formula $\text{C}_6\text{H}_{12}\text{O}_6$; (2) disaccharides: sucrose ($\text{C}_{12}\text{H}_{22}\text{O}_{11}$), maltose, cellobiose, and lactose; and polysaccharides (high polymeric substances). The last group includes the entire starch and cellulose families, as well as pectin, the seaweed products agar and carrageenan, and natural gums. The simple sugars are crystalline and water-soluble, with a sweet taste; starches are water-soluble, tasteless and amorphous; cellulose is insoluble in water and organic solvents, and is only partially crystalline. Galactose, sorbose, xylose, arabinose, and mannose are constituents of more complex sugars. The natural gums are water-soluble plant products composed of monosaccharide units joined by glycosidic bonds (arabic, tragacanth). See also sugar; starch; cellulose; gums, natural; photosynthesis; nutrient.

"Carbo-Korez."⁴¹ Trademark for a carbon-filled, synthetic-resin, acid-proof cement of the phenolformaldehyde type used as a mortar cement where temperatures do not exceed 370°F . Especially good for high concentrations of sulfuric acid.

"Carbolac."²⁷⁵ Trademark for high color channel blacks; used for paint, varnish, and lacquer.

carbolfuchsin (Ziehl's stain). A staining solution of fuchsin in alcohol and aqueous phenol used in the study of microorganisms.

carbolic acid. Legal label name for phenol (q.v.).

carbolic oil (middle oil). Comprises the fraction having a boiling range of about 190 – 250°C obtained from distillation of coal tar, and containing naphthalene, phenol, and cresols.

3-carbomethoxy-1-methyl-4-piperidone hydrochloride $\text{C}_8\text{H}_{13}\text{NO}_3 \cdot \text{HCl}$. White crystalline solid; m.p. 165°C . Soluble in water, alcohols; insoluble in ether, hydrocarbons.

Use: Pharmaceutical intermediate.

2-carbomethoxy-1-methylvinyl dimethyl phosphate. For the alpha isomer, see mevinphos. The beta isomer is also a pesticide.

carbomycin. An antibiotic isolated from products of *Streptomyces halstedii* when grown in suitable media by deep culture method. It inhibits growth of certain gram-positive bacteria such as staphylococci, pneumococci and hemolytic streptococci.

Properties: White, odorless, bitter powder; m.p. 195 – 220°C (dec). Freely soluble in chloroform; very slightly soluble in water; slightly soluble in alcohol and ether. Stable when protected from moisture; pH (saturated solution) 5.5–8.0.

Use: Medicine.

carbon. C. A nonmetallic element; atomic number 6; atomic weight 12.0111; Group IVA of the Periodic Table; normal valence 4, but divalent forms are known (carbenes). Carbon has two stable and four radioactive isotopes. The C^{12} isotope, which comprises 99% of the element, is the standard to which atomic weights of all other elements are referred (i.e., $\text{C} = 12.00$ exactly). One mole of carbon atoms (6.02×10^{23}) is contained in 12 grams of C^{12} . Carbon has two crystalline allotropes (diamond and graphite) and several amorphous allotropes (coal, coke, carbon black, charcoal).

Carbon is present in all organic and in a few inorganic compounds (carbon oxides, carbon disulfide and metallic carbonates such as calcium carbonate). It is the active element in photosynthesis and thus occurs in all plant and animal life. The radioisotope C^{14} is used in tracer research and chemical dating. Carbon is a strong reducing agent and is used as such in purifying metals. It is the only element capable of forming four covalent bonds. Its strong electrical conductivity is used to advantage in electrodes and other electrical devices. Its presence in small proportions in steel has a pronounced effect on the properties of the metal.

Carbon forms binary compounds called carbides with many metals and some nonmetals. A few compounds are known which contain divalent carbon (carbenes or methylenes).

Since its major properties and uses vary widely with its form, the following entries should be consulted: diamond; graphite; carbon, activated; carbon black; carbon, industrial; charcoal; coke; steel; carbon cycle.

carbon 13. Stable, nonradioactive carbon isotope used for special analytical research. Commercially available in gram quantities.

carbon 14 (radiocarbon). Naturally occurring radioactive carbon isotope of mass number 14; a special

case of radioactivity induced by cosmic rays. Half-life, 5580 years; beta radiation. Can be made by reactor irradiation of calcium nitrate.

Uses: Radiation source in thickness gauges and other instruments; elucidation of mechanisms in organic chemistry, metallurgy, and biochemical reactions; radiocarbon dating in geology and archaeology.

carbon, activated (active carbon; activated charcoal).

An amorphous form of carbon characterized by high adsorptivity for many gases, vapors, and colloidal solids. The carbon is obtained by the destructive distillation of wood, nut shells, animal bones, or other carbonaceous material; it is "activated" by heating to 800–900°C with steam or carbon dioxide, which results in a porous internal structure (honeycomb-like). The internal surface area of activated carbon averages about 10,000 square feet per gram. The specific gravity is from 0.08 to 0.5. It is not effective in removing ethylene.

Grades: Technical: U.S.P., as activated charcoal.

Containers: Bags; fiber drums.

Hazard: Moderate, by inhalation of dust. Flammable.

Uses: Decolorizing of sugar; water and air purification; solvent recovery; waste treatment; removal of sulfur dioxide from stack gases and "clean" rooms; deodorant; removal of jet fumes from airports; catalyst; natural gas purification; brewing; chromium electroplating; air conditioning.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label.

carbonate. A compound resulting from the reaction of either a metal or an organic compound with carbonic acid. The reaction with a metal yields a salt (calcium carbonate), and that with an aliphatic or aromatic compound forms an ester, e.g., diethyl carbonate, diphenyl carbonate. The latter are liquids used as solvents and in synthesizing polycarbonate resins.

See also carbonic acid.

carbon bisulfide. See carbon disulfide.

carbon black. Finely divided forms of carbon made by the incomplete combustion or thermal decomposition of natural gas or petroleum oil. The principal types, according to the method of production, are channel black (also called impingement black), furnace black (q.v.), and thermal black.

Channel black is characterized by lower pH, higher volatile content, and less chainlike structure between the particles. It has the smallest particle size (largest specific surface area) of any industrial material; the particles are in the colloidal range. Surface area runs to about 18 acres per pound. Its chief use is as reinforcing agent for rubber (tire treads); it increases both abrasion and oil resistance. Stearic acid is required for optimum dispersion. Channel black is no longer used extensively.

Thermal black consists of relatively coarse particles and is used principally as a pigment. Furnace black produced from natural gas has an intermediate particle size while that produced from oil can be made in a wide range of controlled particle sizes and is particularly suitable for reinforcing synthetic rubber. Furnace black is by far the most important form of carbon black, greatly exceeding the other two in volume used.

Properties: The raw product is extremely fine, smoke-like powder which remains suspended in air and penetrates thin paper and textiles (channel black). Ther-

mal blacks do not "fly" as readily. Sp. gr. 1.8–2.1; b.p. 4200°C. Insoluble in all solvents.

Forms: Powder; pellets; pastes.

Grades: (ASTM) N660, N550, N330, N110, N220, N761, N762, N601, 5300 (channel), 5301.

Containers: Multiwall paper bags; lined barrels.

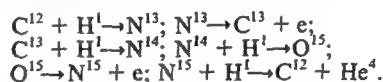

Uses: Tire treads, belt covers, and other abrasion-resistant rubber products; plastics, as reinforcing agent, opacifier, electrical conductivity, UV light absorber; colorant for printing inks; carbon paper; typewriter ribbons; paint pigment; nucleating agent in weather modification; expanders in battery plates.

carbon, combined. A metallurgical term for carbon which has combined chemically with iron to form cementite, as distinct from graphitic carbon in iron or steel. See also pearlite; ferrite.

carbon cycle.

(1) The progress of carbon from the air (carbon dioxide) to plants by photosynthesis (sugar and starches) then through the metabolism of animals to decomposition products which ultimately return it to the atmosphere in the form of carbon dioxide.

(2) One of the processes by which the sun and other self-luminous astronomical bodies are thought to derive their energy. The net process is the combination (fusion) of four hydrogen atoms to form helium. One mechanism, called the carbon cycle, involves successive additions of hydrogen atoms, followed by beta decay, to an initial carbon-12 atom, until a final step is reached in which the new nucleus breaks down to a helium atom and a carbon-12 is regenerated. The carbon thus functions as a catalyst for the process. At the temperatures prevailing in the sun all atoms are stripped of their electrons and the reaction is between the nuclei of the atoms (thermonuclear reaction). Symbolically, the set of reactions is written.

See also fusion (2).

carbon dichloride. See perchloroethylene.

carbon dioxide CO₂. 29th highest-volume chemical produced in the U.S. (1975).

Properties: (a) gas: colorless, odorless, sp. gr. 1.53 (air = 1.00), (b) liquid: volatile, colorless, odorless, sp. gr. (–37°C) 1.101, sp. volume 8.76 cu ft/lb (70°F). (c) solid (dry ice): white, snow-like flakes or cubes, sp. gr. 1.56 (–79°C), m.p. –78.5°C (sublimes). All forms are noncombustible. Soluble in water (carbonic acid, H₂CO₃), hydrocarbons, and most organic liquids. Nontoxic (solid); an asphyxiant gas.

Derivation: (a) gas—CO₂ is present in air to extent of 0.03% by volume and 0.0474% by weight, but is not economically recoverable. Its chief sources are as follows: (1) end product of combustion and respiration, (2) cracking of hydrocarbons, (3) fermentation of carbohydrates, (4) action of heat or acid on limestone, marble, and other carbonates, (5) natural springs or wells. (b) liquid—by compressing and cooling the gas to about –37°C. (c) solid (dry ice)—by expanding the liquid to vapor and snow in presses that compact the product into blocks. The vapor is recycled.

Grades: Technical; U.S.P.; commercial and welding 99.5%.

Containers: Liquid—steel cylinders, tank cars and

trucks. Solid—ten-inch cubes wrapped in paper, insulated corrugated board or other special types. Shipped in insulated refrigerator cars or trucks.

Hazard: (solid) Damaging to skin and tissue; keep away from mouth and eyes. Tolerance (gas): 5000 ppm in air.

Uses: Refrigeration; carbonated beverages; aerosol propellant; chemical intermediate (carbonates, synthetic fibers, paraxylene, etc.); low-temperature testing; fire extinguishing; inert atmospheres; municipal water treatment; medicine; enrichment of air in greenhouses; fracturing and acidizing of oil wells; mining (Cardox method); miscellaneous pressure source; hardening of foundry molds and cores; shielding gas for welding; cloud seeding; moderator in some types of nuclear reactors; immobilization for humane animal killing; special lasers; blowing agent.

Shipping regulations: (Rail) (liquid) Green label. (Air) (Gas or liquid) Nonflammable Gas label.

Note: Carbon dioxide is the source of the carbon utilized by plants to form organic compounds in the photosynthetic reaction, catalyzed by chlorophyll. See photosynthesis; carbon cycle (1).

carbon disulfide (carbon bisulfide) CS₂.

Properties: Clear, colorless or faintly yellow liquid, almost odorless when pure; strong disagreeable odor. Sp. gr. 1.260 at 25/25°C; b.p. 46.3°C; freezing point -111°C; wt/gal 10.48 lb (25°C); refractive index 1.6232 (25°C); flash point -22°F; autoignition temp. 212°F. Soluble in alcohol, benzene, and ether; slightly soluble in water. Classed as an inorganic compound.

Derivation: (a) Reaction of natural gas or petroleum fractions with sulfur. (b) From natural gas and hydrogen sulfide at extremely high temperature (plasma process). (c) By heating sulfur and charcoal and condensing the carbon disulfide vapors.

Method of purification: Distillation.

Impurities: Sulfur compounds.

Grades: 99.9%; spectrophotometric.

Containers: Drums; tank cars.

Hazard: Highly flammable; dangerous fire and explosion risk; can be ignited by friction. Explosive limits in air 1 to 50%. Poisonous. Tolerance, 20 ppm in air. Absorbed by skin. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Viscose rayon; cellophane; manufacture of carbon tetrachloride and flotation agents; veterinary medicine; solvent.

Shipping regulations: (Rail) Red label. Not accepted by express. (Air) Not acceptable.

carbon fiber. See graphite fiber.

carbon fluoride CF₄, C₂F₆. A solid nonconductive material formed on carbon anodes during electrolysis of molten potassium fluoride-hydrogen fluoride mixtures to yield elemental fluorine. C₂F₆ is unstable at 60°C and higher temperatures. (CF) forms only at higher temperatures.

carbon, graphitic. A metallurgical term referring to practically pure carbon which forms in pig iron during cooling, because the absorbing power of iron for carbon decreases as its temperature falls. It exists in the iron in the form of tiny flakes distributed throughout the mass. The tendency of graphitic carbon is to weaken the metal, while combined carbon up to the limit of about 0.90% strengthens it. See also pearlite; cementite; ferrite.

carbon hexachloride. See hexachloroethane.

carbonic acid.

A weak acid formed by reaction of carbon dioxide with water. Both organic and inorganic carbonates are formed from it by reaction with organic compounds or metals, respectively. Thus inorganic carbonates (CaCO₃, KCO₃, Na₂CO₃, etc.) are salts of carbonic acid and organic carbonates are esters of carbonic acid.

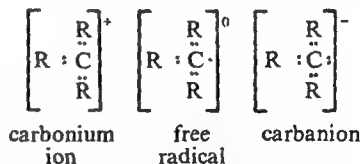

carbonic anhydrase. An enzyme in red blood cells which catalyzes the production of carbon dioxide and water from carbonic acid.

Use: Biochemical research.

carbon, industrial. Any form of pure carbon used for industrial purposes, exclusive of fuel. Coke is one of the most important. Besides its use (combined with coal-tar pitch) for refractories, furnace linings, electrodes, fibers, etc., it has tremendous volume consumption for reduction of iron in blast furnaces (see coke). Graphite in its many applications is another form; activated carbon for decolorizing and solvent recovery, carbon black for rubber and printing inks, industrial diamonds as abrasives and drilling bits, compressed carbon for electrodes and other electrical uses, and carbon fibers and whiskers are all included in this term.

carbonium ion. A positively charged organic ion such as H₃C⁺, H₂RC⁺, R₃C⁺=O, etc., having one less electron than the corresponding free radical and acting in subsequent chemical reactions as though the positive charge was localized on the carbon atom. Such ions can exist only when corresponding negative ions are also present. An electron-deficient carbon atom is extremely reactive and has only a transitory existence in most cases, but many organic rearrangement and replacement reactions are effectively explained in terms of a carbonium ion intermediate, including acid-catalyzed polymerization of propylene and other olefins. In this case propylene and hydrogen ion form a carbonium ion as follows: H₃C—HC=CH₂ + H⁺ → H₃C—HC⁺—CH₃. The latter then combines with another molecule of H₃C—HC=CH₂ to start chain growth.

The difference between a carbonium ion, a free radical and a carbanion may be illustrated as follows:

carbonization. See destructive distillation.

carbon monoxide CO. Discovered by Priestley in America in 1799.

Properties: Colorless gas or liquid; practically odorless. Burns with a violet flame. Slightly soluble in water; soluble in alcohol and benzene. Sp. gr. 0.96716; b.p. -190°C; solidification point -207°C; specific volume 13.8 cu ft/lb (70°F). Autoignition temp. (liquid) 1128°F. Classed as an inorganic compound.

Derivation: (a) Obtained almost pure by placing a mixture of oxygen and carbon dioxide in contact with incandescent graphite, coke or anthracite. (b) Action of steam on hot coke or coal (water gas) or on natural gas (synthesis gas). In the latter case, carbon dioxide is removed by absorption in amine solutions, and the hydrogen and carbon monoxide sep-

arated in a low-temperature unit. (c) By-product in chemical reactions. (d) Combustion of organic compounds with limited amount of oxygen as in automobile cylinders. (e) Dehydration of formic acid.

Grades: Commercial (98%); C.P. (99.5%).

Containers: Cylinders; (liquid) special insulated double-walled trucks.

Hazard: Highly toxic by inhalation; highly flammable, dangerous fire and explosion risk; lower explosion limit in air 12.5% by volume. Tolerance, 50 ppm (industrial workrooms); U.S. standard, 35 ppm. Note: CO has an affinity for blood hemoglobin over 200 times that of oxygen. A major air pollutant.

Uses: Organic synthesis (methanol, ethylene, isocyanates, aldehydes, acrylates; phosgene); fuels (gaseous); metallurgy (special steels, reducing oxides, nickel refining); zinc white pigments.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. See also synthesis gas (I).

"Carbonox."²³⁶ An organic humic acid material used for treatment of drilling mud to reduce viscosity and gel strength. Also used to prepare emulsion muds characterized by low filtration rates, stability, and easy maintenance.

carbon oxybromide. See bromophosgene.

carbon oxychloride. See phosgene.

carbon oxycyanide. See carbonyl cyanide.

carbon oxyfluoride. See carbonyl fluoride.

carbon oxysulfide. See carbonyl sulfide.

carbon steel. See steel.

carbon tetrabromide (tetrabromomethane) CBr_4 . A brominated hydrocarbon.

Properties: Colorless crystals; sp. gr. 3.42; m.p. 90.1°C; b.p. 189.5°C; insoluble in water; soluble in alcohol, ether, and chloroform. Noncombustible.

Hazard: Moderately toxic; narcotic in high concentrations.

Use: Organic synthesis.

carbon tetrachloride (tetrachloromethane; perchloromethane) CCl_4 . A chlorinated hydrocarbon.

Properties: Colorless liquid; yields vapors 5.3 times heavier than air; sweetish, distinctive odor. Sp. gr. 1.585 (25/4°C); b.p. 76.74°C; freezing point -23.0°C; refractive index 1.4607 at 20°C; vapor pressure 91.3 mm (20°C); wt/gal 13.22 lb (25°C); flash point, none. Miscible with alcohol, ether, chloroform, benzene, solvent naphtha, and most of the fixed and volatile oils; insoluble in water. Noncombustible.

Derivation: (a) Interaction of carbon disulfide and chlorine in presence of iron; (b) chlorination of methane or higher hydrocarbons at 250-400°C.

Method of purification: Treatment with caustic alkali solution to remove sulfur chloride, followed by rectification.

Grades: Technical; C.P.; electronic.

Containers: 55-gal drums; tank cars; tank trucks.

Hazard: Highly toxic by ingestion, inhalation, and skin absorption. Narcotic. Tolerance, 10 ppm in air. Decomposes to phosgene at high temperature. Do not use to extinguish fire. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Refrigerants and propellants, especially the chlorofluorohydrocarbons; metal degreasing; agri-

cultural fumigant; chlorinating organic compounds; production of semiconductors.

Shipping regulations: (Air) Poison label. (Rail) Poisonous liquids, n.o.s., Poison label.

Note: Not permitted in products intended for home use.

carbon tetrafluoride. See tetrafluoromethane.

carbon trichloride. See hexachloroethane.

carbonyl group. The divalent group $\text{C}=\text{O}$, which occurs in a wide range of chemical compounds. It is present in aldehydes, ketones, organic acids and sugars, as well as in the carboxyl group, i.e., $\text{C}\begin{smallmatrix} \text{O} \\ \parallel \\ \text{OH} \end{smallmatrix}$.

In combination with transition metals it forms coordination compounds which are highly toxic, as they decompose to release carbon monoxide when absorbed by the body, e.g., nickel carbonyl. Several metal carbonyls have antiknock properties. The carbonyl group is also found in combination with non-metals, as in phosgene (carbonyl chloride); these compounds are also poisonous.

$\text{N,N}'$ -carbonylbis(4-methoxymetanilic acid) disodium salt (sodium methoxymetanilate urea) $[\text{C}_6\text{H}_3(\text{OCH}_3)(\text{SO}_3\text{Na})\text{NH}]_2\text{CO}$.

Properties: Gray paste; solids approx. 70%.

Grades: Technical.

Hazard: May be toxic.

Use: Intermediate.

carbonyl bromide. See bromophosgene.

carbonyl chloride. See phosgene.

carbonyl cyanide (carbon oxycyanide) $\text{CO}(\text{CN})_2$.

Properties: Colorless liquid. Unstable in the presence of water. B.p. -83°C; sp. gr. 1.139 (-114°C); m.p. -114°C.

Hazard: Highly toxic. Tolerance (as CN), 5 mg per cubic meter in air.

Uses: Organic synthesis.

Shipping regulations: (Rail) (Air) Cyanide solutions, n.o.s., Poison label.

carbonyl fluoride (fluoroformyl fluoride; carbon oxyfluoride) COF_2 .

Properties: Colorless gas. Unstable in the presence of water. B.p. -83°C; sp. gr. 1.139 (-114°C); f.p. -114°C. Minimum purity, 97 mole %. Nonflammable. Derivation: Action of silver fluoride on carbon monoxide.

Containers: Liquefied gas in steel cylinders.

Grades: Technical.

Hazard: Highly toxic. Use may be restricted. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Organic synthesis.

Shipping regulations: (Rail) Poisonous gases, n.o.s., Poison Gas label. Not accepted by express. (Air) Not acceptable.

carbonyl sulfide (carbon oxysulfide) COS.

Properties: Colorless gas with typical sulfide odor except when pure. Sp. gr. gas (air = 1) 2.1; f.p. -138.8°C; b.p. -50.2°C (1 atm). Soluble in water and alcohol.

Derivation: Hydrolysis of ammonium or potassium thiocyanate.

Containers: Steel cylinders.

Hazard: Flammable; explosion limits in air 12 to 28.5%. Highly toxic; narcotic in high concentrations.

Uses: Synthesis of thio organic compounds.

Shipping regulations: (Rail) Red gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

carbophenothion Generic name for (S)-[[(para-chlorophenyl)thio]methyl]-O,O-diethyl phosphorodithioate; O,O-diethyl S-(para-chlorophenylthiomethyl) phosphorodithioate. (C₁₂H₁₁O)₂P(S)SCH₂SC₆H₄Cl.

Properties: Amber liquid; b.p. 82°C (0.1 mm); sp. gr. 1.29 (20°C). Essentially insoluble in water; miscible in common solvents.

Hazard: Toxic. Use may be restricted. Cholinesterase inhibitor.

Uses: Insecticide; acaricide.

"Carbopol."¹¹⁹ Trademark for a group of water-soluble resins having excellent suspending, thickening, and gel-forming properties.

Uses: Suspensions of glass fibers, graphite, powdered metals; gel formation in hydrocarbons; emulsifier for creosote, tars, and asphalts.

carborane. A crystalline compound comprised of boron, carbon, and hydrogen. It can be synthesized in various ways, chiefly by the reaction of a borane (penta- or deca-) with acetylene, either at high temperature in the gas phase or in the presence of a Lewis base. Alkylated derivatives have been prepared. Carboranes have different structural and chemical characteristics, and should not be confused with hydrocarbon derivatives of boron hydrides. The predominant structures are the cage type, the nest type and the web type, these terms being descriptive of the arrangement of atoms in the crystal. Active research on carborane chemistry has been conducted under sponsorship of the U.S. Office of Naval Research.

"Carbortam."¹³⁷ Trademark for a metallurgical processing alloy containing 15–20% titanium, 6–8% carbon, 2.4–4.0% silicon, 1.75–2.25% boron, and the balance iron except with traces of phosphorus and sulfur. Used to deoxidize and harden steel.

"Carborundum."²⁸⁰ Trademark for abrasives and refractories of silicon carbide, fused alumina and other materials.

Properties: For silicon carbide—Crystalline form ranges from small to massive crystals in the hexagonal system, the crystals varying from transparent to opaque with colors from pale green to deep blue or black; hardness 9.17 (Mohs); sp. gr. 3.06–3.20; non-combustible; not affected by acids; slowly oxidizes at temperatures above 1000°C; good heat dissipator; highly refractory. For fused alumina—See properties under the trademark "Aloxite."

Uses: Abrasive grains and powders for cutting, grinding and polishing; valve-grinding compounds; grinding wheels; stones; bones; rubbing bricks; coated abrasive products; antislip tiles and treads; refractory grains.

carbosand. Fine sand that has been treated with an organic solution and roasted to produce a material that can be sprayed onto oil slicks to aid in sinking or dispersing them. See also oil spill treatment.

"Carbose."²⁰³ Trademark for various grades of sodium carboxymethylcellulose.

Uses: Detergency promotion; paint, paper and textile coatings; and drilling muds.

"Carboseal."²¹⁴ Trademark for hygroscopic liquid compositions for joint sealing.

Uses: Swelling and moistening agent for jute and other packing in cast-iron gas mains, to correct joint leakage and lay dust.

"Carbo-Sour."²⁴⁴ Trademark for a product consisting of highly soluble fluorine compounds. Used as a laundry sour, when high solubility is desired.

"Carbotronic."²⁸⁰ Trademark for self-bonded silicon carbide in granular form; used in lightning arresters and for electrical purposes.

"Carbo-Vitrobon."⁴¹ Trademark for a carbon-filled, sulfur-based compound for use as a hot-pour acid-proof cement where temperatures do not exceed 200°F. Has excellent resistance to hydrofluoric acid and fluoride salts.

"Carbowax."²¹⁴ Trademark for polyethylene glycols and methoxypolyethylene glycols.

Grades: Available in various numbered grades, i.e., 200, 400, 1000, 4000, 6000. Usually designated by approximate molecular weight of polymer.

Uses: Water-soluble lubricants; solvents for dyes, resins, proteins; plasticizers for casein and gelatin compositions, glues, zein, cork, and special printing inks; solvent and ointment bases for cosmetics and pharmaceuticals; intermediates for nonionic surfactants and alkyl resins.

"Carboxide."²¹⁴ Trademark for proprietary fumigant-sterilant mixture of ethylene oxide and carbon dioxide. Ethylene oxide is the active agent.

Uses: Fumigant and sterilizing agent to eliminate insects such as beetles, moths, cockroaches, insect larvae and insect eggs. There is definite reduction in thermophilic bacteria, and destruction of mold and fungi, including spores.

carboxybenzene. See benzoic acid.

2-carboxy-2'-hydroxy-5'-sulfoformazylbenzene (ortho-[alpha-(2-hydroxy-5-sulphophenyl)-azobenzylidene]-hydrazino benzoic acid)

HO3SC6H3(OH)N:NC(C6H5):N:NC6H4COOH.

Uses: Reagent used for the colorimetric determination of zinc and copper.

carboxyl group. The chemical group characteristic of carboxylic acids, which include fatty acids and amino acids. It usually occupies the terminal position in the molecule and is capable of assuming a negative charge which makes the end of the molecule water-soluble. Though it is customarily shown as either COOH or CO₂H, the structure of the group is $\text{C} \begin{smallmatrix} \text{O} \\ \parallel \end{smallmatrix} \text{OH}$; thus it is composed of a carbonyl group and a hydroxyl group.

carboxylase. A decarboxylase enzyme found in plant tissues which acts upon pyruvic acid, producing acetaldehyde and carbon dioxide.

Use: Biochemical research.

carboxylic acid. Any of a broad array of organic acids comprised chiefly of alkyl (hydrocarbon) groups (CH₂, CH₃), usually in a straight chain (aliphatic), terminating in a carboxyl group (COOH). Exceptions to this structure are formic acid (HCOOH) and oxalic acid (HOCCOOH). The number of carbon atoms ranges from 1 (formic) to 26 (cerotic), the carbon of the terminal group being counted as part of the chain. Carboxylic acids include the large and important class of fatty acids (q.v.), and may be either saturated or unsaturated. A few contain halogen atoms (chloroacetic). There are also some natural aromatic carboxylic acids (benzoic, salicylic) as well as alicyclic types (abietic, chaulmoogric). See also amino acid.

carboxymethylcellulose (CMC; sodium carboxymethylcellulose; CM cellulose). A semisynthetic, water-soluble polymer (q.v.) in which CH₂COOH groups

are substituted on the glucose units of the cellulose chain through an ether linkage. Molecular weight ranges from 21,000 to 500,000. Since the reaction occurs in an alkaline medium, the product is the sodium salt of the carboxylic acid $R-O-CH_2COONa$.

Properties: Colorless, odorless, nontoxic, water-soluble powder or granules; pH (1% solution) 6.5–8.0; stable in pH range 2–10. Sp. gr. 1.59; refractive index 1.51; tensile strength 8000–15,000 psi. Viscosity of 1% solution varies from 5 to 2000 centipoises, depending on the extent of etherification. Insoluble in organic liquids. Reacts with heavy-metal salts to form films that are insoluble in water, transparent, relatively tough, and unaffected by organic materials. Many of its colloidal properties are superior to those of natural hydrophilic colloids. It also has thixotropic properties (q.v.) and functions as a polyelectrolyte (q.v.). See also cellulose, modified.

Derivation: By reaction of alkali cellulose and sodium chloroacetate.

Grades: Crude; technical (about 75% pure); high viscosity; low viscosity; semirefined; refined (99.5+% pure); U.S.P.; F.C.C.

Containers: 13-, 51-gal drums; 50-lb bags.

Uses: Detergents, soaps, food products (especially dietetic foods and ice cream), where it acts as water binder, thickener, suspending agent, and emulsion stabilizer; textile manufacturing (sizing); coating paper and paper board to lower porosity; drilling muds; emulsion paints; protective colloid; pharmaceuticals; cosmetics.

carboxymethylmercaptosuccinic acid

$HOOCCH_2SCH(COOH)CH_2(COOH)$.

Properties: White powder; melting range 136–138°C. Water solubility, 147 g/100 g at 25°C; ethanol solubility, 76 g/100 g at 25°C.

Uses: Heavy-metal chelator and deactivator.

carboxymethylpyridinium chloride hydrazide. See Girard's "P" reagent.

carboxymethyltrimethyl ammonium chloride hydrazide. See Girard's "T" reagent.

carboxypeptidase. A proteolytic enzyme found in the pancreas which catalyzes the hydrolysis of native food proteins. It acts upon polypeptides producing simpler peptides and amino acids.

Use: Biochemical research.

4-carboxyresorcinol. See beta-resorcylic acid.

4-carboxyuracil. See orotic acid.

carbomal. See bromodiethylacetylurea.

carbutamide. See 1-butyl-3-sulfanilylurea.

"Carbyne."⁵³³ Trademark for an herbicide containing 4-chloro-2-butyryl meta-chlorocarbanilate (barban).

carcinogen. Any substance that causes the development of cancerous growths in living tissue. Such substances are usually grouped in two classifications: (1) Those that are known to induce cancer in man or animals either by operational exposure in industry or by ingestion in feedstuffs, e.g., asbestos particulates, nickel carbonyl, trichloroethylene, benzidine and compounds, vinyl monomer, diethylstilbestrol, benzopyrene, aflatoxin, chloromethyl ether, betanaphthylamine, as well as anthracene, phenanthrene, chrysene, and other polynuclear hydrocarbons of coal-tar origin. (2) Those that have been found to cause cancer in animals under experimental condi-

tions, namely, by external application or feeding of extremely high concentrations of the substance; among these are dimethyl sulfate, cyclamate compounds, ethyleneimine, nitrilotriacetic acid, and 4-dimethylaminoazobenzene. (The validity of the tests made on cyclamates has been questioned). The Delany amendment to the Food, Drug and Cosmetic Act forbids the use in human foods of any substance falling in this group.

The substances mentioned above by no means comprise a complete list of carcinogens. There are several hundred known and suspected carcinogenic compounds, and new ones are constantly being discovered. The Environmental Protection Agency has stated that a substance will be considered a presumptive cancer risk when it causes a statistically excess incidence of benign or malignant tumors in humans or animals. See also oncogenic.

cardamom oil.

Properties: Colorless or pale-yellow essential oil; strongly aromatic, camphoraceous odor and taste. Sp. gr. 0.917–0.947 (25/25°C); refractive index 1.4630–1.4660 (20°C); optical rotation +22° to +44° in 100 mm tube at 25°C. Insoluble in water, soluble in alcohol and ether. Keep well closed, cool, and protected from light. Combustible; nontoxic.

Chief known constituents: Terpinene, dipentene, limonene, eucalyptol; borneol.

Derivation: Distilled from the seeds of *Elettaria cardamomum* from Malabar and Ceylon.

Grades: Technical; N.F.; F.C.C.

Uses: Flavoring; liqueurs; medicine.

"Cardanol."¹⁵⁸ Trademark for a mixture of 3-pentadecenyl and less saturated C_{15} phenols, as, $C_6H_4OH \cdot C_{15}H_{27}$.

Properties: Amber liquid, boiling range 180–230°C (1 mm); soluble in oils, waxes, and all organic solvents; insoluble in water, glycerin, and aqueous alkalis.

Uses: Aldehyde-reactive plasticizer for phenol-aldehyde resins, particularly for laminating purposes.

"Cardanol Bis-Phenol."¹⁵⁸ Stated to be 1,8-di(hydroxyphenyl)pentadecane $C_6H_4OH \cdot C_{15}H_{30} \cdot C_6H_4OH$.

Properties: Brown viscous liquid (10,000 cps at 25°C). **Uses:** Base for epoxy resins and for synthetic resins of phenol-formaldehyde type useful as wire enamel.

"Cardene."⁴⁵⁸ Trademark for technical grade of N,N-bis(hydroxyethyl)oleamide containing about 25% excess amine.

"Cardilate."³⁰¹ Trademark for erythritol tetranitrate (q.v.).

"Cardinal."⁴⁸⁸ Trademark for phthalic anhydride.

"Cardio-Green."³⁴⁸ Trademark for indocyanine green, a diagnostic dye used in medicine.

"Cardolite."¹⁵⁸ Trademark for friction components based upon a phenolic-type liquid found in the fibrous outer shell of the cashew nut. These materials are produced in the form of friction-fortifying particles, and binding resins in liquid or powdered form.

Uses: Brake linings, brake blocks, clutch facings and other friction units which have high heat resistance, and outstanding friction and wear characteristics.

"Cardosol" Brand Resin.¹⁵⁸ Trademark for a water-soluble ketone formaldehyde condensate which can be gelled and cured by alkali or heat.

Use: Water-resistant adhesives for box board, coatings, for glass fibers and as a ceramic binder.

"Cardura" E Ester.¹²⁵ Trademark for glycidyl ester of "Versatic" 911 Acid.

Hazard: Irritant to skin on prolonged contact.

Use: Modifier for alkyd resins and thermosetting acrylic systems; reactive diluent for epoxy resins.

delta-3-carene $C_{10}H_{16}$. 3,7,7-Trimethylbicyclo[4.1.0]-hept-3-ene, a terpene hydrocarbon having both a six-member and a three-member ring.

Properties: Clear, colorless liquid; sp. gr. 0.8668 (15°C); b.p. 170°C; refractive index (n_D²⁰) 1.4723.

Stable to about 250°C. Resinifies with oxygen. Combustible.

Derivation: From wood turpentine.

Uses: Solvent; intermediate.

"Carmethose."³⁰⁵ Trademark for sodium carboxymethylcellulose.

carmine. An aluminum lake of the pigment from cochineal (q.v.). Bright red pieces, easily powdered. Soluble in alkali solutions, borax; insoluble in dilute acids; slightly soluble in hot water.

Grades: Technical.

Uses: Dyes, inks, indicator in chemical analysis; coloring food materials, medicines, etc.

carminic acid $C_{22}H_{20}O_{13}$, a tricyclic compound. The essential constituent of carmine.

Properties: Dark, purplish-brown mass or bright-red powder. M.p., decomposes at 136°C; pH 4.8 yellow; pH 6.2 violet. Soluble in water, alcohol, alkali hydroxide solutions; insoluble in ether, benzene, chloroform. Combustible.

Derivation: By extraction from the insects, *Coccus cacti* (cochineal).

Uses: Stain in microscopy; indicator in analytical chemistry; coloring proprietary medicines; pigment for fine oil colors; color photography; dyeing.

carminite $KCl \cdot MgCl_2 \cdot 6H_2O$ or $KMgCl_3 \cdot 6H_2O$.

Properties: A natural hydrated double chloride of potassium and magnesium. White, brownish and reddish; streak, white; shining, greasy luster; strongly phosphorescent; bitter taste; deliquescent. Sp. gr. 1.62; Mohs hardness 1.

Occurrence: West Germany; Alsace; New Mexico.

Use: A commercial source of manufactured potash salts.

carnauba wax (Brazil wax). The hardest and most expensive commercial wax.

Properties: Hard solid in form of yellow to greenish brown lumps; slight odor. Sp. gr. 0.995 (15/15°C); m.p. 84–86°C; acid number 2–9; iodine number 13.5. Soluble in ether, boiling alcohol and alkalies; insoluble in water. Combustible. Nontoxic.

Derivation: Exudation from leaves of the wax palm, *Copernicia cerifera* (Brazil).

Grades: By numbers and sources; crude and refined; powdered; F.C.C.

Containers: Bags; boxes.

Uses: Shoe polishes; leather finishes; varnishes; electric insulating compositions; furniture and floor polishes; carbon paper; waterproofing; to prevent sun-checking of rubber and plastic products; confectionery.

carnosine (beta-alanylhistidine; ignotine) $C_9H_{14}N_4O_3$.

An amino acid occurring in muscle of many animals and man. Occurs naturally in the L(+) form.

Properties: M.p. 245–250°C (dec.); soluble in water. Nitrate: crystals; m.p. 222°C (dec.); soluble in water.

Hydrochloride: crystals; m.p. 245°C (dec.); soluble in water. D(–)-carnosine: crystals; m.p. 260°.

Use: Biochemical research.

carnotite $K_2(UO_2)_2(VO_4)_2 \cdot 3H_2O$. A natural hydrated vanadate of uranium and potassium, usually found in sandstones and other sedimentary rocks.

Properties: Bright lemon yellow; luster dull or earthy, pearly or silky when coarsely crystalline. Soluble in acids. Radioactive. Usually occurs as a powder or in fine-grained aggregates.

Occurrence: Colorado, Utah, Arizona, New Mexico, South Dakota; Australia; Congo; U.S.S.R.

Hazard: A radioactive poison.

Use: Ore of uranium; source of radium.

Shipping regulations: (Rail, Air) Consult regulations.

Carnot's reagent. A reagent for the determination of potassium; an alcoholic solution of sodium bismuth thiosulfate, made from sodium thiosulfate and bismuth subnitrate.

carob-seed gum (locust bean gum). A polysaccharide plant mucilage which is essentially galactomannan (carbohydrate). Molecular weight about 310,000. Swells in cold water, but viscosity increases when heated. Insoluble in organic solvents. Combustible; nontoxic on basis of present data. See note.

Containers: Bags.

Derivation: Extracted from carob seeds, from the tree *Ceratonia siliqua*.

Grades: Technical; F.C.C. (as locust-bean gum).

Uses: In foods as stabilizer, thickener, emulsifier, and packaging material; cosmetics; sizing and finishes for textiles; pharmaceuticals; paints.

Note: Restricted by FDA to level of use current in 1973.

Caro's acid (peroxysulfuric acid; persulfuric acid)

H_2SO_5 or $HOSO_2OOH$.

Properties: White crystals; m.p. 45°C (decomposes).

Derivation: Action of hydrogen peroxide on concentrated sulfuric acid; action of 40% sulfuric acid on potassium persulfate.

Hazard: Strong irritant to eyes, skin and mucous membranes. Strong oxidizer; may explode in contact with organic materials.

Use: Caro's reagent, a pasty mass of great oxidizing power for testing aniline, pyridine, and alkaloids.

carotene (provitamin A) $C_{40}H_{56}$. A precursor of vitamin A occurring naturally in plants. It consists of 3 isomers; about 15% alpha, 85% beta, and 0.1% gamma. Carotene is a member of a large class of pigments called carotenoids. It has the same basic molecular structure as vitamin A and is transformed to the vitamin in the liver.

Properties: Ruby-red crystals, easily oxidized on contact with air; m.p. (alpha) 188°C, (beta) 184°C, (gamma) 178°C; insoluble in water; slightly soluble in alcohol and ether; soluble in chloroform, benzene, and oils. Nontoxic.

Source: Orange-yellow pigment in plants, algae, fungi, and some marine animals, especially in leaves, vegetation, and root crops, in trace concentrations. Notably present in butter and carrots.

Derivation: By extraction from carrots and palm oil concentrates; by a chromatographic process from alfalfa, beta-Carotene is also made by a microbial fermentation process from corn and soybean oil.

Grades: According to U.S.P. units of vitamin A. Solid as pure crystals; as solutions in various oils; as colloidal dispersion. Also F.C.C.

Uses: Pharmaceuticals; coloring margarine and butter; feed and food additive.

carotenoid. A class of pigments occurring in the tissues of higher plants, algae, and bacteria, as well as in fungi. Also present in some animals, as squalene

in shark liver oil. They include the carotenes and xanthophylls (q.v.).

Properties (general): Yellow to deep red crystalline solids; soluble in fats and oils; insoluble in water; high-melting; stable to alkali but unstable to acids and to oxidizing agents; color easily destroyed by hydrogenation or by oxidation; some are optically active.

Carothers, Wallace H. (1896–1937). Born in Iowa, Carothers obtained his doctorate in chemistry at University of Illinois. He joined the research staff of DuPont in 1928 and began the development of several of the greatest achievements of synthetic organic chemistry. One of these was polychloroprene, the first successful synthetic rubber, now known as neoprene. Further research in the detailed chemistry of polymerization culminated in the synthesis of nylon, the reaction product of hexamethylenetetramine and adipic acid. Carothers' work in the polymerization mechanisms of fiber-like synthetics of cyclic organic structures was brilliant and productive, and he is regarded as one of the most original and creative American chemists of the early 20th century.

carrageenan. A phycocolloid. The aqueous, usually gel-forming cell-wall polysaccharide mucilage found in the red algae (*Chondrus crispus* and several other species). Water-extracted from a seaweed called carrageen or Irish moss (east coast of southern Canada, New England, and south to New Jersey). It is a mixture of polysaccharide fractions; (1) the lambda fraction is cold-water soluble, contains D-galactose and 35% esterified sulfate, and does not gel; (2) the kappa fraction contains D-galactose and 3,6-anhydro-D-galactose (1.4 to 1 ratio) and 25% esterified sulfate. Kappa form does not gel without addition of a solute; the properties of the gel depend on the amount and nature of the added solute. Another species of seaweed produces 100% kappa form (N. Carolina to tropics). Carrageenan is a hydrophilic colloid which absorbs water readily and complexes with milk proteins.

Forms: Dehydrated, purified powder.

Grades: Technical; F.C.C.

Uses: Emulsifier in food products, especially chocolate milk; toothpastes; cosmetics; pharmaceuticals; protective colloid; stabilizing aid in ice cream (0.02%).

"Carrene 16."⁵⁴ Trademark for a 54% aqueous solution of lithium bromide containing an additive for corrosion inhibition in absorption refrigeration systems.

"Carrene 500."⁵⁴ Trademark for an azeotropic mixture of 73.8% dichlorodifluoromethane and 26.2% unsymmetrical difluoroethane boiling at -28°F and used as a refrigerant. Nonflammable; low toxicity.

carrier. (1) A neutral material such as diatomaceous earth used to support a catalyst in a large-scale reaction system. (2) A gas used in chromatography to convey the volatilized mixture to be analyzed over the bed of packing which separates the components. (3) An atomic tracer carrier: a stable isotope or a normal element to which radioactive atoms of the same element have been added for purposes of chemical or biological research. See also tracer.

"Carstan."⁴⁵⁸ Trademark for a series of stannous carboxylate salts used as catalysts in flexible and rigid urethane foams and elastomers.

carthamin (carthamic acid; safflor carmine; safflor red) $C_{21}H_{22}O_{11}$.

Properties: Dark-red powder with green luster. Slightly soluble in water; soluble in alcohol; insoluble in ether; solutions rapidly decompose.

Derivation: A glucoside coloring matter from *Carthamus tinctorius*.

"Carum."⁵¹ Trademark for grease-type lubricants prepared for use in chemical processing industries where insolubility in the material being processed is essential. Intended for valves and pumps handling such materials. One grade is permissible under FDA Regulations for lubrication where incidental contact with food might occur.

carvacrol (isopropyl-ortho-cresol; 2-methyl-5-isopropylphenol; 2-hydroxy-para-cymene) $(CH_3)_2CHC_6H_3(CH_3)(OH)$. An alcohol.

Properties: Thick, colorless oil; thymol odor; sp. gr. 0.976 (20/4°C); b.p. 237°C; m.p. 0°C; refractive index 1.523 (20°C). Insoluble in water; soluble in alcohol, ether, and alkalies. Combustible. Low toxicity.

Derivation: From para-cymene by sulfonation, followed by alkali fusion.

Uses: Perfumes; fungicides; disinfectant; flavoring.

carvone $CH_3C:CHCH_2CH[C(CH_3)_2CH_2]CH_2CO$. A ketone derived from the terpene dipentene. It is optically active, occurring naturally in both *d*- and *l*-forms.

Properties: Pale-yellowish or colorless liquid with a strong characteristic odor. Sp. gr. 0.960 (20°C); b.p. 227–230°C; refractive index (n_D¹⁸) 1.4999. Soluble in alcohol, ether, chloroform, propylene glycol, and mineral oils; insoluble in glycerin and in water. Combustible; low toxicity.

Derivation: The *d*-form is the main constituent of caraway and dill oils; the *l*-form occurs principally in spearmint oil and may be synthesized from *d*-limonene.

Method of purification: Rectification.

Grades: F.C.C. (both *d*- and *l*-forms); technical.

Uses: Flavoring; liqueurs; perfumery.

"Carwinat."⁵²⁰ Trademark for isocyanates used to make urethane elastomers, coatings, foams, adhesives, rigid plastics, sealants, and one-shot flexible, semi-flexible and semi-rigid foams.

caryophyllene $C_{15}H_{24}$. A mixture of sesquiterpenes occurring in many essential oils. It forms the chief hydrocarbon component of clove oil (q.v.).

caryophyllic acid. See eugenol.

"Cascamite."⁶⁵ Trademark for a powdered urea-formaldehyde resin glue; water-resistant, moldproof, stainfree.

cascarilla oil. The volatile oil obtained by steam distillation of the dried bark of *Croton eleuteria* Bennett. Light yellow to brown amber liquid having a pleasant spicy odor. Soluble in most fixed oils, and in mineral oil; practically insoluble in glycerin and propylene glycol.

Use: Flavoring agent in foods, medicine, tobacco.

case-hardening compound. A material used to impart a hard surface to steel while the interior remains soft and tough. This is accomplished by heating the steel out of contact with air while packed in carbonaceous material, cooling it to black heat, reheating to a high

temperature, and quenching. The materials are usually wood charcoal with sodium, potassium, or barium carbonates, cyanides, etc.

casein. Though commonly regarded as the principal protein in milk (about 3%), casein is actually a colloidal aggregate composed of several identifiable proteins, together with phosphorus and calcium. It occurs in milk as a heterogeneous complex called calcium caseinate, which can be fractionated by a number of methods. It can be precipitated with acid at pH 4.7, or with the enzyme rennet (rennin). The product of the latter method is called paracasein, the term being applied to any of the casein fractions involved, i.e., alpha, beta, kappa, etc.

Properties: White, tasteless, odorless, nontoxic, solid; sp. gr. 1.25–1.31; hygroscopic; stable when kept dry but deteriorates rapidly when damp. Soluble in dilute alkalis and concentrated acids; almost insoluble in water; precipitates from weak acid solutions.

Derivation: Acid casein; warm skim milk is acidified with dilute sulfuric, hydrochloric, or lactic acid, the whey drawn off, the curd washed, pressed, ground and dried. Rennet casein: warm skim milk is treated with an extract of the enzyme rennin (rennet). The curd contains combined calcium and calcium phosphate.

Sources: Midwestern U.S.; Australia; Argentina; New Zealand; Poland.

Grades: Acid-precipitated (domestic edible, imported inedible); paracasein.

Uses: Cheese making; plastic items; paper coatings; water-dispersed paints for interior use; adhesives, especially for wood laminates; textile sizing; foods and feeds; textile fibers.

casein-sodium. See sodium caseinate.

cashew gum (anacardium gum). The exudation from the bark of the cashew-nut tree, *Anacardium occidentale*. Hard, yellowish-brown gum, partly soluble in water. Used for inks, insecticides, pharmaceuticals, mucilage, tanning agent, natural varnishes, bookbinders' gum.

cashew nutshell oil (cashew nutshell liquid). The oil obtained from the spongy layer between the inner and outer shells of cashew nuts. The raw liquid contains about 90% anacardic acid, $C_{22}H_{32}O_3$, and a blistering compound containing sulfur. Most of the liquid used in commerce has been heated or treated with chemicals to make it safe to handle. The liquid is non-drying, but can be made drying by proper treatment. It polymerizes on heating and forms condensation products with aldehydes.

Hazard (untreated): Toxic; strong irritant.

Uses: Varnishes and impregnating materials; modifier for phenol-based resins; plasticizers; germicides and insecticides, coloring materials and indelible inks, lubricants, and preservatives.

casinghead gasoline. See gasoline.

cassava. See tapioca.

Cassel brown. See Van Dyke brown.

Cassel green. See barium manganate.

Cassella's acid. See 2-naphthol-7-sulfonic acid; 2-naphthylamine-4,8-disulfonic acid.

Cassella's F acid. See 2-naphthylamine-7-sulfonic acid.

cassia oil (Chinese cinnamon oil; cinnamon, cassia oil; cinnamon oil, U.S.P.).

Properties: See cinnamic aldehyde, its chief constituent.

Derivation: Distilled from leaves and twigs of *Cinnamomum cassia*.

Grades: U.S.P. (as cinnamon oil); redistilled; technical; lead-free.

Containers: Bottles; tins; cans.

Uses: Flavoring; perfumery; medicine; soaps.

casiterite (tinstone, wood tin, stream tin) SnO_2 . Natural tin dioxide, usually in igneous rocks.

Properties: Color brown, black, yellow, white; luster adamantine or dull submetallic; streak white; Mohs hardness 6–7; sp. gr. 6.8–7.1.

Occurrence: Malaya; Bolivia; Indonesia; Africa.

Use: Principal ore of tin.

cast iron. Generic term for a group of metals that basically are alloys of carbon and silicon with iron. Relative to steel, cast irons are high in carbon and silicon, carbon ranging from 0.5 to 4.2% and silicon from 0.2 to 3.5%. All these metals may contain other alloys added to modify their properties.

Iron castings are produced in an exceptionally wide range of sizes and weight, from piston rings a fraction of an inch in diameter and weighing less than 1 oz to steam-turbine bases 20 ft long and weighing 180,000 lb.

Most cast iron is manufactured by melting a mixture of steel scrap, cast-iron scrap, pig iron, and alloys in a cupola using coke as a fuel. A small percentage is melted in electric furnaces. It is poured into molds of silica sand bonded with bentonite, fire-clay, and water. A small percentage is cast into metal molds or into molds of baked or fired ceramics. Internal cavities are formed by hard but collapsible cores of sand bonded with drying oils or synthetic resins. Small molds and cores usually are made by machine, using patterns of wood or metal.

"Castolast H-W."⁴⁴⁶ Trademark for a 93% high-alumina castable cement bonded with low iron calcium aluminate cement. Shipped dry; with water addition, develops and maintains high strength, through 3200°F. Resistant to abrasion and impact.

Uses: Petrochemical unit liner; burner blocks and other high temperature applications. Can be cast, trowelled or applied with an air placement gun.

castor.

Derivation: Dried preputial follicles with their secretions of the common beaver (*Castor fiber*). Solid unctuous masses contained in pairs of sacs, each about 2 in. in length. Characteristic irritating odor.

Contains 40–70% resin.

Grades: Canadian or American; Russian.

Uses: Medicine; perfume fixative; flavoring. A synthetic castor is also marketed.

"Castordag."⁴⁴⁶ Trademark for a dispersion of colloidal graphite in castor oil. Used as an assembly and maintenance lubricant.

castor oil (*ricinus oil*).

Properties: Pale-yellowish or almost colorless, transparent, viscid liquid; faint, mild odor; nauseating taste. A non-drying oil. Sp. gr. 0.945–0.965 (25/25°C); saponification value 178; iodine value 85; solidifies at –10°C. Flash point 445°F; autoignition temp. 840°F. Combustible. Soluble in alcohol, benzene, chloroform and carbon disulfide; dextrorotatory. Nontoxic.

Derivation: From the seeds of the castor bean, *Ricinus communis* (Brazil, India, U.S.S.R., U.S.). They are cold pressed for the first grade of medicinal oil and hot pressed for the common qualities, about 40% of the oil content of the bean being obtained. Re-

sidual oil in the cake is obtained by solvent extraction.

Chief constituent: Ricinolein (glyceride of ricinoleic acid).

Grades: U.S.P. No. 1; No. 3; refined; F.C.C.

Containers: Bottles; drums; tanks.

Hazard: Develops heat spontaneously.

Uses: Plasticizer in lacquers and nitrocellulose; production of dibasic acids; lipsticks; polyurethane coatings, elastomers and adhesives; fatty acids; surface-active agents; hydraulic fluids; pharmaceuticals; industrial lubricant; electrical insulating compounds; mfg. of Turkey Red oil (q.v.); source of sebacic acid and of ricinoleates; medicine (laxative).

See also castor oil, dehydrated; blown oil.

castor oil, acetylated. See glyceryl triacetylricinoleate.

castor oil acid. See ricinoleic acid.

castor oil, blown. See blown oil.

castor oil, dehydrated (DCO). A castor oil from which about 5% of the chemically combined water has been removed, and which as a result, has drying properties similar to those of tung oil. Dehydration is carried out commercially by heating the oil in the presence of catalysts, such as sulfuric and phosphoric acids, clays, and metallic oxides. The commercial product is offered in a wide range of viscosities and analytical constants. Used in protective coatings and alkyd resins.

castor oil, hydrogenated. Principally glyceryl tri-12-hydroxystearate (q.v.). A hard, waxy product used in making hydroxystearic acid.

castor oil, polymerized. A rubber-like polymer results from combination of castor oil with sulfur or diisocyanates; this can be blended with polystyrene to give a tough, impact-resistant product.

castor oil, sulfonated. See Turkey red oil.

castor seed oil meal (castor cake; castor meal). The residue from extraction of oil from the castor seed (ricinus). The normal product contains 29.5% crude protein; 35.8% crude fiber; 13.2% nitrogen-free extract and 1.0% crude fat. The total digestible nutrients approximate 25%. The ash content of 7.5% is high in potash and phosphate.

Containers: Bag or bulk; carlots.

Hazard: Contains highly toxic ricin which must be removed before internal use.

Use: Animal feeds (after removal of toxic ingredients); fertilizer.

"Castorwax."²⁰² Trademark for hydrogenated castor oil, the triglyceride of 12-hydroxystearic acid.

Properties: White, hard, synthetic wax; m.p. 85°C; sp. gr. 0.9990 (25°C); acid value 2; iodine value 3; saponification value 180; insoluble in most organic solvents at room temperature and compatible with ethylcellulose, cellulose acetate butyrate, polyethylene (up to 25%), polymethacrylate, rosin, shellac, natural and synthetic rubbers, insect and vegetable waxes.

Uses: Potting compounds, greases, sealants and impregnating compositions; wax blends where increase in grease and solvent resistance, hardness and melting point is desired; blending agent and viscosity reducer in hot melts; direct application to paper for resistance to moisture and fat.

"Castung."²⁰² Trademark for dehydrated castor oil. See castor oil, dehydrated.

catalase. An oxidizing enzyme occurring in both plant and animal cells. It decomposes hydrogen peroxide. It can be isolated and is used in food preservation (removing oxygen in packaged foods) and in decomposing residual hydrogen peroxide in bleaching and oxidizing processes.

"Catalin."³⁵³ Trademark for a phenolformaldehyde resin. Nonflammable.

Uses: Miscellaneous molded articles.

catalysis. One of the most important phenomena in nature, catalysis is the "loosening" of the chemical bonds of two (or more) reactants by another substance, in such a way that a fractionally small percentage of the latter can greatly accelerate the rate of the reaction, while remaining unconsumed. (See catalyst). Thus one part by volume of catalyst can activate thousands of parts of reactants. Though the mechanism of their action is not completely known, the electronic configuration of the surface molecules of the catalyst is often the critical factor. The surface irregularities give rise to so-called "active points," at which intermediate compounds can form. Most industrial catalysis is performed by finely divided transition metals or their oxides.

Solid catalysts may combine chemically (bond) at the surface with one or more of the reactants. This is known as chemisorption, and occurs on only a small portion of the catalyst surface (i.e., at the active points); it results in changing the chemical nature of the chemisorbed molecules. Catalysis of chemical reactions by surfaces must proceed by chemisorption of at least one of the reactants.

See also catalyst; chemisorption; hydrogenation; enzyme.

catalysis, heterogeneous. A catalytic reaction in which the reactants and the catalyst comprise two separate phases, e.g., gases over solids, or liquids containing finely divided solids as a disperse phase.

catalysis, homogeneous. A catalytic reaction in which the reactants and the catalyst comprise only one phase, e.g., an acid solution catalyzing other liquid components.

catalyst. Any substance of which a fractional percentage notably affects the rate of a chemical reaction without itself being consumed or undergoing a chemical change. Most catalysts accelerate reactions, but a few retard them (negative catalysts or inhibitors). Catalysts may be inorganic, organic, or a complex of organic groups and metal halides (see catalyst, stereospecific). They may be either gases, liquids, or solids. In some cases their action is destructive and undesirable, as in the oxidation of iron to its oxide, which is catalyzed by water vapor, and similar types of corrosion. The life of an industrial catalyst varies from 1000 to 10,000 hours, after which it must be replaced or regenerated.

Note: Though it is not a "substance," light in the visible wavelengths can act as a catalyst, as in photosynthesis and other photochemical reactions.

Following is a partial list of catalysts; the asterisk indicates a destructive effect.

Substance	Reaction type
aluminum chloride	condensation (Friedel-Crafts)
aluminum alkyl + titanium chloride	Ziegler catalyst for stereospecific polymers

<i>Substance</i>	<i>Reaction type</i>
aluminum oxide	hydration; dehydration
ammonia	condensation (polymers)
chromic oxide	methanol synthesis; aromatization; polymerization
cobalt	hydrocarbon synthesis; Oxo process
copper salts	oxidation (of rubber)*
hydrogen fluoride	alkylation; condensation; dehydration; isomerization
iron	ammonia synthesis; hydrocarbon synthesis
iron oxide	dehydrogenation (oxidation)
manganese dioxide	oxidation
molybdenum oxide	dehydrogenation; polymerization; aromatization; partial oxidation
nickel	hydrogenation (oils to fats)
phosphoric acid	polymerization; isomerization
platinum metals	hydrogenation; aromatization
silica-alumina	cracking hydrocarbons
silver	hydration; oxidation
sulfuric acid	isomerization; corrosion*
vanadium pentoxide	oxidation (sulfuric acid)
water (esp. + NaCl)	oxidation (corrosion)*

Catalysts are highly specific in their application; they are widely used in the petroleum-refining, synthetic organic chemical and pharmaceutical industries. For details of application, see the preceding list. Since the activity of a solid catalyst is often centered in a small fraction of its surface, the number of active points can be increased by adding promoters (q.v.), which increase the surface area in one way or another, e.g., by increasing porosity. Catalytic activity is decreased by substances that act as poisons (q.v.), which clog and weaken the catalyst surface, e.g., lead in the catalytic converters used to control exhaust emissions.

Besides inorganic substances, there are many organic catalysts that are vital in the life processes of plants and animals. These are called enzymes (q.v.) and are essential in metabolic mechanisms, e.g., pepsin in digestion. Vitamins and hormones also have catalytic properties. See also catalysis; catalyst, stereospecific; enzyme.

catalyst, negative. See inhibitor.

catalyst, organic. See enzyme.

catalyst, stereospecific. An organometallic catalyst which permits control of the molecular geometry of polymeric molecules. Examples are Ziegler and Natta catalysts derived from a transition metal halide and a metal alkyl, or similar substances. There are many patented catalysts of this general type, most of them developed in connection with the production of polypropylene, polyethylene, or other polyolefins. See also polymer, stereospecific; Natta catalyst; Ziegler catalyst.

catalyst, thermonuclear. See carbon cycle (2).

catechol. See pyrocatechol.

catenane. A compound with interlocking rings, which are not chemically bonded, but which cannot be separated without breaking at least one valence bond. The model would resemble the links of a chain.

"Cat-Floc"¹⁰⁸ (diallyldimethylammonium chloride). Trademark for a quaternary ammonium polymer.

Derivation: Monomer in water solution is mixed with catalytic amount of butylhydroperoxide and kept at 50–75°C for 48 hours; the solid formed is taken up in water, precipitated, and washed with acetone.

Uses: Flocculating agent; textile spinning aid; anti-static agent; wet-strength improvers in paper; rubber accelerators; curing epoxy resins; surfactants; bacteriostatic and fungistatic agents.

cathode. The negative electrode of an electrolytic cell, to which positively charged ions migrate when a current is passed, as in electroplating baths. The cathode is the source of free electrons (cathode rays) in a vacuum tube. In a primary cell (battery), the cathode is the positive electrode. See also anode; electrode.

cathode sputtering. See sputtered coating.

cation. An ion having a positive charge. Cations in a liquid subjected to electric potential collect at the negative pole or cathode.

cation exchange. See ion exchange.

cationic reagent. One of several surface-active substances in which the active constituent is the positive ion. Used to flocculate and collect minerals that are not flocculated by oleic acid or soaps (in which the surface-active ingredient is the negative ion). Reagents used are chiefly quaternary ammonium compounds e.g., cetyl trimethyl ammonium bromide.

catlinite (pipestone). A fine-grained silicate mineral related to pyrophyllite which is easily compressible, has high surface friction, and is used for gaskets in very high-pressure equipment.

"Cato."⁵³ Trademark for a cationic derivative of starch, available in ungelatinized or gelatinized (cold water soluble) form. Used in manufacture of paper, warp sizing, etc.

"Cat-Ox."⁵⁸ Proprietary catalytic oxidation process for removing sulfur dioxide and fly ash from stack gases and converting the former to sulfuric acid. It involves passing the flue gases at 900°F (1) through an electrostatic precipitator, (2) through a converter where sulfur dioxide is oxidized to the trioxide with vanadium pentoxide, (3) through heat exchangers to cool the gases so that the SO₃ combines with water vapor, and (4) through an absorbing tower which condenses the sulfuric acid. Commercial acid (70%) is made in this way. See also sulfuric acid.

caulking compound. See sealant.

caustic. (1) Unqualified, this term usually refers to caustic soda (sodium hydroxide). (2) As an adjective, it refers to any compound chemically similar to sodium hydroxide, e.g., caustic alcohol (C₂H₅ONa). (3) Any strongly alkaline material which has a corrosive or irritating effect on living tissue.

caustic baryta. See barium hydroxide.

causticized ash. Combinations of soda ash and caustic soda in definite proportions marketed for purposes where an alkali is needed ranging in causticity between the two materials. Causticized ash is usually designated by its caustic soda content and the range of standard marketed products embraces 7%, 10%, 15%, 25%, 36%, 45%, and 67% of caustic soda.

caustic lime. See calcium hydroxide.

caustic potash. See potassium hydroxide. Caustic potash, liquid, is the legal label name for potassium hydroxide solution.

caustic soda. Legal label name for sodium hydroxide solution.

"Cavalite."²⁸ Trademark for a series of fiber-reactive dyes for cellulose.

cavitation. Formation of air bubbles in a liquid such as salt water when subjected to intense vibration, resulting severe mechanical damage to the surfaces of metals exposed to it, e.g., ship propellers, steam condensers, pumps and piping systems. The erosive effect is due to the shock waves created by collapse of the bubbles. The pressures exerted by cavitation have been calculated to be in the range of 30,000 psi. This phenomenon plays a part in corrosion of metals as well as in emulsion formation. See also corrosion; homogenization.

Cb Symbol for columbium, an obsolete name for niobium.

CBM. Abbreviation for chlorobromomethane (see bromochloromethane); also for constant boiling mixture. See azeotropic mixture.

cc. Abbreviation for cubic centimeter. See also milliliter.

Cd Symbol for cadmium.

CDA. Abbreviation for completely denatured alcohol. See alcohol, denatured.

CDAA. See alpha-chloro-N,N-diallylacetamide.

"CDB-59."⁵⁵ Trademark for potassium dichloroisocyanurate (q.v.).

"CDB-60"⁵⁵ Trademark for sodium dichloroisocyanurate (q.v.).

"CDB-85."⁵⁵ Trademark for trichloroisocyanuric acid (q.v.).

CDEC. See 2-chloroallyl diethyldithiocarbamate.

CDP. (1) Abbreviation for cytidine diphosphate. See cytidine phosphates. (2) Abbreviation for cresyl diphenyl phosphate.

"CDP-GA."¹ Trademark for a phosphorus-containing deposit modifier for automotive gasolines.

CDTA. See trans-1,2-diaminocyclohexanetetraacetic acid.

Ce Symbol for cerium.

"Cebicure."¹²³ Trademark for ascorbic acid for meat curing.

"Cebitate."¹²³ Trademark for sodium ascorbate for meat curing.

cedar leaf oil. True cedar leaf oil is distilled from the leaves of *Juniperus virginiana*. The name has also been used as a synonym for thuja oil (q.v.) (from *Thuja occidentalis*). The properties of the two oils are quite different.

Properties: Colorless liquid; sp. gr. 0.870–0.890; optical rotation +55° to 65° (20°C); soluble in alcohol and ether. Combustible; nontoxic.

Chief constituents: Limonene, cadinene, borncol, and bornyl esters.

Containers: Drums; cans.

Uses: Medicine; microscopy; perfume; flavoring.

cedrol C₁₅H₂₆O, a tertiary terpene alcohol.

Properties: Colorless crystals; cedarwood odor. M.p. 86°C. Soluble in 11 parts of 95% alcohol. Combustible.

Uses: Perfumery, for woody and spicy notes; odorant for disinfectants.

cedryl acetate CH₃COOC₁₅H₂₅.

Properties: Colorless liquid, having a light cedar odor. Sp. gr. 0.975–0.995; refractive index 1.496–1.510. Soluble in one volume of 90% alcohol. Combustible.

Use: Perfumery.

"Celanar."³⁵² Trademark for a polyester film made from polyethylene terephthalate, (q.v.).

Properties: Transparent; biaxially oriented; density 1.395; tensile strength 30,000 psi; dielectric strength 7000 volts/mil; melting point 260°C; service temperature -60 to 150°C; outstanding dimensional stability and chemical resistance.

Uses: Magnetic recording tape; drafting and engineering reproduction materials; metallic yarn; roll leaf; pressure-sensitive tapes; packaging; dielectric material in capacitors, wire and cable, motors, generators, transformers, and oils.

"Celanese CL."³⁵² Trademark for a series of polyvinyl acetate emulsions. Available as:

102: Fine particle size, water resistant homopolymer emulsion.

202: Fine particle size, water resistant copolymer emulsion.

203: Vinyl-acrylic copolymer emulsion.

204: Vinyl copolymer emulsion.

Uses: Paints, adhesives and paper-coating specialties.

"Celanese Solvent."³⁵² Trademark for a series of special solvents. Available as:

203: Replacement for normal butyl alcohol in nitrocellulose lacquers, alkyd resin formulations and thinners; distillation range 115–120°C; flash point 100°F (open cup).

601: Replacement for methyl ethyl ketone in vinyl and nitrocellulose applications; distillation range 74–84°C; flash point 10°F (open cup).

Hazard: Flammable, dangerous fire risk.

901H: Replacement for butanol and methylisobutyl carbinol in lacquers and brake fluids; distillation range 125–155°C; flash point 120°F (open cup).

"Celanthrene."²⁸ Trademark for a group of anthraquinone disperse dyes designed especially for acetate; also suitable for application to nylon.

"Celatom."⁴⁶⁸ Trademark for a group of diatomaceous silicas (diatomite) of high quality and uniformity.

Uses: Filter aid, including foods and beverages; absorbents, as in insecticides and fertilizers; catalyst supports; fillers for paper, paints, explosives, concrete and asphalt; chromatography.

"Cel-Bak."³¹⁵ Trademark for latex foam used in carpeting: high-density and regular grades.

"Celcon."³⁵² Trademark for a highly crystalline acetal copolymer based on trioxane. See acetal resin.

celestine blue. A dye used for staining biological specimens.

celestite SrSO₄. Natural strontium sulfate, usually found in sedimentary rocks.

Properties: Colorless, white, pale blue, or red; luster vitreous to pearly. Resembles barite (q.v.). Sp. gr. 3.95; Mohs hardness 3-3.5.

Occurrence: United States; Canada; Europe, Mexico. Uses: Strontium chemicals; oil-well drilling mud; sugar refining; ceramics; production of very pure caustic soda.

"Celestone."³²¹ Trademark for a brand of betamethasone.

"Celite."²⁴⁷ Trademark for diatomaceous earth and related products.

Properties: Color, white to pale brownish white, depending on grade and processing, calcined grades being pink to buff; sp. gr. 0.24-0.34; porous, capable of absorbing 300-400% water by weight; poor conductor of heat, sound, and electricity; resistant to acids except hydrofluoric; slowly soluble in hot alkali. Grades: Filtration; mineral filler.

Containers: Drums; multiwall paper bags; bulk. Uses: Filtering; fillers; absorbent; abrasive in glass and metal polishing; catalyst carrier; ingredient in cements, flameproofing agents, and other products.

"Celkate."²⁴⁷ Trademark for finely divided hydrated synthetic magnesium silicates having high absorption properties; light tan in color; density 10-18 lb/cu ft; surface area 150-250 sq m/gram.

Grades: Available in various grades of purifying of petroleum-base solvents, chemical and drug solutions, and for decolorizing of animal, fish, and vegetable oils.

Uses: Filter agent to remove solids and free fatty acids; absorptive carrier of liquids; conditioning agent to improve flow properties of dry powders.

cell. (1) The fundamental unit of biological structure, comprised of (a) an outer membrane, or wall, about 100 Å thick which, being semipermeable, maintains by osmosis (q.v.) the biochemical equilibrium of the intracellular fluids; (b) the cytoplasm (q.v.) containing mitochondria, ribosomes, and other structures; and (c) the nucleus (q.v.), in which lie the chromosomes and genes. An extremely complex biochemical organization, the cell is the dynamic unit of all life; its ability to reproduce itself and to control its functions systematically is of basic importance to maintenance of life and growth. All organic matter is either found in cells or is produced by cellular activity, and was ultimately derived from photosynthesis (q.v.). Cells are comparatively large units which can be resolved in an optical microscope; the largest single cells are represented by the eggs of oviparous animals. See also mitosis.

(2) Any self-contained unit having a specific functional purpose, as follows: (a) voltaic cell (battery) to generate electric current; (b) electrolytic cell to effect electrolysis; (c) fuel cell to convert chemicals into electricity; and (d) solar cell to capture heat from sunlight. All except the last involve use of electrodes and electrolytes. See also specific entry.

(3) Any completely enclosed hollow unit, as in a honeycomb or cellular plastic.

cell, dry. See dry cell.

cell, electrolytic. See electrolytic cell.

"Cellex."²³⁶ Trademark for sodium carboxymethyl-cellulose. Used as an organic colloidal compound for providing low filtrate loss in drilling mud.

cell, fuel. See fuel cell.

"Cellidor."⁴⁷⁰ Trademark for cellulose acetate and acetate butyrate plastics.

"Cellitazol."³⁰⁷ Trademark for a series of developed acetate dyestuffs.

"Celliton."³⁰⁷ Trademark for a series of disperse dyestuffs characterized by good fastness to light, washing, etc. Used for dyeing and printing acetate fibers.

cellobiose $C_{12}H_{22}O_{11}$. The product of the partial hydrolysis of cellulose; composed of two D-glucose molecules.

Properties: Colorless crystals; m.p. 225°C (dec); soluble in water; slightly soluble in alcohol; nearly insoluble in ether; insoluble in acetone.

Use: Bacteriology.

"Cello-Flex."¹¹⁶ Trademark for a special kraft paper electrical insulation used mainly for transformers.

celloidin. A pure form of pyroxylin, used for imbedding sections in microscopy.

"Cellolyn."²⁶⁶ Trademark for a series of pale, low-melting hydroabietyl ester resins. Used for lacquers, inks and adhesives.

cellophane (regenerated cellulose). Film produced from wood pulp by the viscose process.

Properties: Transparent, strong, flexible, and highly resistant to grease, oil, and air. The base cellulose film is modified by softeners, flame-resisting materials and dyes; also by coating with other materials. On exposure to heat the untreated film loses strength at 300°F, decomposes 350°-400°F; does not melt; burns readily and is not self-extinguishing.

Hazard: Flammable, moderate fire risk.

Uses: Wrapper or protective package for fabricated articles and industrial applications. See also rayon, viscose.

"Cellosize."²¹⁴ Trademark for hydroxyethyl cellulose (q.v.) and carboxymethylcellulose (q.v.). See also cellulose, modified.

"Cellosolve."²¹⁴ Trademark for mono- and dialkyl ethers of ethylene glycol and their derivatives, widely used as industrial solvents.

butyl "Cellosolve"
See ethylene glycol monobutyl ether.

butyl "Cellosolve" acetate
See ethylene glycol monobutyl ether acetate.

"Cellosolve" acetate
See ethylene glycol monoethyl ether acetate.

"Cellosolve" solvent
See ethylene glycol monoethyl ether.

dibutyl "Cellosolve"
See ethylene glycol dibutyl ether.

n-hexyl "Cellosolve"
See ethylene glycol monohexyl ether.

methyl "Cellosolve"
See ethylene glycol monomethyl ether.

methyl "Cellosolve" acetate
See ethylene glycol monomethyl ether acetate.

phenyl "Cellosolve"
See ethylene glycol monophenyl ether.

cell, photovoltaic. See solar cell.

cell, solar. See solar cell.

"Cellu-Aid."²¹⁸ Trademark for diatomite used as extender for paper.

"Celluflex" 112.¹ Trademark for cresyl diphenyl phosphate (q.v.). Used for flame-resistance in vinyl formulations.

"Celluflex" 179.¹ Trademark for tricresyl phosphate (q.v.).

"Celluflux" TPP.¹ Trademark for triphenyl phosphate. (q.v.). Used as plasticizer in cellulose acetate and phenolic plastics.

"Celluguard."¹ Trademark for a water glycol fire-resistant hydraulic fluid.

cellular plastic. A thermosetting or thermoplastic foam composed of cellular cores with integral skins having high strength and stiffness. The cells result from the action of a blowing agent, either at room temperature or during heat treatment of the plastic mixture. The resulting product may be either flexible or rigid, the latter being machinable. The foaming action in some cases may occur *in situ* (foamed-in-place plastics). Cellular plastics are combustible. For details see foam, plastic.

Uses (flexible): Furniture, automobile interiors, mattresses, etc. where softness and resiliency are desired. (Rigid) Insulating material; boat building and similar light construction; salvage of water-logged ships.

See also foam, plastic; rubber sponge. For further information refer to Cellular Plastics Division, Society of the Plastics Industry, 250 Park Ave., New York.

cellulase. An enzyme complex produced by the fungi *Aspergillus niger* and *Trichoderma viride* which is capable of decomposing cellulosic polysaccharides into smaller fragments, primarily glucose. It has been used as a digestive aid in medicine and in the brewing industry. Research has been devoted to experimental application of cellulase to disposal of cellulosic solid wastes. The resulting glucose can be fermented to ethyl alcohol, used to grow yeast for animal feed proteins, or as a chemical feedstock.

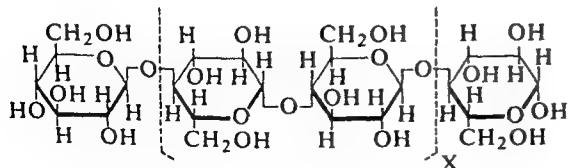

"Celluloid."³⁵² Trademark for a plastic consisting essentially of a solid solution of cellulose nitrate and camphor or other plasticizer with or without the presence of pigments and coloring matter. Available in sheets, rods, tubes, films. Also called pyroxylin.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Scrap: Not acceptable. Consult regulations for details.

See also nitrocellulose; Hyatt.

cellulose ($C_6H_{10}O_5$)_n. A natural carbohydrate high polymer (polysaccharide) consisting of anhydroglucose units joined by an oxygen linkage to form long molecular chains that are essentially linear. It can be hydrolyzed to glucose. The degree of polymerization (q.v.) is from 1000 for wood pulp to 3500 for cotton fiber, giving a molecular weight from 160,000 to 560,000.

Cellulose is a colorless solid, specific gravity about 1.50, insoluble in water and organic solvents; it will swell in sodium hydroxide solution and is soluble in Schweitzer's reagent (q.v.). It is the fundamental constituent of all vegetable tissues (wood, grass, flowers) and is thus the most abundant organic material in the

world. Cotton fibers are almost pure cellulose; wood contains about 50%.

The physical structure of cellulose is unusual in that it is not a single crystal, but consists of crystalline areas embedded in amorphous areas. Chemical reagents penetrate the latter more easily than the former. Cellulose is virtually odorless and tasteless, but it is combustible, with an ignition point of about 450°F; in some forms it is flammable. For example, railroad shipping regulations require a yellow label on such odd items as "burnt fiber," "burnt cotton," "wet waste paper" and "wet textiles." Fires have been known to occur in warehouses in which telephone books were stored. These were undoubtedly due to heat build-up in the paper caused by microbial activity and self-sustaining oxidation. See also flammable material.

The most important uses of cellulose as such are in the form of bulk woods of many kinds; paper, most of which is made from wood pulp; cotton products (clothing, sheeting, industrial fabrics); and packaging, ranging from wooden barrels to candy pats. Specialized uses include nonwoven fabrics, medical equipment (artificial kidney), insulation and sound-proofing, sausage casings, etc.

There are many chemical modifications of cellulose, including its esters (cellulose acetate), ethers (methylcellulose), the nitrated product (nitrocellulose), as well as rayon and cellophane (from cellulose xanthate). Thus it is the basis of many plastics, fibers, coatings, lacquers, explosives, and emulsion stabilizers. Alkali cellulose is an intermediate made by the action of sodium hydroxide solution on cellulose and is used for making cellulose ethers and viscose. See also cellulose, modified.

Cellulose exists in three forms—alpha, beta, and gamma. Alpha-cellulose has the highest degree of polymerization and is the chief constituent of paper pulp. The beta and gamma forms have much lower D.P. and are known as hemicellulose (q.v.). Methods of determining the alpha content of pulps are detailed in TAPPI Method T203 and ASTM D-588-42. See also pulp, paper.

Cellulose has been prepared in microcrystalline form. See "Avicel." Cellulose can be decomposed to glucose by the enzyme cellulase (q.v.).

Hazard: Cellulosic materials (paper, cotton and textile wastes) when wet with water are a dangerous fire hazard. Yellow label is required for rail freight; not accepted by express.

See also rayon; cellophane; nitrocellulose; carboxymethylcellulose; and following entries.

cellulose acetate (CA). A cellulose ester in which the cellulose is not completely esterified by acetic acid.

Properties: White flakes or powder. A thermoplastic resin, softening about 60–97°C and melting about 260°C. Sp. gr. 1.27–1.34; soluble in acetone, ethyl acetate, cyclohexanol, nitropropane, ethylene dichloride. Notable for toughness, high impact strength, and ease of fabrication. Subject to dimensional change due to cold flow, heat, or moisture absorption (1–7%). Fibers weaken above 80°C and are difficult to dye uniformly; not attacked by microorganisms. Nontoxic.

Derivation: Reacting cellulose (wood pulp or cotton linters) with acetic acid or acetic anhydride, with sulfuric acid catalyst. The cellulose is fully acetylated (three acetate groups per glucose unit) and at the same time the sulfuric acid causes appreciable degra-

dation of the cellulose polymer so that the product contains only 200–300 glucose units per polymer chain. At this point in the process the cellulose acetate ordinarily is partially hydrolyzed by the addition of water until an average of 2–2.5 acetate groups per glucose unit remain. This product is thermoplastic and soluble in acetone. Fibers are produced by forcing an acetone solution through orifices of the spinneret into a stream of warm air, which evaporates the solvent. Fibers are also produced in a similar manner from cellulose triacetate, which is insoluble in acetone but soluble in methylene chloride. See acetate fiber; acetate film.

Forms: Sheet, film, or fiber; molded items.

Grades: Filtered and unfiltered. Also graded by percent combined acetic acid content: plastic 52–54%; lacquer 54–56%; film 55.5–56.6%; water-resisting 56.5–59%; triacetate 60.0–62.5%.

Containers: Cartons, drums, multiwall paper sacks.

Hazard: Flammable; not self-extinguishing. Moderate fire risk.

Uses: Acetate fiber, lacquers, protective coating solutions, photographic film, transparent sheeting, thermoplastic molding composition, cigarette filters, magnetic tapes, osmotic cell membrane.

cellulose acetate butyrate (CAB; cellulose acetobutyr-ate).

Properties: White pellets or granules. A thermoplastic resin. Sp. gr. 1.2. Soluble in ketones, organic acetates, lactates, methylene, ethylene, and propylene chlorides and high-boiling solvents. Excellent weathering properties, low water absorption, low heat conductivity and high dielectric strength; high resistance to oil and grease. Combustible. Nontoxic.

Derivation: Reaction of purified cellulose with acetic and butyric anhydrides with sulfuric acid as catalyst and glacial acetic acid as solvent. The ratio of acetic and butyric components may be varied over a wide range.

Grades: According to butyryl content (17, 27, 38, 50%).

Containers: Fiber cartons and drums.

Uses: Molding compositions; film and sheet; photographic film, lacquers, protective coating solutions; tail-light lenses; water desalination membrane; piping and tubing; covering for aluminum fibers; toys; packaging; brush handles; hydrometers; miscellaneous consumer products.

cellulose acetate phthalate. A reaction product of phthalic anhydride and cellulose acetate, used for coating of tablets and capsules.

cellulose acetate propionate (cellulose propionate). Similar to cellulose acetate butyrate but made with propionic anhydride instead of butyric anhydride. Unusually stable; requires less plasticizer and is compatible with more plasticizers than the butyrate.

cellulose acetobutyr-ate. See cellulose acetate butyrate.

cellulose ether. See ethylcellulose; methylcellulose.

cellulose gum. A purified grade of carboxymethylcellulose (q.v.).

cellulose, hydrated (hydrocellulose). Cellulose that has been caused to react with water (about 8–12%), forming a gelatinous mass. Combustible.

Derivation: By mechanical pulverization and agitation with water, by the action of strong salt solutions, alkalis, or acids.

Use: In the manufacture of paper, vulcanized fiber, mercerized cotton, viscose rayon.

See also hydration.

cellulose methyl ether. See methylcellulose.

cellulose, modified. One of many derivatives of cellulose, formed by substitution of appropriate radicals (carboxyl, alkyl, acetate, nitrate, etc.) for hydroxyl groups along the carbon chain. Such reactions are usually not stoichiometric. Some of these products (carboxymethyl and hydroxyalkyl cellulose) are water-soluble ethers; others are organosoluble esters (cellulose acetate), nitrates (nitrocellulose), or xanthates (viscose). See also modification.

Biodegraded cellulose has been used as a microbial growth medium for protein formation; a tobacco substitute based on a cellulose modification has been developed. See "Cytrel".

cellulose nitrate. See nitrocellulose.

cellulose, oxidized (cellulosic acid). Derivative of cotton cellulose produced by treatment with nitrogen dioxide. Is soluble in alkali but may be made to retain original form of the cellulose and much of its tensile strength.

Properties: Slightly off-white gauze, lint, or powder. Slight charred odor; acid taste; soluble in aqueous organic bases, in dilute alkali, and in ammonium hydroxide, forming salts and esters. It is insoluble in water, acids, and common organic solvents. It slowly degrades at room temperatures and should be kept cool. Combustible.

Grades: U.S.P. technical.

Containers: Glass bottles; fiber cans.

Uses: Surgery and medicine; ion-exchange medium; thickening agent.

cellulose propionate. See cellulose acetate propionate. See also "Forticel."

cellulose, regenerated. See cellophane; rayon.

cellulose sponge. A sponge of regenerated cellulose, highly absorbent, soft and resilient when wet, long-lasting. It will not scratch, can be sterilized by boiling and is not affected by ordinary cleaning compounds. The pores vary in size from coarse pore (the size of a pea) to fine pore (the size of a pinhead). Yarn made of cellulose sponge consists of cotton fiber covered with the sponge product. Combustible.

Uses: Washing automobiles and trucks, walls and painted surfaces, windows, etc.; general cleaning; sponge used in photographic laboratories; wet mops, cleaning pads, etc.

cellulose triacetate. A cellulose resin in which the cellulose is completely esterified by acetic acid.

Properties: White flakes; sp. gr. 1.2; soluble in chloroform, methylene chloride, tetrachloroethane. Combustible; nontoxic.

Derivation: Reaction of purified cellulose with acetic anhydride in the presence of sulfuric acid as catalyst and glacial acetic acid as solvent, followed by very slight hydrolysis.

Grade: Flake.

Containers: Fiber cartons or drums.

Use: Protective coatings resistant to most solvents; textile fibers; base for magnetic tape.

cellulose xanthate. See viscose process.

cellulosic plastic. One of a number of semisynthetic polymers based on cellulose. See cellophane; cellulose acetate; cellulose, modified; nitrocellulose; rayon, viscose; carboxymethylcellulose.

Note: Development and use of cellulosics may be expected to increase due to the shortage of petroleum.

cellulosic thiocarbonate. A reactive intermediate in the graft polymerization of certain synthetic polymers to cellulosic fibers. The latter are treated with

sodium hydroxide and a sulfur-containing compound, and the cellulose thus activated is placed in an emulsion or solution of monomers. Polymerization at 50°C occurs with a peroxide catalyst to form the graft. See also graft polymer.

"Cellulube."¹ Trademark for a series of functional fluids (phosphate esters) combining fire-resistance and lubricating qualities. Available in controlled viscosities for industrial hydraulic and lubricant applications.

"Celluphos 4."¹ Trademark for tributyl phosphate. Uses: Plasticizer for nitrile elastomers; foam depressant for emulsion systems; solvent, extractant and complexing agent for inorganics.

"Cellutherm."¹ Trademark for a series of synthetic lubricants based on trimethylolpropane esters.

cell, voltaic. See voltaic cell.

"Celogen."²⁴⁸ Trademark for a series of blowing agents. AZ. Azodicarbonamide.
OT. Para, para-Oxybis-(benzenesulfonylhydrazide).
RA. para-Toluene sulfonyl semicarbazide.

"Celoron."²⁸¹ Trademark for macerated canvas or paper-based industrial laminated or molded plastics. Properties: Mottled brown or black; sp. gr. 1.35; high impact strength; unaffected by rapid temperature changes; resistant to heat, oil, water, and many chemicals; may be used continuously at 225–250°F. Combustible.

Forms: Sheets; cut pieces; blanks; rings; molded parts. Uses: Timing gears for automobile industry; electrical insulation; structural parts.

"Celotex."³⁵¹ Trademark for structural building and insulation board produced in large sheets. Made from bagasse (q.v.) or wood fiber and treated to be resistant to fungi, termites, and water penetration. The name also includes roofing products, gypsum, wallboard, lath, plasters, mineral wool, and hard board.

Celsius, A. (1701–1744). A Swedish physicist who proposed the use of the centigrade temperature scale! His name is now generally applied to this scale (degrees centigrade = degrees Celsius). See centigrade.

cement, aluminous (high alumina cement). A hydraulic cement which contains at least 30 to 35% alumina (in contrast to Portland cement, which contains less than 5%). The alumina is usually supplied by inclusion of bauxite. Aluminous cement attains its maximum strength more rapidly than Portland cement. It is also more resistant to solutions of sulfates. It exists in two modifications, sintered and fused.

cementation. A process in which steel or iron objects are coated with another metal by immersing them in a powder of the second metal and heating to a temperature below the melting point of any of the metals concerned. Zinc, chromium, aluminum, copper and other metals are applied to iron or steel in this fashion. The process is basically diffusion of one metal into the other, so that intermetallic alloy layers are formed at the interface of the basis and coating metals. See also sherardizing.

cemented carbide. See carbide, cemented.

cement, hydraulic. Any mixture of fine-ground lime, alumina, and silica that will set to a hard product by admixture of water, which combines chemically with

the other ingredients to form a hydrate. See also cement, aluminous and cement, Portland.

cementite Fe_3C . A carbide of iron formed in the manufacture of pig iron and steel. Composed of 93.33% iron and 6.67% carbon, it is very hard and brittle and will scratch glass and feldspar, but not quartz. It is about two-thirds as magnetic as pure iron under an exciting current. It occurs in ordinary steels of more than 0.85% carbon and takes its name from cement steel, made by the cementation process, which contains a great deal of this carbide. See also carbide.

cement, organic. Any of various types of rubber cement, silicone adhesives, deKhotinsky cement. See adhesive, rubber-based; silicone; deKhotinsky cement.

cement, Portland. A type of hydraulic cement in the form of finely divided gray powder composed of lime, alumina, silica and iron oxide as tetracalcium aluminoferrate ($4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$), tricalcium aluminate ($3\text{CaO} \cdot \text{Al}_2\text{O}_3$), tricalcium silicate ($3\text{CaO} \cdot \text{SiO}_2$), and dicalcium silicate ($2\text{CaO} \cdot \text{SiO}_2$). These are abbreviated respectively as C_4AF , C_3A , C_3S and C_2S . Small amounts of magnesia, sodium, potassium, and sulfur are also present. Hardening does not require air, and will occur under water. Sand is often added as a diluent. Cement may be modified with various plastic latices in proportions up to 0.2 part latex solids to 1 part cement to improve adhesion, strength, flexibility, and curing properties. Water evaporation can be retarded by adding such resins as methylcellulose and hydroxyethyl cellulose.

For further information refer to the Portland Cement Association, Chicago, Illinois.

cement, rubber. See adhesive, rubber-based.

"CE Methyl Esters."⁴⁸⁷ Trademark for a series of methyl esters of straight chain (normal) even numbered fatty acids ranging from C_8 (octanoate) to C_{18} (octadecanoate) and including mixtures of these. Properties: Colorless to light yellow liquids or white solids. Sp. gr. about 0.87.

Containers: Up to tank cars and trucks. Uses: Chemical intermediates; lubricants; cosmetic ingredients; formulating aids (rubber, wax, etc.).

"Centifoliol."¹⁸⁸ Trademark for a replacement for otto of rose and rose absolute. Uses: Perfume and cosmetic compositions.

centigrade. The internationally used scale for measuring temperature, in which 100° is the boiling point of water at sea level (1 atmosphere), and 0° is the freezing point. A temperature given in centigrade degrees may be converted to the corresponding Fahrenheit temperature by multiplying it by 9/5 (or 1.8), and adding 32 to the product. A temperature given in Fahrenheit degrees is converted to the corresponding centigrade temperature by subtracting 32, and multiplying the remainder by 5/9. The centigrade scale was devised by the Swedish scientist Celsius, and his name is now increasingly used in reference to it.

centigrade heat unit. See chu.

centipoise (cp). One one-hundredth of a poise. The poise is the metric system unit of viscosity, and has the dimensions of dyne-second per square centimeter or grams per centimeter-second.

centistoke (cs). One one-hundredth stoke, the kinematic unit of viscosity; it is equal to the viscosity

in poises divided by the density of the fluid in grams per cubic centimeter, both measured at the same temperature.

centrifugation. A separation technique based on the application of centrifugal force to a mixture or suspension of materials of closely similar densities. The smaller the difference in density, the greater is the force required. The equipment used (centrifuge) is a chamber revolving at high speed to impart a force up to 17,000 times that of gravity; the materials of higher density are thrown toward the outer portion of the chamber, while those of lower density are concentrated at or near the inner portion. This technique is used effectively in a number of biological and industrial operations, such as separation of the components of blood, concentration of rubber latex, and of fat particles from other milk components. Separation of isotopes, especially those of uranium, by this method is now practicable for producing enriched uranium; this method is economically superior to the gaseous diffusion process.

"Century."¹⁸⁹ Trademark for a series of stearic acids, oleic acids, special fatty acids and hydrogenated fatty acids.

Uses: Cosmetics, pharmaceuticals, textile finishes, wetting agents, carbon paper, cutting oils, plastics, esters, polishes, rubber compounding, soaps and lubricating greases.

"Cenwax."¹⁸⁹ Trademark for a series of hydrogenated castor oil products. Used as lubricants, coatings for leather, paper and textiles, candles, crayons, sealing compounds, polishes and wax extenders.

cephalin (kephalin; phosphatidyl ethanolamine; phosphatidyl serine)

$\text{CH}_2\text{OR}_1\text{CHOR}_2\text{CH}_2\text{OP}(\text{O})(\text{OH})\text{OR}_3$. A group of phospholipids in which two fatty acids (R_1 and R_2) form ester linkages with the two hydroxyl groups of glycerophosphoric acid (q.v.) and either ethanolamine or serine (R_3) forms an ester linkage with the phosphate group. Cephalins are, therefore, either phosphatidyl ethanolamine or phosphatidyl serine. They are associated with lecithins found in brain tissue, nerve tissue, and egg yolk.

Properties: Yellowish, amorphous substance; characteristic odor and taste; insoluble in water and acetone; soluble in chloroform and ether; slightly soluble in alcohol.

Uses: Medicine; biochemical research.

cephalosporin. Any of a family of antibiotics related to penicillin discovered in 1953; an important member of this group was synthesized by Woodward in 1966. Several cephalosporins are used clinically (cephalothin, cephaloridine, and cephalixin). The molecule contains a fused beta-lactam-dihydrothiazine ring system with an N-acyl side chain and an acetoxy group attached to the dihydrothiazine ring. Cephalosporins are reported to be free from the allergic reactions common with penicillin. Development of new cephalosporin derivatives is being actively pursued by pharmaceutical research chemists. See also penicillin; antibiotic.

ceramic. A product manufactured by the action of heat on earthy raw materials, in which the element silicon with its oxide and complex compounds known as silicates occupy a predominant position (American Ceramic Society). The chief major groups of the ceramics industry are as follows: (1) structural clay products (brick, tile, terra cotta, glazed architectural brick); (2) whitewares (dinnerware, chemical

and electrical porcelain, e.g., spark plugs, sanitary ware, floor tile); (3) glass products of all types; (4) porcelain enamels; (5) refractories (materials that withstand high temperatures); (6) Portland cement, lime, plaster and gypsum products; (7) abrasive materials such as fused alumina, silicon carbide and related products; (8) aluminum silicate fibers. A wide range of ceramics is now available as ultra-fine particles (10–150 microns); and ceramic foams are offered commercially. See also specific entries. For further information refer to the American Ceramic Society, 4055 North High St., Columbus, Ohio.

ceramic, ferroelectric. A unique type of polycrystalline ceramic having properties that make possible the production of reliable, high-density optical memories for computers that are more efficient than conventional types. Lead zirconate titanate (q.v.), heated and pressed into thin plates, is one of the compounds used. As a result of its ferroelectric properties, an applied voltage aligns the electric charges in the molecules of ceramic in the direction of the field, and the polarization so induced remains indefinitely, until changed. Thus the material accommodates itself to the requirements of the digital system, namely, binary 0 and binary 1. See also ferroelectric.

ceramic, glass. See glass ceramic.

"Ceramix."¹⁷⁷ Trademark for a technical grade of barium carbonate used in ceramic industry.

Hazard: May be toxic by ingestion.

"Ceramol."⁴⁰⁰ Trademark for a blend of cetyl and stearyl alcohols and higher alcohol sulfates. Melts from 50–60°C; acid number 1.0 max; saponification value 3 max; iodine number 5 max; acetyl value 185–195. Not alkaline to phenolphthalein. Combustible.

Uses: Emulsifier for cosmetic creams, ointments and lipsticks.

"Ceramvar."¹⁵⁵ Trademark for an iron, nickel, cobalt alloy designed for ceramic-to-metal sealing.

"Ceraphyl."¹¹⁰ Trademark for a series of lactate emollients designed for use in cosmetics and pharmaceutical applications.

"Ceratak."¹²⁸ Trademark for a grade of petroleum microcrystalline wax. Minimum m.p. 165°F.

"Cerathane" 63-L.¹²⁸ Trademark for an emulsifiable microcrystalline wax; minimum m.p. 200°F.

"Ceraweld."¹²⁸ Trademark for a grade of petroleum microcrystalline wax. Minimum m.p. 165°F.

"Cercor."²⁰ Trademark for thin-walled, cellular ceramic structures which can be used for a wide range of high temperature applications.

Uses: Gaseous heat exchangers; burner plates; acoustics; flame arresting; filtering and insulation.

cerebrosides. Derivatives of sphingosine (q.v.) in which the amino group is connected in an amide linkage to a fatty acid and the terminal hydroxyl group is connected to a molecule of sugar usually galactose, in glycosidic linkage. They are found in brain and nervous tissue, usually in association with sphingomyelin (q.v.).

"Cerelose."³⁰ Trademark for a white, crystallized, refined, dextrose (pure monosaccharide); 100% fermentable. Available in hydrate, anhydrous and liquid forms.

Containers: Up to tank cars and trucks.

Uses: Adhesives; chemicals; drugs and pharmaceuticals; foundry processes; and plastics.

"Ceresan."²⁸ Trademark for a series of mercury compounds used as seed disinfectants.

Hazard: Highly toxic.

ceresin wax (purified ozocerite; earth wax; mineral wax; cerosin; cerin).

Properties: White or yellow waxy cake; white is odorless; yellow has a slight odor. Sp. gr. 0.92-0.94; m.p. 68-72°C. Soluble in alcohol, benzene, chloroform, naphtha; insoluble in water. Combustible. Nontoxic. Derivation: Purification of ozocerite by treatment with concentrated sulfuric acid and filtration through animal charcoal.

Grades: White; yellow.

Containers: Bags; cartons.

Uses: Candles; sizing; bottles for hydrofluoric acid; electrical insulation; shoe and leather polishes; impregnating and preserving agent; lubricating compounds; wood filler; floor polishes; antifouling paints; waxed papers; cosmetics; ointments; matrix compositions; waterproofing textile fabrics.

ceria. See ceric oxide; rare earth.

ceric ammonium nitrate (cerium-ammonium nitrate; ammonium hexanitratocerate) $\text{Ce}(\text{NO}_3)_4 \cdot 2\text{NH}_4\text{NO}_3$.

Properties: Small prismatic, yellow crystals. Soluble in water and alcohol; almost insoluble in concentrated nitric acid; soluble in other concentrated acids.

Derivation: By electrolytic oxidation of cerous nitrate in nitric acid solution, and subsequently mixing solutions of cerium nitrate and ammonium nitrate, followed by crystallization.

Hazard: Strong oxidizing agent. Dangerous fire risk in contact with organic materials.

Uses: Analytical chemistry; oxidant for organic compounds; scavenger in the manufacture of azides.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

ceric hydroxide (ceric oxide, hydrated; cerium hydrate) $\text{CeO}_2 \cdot x\text{H}_2\text{O}$.

Properties: Whitish powder when pure; a hydrated oxide containing 85-90% ceric oxide. Soluble in concentrated mineral acids; insoluble in water.

Derivation: By treating a solution of a ceric salt with strong alkali. Reagent grade is prepared by adding a saturated solution of ceric ammonium nitrate to an excess of ammonium hydroxide.

Grades: Commercial; high purity; reagent.

Containers: Cans; bottles; fiber drums.

Uses: Production of cerium salts and ceric oxide; opacifier in glasses and enamels (imparts yellow color); shielding glass.

ceric oxide (cerium dioxide; cerium oxide; ceria) CeO_2 .

Properties: Pale yellow, heavy powder (white when pure). Commercial product is brown. Sp. gr. 7.65; m.p. 2600°C. Soluble in sulfuric acid; insoluble in water and dilute acid; requires reducing agent with acid to dissolve the anhydrous oxide. Noncombustible.

Derivation: By decomposing cerium oxalate by heat. Hardness depends on firing temperature.

Grades: Technical; high purity (99.8%).

Containers: Fiber drums; car lots.

Uses: Ceramics; abrasive for glass polishing; opacifier in photochromic glasses; retarder of discoloration in glass, especially radiation shielding and color TV tubes; catalyst; enamels and ceramic coatings; phosphors; cathodes; capacitors; semiconductors; refractory oxides; diluent in nuclear fuels.

ceric sulfate (cerium sulfate) $\text{Ce}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White or reddish-yellow crystals; sp. gr. 3.91; soluble in water (decomposes); soluble in dilute sulfuric acid. Strong oxidizing agent.

Derivation: Action of sulfuric acid on cerium carbonate.

Hazard: Fire risk in contact with organic materials.

Uses: Dyeing and printing textiles; analytical reagent; waterproofing; mildewproofing.

ceric sulfide (cerium sulfide). A high-temperature thermoelectric material that is stable and efficient up to 1100°C.

cerin. See ceresin wax.

cerite. A rare-earth ore found chiefly in Sweden. A minor source of cerium.

cerium Ce A rare-earth element of the lanthanide group of the Periodic Table. Atomic number 58; atomic weight 140.12; valences 3,4. Four stable isotopes.

Properties: Gray, ductile, highly reactive metal; sp. gr. 6.78; m.p. 795°C; b.p. 3257°C. Attacked by dilute and concentrated mineral acids and by alkalis. Readily oxidizes in moist air at room temperature. It has four allotropic forms. It is the second most reactive rare-earth metal. Cerium forms alloys with other lanthanides (see misch metal); it also forms a nonmetal with hydrogen, as well as carbides and intermetallic compounds. Decomposes water; nontoxic.

Ores: Cerite (Sweden), bastnasite (California, New Mexico), monazite (beach sands in Florida, Brazil, India; South Africa).

Derivation: Chemical processing and separation of ores.

Grades: Granules; ingots; rods (99.9% pure).

Hazard: May ignite on heating to 300°F. Strong oxidizing agent.

Uses: Cerium salts; cerium-iron pyrophoric alloys; ignition devices; military signalling; illuminant in photography; reducing agent (scavenger); catalyst; alloys for jet engines; solid state devices; rocket propellants; getter in vacuum tubes; diluent in plutonium nuclear fuels. See also misch metal.

Note: Cerium compounds have been found to have antiknock properties, e.g., cerium (2,2,6,6-tetramethyl-3,5-heptanedionate)₄, or $\text{Ce}(\text{thd})_4$.

cerium 141. Radioactive cerium of mass number 141.

Properties: Half-life 32.5 days; radiation, beta and gamma.

Derivation: From cerium-140 by capture of a neutron and emission of a gamma photon.

Form available: CeCl_3 in hydrochloric acid solution.

Hazard: Radioactive poison.

Uses: Biological and medical research.

Shipping regulations: (Rail, Air) Consult regulations.

cerium-ammonium nitrate. See ceric ammonium nitrate.

cerium carbonate. See cerous carbonate.

cerium chloride. See cerous chloride.

cerium dioxide. See ceric oxide.

cerium hydrate. See ceric hydroxide or cerous hydroxide.

cerium naphthenate.

Properties: A rubbery material, very difficult to dry. Almost insoluble without small quantities of organic stabilizers.

Derivation: By saponifying naphthenic acids and treating the sodium naphthenate formed with a suitable cerium salt. The commercial product is a mixture of rare earth soaps.

Uses: See soap (2).

cerium nitrate. See cerous nitrate.

cerium oxalate. See cerous oxalate.

cerium oxide. See ceric oxide.

cerium sulfate. See ceric sulfate; cerous sulfate.

cermet (ceramic + metal). A semisynthetic product consisting of a mixture of ceramic and metallic components having physical properties not found solely in either one alone, e.g., metal carbides, borides, oxides, and silicides. They combine the strength and toughness of the metal with the heat and oxidation resistance of the ceramic material. The composition may range from predominantly metallic to predominantly ceramic, e.g., SAP sintered aluminum contains 85% aluminum and 15% aluminum oxide. The most important industrial cermets are titanium carbide-based, aluminum oxide-based, and special uranium dioxide types. Cermets are made by powder metallurgy techniques, involving use of bonding agents such as tantalum, titanium and zirconium. High stress-to-rupture properties; operate continuously at 1800°F, for short periods at 4000°F.

Uses: Gas turbines, rocket motor parts, turbojet engine components, nuclear fuel elements; coatings for high-temperature resistance; sensing elements in instruments; seals, bearings, etc. in special pumps and other equipment.

"Cer-O-Cillin."³²⁷ Trademark for an antibacterial substance which differs from penicillin G in that the benzyl group is replaced by an allylmercaptomethyl group. Soluble in concentrations up to 500,000 units per cc. in sterile water for injection, sterile sodium chloride for injection, or sterile 5% dextrose.

Uses: Medicine.

cerosin. See ceresin wax.

cerotic acid (hexacosanoic acid; cerinic acid)

$\text{CH}_3(\text{CH}_2)_{24}\text{COOH}$. A fatty acid obtained from beeswax, carnauba wax or Chinese wax.

Properties: White odorless crystals or powder; sp. gr. 0.8198 (100/4°C); m.p. 87.7°C; refractive index 1.4301 (100°C). Insoluble in water; soluble in alcohol, benzene, ether, acetone. Combustible; low toxicity.

cerous carbonate (cerium carbonate) $\text{Ce}_2(\text{CO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: White powder; soluble in mineral acids (dilute); insoluble in water. Low toxicity.

Derivation: By adding an alkali carbonate to a solution of a cerous salt.

Containers: Fiber drums; car lots.

cerous chloride (cerium chloride) $\text{CeCl}_3 \cdot x\text{H}_2\text{O}$.

Properties: White crystals; deliquescent; sp. gr. 3.88 (anhydrous); m.p. 848°C (anhydrous); b.p. 1727°C. Soluble in water, alcohol, and acids. Low toxicity.

Derivation: Action of hydrochloric acid on cerium carbonate or hydroxide.

Containers: Fiber drums; car lots.

Uses: Incandescent gas mantles; spectrography; preparation of cerium metal.

cerous fluoride $\text{CeF}_3 \cdot x\text{H}_2\text{O}$.

Properties: Off-white powder, insoluble in water and acids. Sp. gr. (anhydrous) 6.16; m.p. 1460°C; b.p. 2300°C.

Derivation: By treating cerous oxalate with hydrofluoric acid.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: In arc carbons to increase their brilliance; preparation of cerium metal.

cerous hydroxide (cerium hydrate). Approximate formula $\text{Ce}(\text{OH})_3$.

Properties: White gelatinous precipitate; yellow, brown or pink when impurities are present. Soluble in acids; insoluble in water and alkali.

Derivation: Chief source is monazite sand.

Grades: Pure; crude.

Use: Pure form: To produce cerium salts; impart yellow color to glass; opacifying agent in glazes and enamels. Crude form: flaming arc lamp.

cerous nitrate (cerium nitrate) $\text{Ce}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless crystals; deliquescent. Soluble in water, alcohol, and acetone.

Constants: M.p., loses $3\text{H}_2\text{O}$ at 150°C; b.p. decomposes at 200°C.

Derivation: Action of nitric acid on cerous carbonate. **Containers:** Fiber drums; car lots.

Hazard: Strong oxidizing agent. Fire risk in contact with organic materials.

Uses: Incandescent gas mantles; medicine; reagent.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cerous oxalate (cerium oxalate) $\text{Ce}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Yellowish white, odorless, tasteless, crystalline powder; decomposes upon heating; soluble in dilute sulfuric and hydrochloric acid; very slightly soluble in water; insoluble in oxalic acid solution, alkalies, alcohol and ether.

Derivation: By extraction from monazite sand with oxalic or hydrochloric acid and conversion into the oxalate, followed by crystallization.

Grades: Pure; the commercial product is a complex mixture of oxalates of cerium, lanthanum and didymium.

Hazard: Toxic; strong irritant.

Uses: Medicine; isolation of cerium metals.

cerous sulfate (cerium sulfate) $\text{Ce}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$.

Properties: White crystals or powder; soluble in water and in acids. M.p. 630°C (dehydrated); sp. gr. 2.886. Low toxicity.

Derivation: Reagent grade is prepared by reducing a solution of ceric sulfate in sulfuric acid with hydrogen peroxide.

Grades: Technical and purified (reagent).

Uses: Developing agent for aniline black.

"Cerox."⁴⁵⁵ Trademark for a series of high alumina refractories with resistance to thermal shock, corrosion, abrasion, erosion, and reducing atmospheres. Fusion temperature up to 3600°F. Available in pre-fired shapes. Used in production of steel, of electronic ceramic components, of abrasives, in solid state ore reduction, metal powder sintering, in high-temperature gas reactors.

"Cerrobaze."⁶⁰ Trademark for the eutectic alloy of bismuth and lead. M.p. 255°F. Shrinks slightly after solidifying, later expands.

Uses: Proof casting forging dies; master patterns; mandrels for electroforming; heat-transfer medium in autoclaves; liquid seal in bright annealing and nitriding furnaces; molds for plastics; fusible foundry cores; filler for bending large diameter tubing.

"Cerrobend."⁶⁰ Trademark for the eutectic alloy of bismuth, lead, tin and cadmium, m.p. 158°F. Expands during and after solidification.

Uses: Filler in thin-walled tubing; assembly, check-

ing, drilling, spotting fixtures in aircraft and automotive tooling; anchoring medium in precision machining jet engine components (buckets and blades).

"Cerrocast."⁶⁰ Trademark for a non-eutectic alloy of bismuth and tin. Melting range 281–338°F. Exhibits negligible volume change during and after solidification.

Uses: Soft metal dies for "lost wax" patterns; engraving machine patterns; split jaw chucks; molds for plastics; mandrels for electroforming.

"Cerromatrix."⁶⁰ Trademark for a bismuth alloy with melting range 217–440°F, pouring at 250°F, expanding during and after solidification.

Uses: Die making to anchor punches; fastening bearings, bushings, and non-moving parts in machinery; nests in drill jigs and dial feeding stations; sheet-metal forming dies, etc.

"Cerosafe."⁶⁰ Trademark for a bismuth, lead, tin, and cadmium alloy with melting range 158–190°F. Shrinks 15 minutes after solidification, then expands.

Uses: Accurate duplicate patterns; proof casting cavities, such as gun chambers, bullet molds; toy castings and hobby models; sprayed-on protective coating on wood patterns and core boxes.

"Cerrotru."⁶⁰ Trademark for a non-shrinking bismuth-tin eutectic alloy, m.p. 281°F.

Uses: Anchoring shafts in Alnico rotors, forming blocks in stretch presses; engraving machining models; special jaws in tangent tube bending; soft metal dies in "lost wax" process; mandrels in electroforming; molds by "dip" casting.

certified color. See food color; FD&C color.

cerulean blue. A light blue pigment essentially cobaltous stannate $\text{CoO} \cdot n(\text{SnO}_2)$.

cerussite PbCO_3 . Natural lead carbonate, found in the upper zone of lead deposits.

Properties: Colorless, white, gray; luster adamantine; Mohs hardness 3–3.5; sp. gr. 6.55. Effervesces in nitric acid.

Occurrence: Colorado, Arizona, New Mexico, Idaho; Australia; Europe.

Uses: An ore of lead.

"Cer-Vit."¹⁹¹ Trademark for a glass ceramic (q.v.) having linear expansion coefficient near zero. Used for specialty products such as telescope mirrors, where minimum distortion is essential.

ceryl alcohol $\text{C}_{26}\text{H}_{53}\text{OH}$. An alcohol obtained from Chinese wax.

Properties: Colorless crystals; m.p. 79°C; insoluble in water; soluble in alcohol and ether. Combustible.

ceryl cerotate $\text{C}_{26}\text{H}_{53}\text{OOCOC}_{25}\text{H}_{51}$. The chief constituent of Chinese wax and typical of natural waxes. Colorless crystals with m.p. 84°C.

CES. Abbreviation for cyanoethyl sucrose.

cesium (caesium) Cs An alkali-metal element of Group 1A of the Periodic Table; atomic number 55; atomic weight 132.9055; valence 1. No stable isotopes.

Properties: Liquid at slightly above room temperature; soft solid below melting point; highly reactive. Decomposes water, with evolution of hydrogen, which ignites instantly. Also reacts violently with oxygen, the halogens, sulfur, and phosphorus, with spontaneous ignition and/or explosion. Sp. gr. 1.90; m.p. 28°C; b.p. 705°C. Mohs hardness 0.2. Cesium

has highest position in the electromotive series; it also has the lowest m.p. of any alkali metal, and the lowest ionization potential of any element. Soluble in acids and alcohol. Low toxicity.

Derivation: By thermochemical reduction of cesium chloride with calcium, or by electrolysis of the fused cyanide. Its chief ore is pollucite, found in Maine, So. Dakota, Manitoba, Elba, So. Africa.

Grades: Technical; 99.9%.

Containers: Due to its reactivity, cesium must be handled in sealed glass ampules with special break seals, or in stainless steel cylinders.

Hazard: Dangerous fire and explosion risk. Ignites spontaneously in moist air; may explode in contact with sulfur or phosphorus; reacts violently with oxidizing materials; causes burns in contact with skin.

Uses: Photoelectric cells; getter in vacuum tubes; hydrogenation catalyst; ion propulsion systems; plasma for thermoelectric conversion; atomic clocks; rocket propellant; heat transfer fluid in power generators; seeding combustion gases for magnetohydrodynamic generators.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes unless in cartridges.

cesium 137. Radioactive cesium of mass number 137.

Properties: Half-life 33 years; radiation, beta.

Hazard: Radioactive poison. The beta decay of Cs-137 produces barium 137, which in turn is radioactive, emitting a 0.662 mev gamma ray, with a 2.6 minute half-life.

Uses: Most applications of Cs-137 depend on the fact that any Cs-137 preparation has an equivalent amount of the gamma-emitting Ba-137 daughter. Approved by FDA as gamma radiation source for certain foods.

Shipping regulations: (Rail, Air) Consult regulations.

cesium alum. See cesium aluminum sulfate.

cesium aluminum sulfate (cesium alum)

$\text{CsAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; sp. gr. 2.0215; m.p. 117°C; soluble in water; insoluble in alcohol.

Derivation: By adding a solution of cesium sulfate to a solution of potassium alum, concentrating and crystallizing.

Grades: Pure.

Uses: Mineral waters; purification of cesium by fractional crystallization; preparation of cesium salts.

cesium antimonide. Used as a high-purity binary semiconductor.

Hazard: Toxic by ingestion.

cesium arsenide. Used as a high-purity binary semiconductor.

Hazard: Toxic by ingestion.

Shipping regulations: Arsenical compounds, n.o.s., (Rail, Air) Poison label.

cesium bromide CsBr.

Properties: Colorless crystalline powder; sp. gr. 4.44; m.p. 636°C; b.p. 1300°C; soluble in water; slightly soluble in alcohol.

Grades: Technical; single crystals.

Uses: Medicine; crystals for infrared spectroscopy; scintillation counters.

cesium carbonate Cs_2CO_3 .

Properties: White, hygroscopic, crystalline powder; very stable; can be heated to high temperature with-

out loss of CO_2 . Soluble in water, alcohol, and ether.

Derivation: By passing carbon dioxide into a solution of cesium hydroxide and subsequent crystallization.

Uses: Brewing; mineral waters; ingredient of specialty glasses.

cesium chloride CsCl .

Properties: Colorless crystals; sp. gr. 3.972; m.p. 646°C ; sublimates at 1290°C . Soluble in water and alcohol; insoluble in acetone.

Derivation: Action of hydrochloric acid on cesium oxide and crystallization.

Grades: Pure; low-optical density; single crystals.

Uses: Medicine; brewing; preparation of other cesium compounds; mineral waters; evacuation of radio tubes (positive ions supplied at surface of filament); for a density gradient in ultracentrifuge separations.

cesium dioxide Cs_2O_2 .

Properties: Yellow needles; sp. gr. 4.25; m.p. 400°C ; decomposes at 650°C ; soluble in water and acids.

Grades: Technical; pure.

Use: Cesium salts.

cesium fluoride CsF .

Properties: Deliquescent crystals; sp. gr. 4.115; m.p. 682°C ; b.p. 1251°C . Very soluble in water; soluble in methanol; insoluble in dioxane and pyridine.

Grades: 99% min; single crystals.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Optics; catalysis; specialty glasses.

cesium hexafluorogermanate Cs_2GeF_6 .

Properties: White crystalline solid; m.p. approx. 685°C ; density 4.10 g/cc. Slightly soluble in cold water and acids; very soluble in hot water.

Hazard: Toxic and irritant.

cesium hydrate. See cesium hydroxide.

cesium hydroxide (cesium hydrate) CsOH .

Properties: Colorless or yellowish, fused, crystalline mass. Strong alkaline reaction. Hygroscopic. Keep well stoppered. Sp. gr. 3.675; m.p. 272.3°C . Extremely soluble in water; the strongest base known.

Derivation: By adding barium hydroxide to an aqueous solution of cesium sulfate.

Grade: Technical; 50% aqueous solution.

Use: Recommended as electrolyte in alkaline storage batteries at subzero temperatures.

cesium iodide CsI .

Properties: Colorless, crystalline powder; deliquescent. Sp. gr. 4.510; m.p. 621°C ; b.p. 1280°C ; soluble in alcohol and water.

Grades: Technical; single crystals.

Hazard: Moderately toxic.

Uses: Crystals for infrared spectroscopy; scintillation counters.

cesium nitrate CsNO_3 .

Properties: Crystalline powder; saltpeter taste; sp. gr. 3.687; m.p. 414°C ; b.p. (decomposes); soluble in water and acetone; slightly soluble in alcohol.

Derivation: Action of nitric acid on cesium oxide and crystallization.

Grades: Pure, 99.0% min.

Hazard: Dangerous; may ignite organic materials on contact.

Use: Cesium salts.

Shipping regulations: Nitrates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cesium oxide Cs_2O .

Properties: Orange-red crystals; sp. gr. 4.36; m.p. decomposes $360\text{--}400^\circ\text{C}$; very soluble in water; soluble in acids.

Grades: Technical; pure.

Use: Cesium salts.

cesium perchlorate CsClO_4 .

Properties: Crystalline solid; sp. gr. 3.327 (4°C); m.p. (dec.) 250°C ; soluble in water (much more in hot than cold); slightly soluble in alcohol and acetone.

Grade: 99% min.

Hazard: Dangerous fire risk; strong oxidizing agent; may ignite organic materials on contact.

Uses: Optics; catalysis; specialty glasses; power generation.

Shipping regulations: Perchlorates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cesium peroxide. See cesium tetroxide.

cesium phosphide. Used as a high-purity binary semiconductor.

Hazard: Fire risk by decomposition to phosphine.

cesium sulfate Cs_2SO_4 .

Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp. gr. 4.2434; m.p. 1010°C . Low toxicity.

Derivation: Action of sulfuric acid on cesium carbonate.

Grades: Pure; low optical density.

Uses: Brewing; mineral waters; for density gradient in ultracentrifuge separation.

cesium tetroxide (cesium peroxide) Cs_2O_4 .

Properties: Yellow crystals; sp. gr. 3.77; m.p. 600°C ; decomposes violently in water; soluble in acids.

Strong oxidizing agent.

Hazard: Fire risk in contact with organic materials.

Shipping regulations: Oxidizing material, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cesium trioxide Cs_2O_3 .

Properties: Chocolate-brown crystals; sp. gr. 4.25 (0°C); m.p. 400°C ; decomposes in water; soluble in acids.

cetalkonium chloride (USAN) (cetyldimethylbenzylammonium chloride; benzylhexadecyldimethylammonium chloride) $\text{C}_{16}\text{H}_{33}\text{N}(\text{CH}_3)_2(\text{C}_{16}\text{H}_{33})\text{Cl}$. A quaternary ammonium germicide.

Properties: Colorless, odorless, crystalline powder; m.p. $58\text{--}60^\circ\text{C}$. Soluble in water to form colorless, odorless solution having pH 7.2. Compatible with alkalies and antihistamines. Soluble in alcohol, acetone, esters, carbon tetrachloride.

Uses: Medicine; germicide; fungicide; surface-active agent.

"Cetalon SZ"³⁰⁹ Trademark for a combination of formaldehyde sulfoxylate in the form of a white powder, easily soluble in water.

Uses: Stripping agent for wool, nylon, acetate, etc.

cetane. See hexadecane.

cetane number. A rating for Diesel fuel comparable to the octane number rating for gasoline. It is the percentage of cetane ($\text{C}_{16}\text{H}_{34}$) which must be mixed with heptamethylnonane to give the same ignition performance, under standard conditions, as the fuel in question.

"Cetats."⁴³⁰ Trademark for cetyltrimethylammonium tosylate (q.v.).

cetene. See 1-hexadecene.

cetin (cetyl palmitate; palmitic acid, cetyl ester)

Properties: White crystalline wax-like substance. Chief constituent of commercial purified spermaceti. M.p. 50°C; b.p. 360°C; sp. gr. 0.832; refractive index (n 70/D) 1.4398. Soluble in alcohol and ether; insoluble in water. Combustible; nontoxic.

Derivation: By solution from spermaceti.

Uses: Base for ointments, cerates, and emulsions; manufacture of candles, soaps, etc.

"Cetol."⁴³⁰ Trademark for cetyldimethylbenzylammonium chloride (cetalkonium) (q.v.).

"Cetone Alpha."²²⁷ Trademark for alpha-isomethylionone.

"Cetone V."²²⁷ Trademark for allyl-alpha-ionone.

cetyl alcohol (alcohol C-16; cetylic alcohol; 1-hexadecanol; normal primary hexadecyl alcohol; palmityl alcohol) $C_{16}H_{33}OH$. A fatty alcohol. Combustible; nontoxic.

Properties: White, waxy solid; faint odor; sp. gr. 0.8176 (49.5°C); m.p. 49.3°C; b.p. 344°C; refractive index (n 79/D) 1.4283; partially soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: By saponifying spermaceti with caustic alkali; reduction of palmitic acid.

Method of purification: Crystallization; distillation.

Grades: Technical; cosmetic; N.F.

Containers: Tins; cartons; drums; bags; tank cars.

Uses: Perfumery; emulsifier; emollient; foam stabilizer in detergents; face creams, lotions, lipsticks, toilet preparations; chemical intermediate; detergents; pharmaceuticals; cosmetics; base for making sulfonated fatty alcohols; to retard evaporation of water, when spread as a film on reservoirs, or sprayed on growing plants.

cetyl bromide $C_{16}H_{33}Br$.

Properties: Dark yellow liquid. Freezing point 15°C; b.p. 186–197°C (10 mm); sp. gr. 0.991 (25/25°C); lb/gal 8.25 (25°C); refractive index 1.460 (n 25/D); flash point 350°F. Soluble in ether; very slightly soluble in water, methanol. Combustible.

Use: Synthesis.

cetyldimethylbenzylammonium chloride. See cetalkonium chloride.

cetyldimethylethylammonium bromide

Properties: Paste.

Uses: Disinfectant; deodorant; germicide; fungicide; detergents.

cetyldimethylethylammonium chloride

cetylic acid. See palmitic acid.

cetylic alcohol. See cetyl alcohol.

cetyl lactate. See "Ceraphyl."

cetyl mercaptan (hexadecyl mercaptan) $C_{16}H_{33}SH$.

Properties: M.p. 18°C; b.p. 185–190°C (7 mm); strong odor; sp. gr. 0.8474 (20/4°C); refractive index 1.474 (n 20/D); flash point 275°F. Combustible.

Grades: 95% (min.) purity.

Containers: Up to tank cars.

Hazard: Probably toxic.

Uses: Intermediate; synthetic rubber processing; surface-active agent; corrosion inhibitor.

cetyl palmitate. See cetin.

cetyl pyridinium bromide $C_{16}H_{33}C_5H_5NBr$.

Properties: Cream-colored waxy solid. Soluble in acetone, ethanol and chloroform.

Uses: Surface-active agent; germicide.

cetylpyridinium chloride (1-hexadecylpyridinium chloride). The monohydrate of the quaternary salt of pyridine and cetyl chloride; $C_{16}H_{33}C_5H_5NCl \cdot H_2O$.

Properties: White powder with slight odor. M.p. 80–84°C. Very soluble in alcohol, chloroform and water; very slightly soluble in benzene and ether; pH (1% soln) 6.0–7.0.

Grades: Technical; N.F.

Use: Medicine.

cetyltrimethylammonium bromide (hexadecyltrimethylammonium bromide) $C_{16}H_{33}(CH_3)_3NBr$. A quaternary ammonium salt.

Properties: White powder; soluble in water, alcohol and chloroform.

Grade: Technical.

Uses: Surface-active agent; germicide.

cetyltrimethylammonium chloride $C_{16}H_{33}(CH_3)_3NCl$. A quaternary ammonium salt.

cetyltrimethylammonium tosylate

Uses: Germicide; surfactant.

cetyl vinyl ether (vinyl cetyl ether) $C_{16}H_{33}OCH:CH_2$.

Properties: Colorless liquid; sp. gr. 0.822 (27°C); m.p. 16°C; b.p. 142°C (1 mm), 173°C (5 mm); flash point (open cup) 325°F; refractive index (n 25/D) 1.444. Combustible.

Grades: 97%.

Containers: 350 lb drums.

Hazard: Toxic by inhalation; skin irritant. Reacts strongly with organic materials.

Use: Reactive monomer which may be copolymerized with a variety of unsaturated monomeric materials, including acrylonitrile, vinyl chloride, vinylidene chloride, and vinyl acetate, to yield internally plasticized resins.

Cf Symbol for californium.

CF. Abbreviation for citrovorum factor. See folinic acid.

"C- Fatty Acids."⁴⁸⁷ Trademark for fatty acids derived from coconut oil. The major component acids are lauric and myristic. Differ primarily in amount of unsaturated acid components and color. Light-yellow solids which liquefy at about 25°C; obtained from naturally occurring triglycerides; nontoxic; combustible.

Containers: Tank cars and trucks.

Uses: Intermediates, rubber compounding, cosmetic ingredients, buffing compounds, alkyd resins, emulsifiers, grease manufacture and candles.

CFE. Abbreviation for chlorotrifluoroethylene. Also used for polychlorotrifluoroethylene resins.

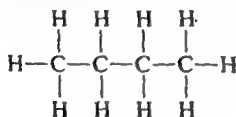

cgs. Abbreviation of centimeter gram second, the system of measurement used internationally by scientists.

chabazite $\text{CaAl}_2\text{Si}_4\text{O}_{12} \cdot 6\text{H}_2\text{O}$. Essentially a natural hydrated calcium aluminum silicate, usually containing some sodium and potassium. A zeolite (q.v.).
Properties: Color white, reddish, yellow, brown; luster vitreous; sp. gr. 2.1; Mohs hardness 4–5.
Occurrence: New Jersey, Colorado, Oregon; Europe.
Use: Water treatment.

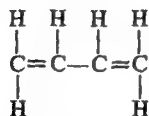

Chadwick, Sir James (1891–). A British physicist who was awarded the Nobel Prize in 1935 for his discovery of the neutron (1932), the existence of which had been predicted by Rutherford. This was an immensely important advance in the knowledge of subatomic particles. See also neutron.

chain. A series of atoms of a particular element directly connected by chemical bonds which constitutes the structural configuration of a compound. Such chains are usually composed of carbon atoms, often shown without their accompanying hydrogens. Carbon chains may be of the following types:

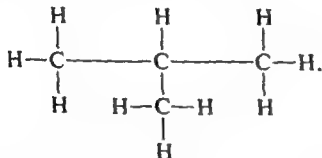

(1) Open or straight chain: a sequence of carbon atoms extending in a direct line; this is characteristic of paraffins and olefins, the former being saturated:

and the latter unsaturated:

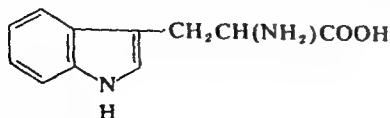

(2) Branched chain: a paraffinic structure isomeric with its straight-chain counterpart, e.g., butane, but having a subordinate chain comprised of one or more carbon atoms:

Such compounds are designated by the prefix *iso-*, and their properties are often notably different from the straight-chain isomer. For example, octane has a very low antiknock rating, whereas that of isooctane is high.

(3) Closed chain, or ring: a cyclic arrangement of carbon atoms giving a closed geometric structure, that is, a ring, pentagon or other form; these are characteristic of alicyclic, aromatic, and heterocyclic compounds. See cyclic compound.

(4) Side-chain: a group of atoms attached to one or more of the locations in a cyclic or heterocyclic compound, e.g., tryptophan:

chain mechanism. See free radical.

chain reaction. See fission, nuclear; nuclear energy.

chalcocite (copper glance) Cu_2S . Natural cuprous sulfide, occurring with other copper minerals.

Properties: Color lead gray, tarnishing dull black; luster metallic; sp. gr. 5.5–5.8; Mohs hardness 2.5–3.

Occurrence: Montana, Arizona, Utah, Nevada; Alaska; Chile; Mexico; Europe.

Use: Important ore of copper.

chalcopyrite (copper pyrites, yellow copper) CuFeS_2 .

Natural copper-iron sulfide, found in metallic veins and igneous rocks.

Properties: Color brass yellow, frequently tarnished bronze or iridescent; luster metallic; streak greenish black; sp. gr. 4.1–4.3; Mohs hardness 3.5–4. May carry gold or silver or mechanically intermixed pyrite.

Occurrence: Montana, Utah, Arizona, Tennessee, Wisconsin; Europe; Chile; Canada.

Use: Important ore of copper.

chalk. A natural calcium carbonate composed of the calcareous remains of minute marine organisms. Decomposed by acids and heat. Odorless, tasteless, nontoxic. See also calcite; calcium carbonate; whiting; chalk, prepared.

chalk, drop. See chalk, prepared.

chalk, French. A variety of soapstone or steatite. See talc.

chalking. A natural process by which paints develop a loose, powdery surface formed from the film. Chalking results from decomposition of the binder, due principally to the action of ultraviolet rays.

chalk, precipitated. See calcium carbonate, precipitated.

chalk, prepared (drop chalk; calcium carbonate, prepared).

Properties: Fine, white to grayish-white impalpable powder, often formed in "conical drops." Odorless, tasteless and stable in air. M.p., decomposes at 825°C with evolution of carbon dioxide; decomposed by acids; practically insoluble in water; insoluble in alcohol. Nontoxic; noncombustible.

Derivation: By grinding native calcium carbonate to a fine powder, agitating with water, allowing the coarser particles to settle, decanting the suspension and allowing the fine particles to settle slowly.

Containers: Fiber cans; tins; glass bottles; multiwall paper sacks.

Uses: Medicine (antacid); tooth powders; calcimine; polishing powders; silicate cements. For other uses, see whiting and calcium carbonate.

chamber process. An obsolete method for manufacturing sulfuric acid from sulfur dioxide, air, and steam in the presence of nitrogen oxides as catalysts. It is no longer used in the U.S.

chamois. A very soft, flexible leather made from the flesh layer of a split sheepskin by treating with fish oils, piling in contact with similarly treated skins, and allowing the fish oils to oxidize. Used chiefly for fine cleaning of smooth surfaces and specialty leather items.

chamomile oil (camomile oil). An essential oil, usually blue in color, used in flavoring and in medicine. There are several varieties, including Roman (English), German, Hungarian, etc. It has a strong aromatic odor and bitter taste.

channel black. See carbon black.

charcoal, activated. See carbon, activated.

charcoal, animal. See bone black; ivory black.

charcoal, bone. See bone black.

charcoal, vegetable. See vegetable black; carbon, activated.

charcoal, wood. An amorphous allotropic form of carbon.

Derivation: Destructive distillation of wood.

Grades: Technical, in lumps; powdered; briquettes.

Containers: Barrels; multiwall paper sacks.

Hazard: Dangerous fire risk in briquette form or when wet; may ignite spontaneously in air.

Uses: Chemical (precipitant in the cyanide process, precipitant of iodine and lead salts from their solutions, catalyst, calcium carbide); decolorizing and filtering medium, gas adsorbent; component of black powder and other explosives; fuel; arc light electrodes; decolorizing and purifying oils; solvent recovery; deodorant.

Shipping regulations: (Rail) (ground, crushed or pulverized) Yellow label; (wet) Not accepted. (Air) (ground, crushed or pulverized) Flammable Solid label; (wet) Not acceptable.

Chardonnet (1839–1924). A native of France, he has been called the father of rayon because of his successful research in producing what was then called artificial silk from nitrocellulose. He was able to extrude fine threads of this semisynthetic material through a spinneret-like nozzle and the textile product was made on a commercial scale in several European countries. He was awarded the Perkin medal for this work in 1914, only a few years before the discovery of rayon.

Charles' Law. At constant volume, the pressure of a confined gas is proportional to its absolute temperature. See also Gay-Lussac's Law.

chaulmoogra oil (gynocardia oil; hydnocarpus oil).

Properties: Brownish-yellow oil or soft fat; repulsive odor; somewhat acrid taste. Soluble in ether, chloroform, benzene, solvent naphtha; sparingly soluble in cold alcohol; almost entirely soluble in hot alcohol, carbon disulfide. Sp. gr. 0.940. Iodine value 85–105, depending on type; optically active.

Chief constituents: Glycerides of chaulmoogric and hydnocarpic acids.

Derivation: Expressed from the seeds of *Taraktogenos kurzii* or *Hydnocarpus anthelminticus* or *wightianus*.

Uses: Medicine (treatment of leprosy and other infective skin diseases).

chaulmoogric acid (hydnocarpyl acetic acid)

$\text{CH}_2\text{CH}_2\text{CHCHCH}(\text{CH}_2)_{12}\text{COOH}$. A cyclic fatty acid.

Properties: Colorless shiny leaflets; m.p. 68.5°C; soluble in ether, chloroform, and ethyl acetate.

Source: Chaulmoogra oil.

Use: Medicine; biochemical research.

chavicol (para-allylphenol; 1-allyl-4-hydroxybenzene) $\text{C}_9\text{H}_8\text{O}$. Liquid; m.p. 16°C; b.p. 230°C; sp. gr. 1.033 (18/4°C); soluble in water and alcohol. Occurs in many essential oils.

CHDM. See 1,4-cyclohexanedimethanol.

"Checlox."³⁰⁷ Trademark for a series of organic chelating and sequestering agents, consisting of polycarboxylic acid derivatives of amines or polyamines or

their salts, as, for example, ethylenediaminetetraacetic acid (q.v.).

"Chel."²¹⁹ Trademark for a series of chelating agents.

chelate. The type of coordination compound (q.v.) in which a central metal ion such as Co^{2+} , Ni^{2+} , Cu^{2+} , or Zn^{2+} is attached by coordinate links to two or more nonmetal atoms in the same molecule, called ligands. Heterocyclic rings are formed with the central (metal) atom as part of each ring. Ligands offering two groups for attachment to the metal are termed bidentate (two-toothed); three groups, tridentate, etc.

A common chelating agent is ethylenediaminetetraacetic acid (EDTA). Nitrilotriacetic acid $\text{N}(\text{CH}_2\text{COOH})_3$ and ethyleneglycol-bis(beta-aminoethyl ether)-N,N-tetraacetic acid $(\text{HOOCCH}_2)_2\text{N}-\text{CH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2$ are used in analytical chemical titrations and to remove ions from solutions and soils. Metal chelates are found in biological systems, e.g., the iron-binding porphyrin group of hemoglobin and the magnesium-binding chlorophyll of plants. Medicinally, metal chelates are used against Gram-positive bacteria, fungi, viruses, etc.

See also ammine; sequestration; complex; cobaltamine.

"Chelon."⁴²⁸ Trademark for a series of chelating agents.

"Chemactant."⁴⁶⁰ Trademark for a series of industrial products derived from lanolin.

Uses: Softener and conditioner for leather, fur, textiles; inks; plastics; rubber; paper; mold release compounds; resin polymerization; waxes, polishes, and cleaners; greases; emulsions; paints; coatings; quick breaking aerosol foams.

"Chemglaze"⁵⁴⁷ Trademark for clear and pigmented, single package, moisture-curing, pure polyurethane coatings.

"Chem-Hoe."¹⁷⁷ Trademark for isopropyl N-phenylcarbamate (IPC), a selective herbicide.

Chemical Abstracts Service (CAS). A systematic, computerized chemical information source developed by the CAS Division of the American Chemical Society (q.v.). *Chemical Abstracts* (1907) has become the largest scientific abstract journal in the world and the repository of all significant chemical research information reported in the international literature. An extensive, in-depth systems approach to the storage and handling of chemical information has enabled CAS to assemble a vast computerized body of knowledge, typified by its Chemical Compound Registry—a collection of unique, structure-based "addresses," or fingerprints, which now contains the structural record of about 2.5 million substances. The ACS chemical publications are one form of the output of this information system.

chemical bond. See bond, chemical.

chemical change. Rearrangement of the atoms, ions, or radicals of one or more substances resulting in the formation of new substances often having entirely different properties. Such a change is called a chemical reaction (q.v.). In some cases energy in the form of heat, light, or electricity is required to initiate the change; this is known as an endothermic reaction. When energy is given off, as a result of rupture of chemical bonds, the change is said to be exothermic.

Chemical changes should be distinguished from physical changes, in which only the state or condition of a substance is modified, its chemical nature remaining the same. A physico-chemical change has some of the characteristics of both. Examples of the three types are:

Chemical Changes

fuel + oxygen → carbon dioxide + water + heat (exothermic)

water + carbon dioxide + energy → sugar + oxygen (endothermic)

Physical Changes

water to ice or steam
distillation processes

coagulation of latex

Physicochemical Changes

cooking of food
vulcanization of rubber
tanning of leather
drying of oil- or plastic-based paints

chemical dating. Estimation of the age of geologic structures and events by measuring the amount of radioactive decay products in existing samples. The age of a uranium-containing material can be determined by measuring the percentage of lead (or helium) formed as a result of disintegration of the uranium. Uranium decays to both helium and the 206 lead isotope, but measurement of helium content is inaccurate because of its strong tendency to escape. By determining the ratio of the percentage of lead in a sample to the percentage of uranium, the age can be calculated. A more recent method, applicable to events within about 10,000 years, involves the use of the natural radioactive carbon isotope (C-14); the percentage of this isotope determined in a carefully prepared sample is an index of its age, based on the half-life of C-14 (5700 years), which was present in the atmospheric CO₂ absorbed by plants centuries ago. This method has yielded valuable results in the study of archaeological specimens, deep-sea sedimentation and dates of volcanic and glacier activity.

chemical economics. The principles and practical application of industrial economics in particular reference to the manufacture of chemicals and chemically derived products. Economic factors that apply especially to the chemical industries are: (1) heavy capital investment; (2) vast range of raw materials and products; (3) complex and varied production methods; (4) high-level R & D for new products, including extensive testing for safety and acceptability; (5) market research to develop new product uses, etc.; (6) substitution of synthetic for natural products or (in some cases) the reverse; (7) utilization of by-product materials; (8) waste reclamation and pollution control. See also chemical process industry.

chemical engineering. That branch of engineering concerned with the production of bulk materials from basic raw materials by large-scale application of chemical reactions worked out in a laboratory. The common to all chemical processing are those transfer, filtration, evaporation, distillation, drying, mixing, adsorption, solvent extraction and gas absorption. Underlying these are the fundamentals involved in every technical problem in chemical engineering: conservation, equilibrium, kinetics, and

Conservation involves the laws of the conservation of matter and energy. The limits of any chemical process are established by its equilibrium conditions; the principles underlying the equilibrium concept (such as the Law of Mass Action) are of fundamental importance (see chemical laws). By kinetics is meant time-dependent processes or rate processes (momentum transfer, thermal transfer, mass transfer and chemical kinetics). Control involves either the systems approach or feedback or closed-loop methods, as well as considerations of the stability of the system. See also equilibrium constant; stoichiometry; kinetics, chemical.

Chemical Industry Institute of Toxicology. An industry-supported organization whose purpose is investigation of environmental and occupational health concerns involving widely used basic chemicals. It will study the toxicity of commodity chemicals and the pertinent testing procedures. The Institute has 20 company members (1976).

chemical kinetics. See kinetics, chemical.

chemical laws. A group of basic principles governing the combining power and reaction characteristics of elements. Among the more important are:

(1) Law of Mass Action: The rate of a homogeneous (uniform) chemical reaction at constant temperature is proportional to the concentrations of the reacting substances.

(2) Law of Definite or Constant Composition: Any chemical compound invariably contains the same elements in the same fixed proportions by weight. A number of exceptions to this law occur in solid compounds such as silicates, which are known as non-stoichiometric compounds.

(3) Law of Multiple Proportions: When two elements unite to form two or more compounds (e.g., nitrogen and oxygen can form five different oxides), the weights of one element that combine with a given weight of the other are in the ratio of small whole numbers. Hydrogen and oxygen unite in the ratio of 1 to 8 in water and of 1 to 16 in hydrogen peroxide. Thus the weights of oxygen that unite with one gram of hydrogen are in the ratio of 1 to 2.

(4) Law of Conservation of Mass: Any chemical reaction between two or more elements or compounds leaves the total mass unchanged, the reaction products having exactly the same mass that was present in the reactants, regardless of the extent to which their other properties are changed.

(5) Law of Avogadro: Equal volumes of gases at constant temperature and pressure contain the same number of molecules, whether the gases are the same or different. 22.4 liters of any gas contain 6.02×10^{23} molecules. See also Avogadro's law; mole.

Chemical Marketing Research Association (CMRA). A professional organization whose primary functions are concerned with market research in the chemical and process industries. Techniques for this comparatively new research are still being evaluated. Major purposes of the Association are to provide opportunities for members to keep in touch with the latest consumer and industrial research concepts; to encourage the general welfare of the chemical industries; to improve the service of these industries to the public; and to cooperate with Government officials in furthering the national welfare. The offices of the organization are at 100 Church St., New York, N.Y.

chemical microscopy. See microscopy, chemical.

chemical milling. The process of producing metal parts to predetermined dimensions by removing

metal from the surface with chemicals. Acid or alkaline pickling or etching baths are used for this purpose. Immersion of a metal part will result in uniform removal of metal from all surfaces exposed to the solution. This process is used by the aircraft industry for weight reduction of large parts; it is also used in the manufacture of instruments and other components where exact tolerances are required.

chemical nomenclature. The origin and use of the names of elements, compounds, and other chemical entities, both individually and as groups, as well as the various proposals for systematizing them. It may be considered to include three major aspects: (1) the gradual sporadic development of these names, many of which go back to the alchemists of the Middle Ages; (2) the proliferation of terminology due to the rapid extension of organic chemistry in the mid-nineteenth century, which led to the recommendations of the Geneva System in 1892; (3) the additional reforms adopted by the International Union of Pure and Applied Chemistry in 1930. There is still no clear-cut elimination of the older names in spite of the changes introduced in these reformed systems. Thus the present nomenclature is in some respects a hybrid; for example, the earlier terms paraffin and olefin are still widely used instead of more modern alkane and alkene, and methyl alcohol is as acceptable as methanol.

A comparatively recent development in the nomenclature of inorganic and complex compounds is use of the Stock system, in which roman numerals indicate the oxidation state or coordination value. For example, iron II chloride stands for ferrous chloride (FeCl_2), and iron III chloride for ferric chloride (FeCl_3).

See also: Geneva System; benzene.

chemical oxygen demand. See oxygen consumed.

chemical planetology. Application of various branches of chemistry (analytical, physical and geochemistry) to study of the composition of the surface and atmosphere of the planets, particularly Venus, Mars and Jupiter. Much information has been obtained by spectrographic methods, and valuable additional data have resulted from space probes. See also astrochemistry.

chemical process industry. An industry whose product(s) results from (a) one or more chemical or physicochemical changes; (b) extraction, separation, or purification of a natural product, with or without the aid of chemical reactions; (c) the preparation of specifically formulated mixtures of materials, either natural or synthetic. Examples are as follows (with allowance for a certain amount of overlapping); (a) the plastics, rubber, leather, food, dye, and synthetic organic industries; (b) the petroleum, paper, textile, and perfume industries; (c) the glass, cement, fertilizer, soap, and paint industries. Many of these involve one or more unit operations of chemical engineering (q.v.), as well as such basic processes as polymerization, oxidation, reduction, hydrogenation, etc., usually with the aid of a catalyst. This definition could be interpreted to include ore processing, separation, and refinement, as well as the manufacture of metal products; however, these are usually considered to comprise the metal and metallurgical industries.

chemical reaction. A chemical change (q.v.) that may occur in several ways, e.g. by combination, by re-

placement, by decomposition, or by some modification of these. Reactions are endothermic when heat is necessary to maintain them, and exothermic when they evolve heat. All chemical reactions are in balance, that is, the number of atoms in the reacting substances is invariably equal to the number of atoms in the reaction products. Common types of reactions are oxidation, reduction, ionization, combustion, polymerization, hydrolysis, condensation, enolization, saponification, rearrangement, etc. Chemical reactions involve rupture of only the bonds which hold the molecules together, and should not be confused with nuclear reactions, in which the atomic nucleus is involved. A reversible reaction is one in which the reaction product is unstable and thus changes back into the original substance spontaneously. In a complete reaction the activity goes to the right and is indicated by an arrow \rightarrow ; if heat or a catalyst is used this is indicated by a symbol or word

above the arrow, as $\xrightarrow{\text{catalyst}}$; a reversible reaction is shown by either \rightleftharpoons or \longleftrightarrow .

chemical smoke. Chemically generated aerosols used primarily for military purposes. They are of 4 types:

(a) FS, a mixture of sulfuric anhydride and chlorosulfonic acid; used in shells and bombs and sprayed from airplanes.

(b) FM, titanium tetrachloride; same as FS, but brilliant white and will drop like a curtain when sprayed.

(c) HC, a mixture of hexachloroethane, aluminum and zinc oxide; burns to yield a white cloud.

(d) WP, a white phosphorus; burns to form white cloud of phosphoric acid; an excellent smoke producer.

See also fog; smoke; chemical warfare.

chemical stoneware (brick, chemical). A clay pottery product widely employed to resist acids and alkalis. It is used for utensils, pipes, stopcocks, ball mills, laboratory sinks, etc.

chemical technology. A general term covering a broad spectrum of physicochemical knowledge of the materials, processes, and operations used in the chemical process industries. It includes (1) basic phenomena such as activation, adsorption, oxidation, catalysis, corrosion, surface activity, polymerization, etc.; (2) the properties, behavior and handling of industrial materials and products (plastics, textiles, coatings, soap, foods, metals, paper, pharmaceuticals, etc.); and (3) their formulation, fabrication and testing (compounding, extruding, molding, assembly, and the like). See also chemical process industry.

chemical thermodynamics. That aspect of thermodynamics concerned with the relationship of heat, work, and other forms of energy to equilibrium in chemical reactions and changes of state. See also thermodynamics; thermochemistry; kinetics, chemical; equilibrium constant.

chemical warfare. The employment of a chemical agent directly for military purposes, i.e., to cause casualties by irritation, burning, asphyxiation, or poisoning; to contaminate ground; to screen action by smoke; or to cause incendiary damage. It includes use of all forms of toxic or irritant gases, including nerve gases (q.v.), smoke-inducing agents, flammable gels such as napalm, and such incendiary materials as magnesium and thermite. Biological

warfare involves the use of bacteria and other infective agents against enemy forces or populations.

Chemico process. A technique used for extracting sulfur from low-grade ores (25 to 50% sulfur) by means of hot water.

"Chemigum."²⁶⁵ Trademark for synthetic acrylonitrile/butadiene dry elastomers and latices produced by emulsion polymerization. They have exceptional resistance to oils and aromatic fuels. They range from high to low nitrile content polymers.

Uses: (dry) Automotive gaskets and hose, refrigerator hose, fuel cell interliners, oil-resistant shoe soles and heels, belt covers, hard packing compounds, adhesives, kitchen and drug sundries, tubing, textile coatings, frictioning compounds, oil-resistant auto parts, rubber rolls, printers' supplies, flooring. (Latex): Saturated and beater-impregnated paper; nonwoven fabric binders, carpet backings, textile and paper coating, foam, dipped goods, textile inks, leather finishes.

"Chemigum AC." A polyacrylic elastomer intended for high temperature, oil resistant service—applications where temperature requirements exceed 275°F.

"Chemigum 200 series." Latices produced with both high and medium nitrile contents. Require conventional cure cycle.

"Chemigum 500 series." Carboxylic-modified NBR latices with medium nitrile content. Their use eliminates the conventional sulfur cure. Other properties: mechanical and chemical stability, low foam formation, advantageous film color and aging properties.

chemiluminescence. The emission of absorbed energy (as light) due to a chemical reaction of the components of the system. It includes the subclassifications of bioluminescence and oxyluminescence, in which light is produced by chemical reactions involving organisms and oxygen, respectively. Chemiluminescence occurs in thousands of chemical reactions covering a wide variety of compounds, both organic and inorganic. Emission of light by fireflies is a common example of bioluminescence. See also luminescence.

"Chemipen."⁴¹² Trademark for potassium phenethicillin.

chemisorption. The formation of bonds between the surface molecules of a metal (or other material of high surface energy) and another substance (gas or liquid) in contact with it. The bonds so formed are comparable in strength to ordinary chemical bonds, and much stronger than the van der Waals type characterizing physical adsorption (q.v.). Chemisorbed molecules are almost always altered, e.g., hydrogen is chemisorbed on metal surfaces as hydrogen atoms; chemisorption of hydrocarbons may result in the formation of chemisorbed hydrogen atoms and hydrocarbon fragments. Even when dissociation does not occur, the properties of the molecules are changed by the surface in important ways. This mechanism is the activating force of catalysis.

A practical example of chemisorption is the boundary lubrication of moving metal parts in machinery. A film of oil forms a chemisorbed layer at the interface (q.v.) and averts the high frictional forces that would otherwise exist. Solids with high surface energies are necessary for chemisorption to occur, e.g., nickel, silver, platinum, iron. See also catalysis.

"Chemivic."²⁶⁵ Trademark for vinyl-reinforced nitrile dry polymers, produced by thoroughly fluxing "Plio-vic" PVC resin into "Chemigum" NBR rubber.

Uses: Integral molded shoe soles and mechanical goods, gaskets, solvent resistant hole and tubing, wire and cable jacketing.

"Chemlok"³⁴⁷ Trademark for a series of adhesives, primarily for bonding rubber to metal.

"Chemlok" 205. A mixture of polymers, organic compounds and mineral fillers in a methyl isobutyl ketone and "Cellosolve" solvent system. Used as a primer with "Chemlok" 220 when the bond must have exceptional resistance to adverse environmental conditions or when surface preparation must be minimized. Also used as a single coat adhesive for bonding nitrile elastomers.

"Chemlok" 220. Dissolved organic polymers and dispersed fillers in a xylene and perchloroethylene solvent system. Used as a versatile one-coat adhesive for bonding uncured elastomers to metals during the vulcanization.

chemodynamics. A comprehensive, interdisciplinary study of chemicals in the environment, with special reference to pesticides.

chemonite (copper arsenite, ammoniacal). A wood-preserved solution prescribed by Federal Specification TT-W-549 to contain copper hydroxide, $\text{Cu}(\text{OH})_2$, 1.84%; arsenic trioxide, As_2O_3 , 1.3%; ammonia, NH_3 , 2.8%; acetic acid, 0.05%; water, as necessary to 100.0%.

Hazard: Highly toxic by ingestion.

Shipping regulations: (Rail) Arsenical compounds, n.o.s., Poison label. (Air) Poison label. Arsenites, liquid, n.o.s., Poison label.

chemonuclear production. Manufacture of chemicals using the energy of a nuclear reactor. Feasibility studies carried out on making hydrogen cyanide from nitrogen and methane, using fission fragments as the energy source for the heat of reaction, have indicated that this process cannot yet compete economically with standard methods. In the case of hydrazine the economic aspect is more favorable, because of the high cost of conventional methods.

chemosterilant. A term coined by the USDA for materials or processes which sterilize insects, usually the males, thus preventing their reproduction. Gamma radiation is one method used. The males are brought to the radiation by sex attractants.

chemotherapy. The treatment or prevention of a disease by administration of a chemical. The term was first used by Paul Ehrlich (q.v.), discoverer of the arsphenamine treatment for syphilis (1910); he stated that chemotherapy results from the interaction of chemically reactive groups on drugs and of chemically reactive receptor groups on parasitic cells, and that an effective drug must be of quite low molecular weight. His achievement was one of the great triumphs of biomedical science. More recent important achievements have been the development of antimalarials (q.v.); the synthesis of sulfa drugs; the discovery and proliferative development of antibiotics (penicillin, streptomycin, etc.); and the synthesis of cortisone. Much research effort has been devoted to the chemotherapeutic investigation of cancer; polycyclohydrocarbons such as anthracene, phenanthrene, benzopyrene, and their derivatives have been exhaustively studied in animals without conclusive results. Some of these compounds have been identified in cigarette tars. See also immunochemistry; adriamycin.

CHEMTREC. Abbreviation of Chemical Transportation Emergency Center; it is a division of the Manufacturing Chemists Association established as an

emergency information source for transportation accidents involving flammable, toxic or explosive materials.

"Chemtree."⁴⁶¹ Trademark for a group of metallic mortars used for various kinds of nuclear shielding, where a combination of formability and high attenuation values is required. They are dry powders which are mixed with water before use.

chemurgy. The linking of agricultural, scientific, and industrial efforts to improve active cooperation between these branches of a nation's economy for their mutual benefit (National Farm Chemurgic Council). The chief objectives of chemurgy are: (1) new, non-food uses for farm crops, their residues and by-products; (2) new and profitable uses for previously unused agricultural wastes of both plant and animal origin; (3) new crops that farmers may grow profitably; (4) more valuable uses for presently used crops through chemurgic upgrading.

chenopodium oil (wormseed oil, American; goosefoot oil).

Properties: Colorless or yellowish oil; characteristic penetrating odor; bitterish, burning taste. Soluble in 3 to 10 vols of 70% alcohol (inferior and adulterated oils do not yield a clear solution). Sp. gr. 0.965 to 0.990 (15°C); optical rotation -4° to -8° 50'; refractive index 1.4740–1.4790 (20°C).

Chief known constituents: Ascaridole, $C_{10}H_{16}O_2$; para-cymene; l-limonene.

Derivation: Distilled from the seeds and leaves of *Chenopodium ambrosioides anthelminticum*.

Containers: Cans.

Hazard: Toxic by ingestion.

Use: Medicine (anthelmintic).

chi acid. See anthraquinone-1,8-disulfonic acid.

Chicago acid. See 8-amino-1-naphthol-5,7-disulfonic acid.

chicle. A thermoplastic, gumlike substance obtained from the latex of the sapodilla tree native to Mexico and Central America. Softens at 90°F. Insoluble in water; soluble in most organic solvents. Chief use is as chewing gum, after incorporation of sugar and specific flavoring. Nontoxic, but ingestion should be avoided.

Chilean nitrate. See sodium nitrate.

Chilean saltpeter. See sodium nitrate.

China clay. See kaolin.

China-wood oil. See tung oil.

"Chip-Cal."¹⁴⁷ Trademark for low-lime calcium arsenate. Available in granular (48% tricalcium arsenate) and powder (85% tricalcium arsenate) form.

Hazard: Highly toxic by ingestion.

"Chipcote."¹⁴⁷ Trademark for a series of organic mercury seed treatments based on methyl mercury nitrile. Hazard: Highly toxic by ingestion.

chiral. In chemistry this term describes asymmetric molecules that are mirror-images of each other, i.e., they are related to each other optically as right and left hands. Such molecules are also called enantiomers, and are characterized by optical activity. See also optical isomer; enantiomer.

chlophedianol hydrochloride (USAN) (alpha-(2-dimethylaminoethyl) ortho-chlorobenzhydrol hydrochloride) $C_{17}H_{20}ClNO \cdot HCl$. Listed in N.D. Used in medicine.

chlor-. See chloro-.

chloral (trichloroacetaldehyde) CCl_3CHO .

Properties: Colorless, mobile, oily liquid; penetrating odor. Sp. gr. 1.505 (25/4°C); f.p. $-57.5^{\circ}C$; b.p. $97.7^{\circ}C$; vapor pressure 35 mm (20°C); index of refraction (n 20/D) 1.4557; latent heat of vaporization 97.1 Btu/lb. Soluble in water, alcohol, ether and chloroform; combines with water forming chloral hydrate.

Derivation: (a) By the chlorination of ethyl alcohol, addition of sulfuric acid, and subsequent distillation; (b) by the chlorination of acetaldehyde.

Grades: Technical, 94% min.

Containers: Drums; glass bottles; tank cars.

Uses: Manufacture of chloral hydrate and DDT.

chloralamide. See chloral formamide.

chloral formamide (chloralamide; chloramide)

$CCl_3CHOHNHOCH$.

Properties: Colorless, lustrous crystals; odorless; slightly bitter taste. Soluble in water (hydrolyzes at 60°C), alcohol, ether and glycerol. M.p. 114–115°C; decomposes at higher temperatures.

Use: Medicine.

chloral hydrate ("knockout drops"; trichloroacetaldehyde, hydrated; trichloroethylidene glycol)

$CCl_3CH(OH)_2$.

Properties: Transparent, colorless crystals; aromatic, penetrating, slightly acrid odor and slightly bitter, sharp taste. Slowly volatilizes when exposed to air. Soluble in water, alcohol, chloroform, and ether; also soluble in olive oil and turpentine oil. Sp. gr. 1.901; m.p. $52^{\circ}C$; b.p. $97.5^{\circ}C$.

Derivation: Action of 1/5 of its volume of water on chloral.

Grades: Technical; U.S.P.

Hazard: Hypnotic drug; dangerous to eyes; toxic in overdose.

Uses: Medicine (sedative); manufacture of DDT; liniments.

chloral hydrate antipyrine (antipyrine chloral hydrate) $C_{11}H_{12}N_2OCl_3CH(OH)_2$.

Properties: Colorless crystals; moderately soluble in water; soluble in alcohol; m.p. $67^{\circ}C$.

Hazard: Probably toxic.

Use: Medicine (sedative).

chlor-alkali cell. See electrolytic cell.

chlorambucil (4-(para[bis(2-chloroethyl)amino]phenyl) butyric acid) $(ClC_2H_4)_2NC_6H_4(CH_2)_3COOH$. A nitrogen mustard derivative.

Properties: Off-white powder; m.p. 65–69°C. Slightly soluble in water; soluble in acetone and ether.

Grade: U.S.P.

Uses: Medicine; insect sterilant.

chloramid. See chloral formamide.

chloramine NH_2Cl . A colorless, unstable, pungent liquid; soluble in water; decomposes (slowly in dilute solution) to form nitrogen, hydrochloric acid, and ammonium chloride. M.p. $-66^{\circ}C$; soluble in alcohol and ether. (Do not confuse with chloramine-T). Chloramine is an intermediate in the Raschig process for hydrazine (q.v.).

chloramine-B. $C_6H_5SO_2NCINa$ (sodium benzenesulfochloramide)

Properties: White powder with faint chlorine odor; soluble in water.
Uses: Medicine (antiseptic).

chloramine-T. (sodium para-toluenesulfochloramine). $CH_3C_6H_4SO_2NNaCl \cdot 3H_2O$. See also dichloramine-T.

Properties: White or slightly yellow crystals or crystalline powder. Contains not less than 11.5 nor more than 13% active chlorine. Slight odor of chlorine. Decomposes slowly in air, liberating chlorine. (Not to be confused with NH_2Cl , which is also termed chloroform, ether; decomposed by alcohol.
Derivation: Reaction of ammonia and paratoluenesulfochloride under pressure. The latter is reacted with sodium hypochlorite in the presence of an alkali and the chloramine produced by crystallization.
Use: Medicine (antiseptic).

chloramphenicol

$NO_2C_6H_4CH(OH)CH(CH_2OH)NHCOCHCl_2$.
D(-)Threo-1-(para-nitrophenyl)-2-dichloroacetamido-1,3-propanediol. An antibiotic derived from *Streptomyces venezuelae* or by organic synthesis. It was the first substance of natural origin shown to contain an aromatic nitro group.

Properties: Fine, white to grayish-white or yellowish-white, needlelike crystals or elongated plates. Bitter to taste, neutral to litmus, and reasonably stable in neutral or slightly acid solutions. M.p. 149–153°C; alcoholic solution is dextrorotatory while ethyl acetate solution is levorotatory. Very slightly soluble in water; freely soluble in alcohol, propylene glycol, acetone and ethyl acetate.
Grade: U.S.P.

Hazard: May have deleterious and dangerous side effects. Must conform to FDA labelling requirements; use is closely restricted.
Uses: Medicine (antibiotic); antifungal agent.

chloramphenicol sodium succinate $C_{15}H_{13}Cl_2N_2NaO_8$.
Properties: Light yellow, crystalline powder. Freely soluble in water and alcohol.
Grade: U.S.P.
Use: Medicine. (See chloramphenicol).

chloranil (tetrachloroquinone; tetrachloro-para-benzoquinone) $C_6Cl_4O_2$.

Properties: Yellow leaflets; m.p. 290°C; sp. gr. 1.97; soluble in alcohol, ether, and benzene; insoluble in water; good storage stability.
Derivation: From phenol, para-chlorophenol, or paraphenylenediamine by treatment with potassium chlorate and hydrochloric acid.
Hazard: Skin irritant.
Uses: Agricultural fungicide; dye intermediate; electrodes for pH measurements; vulcanizing agent.

chloranthrene yellow. See flavanthrene.

chlorapatite. See apatite.

"Chlorasol."²¹⁴ Trademark for a fumigant composition; 70.3% ethylene dichloride, 29.7% carbon tetrachloride by weight. Boiling range 75–78°C; no flash; nonflammable.

Uses: Fumigant for meal, grain and clothes moths; grain weevils; grain, flour, and carpet beetles; the rice weevil; book lice; penetrates stored grain, rolled rugs, upholstered furniture, cartons, sacks, and stacked material.

chlauric acid. See gold trichloride.

chlorazine. Generic name for 2-chloro-4,6-bis(diethylamino)-s-triazine.

$[(C_2H_5)_2N]_2CNC(Cl)NCN$.

Properties: Solid; m.p. 15–18°C; sp. gr. 1.096 (20°C). Soluble in acetone, chloroform, ethyl alcohol, and xylene.

Hazard: May be toxic.

Use: Herbicide.

chlorbenside (par-chlorobenzyl para-chlorophenyl sulfide) $ClC_6H_4CH_2SC_6H_4Cl$. Generic name for an agricultural toxicant.

Properties: Crystals with almond-like odor (technical grades); m.p. 75–76°C; insoluble in water; soluble in most organic solvents; resistant to acid and alkaline hydrolysis.

Grades: Technical.

Hazard: Toxic; skin irritant.

chlor- compounds. Most organic compounds of chlorine retain the letter "o" in accepted chemical terminology, i.e., chlorobenzene, chloroacetic, etc., although the form without the "o" is sometimes used. Therefore, for chlor- compounds, see also chloro-.

chlorcyclizine hydrochloride

$ClC_6H_4CH(C_6H_5)C_4H_8N_2CH_3 \cdot HCl$. 1-(para-Chloro-alpha-phenylbenzyl)-4-methylpiperazine hydrochloride.

Properties: White, odorless, crystalline solid with bitter taste; m.p. 222–227°C; very soluble in water; soluble in chloroform and alcohol; practically insoluble in benzene and ether. Solutions acid to litmus; pH (1 in 100 solution) 4.8–5.5.
Grade: U.S.P.

Use: Medicine (antihistamine, q.v.).

chlordan $C_{10}H_6Cl_8$ (1,2,4,5,6,7,8,8-octachloro-4,7-methano-3a,4,7,7a-tetrahydroindane).

Properties: Colorless, odorless, viscous liquid; sp. gr. 1.57–1.67 (60/60°F); viscosity SSU 100 seconds (38°C); organic chlorine 64–67% by wt, purity 98%; b.p. 175°C (2 mm); refractive index (n_D 25/D) 1.56–1.57; soluble in many organic solvents; insoluble in water; miscible in deodorized kerosine; decomposes in weak alkalis.

Grades: Technical and pure.

Containers: Aluminum, aluminum-clad or phenolic enamel-lined metal containers; pails; drums.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Use has been restricted. Tolerance, 0.5 mg per cubic meter of air.

Uses: Insecticides; oil emulsions, dusts and dispersible liquids.

chlordiazepoxide hydrochloride (USAN) (7-chloro-2-methylamino-5-phenyl-3-H-1,4-benzodiazepine-4-oxide hydrochloride) $C_{16}H_{14}ClN_3O \cdot HCl$.

Properties: Crystals; m.p. 212–218°C; soluble in water; sparingly soluble in alcohol; insoluble in ether and chloroform.

Hazard: Toxic in high concentrations. Central nervous system depressant. Manufacture and dosage controlled by law.

Use: Medicine (tranquilizer).

chlordimeform [*N'*-(4-chloro-*o*-tolyl)-*N,N*-dimethylformamine].

Ovicide, insecticide and miticide designed for use on cotton and vegetable crops. Available in a concentrated emulsion form, it is stated to be less toxic than organophosphates and to be biodegradable. It is trademarked "Galecron."

chlorendic anhydride (hexachloroendomethylenetetrahydrophthalic anhydride) $C_6H_2Cl_6O_3$. 1,4,5,6,7,7-Hexachlorobicyclo-(2,2,1)-5-heptene-2,3-dicarboxylic anhydride.

Properties: Fine, white, free-flowing crystals. M.p. 239–240°C; sp. gr. 1.73. Readily soluble in acetone, benzene, toluene; slightly soluble in water, n-hexane, and carbon tetrachloride. Nonflammable.

Derivation: By Diels-Alder reaction of maleic anhydride and hexachlorocyclopentadiene.

Grades: Technical; pure.

Uses: Flame-resistant polyester resins; hardening epoxy resins; chemical intermediate; source of chlorendic acid.

"Chloretone."³³⁰ Trademark for chlorobutanol (q.v.).

"Chlorex."²¹⁴ Trademark for 2,2'-dichloroethyl ether (q.v.).

"Chlorextol."¹¹⁶ Trademark for a synthetic, nonflammable, non-sludging liquid of high dielectric strength; used for insulating and cooling transformers and other electrical equipment.

"Chlorhydrol."¹⁵⁸ Trademark for an aluminum chlorohydroxide antiperspirant. Offered in liquid or powder form for use in lotions, creams, and gels. Non-corrosive and nonirritant to skin. Does not damage fabrics.

chloric acid $HClO_3 \cdot 7H_2O$. Known only in aqueous solution. Decomposes at 40°C.

Hazard: Toxic; strong oxidizer. Ignites organic materials on contact.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Not acceptable.

chloridizing. Heating in the presence of chlorine, as a step in the recovery of certain metals from their oxides or other compounds.

"Chlorimets."⁴⁷ Trademark for a series of nickel-base cast alloys.

"Chlorimet" 2 contains 32% molybdenum, 3% iron max, 1% silicon and 0.10% carbon.

"Chlorimet" 3 contains 18% molybdenum, 18% chromium, 3% iron max, 1.0% silicon and 0.07% carbon.

chlorinated acetone. See chloroacetone.

chlorinated camphene. See toxaphene.

chlorinated hydrocarbon. See hydrocarbon, halogenated.

chlorinated isocyanuric acid. See dichloro- or trichloroisocyanuric acid, and potassium or sodium dichloroisocyanurate. Used as dry bleaches.

chlorinated lime. See lime, chlorinated.

chlorinated naphthalene (chloronaphthalene). $C_{10}H_7Cl$.

A product of the chlorination of naphthalene. The physical state varies from mobile liquids to crystalline solids depending on the extent of chlorination.

Hazard (tri- and higher): Toxic by ingestion, inhalation, and skin absorption. Strong irritants. Tolerance (tetra compound) 2 mg per cubic meter of air.

See also oil, chloronaphthalene; wax, chloronaphthalene.

chlorinated paraffin. See paraffin, chlorinated.

chlorinated para red. A modification of para red that contains some chlorine. Much lighter than para or

toluidine red and has excellent brilliance but poorer heat resistance.

chlorinated polyether. See "Penton."

chlorinated polyolefin. See rubber, chlorinated; polypropylene, chlorinated.

chlorinated rubber. See rubber, chlorinated.

chlorinated trisodium phosphate. See trisodium phosphate, chlorinated.

chlorine Cl. Nonmetallic, halogen element of atomic number 17; Group VIIA of the Periodic Table. Atomic weight 35.453. Valences 1,3,4,5,7. Two stable isotopes Cl-35 (75.4%) and Cl-37 (24.6%). Seventh highest-volume chemical produced in U.S. (1975).

Properties: (1) A diatomic gas, which is heavy, non-combustible, greenish-yellow; pungent irritating odor. Liquefaction pressure 7.86 atm (25°C), 1 atm at -35°C. Water solubility 0.64 gram Cl_2 per 100 grams water. Sp. gr. 2.49 (0°C) (air = 1). Thermodynamic properties: (a) critical temperature 144.0°C; (b) critical pressure 78.525 atm absolute; (c) critical volume 1.763 liters per kg. Strongly electronegative.

(2) Liquid: Clear, amber color, irritating odor; sp. gr. 1.56 (-35°C); f.p. -101°C; 1 liter of liquid = 456.8 liters of gas at 0°C and 1 atm. Very low electrical conductivity. Soluble in chlorides and alcohols. Extremely strong oxidizing agent. Slightly soluble in cold water.

Occurrence: Not found free in nature; component of minerals halite (rock salt), sylvite, and carnallite; chloride ion in sea water.

Derivation: (1) Electrolysis of sodium chloride brine in either diaphragm or mercury cathode cells; chlorine is released at the anode. (2) Fused salt electrolysis of sodium chloride or magnesium chloride; (3) Electrolysis of hydrochloric acid. (4) Oxidation of hydrogen chloride with nitrogen oxide as catalyst and absorption of steam with sulfuric acid ("Kel-Chlor" process); no by-product caustic is produced.

Grades: Technical (gas and liquid); pure (99.9%).

Containers (liquid): 100 and 150-lb steel cylinders; single-unit tank cars; multi-unit tank cars; motor trucks in cylinders and containers; tank barges (up to 600 tons); pipelines (liquid and gas).

Hazard: Toxic as irritant and by inhalation. Tolerance, 1 ppm in air. Moderate fire risk in contact with turpentine, ether, ammonia, hydrocarbons, hydrogen, powdered metals, and other reducing materials. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of carbon tetrachloride, trichloroethylene, chlorinated hydrocarbons, polychloroprene (neoprene), polyvinyl chloride, hydrogen chloride, ethylene dichloride, hypochlorous acid, metallic chlorides, chloroacetic acid, chlorobenzene, etc. Also in water purification, shrinkproofing wool, in flame-retardant compounds and (with lithium) in special batteries; processing of meat, fish, vegetables and fruit.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label. Not accepted.

For further details, refer to the Chlorine Institute, 342 Madison Ave., N.Y.

chlorine 36. Radioactive chlorine of mass number 36. Half-life about 440,000 years; radiation, beta.

Derivation: Separated from various isotopes produced during the pile irradiation of potassium chloride.

Forms available: As hydrochloric acid solution and as solid potassium chloride.

Hazard: Moderately toxic. Permissible level 4×10^{-7} microcurie per milliliter in air.

Uses: Tracer in studying the salt water corrosion of metals, especially steel; reaction mechanism of chlorinated hydrocarbons; location and flow of salt waters in porous media; etc.

Shipping regulations: (Rail, Air) Consult regulations.

chlorine-bromide. See bromine-chloride.

chlorine dioxide ClO_2 .

Properties: Red-yellow gas; f.p. -59.5°C ; b.p. 10°C ; very reactive, unstable. Strong oxidizing agent. Decomposes in water. Dissolves in alkalis forming a mixture of chlorite and chlorate.

Derivation: Usually made at point of consumption from sodium chlorate, sulfuric acid and methanol, or from sodium chlorate and sulfur dioxide. Concentration of gas is limited to 10% to reduce explosion hazard.

Grades: Sold as hydrate, in frozen form.

Hazard: Irritant to skin and mucous membranes. Explodes when heated or by reaction with organic materials. Tolerance 0.1 ppm in air.

Uses: Bleaching wood pulp, fats and oils; maturing agent for flour (nontoxic in percentage used); water treatment (purification and taste removal); swimming pools; odor control.

Shipping regulations: (Rail) (frozen hydrate): Yellow label. Not accepted by express. (Air) Not listed. Consult authorities.

chlorine trifluoride ClF_3 .

Properties: Nearly colorless gas, pale green liquid, or white solid. B.p. 11.3°C ; f.p. -76.3°C ; density of gas (air = 1) 3.14. Extremely reactive, comparable to fluorine.

Derivation: By reaction of chlorine and fluorine at 280°C and condensation of the product at -80°C . Obtained 99.0% pure.

Containers: Steel cylinders.

Hazard: Corrosive to skin; dangerous fire risk. Explodes in contact with organic materials or with water. Tolerance, 0.1 ppm in air.

Uses: Incendiary; fluorinations; cutting oil well tubes; oxidizer in propellants.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

chlorine water. Clear yellowish liquid; deteriorates on exposure to air and light. Made by saturating water with approximately 0.4% chlorine.

Use: Deodorizer, disinfectant, antiseptic.

chloriodized oil. Chlorinated and iodized vegetable oil. Contains 26.0–28.0% iodine in organic combination.

Properties: Pale yellow, viscous, oily liquid with faint, bland taste. Practically insoluble in water; slightly soluble in alcohol; freely soluble in benzene, chloroform and ether.

Derivation: Formed by chemical addition of iodine monochloride to a vegetable oil.

Hazard: May be toxic by ingestion.

Use: Medicine.

chlorisondamine chloride $\text{C}_{14}\text{H}_{20}\text{Cl}_6\text{N}_2$. 4,5,6,7-Tetrachloro-2-(2-dimethylaminoethyl) isoindoline dimethylchloride. A quaternary ammonium compound. Listed in N.D.

Properties: Crystals; decompose $258\text{--}265^\circ\text{C}$. Soluble in water and alcohol.

Use: Medicine.

chlormerodrin ([3-chloromercuri]-2-methoxypropyl]-urea) $\text{ClHgCH}_2\text{CH}(\text{OCH}_3)\text{CH}_2\text{NHCONH}_2$.

Properties: White, odorless powder with bitter metallic taste. Very soluble in sodium hydroxide; very slightly soluble in chloroform; slightly soluble in alcohol, methanol, and water. Stable to light and air; pH (0.5% solution) 4.3–5.0.

Grade: N.F.

Hazard: Highly toxic in overdose.

Use: Medicine.

Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

chlormethazone $\text{C}_{11}\text{H}_{12}\text{ClNO}_3\text{S}$. 2-(4-Chlorophenyl)-3-methyl-4-metha-thiazanone-1-dioxide.

Properties: Crystals; m.p. 117°C ; insoluble in water; slightly soluble in alcohol.

Use: Medicine (tranquilizer and muscle relaxant.)

chloroacetaldehyde ClCH_2CHO .

Properties: (of 40% aqueous solution): Clear, colorless liquid with pungent odor. Boiling range $90\text{--}100^\circ\text{C}$; f.p. -16.3°C ; sp. gr. 1.19 (25/25°C); refractive index 1.397 (25°C); wt/gal 9.9 lb (25°C). Soluble in water, acetone, methanol. At concentrations in water above 50% it forms an insoluble hemihydrate. Pure substance has flash pt. 190°F . Combustible.

Hazard: Corrosive to skin and mucous membranes; tolerance, 1 ppm in air.

Uses: Intermediate; fungicide.

chloroacetaldehyde dimethyl acetal. See dimethyl chloroacetal.

chloroacetamide (alpha-chloroacetamide; 2-chloroethanamide) $\text{ClCH}_2\text{CONH}_2$.

Properties: Colorless to pale yellow crystals; characteristic odor; m.p. $117\text{--}119^\circ\text{C}$; soluble in water and alcohol; insoluble in ether.

Use: Intermediate.

chloroacetic acid (chloroacetic acid; MCA; monochloroacetic acid) CH_2ClCOOH .

Properties: Colorless to light-brownish crystals; deliquescent. Sp. gr. 1.370 (70°C); crystallizing point, alpha form, $61.0\text{--}61.7^\circ\text{C}$; beta form, 55.5 to 56.5°C ; gamma form, 50°C . The commercial material melts at 61 to 63°C ; boiling range 186 to 191°C . Soluble in water, alcohol, ether, chloroform, carbon disulfide. Nonflammable.

Derivation: Action of chlorine on acetic acid in the presence of acetic anhydride, phosphorus, or sulfur.

Grades: Technical; medicinal; 99.5% pure.

Containers: Drums.

Hazard: Use in food products prohibited by FDA. Irritating and corrosive to skin.

Uses: Herbicide; preservative; bacteriostat; intermediate in production of carboxymethylcellulose, ethyl chloroacetate, glycine, synthetic caffeine, sarcosine, thioglycolic acid, EDTA, 2,4-D, 2,4,5-T.

Shipping regulations: (Rail) (liquid), White label. (Air) (solid and solution), Corrosive label. Legal label name (Rail) monochloroacetic acid.

chloroacetic anhydride (chloroethanoic anhydride; sym-dichloroacetic anhydride) $(\text{ClCH}_2\text{CO})_2\text{O}$.

Properties: Colorless to slightly yellow crystals with pungent odor; m.p. $51\text{--}55^\circ\text{C}$; soluble in chloroform and ether; hydrolyzes with water to chloroacetic acid.

Hazard: Irritating to skin and eyes; moderately toxic by inhalation.

Use: Intermediate.

ortho-chloroacetoacetanilide

Properties: White, crystalline solid. Resembles ethyl acetoacetate in chemical reactivity. M.p. 107°C; vapor pressure 0.1 mm (20°C); nonflammable. Insoluble in water.

Uses: Organic synthesis; dyestuffs.

chloroacetocatechol. See chloroacetypyrocatechol.**alpha-chloroaceto-3,4-dihydroxybenzene.** See chloroacetypyrocatechol.**chloroacetone** (monochloroacetone; 1-chloro-2-propanone; chloracetone; chlorinated acetone)

A lachrymator.
Properties: Colorless liquid; pungent, irritating odor. Sp. gr. 1.162 (16°C); b.p. 119°C; f.p. -44.5°C. Soluble in alcohol, ether and chloroform and water.

Derivation: Chlorination of acetone.

Hazard: Strong irritant to tissue, eyes, and mucous membranes.

Uses: Couplers for color photography; enzyme inactivator; insecticides; perfumes; antioxidant intermediate; medicine; organic synthesis; tear gas.

Shipping regulations: (Rail) (stabilized) Tear Gas label; (unstabilized) Not accepted. Legal label name, monochloroacetone. (Air) (stabilized) Poison label. Not acceptable on passenger planes; (unstabilized) Not acceptable.

chloroacetonitrile (chloroethane nitrile; chloromethyl cyanide) ClCH_2CN .

Properties: Colorless liquid, with pungent odor; sp. gr. 1.2020-1.2035 (25/25°C); refractive index 1.4210-1.4240 (n_D 25/D); 5-95% distills between 124-129°C; soluble in hydrocarbons, alcohols; insoluble in water.

Hazard: Probably toxic and irritant.

Uses: Fumigant; intermediate.

chloroacetophenone (chloracetophenone, CN; phenacylchloride; phenyl chloromethyl ketone)

$\text{C}_6\text{H}_5\text{COCH}_2\text{Cl}$. This formula is for the omega (or alpha) isomer, which is a powerful lachrymator. The para form, $\text{ClC}_6\text{H}_4\text{COCl}$, is also available.

Properties: White crystals; floral odor; m.p. 56°C; b.p. 247°C. The para isomer has m.p. 20°C; b.p. 273°C. Insoluble in water; soluble in acetone, benzene, carbon disulfide.

Derivation: From chloroacetylchloride, benzene and aluminum chloride.

Hazard: Strong irritant to eyes and tissue as gas or liquid. Tolerance (alpha), 0.05 ppm in air.

Uses: Pharmaceutical intermediate; riot control gas.

Shipping regulations: (Rail) Not listed. (Air) (omega isomer) Poison label. Not acceptable on passenger planes.

chloroacetypyrocatechol (chloroacetocatechol; alpha-chloroaceto-3,4-dihydroxybenzene)

$(\text{HO})_2\text{C}_6\text{H}_3\text{COCH}_2\text{Cl}$. Melting range 171-178°C. Pharmaceutical intermediate.

chloroacetyl chloride (chloracetyl chloride)

A lachrymator.
Properties: Water-white liquid; pungent odor. Sp. gr. 1.495 (0°C); b.p. 105 to 110°C; decomposes in water. Nonflammable.

Derivation: (a) Action of chlorine on acetyl chloride in sunlight. (b) Dropping phosphorus trichloride on chloroacetic acid.

Hazard: Irritating to eyes; corrosive to skin.

Uses: Preparation of chloroacetophenone; intermediate; tear gas.

Shipping regulations: (Rail) Corrosive liquid, n.o.s. White label. (Air) Corrosive label. Not acceptable on passenger planes.

chloroacetylurethane $\text{ClCH}_2\text{CONHCOOC}_2\text{H}_5$.

Properties: Crystals; soluble in alcohol; sparingly soluble in water. M.p. 129°C.

Derivation: By interaction of a urethane derivative and ethyl chloroacetate.

chloroacrolein $\text{H}_2\text{C}:\text{CClCHO}$.

Properties: Colorless liquid. Sp. gr. 1.205 at 15°C; b.p. 29 to 31°C (17 mm).

Derivation: Chlorination of acrolein.

Hazard: Toxic; irritating to eyes and skin.

Uses: Tear gas.

Shipping regulations: (Rail, Air) Not listed. Consult regulations.

alpha-chloroacrylonitrile.

Properties: Activated carbon-carbon double bond and reactive chlorine and metal groups. Readily polymerizes, and copolymerizes with other unsaturated monomers. High cross-linking ability.

Derivation: Chlorination of acrylonitrile and dehydrohalogenation by cracking.

Uses: Synthetic fibers, coatings, and films; acrylic polymers; treatment of cotton fiber; intermediate.

2-chloroallyl diethyldithiocarbamate (CDEC).

Properties: Amber liquid; b.p. 128-130°C (1 mm); very slightly soluble in water; soluble in benzene, alcohol, acetone, chloroform, and ether.

Forms available: Liquid and granular.

Hazard: Dry preparations are irritating to eyes and skin.

Uses: Herbicide; pesticide.

1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane chloride $\text{C}_6\text{H}_{12}\text{N}_4(\text{CH}_2\text{CHCHCl})\text{Cl}$. White to cream-colored powder; soluble in water and methanol; almost insoluble in acetone.

Uses: Bactericide used as preservative in latexes, paints, floor polishes, joint cements, adhesives, inks, starches, etc.

chloroaluminum diisopropoxide $[(\text{CH}_3)_2\text{CHO}]_2\text{AlCl}$.

White crystalline solid; m.p. 160°C (dec). Soluble in most organic solvents; hydrolyzes.

Uses: Catalyst and intermediate.

Hazard: May be irritant and toxic.

chloroamino- See aminochloro-.**para-chloro-ortho-aminophenol.** See 2-amino-4-chlorophenol.**2-chloro-4-tert-amylphenol** $\text{C}_5\text{H}_{11}\text{C}_6\text{H}_3\text{ClOH}$.

Properties: Water-white liquid with aromatic odor; sp. gr. 1.11 (20°C); boiling range 253-265°C; flash point 225°F. Combustible.

Hazard: Probably toxic and irritant.

meta-chloroaniline (meta-aminochlorobenzene)

Properties: Colorless to light amber liquid; tends to darken during storage. Boiling range 228-231°C; f.p. -10.6°C. Insoluble in water; soluble in organic solvents.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation and skin absorption.

Uses: Intermediate for azo dyes and pigments; pharmaceuticals; insecticides; agricultural chemicals.

Shipping regulations: (Rail), Not listed. (Air) Poison label.

ortho-chloroaniline (ortho-aminochlorobenzene)
 $\text{ClC}_6\text{H}_4\text{NH}_2$.

Properties: Amber liquid; amine odor; darkens on exposure to air. Distillation range 208–210°C; f.p. –2.3°C; sp. gr. 1.213 (20/4°C); refractive index 1.5896 (n_D 20/D). Miscible with alcohol and ether; insoluble in water.

Grades: Technical.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Dye intermediate; standards for colorimetric apparatus; manufacture of petroleum solvents and fungicides.

Shipping regulations: (Rail) Not listed. (Air) Poison label.

para-chloroaniline (para-aminochlorobenzene)
 $\text{ClC}_6\text{H}_4\text{NH}_2$.

Properties: White or pale yellow solid. M.p. 69.5°C; distilling range 229–233°C. Soluble in hot water and organic solvents.

Grades: Technical.

Containers: Drums.

Hazard: Toxic by inhalation and ingestion.

Use: Dye intermediate; pharmaceuticals; agricultural chemicals.

Shipping regulations: (Rail) Not listed. (Air) Poison label.

4-chloroaniline-3-sulfonic acid $\text{HSO}_3\text{C}_6\text{H}_3\text{ClNH}_2$.

Properties: White to light-grey powder.

Containers: Fiber kegs; polyethylene-lined steel drums.

Hazard: Probably toxic.

Use: Intermediate.

2-chloroanthraquinone $\text{C}_{14}\text{H}_7\text{ClO}_2$.

Properties: See anthraquinone and 2-methylanthraquinone. M.p. 208–211°C. Insoluble in water; soluble in hot benzene. Probably low toxicity.

Derivation: Condensing phthalic anhydride and chlorobenzene in the presence of anhydrous aluminum chloride to form para-chlorobenzoylbenzoic acid. Ring closure of the intermediate acid is brought about by heating in sulfuric acid solution.

Use: Starting material for certain vat dyes.

chloroauric acid. See gold trichloride.

chloroazotic acid. See aqua regia.

chlorobenzal. See benzyl dichloride.

chlorobenzaldehyde $\text{C}_6\text{H}_4\text{CHOCl}$.

Properties: Colorless to yellowish liquid (ortho-) or (powder (para-); boiling range 209–215°C; f.p. 8.0°C (min); sp. gr. 1.240–1.245 (25/25°C). Soluble in alcohol, ether and acetone. Insoluble in water. Combustible.

Hazard: May be toxic.

Uses: Intermediate in the preparation of triphenyl methane and related dyes; organic intermediate.

ortho-chlorobenzalmononitrile (CS).

Properties: Off-white, crystalline powder. Available both unground, and ground with 5% silica aerogel or treated "Cab-O-Sil" (q.v.).

Hazard: Strong irritant to eyes and mucous membranes.

Use: Riot control aerosol.

3-chloro-4-benzamido-6-methylaniline
 $\text{ClC}_6\text{H}_2\text{NH}_2\text{CH}_3(\text{NHCOC}_6\text{H}_5)$.

Properties: White solid; m.p. 198–199°C.

Hazard: Probably toxic.

Uses: Azoic dyes; pigments.

chlorobenzanthrone $\text{C}_{17}\text{H}_9\text{ClO}$.

Properties: All isomers: yellow needles. Soluble in alcohol, benzene, toluene, acetic acid.

Derivation: From benzanthrone by treatment with chlorine.

chlorobenzene (monochlorobenzene; phenyl chloride)
 $\text{C}_6\text{H}_5\text{Cl}$.

Properties: Clear, volatile liquid. Almond-like odor. Sp. gr. 1.105 (25/25°C); b.p. 131.6°C; f.p. –45°C; wt/gal 9.19 lb (25°C); refractive index 1.5216 (25°C); flash point 85°F. (closed cup). Autoignition temp. 1180°F. Miscible with most organic solvents; insoluble in water.

Derivation: By passing dry chlorine into benzene with a catalyst.

Grades: Technical.

Containers: 55-gal drums; tank cars; tank trucks.

Hazard: Flammable, moderate fire risk; avoid inhalation and skin contact. Tolerance, 75 ppm in air. Explosive limits 1.8 to 9.6% in air.

Uses: Phenol; chloronitrobenzene; aniline; solvent carrier for methylene diisocyanate; solvent; pesticide intermediate.

para-chlorobenzenesulfonamide $\text{ClC}_6\text{H}_4\text{SO}_2\text{NH}_2$.

Properties: White, odorless powder; m.p. 145–148°C; soluble in alcohol.

Grade: 98–99% purity.

Hazard: May be toxic.

Use: Intermediate for pharmaceuticals and resins.

para-chlorobenzenethiol. See para-chlorothiophenol.

para-chlorobenzhydrol (para-chlorobenzohydrol)
 $\text{ClC}_6\text{H}_4\text{C}(\text{C}_6\text{H}_5)\text{HOH}$.

Properties: White to off-white, crystalline powder; m.p. 57–61°C; insoluble in water; soluble in ether, alcohol, and benzene.

Use: Organic synthesis.

chlorobenzilate (ethyl 4,4'-dichlorobenzilate; ethyl 2-hydroxy-2,2-bis(4-chlorophenyl acetate)
 $(\text{C}_6\text{H}_4\text{Cl})_2\text{C}(\text{OH})\text{COOC}_2\text{H}_5$.

Properties: Viscous yellow liquid; b.p. 141–142°C (0.06 mm). Sp. gr. (technical, 90%) 1.2816 (20/4°C). Slightly soluble in water; soluble in acetone, benzene, methanol.

Hazard: Reported to cause tumors in mice.

Use: Pesticides.

"Chlorobenzilate."²¹⁹ Trademark for ethyl 4,4'-dichlorobenzilate. Available in emulsifiable solution or 25% wettable powder. Used as a miticide.

para-chlorobenzohydrol. See para-chlorobenzhydrol.

para-chlorobenzoic acid $\text{ClC}_6\text{H}_4\text{COOH}$.

Properties: Nearly white coarse powder; m.p. (ortho-) 137°C, (para-) 238°C. Soluble in methanol, absolute alcohol, and ether; insoluble in water, 95% alcohol, and toluene.

Uses: Intermediate for the preparation of dyes, fungicides, pharmaceuticals and other organic chemicals.

para-chlorobenzophenone $\text{ClC}_6\text{H}_4\text{COC}_6\text{H}_5$.

Properties: White to off-white crystalline powder; m.p. 73–78°C; b.p. 332°C; soluble in acetone, benzene, carbon tetrachloride, ether and hot alcohol. Insoluble in water.

Use: Intermediate.

chlorobenzotriazole $\text{ClC}_6\text{H}_4\text{NHN:N}$.

Properties: White solid; m.p. 157–159°C.

Uses: Intermediate and photographic chemical.

ortho-chlorobenzotrichloride $\text{ClC}_6\text{H}_4\text{CCl}_3$.

Properties: Colorless liquid or solid. M.p. 29.37°C; b.p. 264.3°C; sp. gr. 1.5131 (25/4°C); refractive index (n 20/D) 1.5836. Soluble in alcohol, ether, and acetone; decomposes in water. Low toxicity.

Uses: Intermediate for pharmaceuticals, dyes, and other organic chemicals.

para-chlorobenzotrichloride $\text{ClC}_6\text{H}_4\text{CCl}_3$.

Properties: Water-white liquid; boiling range 248–257°C; f.p. (approx.) 3.8°C; sp. gr. 1.480–1.490 (25/25°C). Soluble in alcohol, ether, and acetone. Insoluble in water. Low toxicity.

Uses: Same as ortho-chlorobenzotrichloride.

meta-chlorobenzotrifluoride (meta-chlorotrifluoromethylbenzene; meta-chloro-alpha, alpha, alpha-trifluorotoluene) $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Water white aromatic liquid; b.p. 138°C; freezing point -56°C; refractive index 1.446 (n 20/D); flash point 122°F (closed cup); sp. gr. 1.351 (15.5/15.5°C). Combustible.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Intermediate in dyes and pharmaceuticals; dielectrics; insecticides.

ortho-chlorobenzotrifluoride (ortho-chlorotrifluoromethylbenzene; ortho-chloro-alpha, alpha, alpha-trifluorotoluene) $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Colorless liquid with aromatic odor; sp. gr. 1.379 (15.5/15.5°C); refractive index (1.456 (20°C); b.p. 152°C; f.p. -7.4°C; flash point (closed cup) 138°F; wt/gal 11.50 lb (15.5°C). Combustible.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Dye intermediate, chemical intermediate, solvent and dielectric fluid.

para-chlorobenzotrifluoride (para-chlorotrifluoromethylbenzene; para-chloro-alpha, alpha, alpha-trifluorotoluene) $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Water-white liquid; aromatic odor; b.p. 139.3°C; f.p. -36°C; refractive index (n 20/D) 1.446; flash point (closed cup) 116°F; sp. gr. (15.5/15.5°C) 1.353; wt/gal 11.28 lb (15.5°C). Combustible.

Hazard: Moderate fire risk. Toxic by ingestion and inhalation. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Same as ortho-chlorobenzotrifluoride.

chlorobenzoyl chloride $\text{ClC}_6\text{H}_4\text{COCl}$.

Properties: Colorless liquid; boiling range 227–239°C; f.p. -4 to -6°C; f.p. (ortho-) -4 to -6°C, (para-) 10 to 12°C; sp. gr. 1.374–1.376 (25/15°C). Soluble in alcohol, ether, and acetone. Insoluble in water.

Use: Intermediate for pharmaceuticals, dyes, and other organic chemicals.

para-chlorobenzoyl peroxide $(\text{ClC}_6\text{H}_4\text{CO})_2\text{OO}$.

Properties: White, odorless powder; decomposes violently on heating or contamination. Insoluble in water; soluble in organic solvents.

Hazard: Dangerous fire and explosion risk; explodes when heated to 38°C; strong oxidizer; will ignite on

contact with organic materials. Store in dark, cool locality.

Uses: Bleaching agent; polymerization catalyst.

Shipping regulations: (Rail) Yellow label. (Air) Organic Peroxide label.

chlorobenzyl chloride $\text{ClC}_6\text{H}_4\text{CH}_2\text{Cl}$.

Properties: Colorless liquid; boiling range 216–222°C; f.p. (ortho-) below -30°C, (para-) 27°C, sp. gr. 1.270–1.280 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water.

Hazard: Probably irritating to skin and eyes.

Use: Intermediate for organic chemicals, pharmaceuticals and dyes.

para-chlorobenzyl para-chlorophenyl sulfide. See chlorobenzide.**para-chlorobenzyl cyanide** $\text{ClC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless to pale yellow solid. M.p. 27°C. Soluble in acetone and alcohol.

Containers: 25-lb cans; 500-lb drums.

Hazard: Highly toxic.

Use: Organic synthesis.

Shipping regulations: (Air) Cyanide solutions, n.e.s., Poison label.

para-chlorobenzyl para-fluorophenyl sulfide. See fluorobenzide.**2-(para-chlorobenzyl)pyridine** (2-(4-chlorobenzyl)pyridine) $\text{ClC}_6\text{H}_4\text{CH}_2\text{C}_5\text{H}_4\text{N}$.

Properties: Liquid; b.p. 310.5°C; f.p. 8.4°C; sp. gr. 1.168 (25°C); refractive index 1.5865 (n 20/D); insoluble in water.

Use: Organic synthesis.

chlorobromo-. See bromochloro-.**2-chlorobutadiene-1,3**. See chloroprene.**1-chlorobutane**. See n-butyl chloride.**chlorobutanol** (trichloro-tert-butyl alcohol; 1,1,1-trichloro-2-methyl-2-propanol; acetone chloroform) $\text{Cl}_3\text{CC}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless to white crystals with characteristic odor and taste. Soluble in alcohol and glycerol; slightly soluble in water; readily soluble in ether, chloroform, and volatile oils. M.p. (anhydrous form) 97°C; m.p. (hemihydrate) 78°C; b.p. 167°C; sublimes easily. Combustible.

Derivation: By action of potassium hydroxide on a solution of chloroform and acetone.

Grade: U.S.P.

Hazard: Toxic; action similar to chloral hydrate (q.v.).

Uses: Plasticizer for cellulose esters and ethers; preservative for biological fluids and solutions.

4-chloro-2-butyryl meta-chlorocarbonyl chloride. See barban.**chlorocarbon**. A compound of carbon and chlorine, or or carbon, hydrogen, and chlorine, such as carbon tetrachloride, chloroform, tetrachloroethylene, etc.**chlorocarbonyl ferrocene** (ferrocenoyl chloride) $\text{C}_5\text{H}_5\text{FeC}_5\text{H}_4\text{COCl}$. Orange-red solid; m.p. 48–49°C.

Hazard: Probably toxic.

Use: Intermediate.

chlorochromic anhydride. See chromyl chloride.**chlorocosane**. See paraffin, chlorinated.

3-chlorocoumarin $C_9H_5O_2Cl$.

Properties: Slightly yellow crystalline solid. Melting point, 118°C.

Grade: Technical.

Use: Tin-plating solutions.

para-chloro-meta-cresol. See 4-chloro-3-methylphenol.

alpha-chloro-N,N-diallylacetylamide (CDAA)

$ClCH_2CON(CH_2CH=CH_2)_2$.

Properties: Amber liquid or granules; b.p. 74°C (0.3 mm); slightly soluble in water; soluble in alcohol, hexane, and xylene.

Hazard: Dry formulations are irritating to eyes and skin.

Use: Herbicide.

1-chloro-2-dichloroarsinoethene. See beta-chlorovinyl-dichloroarsine.

2-chloro-1-(2,4-dichlorophenyl)vinyl diethyl phosphate. See diethyl-1-(2,4-dichlorophenyl)-2-chlorovinyl phosphate.

chlorodifluoroacetic acid $CClF_2 \cdot COOH$.

Properties: Colorless, pungent liquid; b.p. 122°C; f.p. 23°C. Completely soluble in water; miscible with most organic solvents. Strong acid, dissolving cellulose and proteins.

Uses: Catalyst, particularly for esterification and condensation reactions; herbicides; intermediate.

1,1,1-chlorodifluoroethane (1,1,1-difluorochloroethane; difluoromonochloroethane) CH_3CClF_2 .

Properties: Colorless, nearly odorless gas. B.p. -9.2°C; f.p. -130.8°C; sp. gr. 1.194 (-9°C). Insoluble in water.

Derivation: Chlorinating 1,1-difluoroethane in ultraviolet light.

Grade: Technical.

Containers: Cylinders.

Hazard: Flammable; asphyxiant in high concentrations.

Uses: Refrigerant; solvent; intermediate.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. Legal label name (Rail) difluoromonochloroethane.

chlorodifluoromethane (monochlorodifluoromethane; difluorochloromethane; difluoromonochloromethane; propellant 22; refrigerant 22). $CHClF_2$.

Properties: Colorless, nearly odorless gas; density (gas at its b.p.) 4.82 g/l; b.p. -40.8°C; f.p. -160°C; partly soluble in water; nonflammable.

Derivation: Reaction of chloroform with anhydrous hydrogen fluoride with antimony chloride catalyst.

Grades: Technical; 99.9% pure.

Hazard: Asphyxiant in high concentrations.

Uses: Refrigerant; low-temperature solvent; fluorocarbon resins, especially tetrafluoroethylene polymers.

Shipping regulations: (Rail) Green label. (Air) Non-flammable Gas label. Legal label name monochlorodifluoromethane (Rail). See also chlorofluorocarbon.

1-chloro-2,4-dinitrobenzene (dinitrochlorobenzene) $C_6H_3(NO_2)_2Cl$.

Properties: Pale yellow needles; almond odor; soluble in alcohol; insoluble in water; sp. gr. 1.69; m.p. 27-53°C; b.p. 315°C. Flash point 382°F; combustible; upper explosion limit 22%.

Derivation: Chlorination of dinitrobenzene.

Grades: Technical; fused.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion, inhalation, and skin absorption; skin irritant. Moderate explosion hazard. Uses: Dyes; organic synthesis.

Shipping regulations: (Rail, Air) Poison label. Legal label name (Rail) dinitrochlorobenzol.

chlorodiphenyl.

Properties: Colorless, mobile liquid; b.p. 340-375°C; flash point 383°F (open cup). Combustible. Resistant to acids and alkalis.

Grades: 54% chlorine; 42% chlorine.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant. Tolerance (54%) 0.5 mg/cubic meter of air; (42%) 1 mg/cubic meter of air.

Uses: Plasticizer for cellulose, vinyl resins, and chlorinated rubbers.

See also diphenyl.

4-chlorodiphenyl sulfone. See para-chlorophenyl phenyl sulfone.

2-chloroethanamide. See chloroacetamide.

chloroethane. See ethyl chloride.

chloroethane nitrile. See chloroacetonitrile.

chloroethanoic anhydride. See chloroacetic anhydride.

chloroethene. See vinyl chloride.

chloroethyl acetate. See ethyl chloroacetate.

beta-chloroethylchloroformate CH_2ClCH_2OCCl .

Properties: Colorless liquid. Decomposed by alkaline solutions and hot water. Insoluble in cold water. Sp. gr. 1.3825 (20°C); b.p. 152.5°C (752 mm).

Derivation: By bubbling gaseous phosgene into ethylene chlorohydrin at 0°C.

Hazard: Irritating to eyes and skin. Moderately toxic by ingestion and inhalation.

beta-chloroethyl chlorosulfonate $ClCH_2CH_2OSO_2Cl$.

Properties: Colorless liquid. Chloropicrin-like odor.

Darkens on long storage and decomposes with evolution of hydrogen chloride. B.p. 101°C (23 mm).

Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

Derivation: Interaction of sulfonyl chloride and ethylene chlorohydrin. Also from action of sulfur trioxide on ethylene chloride below 45°C.

chloroethylene. See vinyl chloride.

2-chloroethyl methyl sulfide. See hemisulfur mustard.

(2-chloroethyl)trimethyl ammonium chloride.

$[ClCH_2CH_2N(CH_3)_3]Cl$. A plant growth regulator.

2-chloroethyl vinyl ether. $CH_2ClCH_2OCHCH_2$.

Properties: Liquid; b.p. 104-108°C.

Hazard: Moderately toxic by ingestion and inhalation; moderate fire and explosion hazard.

chlorofluorocarbon. Any of several compounds comprised of carbon, fluorine, chlorine and hydrogen, the best known of which are trichlorofluoromethane and dichlorodifluoromethane (numbers 11 and 12, respectively). They are used chiefly as refrigerants and as aerosol propellants. Chlorofluorocarbons are often erroneously called fluorocarbons. Though safer and more efficient than other propellant gases, their use for aerosol sprays has diminished because of their suspected depleting effect on stratospheric ozone. Though this has not been proved, there is a considerable body of evidence that it does occur. Note: Use of these substances for aerosol propellant sprays will be restricted as of 1977.

chloroform (trichloromethane, methenyl trichloride) CHCl_3 .

Properties: Clear, colorless, highly refractive, heavy, volatile liquid; characteristic odor; sweet taste. Keep from light. Miscible with alcohol, ether, benzene, solvent naphtha, fixed and volatile oils; slightly soluble in water. Sp. gr. 1.485 (20/20°C); b.p. 61.2°C; freezing point -63.5°C; wt/gal 12.29 lb (25°C); refractive index 1.4422 (25°C); nonflammable, but will burn on prolonged exposure to flame or high temperature.

Derivation: (a) Reaction of chlorinated lime with acetone, acetaldehyde, or ethyl alcohol; (b) by-product from the chlorination of methane.

Method of purification: Extraction with concentrated sulfuric acid and rectification.

Grades: Technical; C.P.; A.C.S.; N.F.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic by inhalation; narcotic. Prolonged inhalation or ingestion may be fatal. Tolerance, 25 ppm in air; 120 mg per cubic meter of air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C. The National Cancer Institute has found that chloroform causes cancer in rats and mice; it has been prohibited by FDA from use in drugs, cosmetics and food packaging, including cough medicines, toothpastes, etc.

Uses: Fluorocarbon refrigerants and propellants; fluorocarbon plastics; solvent; analytical chemistry; fumigant; insecticides.

chloroformoxime ClHCNOH .

Properties: Needles. Odor resembles that of hydrocyanic acid. Stable at 0°C; unstable at normal temperature. Small quantities volatilize. Large quantities decompose. Aqueous solutions slowly decompose. Soluble in water, alcohol, ether, benzene; slightly soluble in carbon disulfide.

Derivation: Interaction of hydrochloric acid and sodium cyanate.

Hazard: Toxic by inhalation; strong irritant to tissue.

Use: Organic synthesis; tear gas and vesicant.

chloroformyl chloride. See phosgene.

chlorogenic acid (3-(3,4-dihydroxycinnamoyl)quinic acid) $(\text{HO})_2\text{C}_6\text{H}_3\text{CHCHCOOC}_6\text{H}_3(\text{OH})_2\text{COOH}$. Occurs in many plant tissues, especially in diseased tissue. Said to act as a growth inhibitor in plants.

Properties: Crystals; m.p. 208°C. Slightly soluble in cold water; soluble in hot water, alcohol, acetone.

chloroguanide hydrochloride (1-(para-chlorophenyl)-5-isopropylbiguanide hydrochloride) $\text{C}_{11}\text{H}_{16}\text{ClN}_5 \cdot \text{HCl}$.

Properties: Crystals with bitter taste. M.p. 248–252°C. Soluble in alcohol; slightly soluble in water; insoluble in chloroform and ether; pH of saturated aqueous solution 5.8–6.3.

Use: Medicine.

chlorohydrin (alpha-chlorohydrin; 1-chloropropane-2,3-diol; glyceryl alpha-chlorohydrin) $\text{CH}_2\text{OHCHOHCH}_2\text{Cl}$.

Properties: Colorless heavy liquid. Unstable; hygroscopic. The commercial grade is a mixture of the two isomers, alpha and beta, of which alpha is in a greater proportion. Sp. gr. 1.326 (18°C); b.p. 213°C (decomposes); wt/gal 11.012 lb; freezing point -40°C; viscosity 2.388 poise (20°C). Miscible with some organic solvents and water; immiscible with oils. Nonflammable.

Derivation: By passing hydrochloric acid gas into glycerol containing 2% acetic acid.

Grades: Technical.

Uses: Solvent for cellulose acetate, glyceryl phthalate resins; partial solvent for gums; intermediate in organic synthesis.

chlorohydrin rubber. An elastomer made from epichlorohydrin (q.v.). Both a homopolymer and a copolymer with ethylene oxide are available. See also "Hydrin."

chlorohydroquinone (2-chloro-1,4-dihydroxybenzene; 2,5-dihydroxychlorobenzene $[\text{Cl} = 1] \text{ClC}_6\text{H}_3(\text{OH})_2$).

Properties: White to light-tan fine crystals; m.p. 100°C; b.p. 263°C. Very soluble in water and alcohol; slightly soluble in ether.

Grades: Photographic; commercial.

Uses: Photographic developer; organic intermediate; dyestuffs; bactericide.

chlorohydroxybenzene. See chlorophenol.

5-chloro-2-hydroxybenzophenone $\text{C}_6\text{H}_5\text{COC}_6\text{H}_4\text{OHCl}$.

Properties: Yellow crystals; nearly odorless; m.p. 93–95°C; soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.

Use: Light absorber, best at 320–380μ.

2-chloro-4-(hydroxymercuri)phenol. See hydroxymercurichlorophenol.

4-chloro-1-hydroxy-3-methylbenzene. See 4-chloro-3-methylphenol.

6-chloro-3-hydroxytoluene. See 4-chloro-3-methylphenol.

chloro-IPC (isopropyl N-(3-chlorophenyl) carbamate; isopropyl 3-chlorocarbamate; CIPC)

$\text{C}_9\text{H}_{11}\text{ClNHCOC}_3\text{H}_7$.

Properties: Light tan powder; m.p. 41.4°C; vapor pressure (149°C) 2 mm; sp. gr. 1.18 (30°C); very slightly soluble in water.

Containers: 60-, 250-, 450-lb drums; for solution: 55-gal drums; tank cars.

Hazard: Toxic by ingestion.

Use: Pre-emergence herbicide; prevents sprouting of potatoes.

2-chloro-N-isopropylacetanilide (N-isopropyl-alpha-chloroacetanilide) $\text{C}_9\text{H}_9\text{N}[\text{CH}(\text{CH}_3)_2]\text{COCH}_2\text{Cl}$.

Properties: Light tan powder or granules; m.p. 67–76°C; b.p. 110°C (0.03 mm). Very slightly soluble in water; soluble in acetone, alcohol, benzene, xylene, and carbon tetrachloride.

Hazard: May be toxic.

Uses: Herbicide.

chloroisopropyl alcohol. See propylene chlorohydrin.

6-chloro-4-isopropyl-1-methyl-3-phenol. See chlorothymol.

chloromadinone acetate. A nonestrogenic sex hormone used in oral contraception. See also antifertility agent.

chloromaleic anhydride CH:CClC(O)OC(O) .

Properties: Yellow liquid; sp. gr. 1.5; m.p. 10–15°C; b.p. 192°C.

Uses: Catalyst for epoxy resins; intermediate.

chloromercuriferrocene $\text{C}_5\text{H}_5\text{FeC}_5\text{H}_5\text{HgCl}$. Orange crystalline solid; m.p. 193–194°C. Used as an intermediate, and for inorganic polymers.

Hazard: Highly toxic by ingestion and inhalation.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s., Poison label.

1-[3-(chloromercuri)-2-methoxypropyl] urea. See chlormerodrin.

ortho-chloromercuriphenol. See ortho-hydroxyphenylmercuric chloride.

chloromethane. See methyl chloride.

chloromethapyriline citrate. See chlorothen citrate.

3-chloro-2-methylaniline. See 2-amino-6-chlorotoluene.

3-chloro-4-methylaniline. 4-amino-2-chlorotoluene.

5-chloro-2-methylaniline. See 2-amino-4-chlorotoluene.

chloromethylated diphenyl oxide $C_6H_5OC_6H_5$, with up to three $-CH_2Cl$ radicals substituted for H's. Straw-colored liquids or white solids; m.p. up to $55^\circ C$; sp. gr. 1.19-1.30 ($25/25^\circ C$); flash point $307^\circ F$ +. Insoluble in water; very soluble in ether. Combustible. Uses: Intermediate; resins; plasticizers.

chloromethylbenzene. See chlorotoluene.

1-chloro-3-methylbutane. See isoamyl chloride.

chloromethylchloroformate $ClCOOCH_2Cl$.

Properties: Mobile, colorless liquid. Penetrating, irritating odor. Hydrolyzed by hot and cold water. Decomposed by alkalis. Sp. gr. 1.465 at $15^\circ C$; b.p. $106.5-107^\circ C$; vapor density 4.5 (air = 1); vapor tension 5.6 mm ($20^\circ C$). Soluble in most organic solvents. Hazard: Toxic by ingestion and inhalation.

chloromethylchlorosulfonate $ClCH_2OCISO_2$. Properties: Colorless liquid. Sp. gr. 1.63; b.p. $49-50^\circ C$ (14 mm).

Derivation: By protracted boiling of chlorosulfonic acid with chloromethylchloroformate; also from para-formaldehyde and chlorosulfonic acid. Hazard: Toxic by ingestion and inhalation. Strong irritant to tissue.

chloromethyl cyanide. See chloroacetonitrile.

chloromethyl ether.

Hazard: A carcinogen.

Uses: Ion-exchange resins.

1-chloromethylethylbenzene. See ethylbenzyl chloride.

1-chloromethylnaphthalene (alpha-naphthylmethyl chloride) $C_{10}H_7CH_2Cl$.

Properties: Colorless to greenish-yellow liquid with sharp pungent odor; sp. gr. 1.182 ($25/25^\circ C$); coagulation point $23^\circ C$; refractive index 1.6354-1.6360 ($25/D$); insoluble in water; soluble in usual organic solvents. Very reactive.

Hazard: Vapor irritating to eyes. Toxic.

Use: A lachrymator; intermediate.

Shipping regulations: (Rail, Air) Not listed.

4-chloro-3-methylphenol (4-chloro-1-hydroxy-3-methylbenzene; 6-chloro-3-hydroxytoluene; 4-chloro-meta-cresol; so-called para-chloro-meta-cresol) $C_6H_3CH_3OHCl$.

Properties: White or slightly pink crystals with phenolic odor; m.p. $64-66^\circ C$; b.p. $235^\circ C$; volatile with steam; solubility 1:250 in water at $25^\circ C$; soluble in alkalies, organic solvents, fats and oils.

Hazard: May be toxic and irritant to skin.

Uses: External germicide; preservative for glues, gums, paints, inks, textile and leather goods.

4-chloro-2-methylphenoxyacetic acid. See MCP.

chloromethylphosphonic acid $ClCH_2PO(OH)_2$.

Properties: White hygroscopic solid; m.p. $85-95^\circ C$.

Uses: Intermediate for flameproofing agents, resins, lubricants, additives, plasticizers.

chloromethylphosphonic dichloride $ClCH_2POCl_2$.

Properties: Water-white to light straw liquid, highly reactive. Sp. gr. 1.638 ($25^\circ C$); refractive index 1.4960-1.4970 ($n_{25/D}$).

Hazard: Toxic by inhalation; irritant to eyes, lungs and mucous membranes.

Uses: Intermediate for flameproofing agents, resins, lubricants, additives, and plasticizers.

3-chloro-2-methyl-1-propene. See methylallyl chloride.

"Chloromycetin."³³⁰ Trademark for a proprietary form of chloramphenicol, an antibiotic. Must comply with FDA requirements. See chloramphenicol.

chloronaphthalene. See chlorinated naphthalene.

alpha-chloro-meta-nitroacetophenone $NO_2C_6H_4COCH_2Cl$.

Properties: Off-white, free-flowing granules; approx. m.p. $95-100^\circ C$; soluble in chlorinated solvents; insoluble in water.

Uses: Bacteriostat and fungistat in cutting oils, water systems, paint, plastics, textiles; chemical intermediate.

2-chloro-4-nitroaniline (ortho-chloro-para-nitroaniline) $C_6H_3ClNO_2NH_2$.

Properties: Yellow needles. Soluble in alcohol, benzene, ether; slightly soluble in water and strong acids. M.p. $107^\circ C$.

Derivation: (a) From 1,2-dichloro-4-nitrobenzene by heating with alcoholic ammonia. (b) From the chlorination of para-nitroaniline in acid solution.

Hazard: Toxic by ingestion and inhalation.

Use: Intermediate in manufacture of dyes.

4-chloro-2-nitroaniline (para-chloro-ortho-nitroaniline) $C_6H_3ClNO_2NH_2$.

Properties: Orange, crystalline powder; m.p. $163^\circ C$; insoluble in water; soluble in methanol and ether.

Hazard: Toxic by ingestion and inhalation.

Use: Dye and pigment intermediate.

4-chloro-3-nitroaniline $C_6H_3ClNO_2NH_2$.

Properties: Yellow to tan powder; m.p. $95-97^\circ C$. Soluble in alcohol and acetone. Partially soluble in hot water.

Hazard: Toxic by ingestion and inhalation.

Uses: Intermediate in the manufacture of azo dyes, pharmaceuticals and other organic compounds.

meta-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellowish crystals; sp. gr. 1.534; m.p. $44^\circ C$; b.p. $236^\circ C$; soluble in most organic solvents; insoluble in water. Combustible.

Derivation: By chlorinating nitrobenzene in the presence of iodine and recrystallizing.

Containers: Drums.

Hazard: Highly toxic by inhalation and ingestion.

Use: Intermediate.

Shipping regulations: (Rail, Air) Poison label. Legal label name (Rail) meta-nitrochlorbenzene.

ortho-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellow liquid; sp. gr. 1.368; b.p. $245.5^\circ C$; m.p. $325^\circ C$; soluble in alcohol and benzene; insoluble in water. Flash point $261^\circ F$; combustible.

Derivation: By nitrating chlorobenzene and purifying by rectification.

Containers: Drums; tank cars.

Hazard: Highly toxic by inhalation and ingestion.

Uses: Intermediate, especially for dyes.

Shipping regulations: (Rail, Air) Poison label. Legal label name (Rail) ortho-nitrochlorobenzene.

para-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellowish crystals; sp. gr. 1.520; m.p. $83^\circ C$; b.p. $242^\circ C$; soluble in organic solvents; insoluble in water. Combustible.

Derivation: Nitration of chlorobenzene and recrystallization.

Containers: Drums.

Hazard: Highly toxic by inhalation and ingestion.

Use: Intermediate, especially for dyes; manufacture of *p*-nitrophenol, from which parathion is made; agricultural chemicals; rubber chemicals.

Shipping regulations: (Rail, Air) Poison label. Legal label name (Rail) para-nitrochlorobenzene.

2-chloro-5-nitrobenzenesulfonamide

$ClNO_2C_6H_3SO_2NH_2$.

Properties: Grayish-white solid. Insoluble in water; soluble in benzene.

Hazard: Probably toxic by ingestion.

Uses: Dye and pharmaceutical intermediates.

6-chloro-3-nitrobenzenesulfonic acid, sodium salt

$NaSO_3C_6H_3NO_2Cl$.

Properties: Off-white moist crystals.

Hazard: Probably toxic by ingestion.

Use: Intermediate.

4-chloro-3-nitrobenzoic acid $ClC_6H_3NO_2COOH$.

Properties: Light gray or white powder; m.p. $170-174^\circ C$.

Hazard: Probably toxic by ingestion.

Use: Intermediate.

4-chloro-3-nitrobenzotrifluoride (para-chloro-meta-nitrotrifluorotoluene) $C_6H_3CF_3NO_2Cl$.

Properties: Thin, oily liquid; sp. gr. 1.542 ($15.5/15.5^\circ C$); f.p. $-7.5^\circ C$; flash point $275^\circ F$. Combustible. Refractive index ($n_{20/D}$) 1.491; b.p. $222^\circ C$; soluble in organic solvents; insoluble in water.

Grade: 97.5%.

Hazard: Toxic by inhalation and ingestion. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Intermediate for dyestuffs; agricultural chemicals; pharmaceuticals.

4-chloro-2-nitrophenol, sodium salt $ClC_6H_3NO_2ONa$.

Properties: Red needle crystals, with one molecule of water of crystallization. Soluble in hot water.

Derivation: Nitration of para-dichlorobenzene followed by hydrolysis.

Grades: 90% anhydrous sodium salt, containing 80% base.

Hazard: Probably toxic.

Uses: Dye intermediate; manufacture of 2-amino-4-chlorophenol.

1-chloro-1-nitropropane. See korax.

2-chloro-6-nitrotoluene $ClNO_2C_6H_3CH_3$. Solid. m.p.

$36.5-40^\circ C$; insoluble in water. Intermediate.

Hazard: Toxic; dangerous fire risk.

4-chloro-2-nitrotoluene $ClNO_2C_6H_3CH_3$. Solid. m.p.

$35-37^\circ C$; insoluble in water; soluble in alcohol and ether; intermediate.

Hazard: Toxic; dangerous fire risk.

para-chloro-meta-nitrotrifluorotoluene. See 4-chloro-3-nitrobenzotrifluoride.

chloronitrous acid. See aqua regia.

chloropentafluoroacetone ClF_2CCOCF_3 .

Properties: Colorless, nonflammable, hygroscopic, highly reactive gas. B.p. $7.8^\circ C$; f.p. $-133^\circ C$; liquid density 1.43 g/ml ($25^\circ C$).

Hazard: Evolves heat on contact with water.

Use: Intermediate.

chloropentafluoroethane (monochloropentafluoroethane; fluorocarbon 115; propellant 115) $CClF_2CF_3$.

Properties: Colorless gas; b.p. $-37.7^\circ F$; f.p. $-106^\circ C$; insoluble in water; soluble in alcohol and ether. Has good thermal stability. Nonflammable, nontoxic.

Containers: Cylinders up to 1800-lb tanks.

Uses: Refrigerant and dielectric gas.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Legal label name (Rail) monochloropentafluoroethane.

1-chloropentane. See n-amyl chloride.

chlorophene. USAN for ortho-benzyl-para-chlorophenol (q.v.).

meta-chlorophenol (3-chloro-1-hydroxybenzene)

C_6H_4OHCl .

Properties: White crystals with odor similar to phenol; discolors on exposure to air; sp. gr. 1.245; m.p. $33^\circ C$; b.p. $214^\circ C$.

Soluble in alcohol, ether and aqueous alkali; slightly soluble in water.

Derivation: From meta-chloroaniline through the diazonium salt.

Hazard: Toxic by skin absorption, inhalation or ingestion. Strong irritant to tissue.

Use: Intermediate in organic synthesis.

ortho-chlorophenol (2-chloro-1-hydroxybenzene)

C_6H_4OHCl .

Properties: Colorless to yellow brown liquid with unpleasant penetrating odor. Very soluble in water; soluble in alcohol, ether, and aqueous sodium hydroxide. Volatile with steam. B.p. $175^\circ C$; freezing point $7^\circ C$; sp. gr. 1.265 ($15.5^\circ C$); flash point $225^\circ F$. Combustible.

Derivation: Chlorination of phenol.

Hazard: Toxic by skin absorption, inhalation or ingestion. Strong irritant to tissue.

Use: Organic synthesis (dyes).

para-chlorophenol (4-chloro-1-hydroxybenzene)

C_6H_4OHCl .

Properties: White crystals (yellow or pink when impure) with unpleasant penetrating odor. Soluble in water; soluble in benzene, alcohol, and ether. Volatile with steam; b.p. $217^\circ C$; m.p. $42-43^\circ C$; sp. gr. 1.306; refractive index ($n_{40/D}$) 1.5579. A 1% solution is acid to litmus. Flash point $250^\circ F$. Combustible.

Derivation: Chlorination of phenol; from chloroaniline through the diazonium salt.

Grades: N.F.; technical.

Containers: 55-gal drums.

Hazard: Toxic by skin absorption, inhalation or ingestion. Strong irritant to tissue.

Uses: Intermediate in synthesis of dyes and drugs; denaturant for alcohol; selective solvent in refining mineral oils.

chlorophenothane. U.S.P. name for DDT (q.v.).

para-chlorophenyl benzenesulfonate. See fenson.

para-chlorophenyl para-chlorobenzenesulfonate. See ovex.

4-chloro-alpha-phenyl-ortho-cresol. See ortho-benzyl-para-chlorophenol.

3-para-chlorophenyl-1,1-dimethylurea. See monuron.

meta-chlorophenyl isocyanate $\text{ClC}_6\text{H}_4\text{NCO}$.

Properties: Clear water-white to light yellow liquid.

F.p. -4.4°C ; flash point (COC) 215°F . Combustible.

Hazard: Strong irritant to skin, eyes, and mucous membrane.

Use: Intermediate for pharmaceuticals, herbicides, and pesticides.

para-chlorophenyl isocyanate $\text{ClC}_6\text{H}_4\text{NCO}$.

Properties: Colorless to slightly yellow liquid or white crystalline solid. F.p. 29.0°C ; flash point (COC) 230°F . Combustible.

Hazard: Strong irritant to skin, eyes, and mucous membranes.

Use: Intermediate for pharmaceuticals, herbicides, and pesticides.

1-(para-chlorophenyl)-5-isopropylbiguanide hydrochloride. See chloroguanide hydrochloride.

3-(para-chlorophenyl)-5-methylrhodanine

$\text{C}_{10}\text{H}_8\text{ClNOS}_2$. Yellow crystals, m.p. $106-110^\circ\text{C}$. Insoluble in water; soluble in acetone.

Hazard: Toxic by ingestion.

Uses: Fungicide and for nematode control.

chloro-ortho-phenylphenol (chloro-2-phenylphenol)

$\text{C}_6\text{H}_3(\text{OH})\text{ClC}_6\text{H}_5$.

Properties: Clear, colorless to straw colored, viscous liquid with faint characteristic odor; sp. gr. 1.228 ($20/4^\circ\text{C}$); freezing point less than -20°C ; boiling range 5-95% $146-158.7^\circ\text{C}$ (5 mm); flash point 273°F ; readily soluble in most organic solvents. Combustible.

Composition: 80% 4-Chloro-2-phenylphenol; 20% 6-chloro-2-phenylphenol.

Hazard: Toxic by ingestion.

Uses: Fungicide.

para-chlorophenyl phenyl sulfone (4-chlorodiphenyl sulfone, sulphenone). $\text{ClC}_6\text{H}_4\text{SO}_2\text{C}_6\text{H}_5$.

Properties: Dimorphic crystals; slight aromatic odor; tasteless; insoluble in water; soluble in most organic solvents. Relatively stable to acids and alkalis.

Uses: Insecticide and acaricide (harmful to most grapes and pears).

chlorophenyltrichlorosilane $\text{ClC}_6\text{H}_4\text{SiCl}_3$. A mixture of isomers.

Properties: Colorless to pale yellow liquid. B.p. 230°C ; sp. gr. 1.439 ($25/25^\circ\text{C}$); refractive index ($n_{20/D}$) 1.5414; flash point (COC) 255°F . Readily hydrolyzed, with liberation of hydrochloric acid. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and chlorophenylmagnesium chloride.

Grades: Technical.

Hazard: Highly toxic. Corrosive to skin when wet.

Use: Intermediate for silicones.

Shipping regulations: (Rail) Corrosive material, n.o.s., White label. (Air) Corrosive label. Not acceptable on passenger planes.

4-chlorophthalic acid $\text{C}_6\text{H}_3\text{Cl}(\text{COOH})_2$.

Properties: Colorless crystals; m.p. 150°C ; decomposes on further heating; soluble in alcohol and ether; insoluble in water.

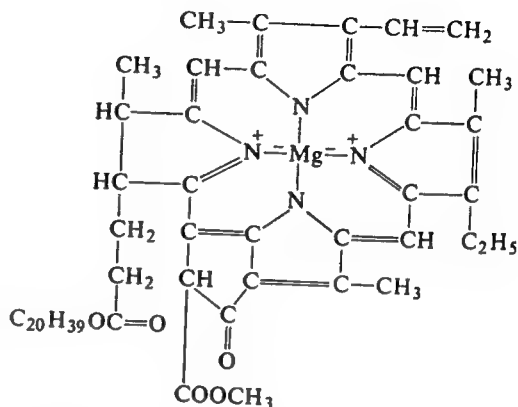

Derivation: Chlorination of phthalic acid.

chlorophyll. The green plant pigment essential to photosynthesis (q.v.). It occurs in three forms (a, b, and c), all of which are magnesium-centered porphyrins containing a hydrophilic carbocyclic ring with a lipophilic phytol tail. Chlorophyll is a photoreceptor

up to wavelengths of $700\text{ m}\mu$; it can readily transfer radiant energy to its chemical environment, and thus acts as a transducer in photosynthesis. It is structurally analogous to the red blood pigment hemi (q.v.). Chlorophyll a has been synthesized by two different routes. Its derivatives are relatively unstable to light, oxidizing agents, and chemical reagents. It is nontoxic.

Properties:

Chlorophyll a: $\text{C}_{55}\text{H}_{72}\text{MgN}_4\text{O}_5$.

Blue-green microcrystalline wax. About three times as plentiful as b. M.p. $117-120^\circ\text{C}$. Freely soluble in ether, ethanol, acetone, chloroform, carbon disulfide, benzene; sparingly soluble in cold methanol; insoluble in petroleum ether. The alcoholic solution is blue-green with a deep-red fluorescence.

Chlorophyll b: $\text{C}_{55}\text{H}_{70}\text{MgN}_4\text{O}_6$. Yellow-green microcrystalline wax. Sparingly soluble in absolute alcohol, ether. Ether solution has a brilliant green color. Solutions with other organic solvents are usually green to yellow-green with red fluorescence.

Chlorophyll c: Occurs in marine organisms, and may be as important as chlorophyll b.

Derivation: Alcoholic extraction of green plants; isolation by chromatography.

Grades: Aqueous, alcoholic or oil solutions; water solutions are prepared by saponification of oil-soluble chlorophyll.

Containers: Glass bottles.

Uses: Colorant for soaps, oils, fats, waxes, liquors, confectionery, preserves; cosmetics; perfumes; dentistry; source of phytol; sensitizer for color film; toothpaste additive; medicine.

See also photosynthesis; porphyrin.

Note: An experimental use of chlorophyll to act as energy converter in a synthetic photovoltaic cell has aroused interest in connection with solar energy research. The cell is termed a "synthetic leaf", as it is an attempt to approximate the energy-trapping function of a natural leaf.

chlorophyllin. Reaction product of alcoholic potassium or sodium hydroxide and alcoholic leaf extracts. The methyl and phytol groups are replaced by alkali but the magnesium is not replaced. Used in food coloring, dyes, deodorants, and medicine.

chloropicrin (chloropicrin; nitrotrichloromethane; trichloronitromethane; nitrochloroform) CCl_3NO_2 .

Properties: Pure product slightly oily, colorless, refractive liquid. Relatively stable; not decomposed by water or mineral acids. Sp. gr. 1.692 (0°C); b.p. 112°C ; f.p. -69.2°C . Soluble in alcohol, benzene, carbon disulfide; slightly soluble in ether and water. Nonflammable.

Derivation: (a) Action of picric acid on calcium hypochlorite. (b) Nitrification of chlorinated hydrocarbons.

Hazard: Highly toxic by ingestion and inhalation; strong irritant. Tolerance, 0.1 ppm in air.

Uses: Organic synthesis; dye-stuffs (crystal violet); fumigants; fungicides; insecticides; rat exterminator; poison gas.

Shipping regulations: (Rail) Poison label. Legal label name chlorpicrin. (Air) Not acceptable.

chloroplatinic acid $\text{H}_2\text{PtCl}_6 \cdot 6\text{H}_2\text{O}$.

Properties: Red-brown crystals. Soluble in water, alcohol and ether. Sp. gr. 1.431; m.p. 60°C.

Derivation: By solution of platinum in aqua regia, evaporation and crystallization.

Containers: Glass bottles.

Hazard: See platinum chloride.

Uses: Electroplating; platinizing pumice and the like for catalysts; etching zinc for printing; platinum mirrors; indelible ink; ceramics (producing fine color effects on high-grade porcelain); microscopy.

chloroprene (2-chlorobutadiene-1,3) $\text{H}_2\text{C}:\text{CHCl}:\text{CH}_2$.

Properties: Colorless liquid; b.p. 59.4°C; sp. gr. 0.9583 (20/20°C); soluble in alcohol; slightly soluble in water. Flash point -4°F.

Derivation: Addition of cold hydrogen chloride to vinylacetylene; chlorination of butadiene.

Grades: Pure, 95% min.

Containers: Cylinders; tank trucks.

Hazard: Flammable, dangerous fire risk; explosive limits in air, 4.0 to 20%. Toxic by ingestion, inhalation, and skin absorption. Tolerance, 25 ppm in air. May be carcinogenic.

Use: Manufacture of neoprene (q.v.).

Shipping regulations: (Rail) Flammable liquid, n.o.s., (Rail) Red label (Air) Flammable Liquid label.

1-chloropropane. See propyl chloride.

3-chloropropane-1,2-diol. See chlorohydrin.

1-chloro-2-propanol. See propylene chlorohydrin.

1-chloro-2-propanone. See chloroacetone.

1- or 3-chloropropene. See allyl chloride.

2-chloropropene (isopropenyl chloride) $\text{CH}_3\text{CCl}:\text{CH}_2$.

Properties: Colorless gas or liquid; sp. gr. 0.918 (9°C); f.p. -137.4°C; b.p. 22.65°C (1 atm).

Derivation: By treating propylene dichloride with alcoholic potassium hydroxide and fractionating from the simultaneously formed 1-chloropropene.

Grade: 95% purity.

Containers: Steel cylinders.

Hazard: Flammable, dangerous fire risk; may be toxic. Uses: Intermediate in organic synthesis; formulation of copolymers.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label. Not accepted on passenger planes.

2-chloropropionic acid (alpha-chloropropionic acid) $\text{CH}_3\text{CHClCOOH}$.

Properties: Crystals; sp. gr. 1.260-1.268 (20°C); b.p. 183-187°C. Soluble in water. Combustible.

Use: Intermediate for weed killers.

3-chloropropionic acid (beta-chloropropionic acid) $\text{CH}_2\text{ClCH}_2\text{COOH}$.

Properties: Crystals; m.p. 41°C; b.p. 200°C; soluble in water, alcohol, chloroform. Combustible.

Use: Intermediate.

3-chloropropionitrile $\text{ClCH}_2\text{CH}_2\text{CN}$.

Properties: Colorless liquid; f.p. -51°C; flash point (closed cup) 168°F; refractive index (n_{25/D}) 1.4341; sp. gr. 1.1363 (25°C); b.p. 176°C (dec.). Miscible with acetone, benzene, carbon tetrachloride, alcohol, and ether. Combustible.

Hazard: Toxic by ingestion, inhalation and skin contact.

Uses: Intermediate.

alpha-chloropropylene. See allyl chloride.

chloropropylene oxide. See epichlorohydrin.

3-chloropropyl mercaptan $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{SH}$.

Properties: Liquid; distillation range 141.1-145.6°C; sp. gr. 1.131 (15.5°C); refractive index 1.492 (20°C); flash point approx. 110°F. Combustible.

Hazard: Moderate fire risk.

Use: Intermediate.

3-chloro-1-propyne. See propargyl chloride.

2-chloropyridine $\text{ClC}_5\text{H}_4\text{N}$.

Properties: Oily liquid; sp. gr. 1.205 (15°C); b.p. 170°C. Slightly soluble in water; soluble in alcohol and ether.

Uses: Production of antihistamines, germicides, pesticides, and agricultural chemicals.

6-chloroquinaldine $\text{C}_9\text{H}_5\text{N}(\text{CH}_3)\text{Cl}$.

Properties: Brownish-black oily crystalline mass.

Grade: Technical.

Use: Intermediate.

chloroquine $\text{C}_9\text{H}_5\text{NCINHC}(\text{CH}_3)(\text{CH}_2)_3\text{N}(\text{C}_2\text{H}_5)_2$. 7-Chloro-4-(4-diethylamino-1-methylbutylamino)-quinoline.

Properties: Colorless crystals. Bitter taste; m.p. (free base) 87°C. Soluble in water; insoluble in alcohol, benzene, chloroform, ether.

Derivation: Condensation of 4,7-dichloroquinoline with 1-diethylamino-4-aminopentane.

Hazard: Moderately toxic.

Use: Medicine (antimalarial). Usually dispensed as the phosphate.

5-chlorosalicylanilide $\text{ClC}_6\text{H}_4\text{OHCONHC}_6\text{H}_5$.

Properties: White crystals; m.p. 209-211°C; slightly soluble in water; soluble in alcohol, ether, chloroform and benzene.

Hazard: Toxic by ingestion.

Use: Fungicide; antimildew agent; intermediate for pharmaceuticals, dyes, pesticides.

5-chlorosalicylic acid $\text{ClC}_6\text{H}_4\text{OHCOOH}$.

Properties: White crystals; m.p. 174-176°C; slightly soluble in water; soluble in alcohol, ether, chloroform and benzene.

Hazard: May be toxic by ingestion.

Use: Mothproofing; insecticide; intermediate for pharmaceuticals, dyes, pesticides.

N-chlorosuccinimide (NCS) $\text{COCH}_2\text{CH}_2\text{CONCl}$.

Properties: White crystalline powder; m.p. 148-149°C; soluble in water; sparingly soluble in chloroform and carbon tetrachloride.

Hazard: Strong skin irritant.

Uses: Chlorinating agent; disinfectant for swimming pools; bactericide.

chlorosulfonic acid (sulfuric chlorohydrin) ClSO_3OH .

Properties: Colorless to light yellow, fuming, slightly cloudy liquid; pungent odor; sp. gr. 1.76-1.77 (20°C); f.p. -80°C; b.p. 158°C. Decomposes in water

to sulfuric and hydrochloric acids. Decomposed by alcohol and acids.

Derivation: By treating sulfur trioxide or fuming sulfuric acid with hydrochloric acid.

Grades: Technical.

Containers: Carboys; drums; tank cars.

Hazard: Highly toxic by inhalation. Strong irritant to eyes and skin. Can ignite combustible materials; evolves hydrogen on contact with most metals. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Synthetic detergents; pharmaceuticals; dyes; pesticides; intermediates; ion-exchange resins; anhydrous hydrogen chloride and smoke-producing chemicals.

Shipping regulations: (Rail) White label (Air) Corrosive label.

4-chlorosulfonylbenzoic acid $\text{ClSO}_2\text{C}_6\text{H}_4\text{COOH}$.

Properties: Light tan powder; soluble in benzene; slightly soluble in ether.

Use: Intermediate.

chlorosulfuric acid. See suluryl chloride.

chlorotetracycline. See chlortetracycline.

chlorotetrafluoroethane (monochlorotetrafluoroethane)

Properties: Nonflammable, nontoxic, odorless and colorless gas. Much heavier than air.

Containers: Cylinders.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Legal label name (Rail) monochlorotetrafluoroethane.

chlorothen citrate (chloromethapyrilene citrate)

Properties: White, practically odorless crystalline powder. Slightly soluble in alcohol and water; practically insoluble in chloroform, ether and benzene. 1% solution is clear and colorless. pH (1% solution) 3.9–4.1. Melts at 112–116°C; on further heating solidifies and remelts at 125–140°C (dec).

Grade: N.F.

Use: Medicine (antihistamine).

"Chlorothene."²³³ Trademark for a series of chlorinated organic solvents.

Grades: NU and Industrial are both inhibited 1,1,1-trichloroethane. Used for cold cleaning of metal parts and as industrial solvents.

para-chlorothiophenol (para-chlorobenzenethiol)

Properties: Moist white to cream crystals; m.p. 52–55°C; b.p. 205–207°C. Soluble in most organic solvents.

Hazard: May be toxic by ingestion.

Uses: Oil additives; agricultural chemicals; plasticizers; rubber chemical; dyes; wetting agents and stabilizers.

chlorothymol (6-chloro-4-isopropyl-1-methyl-3-phenol)

Properties: White crystals or crystalline granular powder; characteristic odor; aromatic, pungent taste; becomes discolored with age; affected by light; m.p. 59–61°C. Soluble in benzene, chloroform, dilute caustic soda, alcohol; insoluble in water.

Derivation: Action of suluryl chloride on thymol in a solution of carbon tetrachloride.

Grades: N.F.

Hazard: Irritating to skin and mucous membranes in concentrated solution.

Use: Bactericide; component of antiseptic solutions.

alpha-chlorotoluene. See benzyl chloride.

meta-chlorotoluene. (3-chloro-1-methylbenzene)

Properties: Colorless liquid; sp. gr. 1.07218 (20/4°C); b.p. 161.6°C; f.p. –48.0°C.

Derivation: Diazotization of meta-toluidine followed by treating with cuprous chloride.

Hazard: Narcotic in high concentrations. Avoid inhalation.

Uses: Solvent; intermediate.

ortho-chlorotoluene (2-chloro-1-methylbenzene).

Properties: Colorless liquid. B.p. 159.2°C; f.p. –35.1°C; sp. gr. 1.0776 (25/4°C); refractive index (n_D 20/D) 1.5268. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and n-heptane; slightly soluble in water.

Derivation: By catalytic chlorination of toluene.

Hazard: Toxic by inhalation. Tolerance, 50 ppm in air.

Uses: Solvent and intermediate for organic chemicals and dyes.

para-chlorotoluene (4-chloro-1-methylbenzene)

Properties: Colorless liquid; boiling range 162–166°C; f.p. approx. 6.5°C; sp. gr. 1.065–1.067 (25/15°C); refractive index 1.5184 (22°C). Soluble in alcohol, ether, acetone, benzene, and chloroform. Insoluble in water.

Hazard: Avoid inhalation.

Uses: Solvent and intermediate for organic chemicals and dyes.

2-chlorotoluene-4-sulfonic acid (ortho-chlorotoluene-para-sulfonic acid) $\text{CH}_3\text{C}_6\text{H}_3(\text{SO}_3\text{H})\text{Cl}$.

Properties: White glistening plates. Soluble in hot water.

Derivation: Chlorination of toluene-para-sulfonic acid.

Method of purification: Recrystallization from water.

Uses: Dye intermediate.

2-chloro-para-toluidine. See 4-amino-2-chlorotoluene.

4-chloro-ortho-toluidine. See 2-amino-4-chlorotoluene.

6-chloro-ortho-toluidine. See 2-amino-6-chlorotoluene.

4-chloro-ortho-toluidine hydrochloride

Hazard: Toxic by ingestion, inhalation and skin absorption.

2-chloro-5-toluidine-4-sulfonic acid (6-chloro-meta-toluidine-4-sulfonic acid) $\text{CH}_3\text{C}_6\text{H}_2(\text{NH}_2)(\text{SO}_3\text{H})\text{Cl}$.

Properties: Fine white crystals. Soluble in dilute caustic solution.

Derivation: From ortho-chlorotoluene-para-sulfonic acid by nitration and subsequent reduction.

Hazard: Probably toxic.

Use: Intermediate.

chlorotrianisene (chlorotris(para-methoxyphenyl) ethylene; tri-para-anisylchloroethylene)

A synthetic non-steroid estrogen.

Properties: White, odorless, crystalline powder. M.p. 115–117°C. Freely soluble in acetone, benzene and chloroform; slightly soluble in ether; very slightly soluble in alcohol and water.

Grade: N.F.

Use: Medicine.

chlorotriazinyl dye. A fiber-reactive dye (q.v.); both mono- and di-derivatives have been developed. They react readily and permanently with cellulose under alkaline conditions with 70–80% efficiency.

chlorotrifluoroethylene (CFE; CTFE; trifluorochloroethylene) ClFC:CH_2 .

Properties: Colorless gas with faint ethereal odor; b.p. -27.9°C ; f.p. -157.5°C ; sp. gr. (liquid) (20°C) 1.305; flammable limits in air 8.4–38.7% by volume; decomposes in water.

Derivation: From trichlorotrifluoroethane and zinc.

Grades: Technical; 99.0%.

Containers: Cylinders; tank cars; tank trucks. Shipped with inhibitor.

Hazard: Moderately toxic; flammable; dangerous fire risk.

Uses: Intermediate; monomer for chlorotrifluoroethylene resins.

Shipping regulations: (Rail) Red Gas label. (Air) (Inhibited) Flammable Gas label; Not accepted on passenger planes. (Uninhibited) Not acceptable. Legal label name (Rail) trifluorochloroethylene.

chlorotrifluoroethylene polymer (polytrifluorochloroethylene resin; fluorothene). A polymer of chlorotrifluoroethylene, usually including vinylidene fluoride, characterized by the repeating structure $(\text{CF}_2\text{-CFCl})_n$.

Properties: Colorless; sp. gr. 2.10–2.15; refractive index 1.43. Impervious to corrosive chemicals; resistant to most organic solvents; heat-resistant; nonflammable; thermoplastic. Zero moisture absorption; high impact strength; transparent films and thin sheets.

Uses: Chemical piping, gaskets, tank linings, connectors, valve diaphragms, wire and cable insulation; electronic components.

See also "Kel-F"; fluorocarbon polymer.

chlorotrifluoromethane (monochlorotrifluoromethane; trifluorochloromethane) CClF_3 .

Properties: Colorless, nonflammable gas; ethereal odor; b.p. -81.4°C ; f.p. -181°C ; heavier than air.

Derivation: From dichlorodifluoromethane in vapor phase with aluminum chloride catalyst.

Grade: 99.0% min. purity.

Containers: Cylinders.

Hazard: Moderately toxic by inhalation; slightly irritant.

Uses: Dielectric and aerospace chemical; refrigerant and coolant; hardening of metals; pharmaceutical processing.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label. Legal label name (Rail) monochlorotrifluoromethane.

See also chlorofluorocarbon.

2-chloro-5-trifluoromethylaniline $\text{C}_6\text{H}_3\text{ClCF}_3\text{NH}_2$.

Properties: Amber colored oil; f.p. $6-8^\circ\text{C}$; insoluble in water; soluble in alcohol and acetone. Forms water-soluble salts with mineral acids.

Hazard: Toxic. Irritant to eyes and skin.

Use: Intermediate for dyes and other organic chemicals.

chlorotrifluoromethylbenzene. See chlorobenzotrifluoride.

chloro-alpha, alpha, alpha-trifluorotoluene. See chlorobenzotrifluoride.

chlorotris (para-methoxyphenyl)ethylene. See chlorotrisanisene.

chlorovinylarsinedichloride. See beta-chlorovinyl-dichloroarsine.

beta-chlorovinyl-dichloroarsine (1-chloro-2-dichloroarsinoethene; dichloro(2-chlorovinyl)arsine; chlorovinyl-

arsinedichloride; lewisite). Two isomers, probably cis and trans, are known. ClCH:CHAsCl_2 .

Properties: Colorless liquid when pure. Impurities influence a color change ranging from violet to brown. Geranium-like odor. Decomposed by water and alkalis. Inactivated by bleaching powder. Antidote is dimercaptopropanol (q.v.).

Derivation: Condensation of arsenic trichloride with acetylene in the presence of aluminum or copper or mercury chloride. The mixed arsines are separated by fractionating.

Hazard: Highly toxic vesicant gas.

Use: Poison gas; skin blistering agent.

Shipping regulations: (Rail) Poison Gas label. Not accepted by express. (Air) Not acceptable. Legal label name: lewisite.

beta-chlorovinyl ethyl ethynyl carbinol. See ethchlor-vynol.

beta-chlorovinylmethylchloroarsine
 ClCH:CHAsClCH_3 .

Properties: Liquid; decomposed by water. B.p. $112-115^\circ\text{C}$ (10 mm).

Derivation: Interaction of acetylene and methyl-dichloroarsine in the presence of aluminum chloride.

Hazard: Highly toxic; strong irritant; absorbed by skin.

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

"**Chlorowax**."²⁴⁴ Trademark for a series of liquid and resinous chlorinated paraffins containing from 40% to 70% chlorine by weight. They are odorless, nonflammable, insoluble in water, and have low toxicity. See also paraffin, chlorinated.

para-chloro-meta-xylene (4-chloro-3,5-dimethylphenol). $\text{C}_6\text{H}_2(\text{CH}_3)_2\text{OHCl}$. Crystals with phenolic odor.

Hazard: Toxic by ingestion; strong irritant; absorbed by skin.

Uses: Active ingredient in germicides, antiseptics, etc.; fungistat.

6-chloro-3,4-xylyl methylcarbamate (6-chloro-3,4-dimethylphenyl N-methylcarbamate)
 $\text{ClC}_6\text{H}_2(\text{CH}_3)_2\text{OCONHCH}_3$.

Properties: Solid; m.p. $120-133^\circ\text{C}$.

Hazard: May be toxic by ingestion and inhalation.

Use: Pesticide.

chlorpheniramine maleate (chlorophenpyridamine maleate) $\text{C}_{16}\text{H}_{19}\text{ClN}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$. 1-(para-Chlorophenyl)-1-(2-pyridyl)3-dimethylaminopropane maleate.

Properties: White odorless crystals. M.p. $130-135^\circ\text{C}$. Slightly soluble in ether; soluble in alcohol, chloroform, and water. pH (1% solution) about 4.8.

Grade: U.S.P.

Use: Medicine (antihistamine).

chlorphenol red (dichlorosulfonphthalein)

$\text{C}_6\text{H}_4\text{SO}_3\text{OC}(\text{C}_6\text{H}_4\text{ClOH})_2$. An acid-base indicator (q.v.), showing color change from yellow to red over the pH range 5.2 to 6.8.

chlorpicrin. Legal label name (Rail) for chloropicrin (q.v.).

chlorpromazine (2-chloro-10-(3-dimethylaminopropyl)-phenothiazine) $\text{C}_{17}\text{H}_{19}\text{ClN}_2\text{S}$.

Properties: Oily liquid; amine odor; alkaline reaction; b.p. $200-205^\circ\text{C}$, (0.8 mm).

Hazard: May have toxic side effects; central nervous system depressant.

Use: Medicine (antipsychotic drug).

chlorpropenpyridamine maleate. See chlorpheniramine maleate.

chlorquinaldol (5,7-dichloro-8-hydroxyquinaldine; 5,7-dichloro-2-methyl-8-quinolinol) $\text{CH}_3\text{C}_9\text{H}_7\text{N}(\text{OH})\text{Cl}_2$. Properties: Yellow, crystalline, tasteless powder with a pleasant medicinal odor; m.p. 114°C ; soluble in alcohol, chloroform; insoluble in water.

Use: Medicine (bactericide and fungicide).

chlortetracycline (CTC; chlorotetracycline)

$\text{C}_{22}\text{H}_{23}\text{ClN}_2\text{O}_8$. An antibiotic produced by the growth of *Streptomyces aureofaciens* in submerged cultures. It has a wide antimicrobial spectrum including many Gram-positive and Gram-negative bacteria, rickettsiae and several viruses. Its chemical structure is that of a modified naphthacene molecule. Low toxicity. Also available as the hydrochloride.

Properties: Golden-yellow crystals. M.p. $168\text{--}169^\circ\text{C}$. Slightly soluble in water; very soluble in aqueous solutions above pH 8.5; freely soluble in the "Cello-solves," dioxane and "Carbitol"; slightly soluble in methanol, ethanol, butanol, acetone, ethyl acetate, and benzene; insoluble in ether and naphtha.

Derivation: By submerged aerobic fermentation, filtration, solvent extraction, and crystallization.

Use: Medicine (antibiotic); feed supplement; preservative for raw fish.

chlorthion. Generic name for O,O-dimethyl-O(3-chloro-4-nitrophenyl) thiophosphate. Phosphoric acid ester containing chlorine. Related chemically to parathion (q.v.) and malathion (q.v.). Cholinesterase inhibitor.

Hazard: Highly toxic by inhalation and ingestion; absorbed by intact skin. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Not listed.

"Chlor-Trimeton Maleate."³²¹ Trademark for chlorpheniramine maleate.

cholic acid. See taurocholic acid.

cholecalciferol (5,7-cholestadien-3-beta-ol; 7-dehydrocholesterol, activated; vitamin D_3) $\text{C}_{27}\text{H}_{44}\text{O}$. A free vitamin D_3 , isolated in crystalline state from the 3,5-dinitrobenzoate; produced by irradiation and equivalent in activity to the vitamin D_3 of tuna liver oil.

Properties: Colorless crystals. Unstable in light and air. Insoluble in water. Soluble in alcohol, chloroform and fatty oils. Melting range $84\text{--}88^\circ\text{C}$. Specific rotation $+105$ to $+112^\circ$.

Grade: U.S.P.; F.C.C.

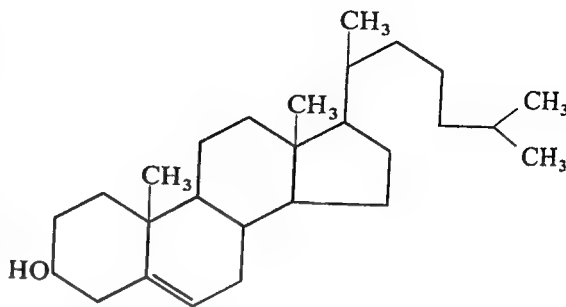

Package: Hermetically sealed under nitrogen.

Use: Medicine (antirachitic vitamin).

choleic acid. A general term applied to the coordination complexes formed by deoxycholic acid (a bile acid) with fatty acids or other lipids, and with a variety of other compounds, including such aromatics as phenol and naphthalene. These complexes are similar to those used in separation processes, such as the urea adducts, for large-scale purification. See also cholic acid.

cholesterol (cholesterin; 5-cholesten-3-beta-ol) $\text{C}_{27}\text{H}_{46}\text{O}$. The most common animal sterol; a monohydric secondary alcohol of the cyclopentenophenanthrene (4-ring fused) system, containing one double bond. It occurs in part as the free sterol and in part esterified with higher fatty acids as a lipid in

human blood serum. The primary precursor in biosynthesis appears to be acetic acid or sodium acetate. Cholesterol itself in the animal system is the precursor of bile acids, steroid hormones and provitamin D_3 .

Properties: White, or faintly yellow, almost odorless, pearly granules or crystals; affected by light; m.p. 148.5°C ; b.p. 360°C (dec); sp. gr. 1.067 ($20/4^\circ\text{C}$); levorotatory; specific rotation (25°C) -34 to -38° ; insoluble in water; slightly soluble in alcohol; soluble in fat solvents, vegetable oils and aqueous solutions of bile salts.

Occurrence: Egg yolk, liver, kidneys, saturated fats and oils.

Source: Prepared from beef spinal cord by petroleum ether extraction of the nonsaponifiable matter; purification by repeated bromination.

Grades: Technical; U.S.P.; S.C.W., standard for clinical work.

Containers: 1- and 5-lb bottles.

Uses: Medicine; emulsifying agent in cosmetic and pharmaceutical products; source of estradiol (q.v.).

Note: Regarding the part played by cholesterol in heart disease (atheroma), Dr. W. Stanley Hartroft of Toronto has stated "It still has not been shown that lowering the cholesterol in the blood by this amount [20%] will have any protective effect for the heart and vessels against the development of atheroma and the onset of its serious complications."

See also sterol.

cholic acid $\text{C}_{24}\text{H}_{40}\text{O}_5$. The most abundant bile acid. In bile it is conjugated with the amino acids glycine and taurine as glycocholic acid and taurocholic acid, respectively, and does not occur free.

Properties: The monohydrate crystallizes in plates from dilute acetic acid; bitter taste with sweetish aftertaste; anhydrous form, m.p. 198°C . Not precipitated by digitonin. Soluble in glacial acetic acid, acetone, and alcohol; slightly soluble in chloroform; practically insoluble in water and benzene.

Derivation: From glycocholic and taurocholic acids in bile; organic synthesis.

Grade: F.C.C.

Use: Biochemical research; pharmaceutical intermediate; emulsifying agent in foods, up to 0.1%.

choline (choline base; (beta-hydroxyethyltrimethylammonium hydroxide) $(\text{CH}_3)_3\text{N}(\text{OH})\text{CH}_2\text{CH}_2\text{OH}$. Member of the vitamin B complex. Essential in the diet of rats, rabbits, chickens, and dogs. In man it is required for lecithin formation and can replace methionine in the diet. There is no evidence of disease in man due to choline deficiency. It is a dietary factor important in furnishing free methyl groups for transmethylation; has a lipotropic function.

Source: Egg yolk, kidney, liver, heart, seeds, vegetables and legumes; synthetic preparation from tri-

methylamine and ethylene chlorohydrin or ethylene oxide.

Units: Amounts are expressed in milligrams of choline.
Uses: Medicine; nutrition; feed supplement; catalyst; curing agent; control of pH; neutralizing agent; solubilizer.

choline bicarbonate. See 2-hydroxyethyltrimethylammonium bicarbonate.

choline bitartrate ($C_5H_{14}NO \cdot C_4H_5O_6$).

Properties: White crystalline powder; odorless or faint trimethylamine-like odor; acid taste; hygroscopic; soluble in water and alcohol. Insoluble in ether, chloroform and benzene.

Grade: F.C.C.

Use: Medicine; dietary supplement; nutrient.

choline chloride ($CH_3)_3N(Cl)CH_2CH_2OH$. Animal feed additive derived from agricultural waste or made synthetically. Available as 50% dry feed-grade and 70% solution.

choline chloride carbamate. See carbachol.

cholinesterase

(1) (acetylcholinesterase). Enzyme specific for the hydrolysis of acetylcholine to acetic acid and choline in the body. It is found in the brain, nerve cells and red blood cells and is important in the mechanism of nerve action. See nerve gases; parathion; insecticide.

Derivation: From bovine erythrocytes.

Uses: Biochemical research; determination of phosphorus in insecticides and poisons.

(2) "Pseudo" or nonspecific cholinesterase, prepared from horse serum. This esterase hydrolyzes other esters as well as choline esters. It occurs in blood serum, pancreas and liver.

cholinesterase inhibitor. A chemical compound which deactivates the enzyme cholinesterase, thus preventing or retarding hydrolytic breakdown of the highly toxic acetylcholine formed in the body by the nervous system. Nerve gases act in this way, and so do a number of insecticides. The compounds involved are usually organic esters of phosphoric acid derivatives. Serious poisoning and death may occur on ingestion or inhalation of such compounds. See also parathion; nerve gas.

"Cholograffin Sodium."⁴¹² Trademark for sodium iodipamide (q.v.).

cholytaurine. See taurocholic acid.

chondroitin sulfate. A major constituent of the cartilaginous tissue in the body.

chondrus. See carrageenan.

chorionic gonadotropin (HCG). A hormone isolated from blood and urine of pregnant women; is secreted by the placenta. It is a glycoprotein containing about 11% galactose and having a molecular weight of about 100,000.

Properties: Rods or needle-like crystals. Soluble in water and glycols. Relatively unstable in aqueous solution; stable in dry form. It enhances estrone and progesterone production.

Units: One international unit equals the activity of 0.1 mg of a standard preparation.

Use: Medicine; veterinary medicine.

"Chromacyl."²⁸ Trademark for a group of dyes that contain chromium in the molecule. Suitable for wool and nylon.

chlorinated zinc chloride. See zinc chloride chromated.

chromatin. A deoxyribonucleoprotein complex consisting of (1) double-stranded DNA molecules, (2) a basic protein called histone, and (3) other proteins. The latter protect the DNA from attack by enzymes. Chromatin occurs in the cell nucleus (q.v.), where it forms chromosomes, the carriers of genes. Its name is derived from its sensitivity to biological stains. See also deoxyribonucleic acid; chromosome; gene.

chromatography. A laboratory analytical technique for the separation and identification of chemical compounds in complex mixtures. Basically, it involves the flow of a mobile (gas or liquid) phase over a stationary phase (which may be a solid or a liquid). Liquid chromatography is used for soluble substances and gas (vapor-phase) chromatography for volatile substances. As the mobile phase moves past the stationary phase, repeated adsorption and desorption of the solute occurs at a rate determined chiefly by its ratio of distribution between the two phases. If the ratio is large enough, the components of the mixture will move at different rates, producing a characteristic pattern, or chromatograph, from which their identity can be determined. See also liquid chromatography; gas chromatography; paper chromatography; thin-layer chromatography; ion-exchange chromatography; gel filtration.

"Chromax" Castings.³⁵⁰ Trademark for ferrous alloys containing 20–30% nickel and 15–20% chromium.

chrome alum. See chromium potassium sulfate.

chrome ammonium alum. See chromium ammonium sulfate.

chrome cake. A green form of salt cake (sodium sulfate) containing a low percentage of chromium. A by-product of sodium dichromate manufacture used in the paper industry.

chrome dye. A mordant dye, most frequently one in which sodium dichromate is used as the mordant.

chrome green. See chrome pigment.

"Chromekill 4A."¹⁴² Trademark for a nearly neutral material composed of organic and inorganic reducing agents designed for the reduction of hexavalent chromium to trivalent chromium when it is present in low percentages in alkaline cleaning solutions and electroplating baths.

"Chromel."¹⁶⁶ Trademark for a series of nickel-chromium alloys. There are a number of different compositions ranging from 35% to 80% nickel and 16% to 20% chromium, some containing iron. The 80Ni-20Cr types are useful up to 2100–2200°F.

chrome-molybdenum steel. Steel made by any accepted method of quality steel-making containing both chromium and molybdenum, usually in the ranges of chromium 0.35 to 1.10% and molybdenum 0.08 to 0.35%.

chrome-nickel steel. See steel, stainless.

chrome pigment. An inorganic pigment (q.v.) containing chromium. The most important types are: (1) chrome oxide green, one of the most permanent and stable pigments known, the pure grade consisting of 99% Cr_2O_3 , used in paints applied to cement and lime-containing surfaces; (2) chrome green, chrome yellow, and chrome red, consisting chiefly of lead

chromate, and used in paints, rubber, and plastic products; (3) miscellaneous pigments such as molybdate orange and zinc yellow, based on lead and zinc compounds of chromium, respectively. All these are more stable to sunlight, weathering, and chemical action than the brighter organic dyes.
Hazard: See lead chromate.

chrome potash alum. See chromium potassium sulfate.

chrome red. See chrome pigment.

chrome steel. A steel made by any accepted method of quality steel-making containing chromium as alloying element usually in the range 0.20 to 1.60%, although the percentage may be as high as 25% in specialized heat-resistant and wear-resistant steels and in stainless steels. See also steel, stainless.

chrome tanning. See tanning.

chrome-vanadium steel. A steel made by any accepted method of quality steel-making containing both chromium and vanadium, usually in the ranges of chromium 0.50 to 1.10% and vanadium 0.10 to 0.20%.

chrome yellow. See lead chromate; chrome pigment.

chromia. See chromic oxide.

chromic acetate (chromium acetate) $\text{Cr}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot \text{H}_2\text{O}$. Properties: Grayish-green powder or bluish-green, pasty mass. Soluble in water; insoluble in alcohol. Derivation: Action of acetic acid on chromium hydroxide. The solution is evaporated and crystallized. Hazard: Toxic by ingestion. Uses: Textile mordant; tanning.

chromic acid (chromium trioxide; chromic anhydride) CrO_3 . The name is in common use, although the true chromic acid, H_2CrO_4 , exists only in solution.

Properties: Dark-purplish red crystals; soluble in water, alcohol and mineral acids. Deliquescent. Sp. gr. 2.67–2.82; m.p. 196°C.

Derivation: (a) Sulfuric acid is added to a solution of sodium dichromate and the product is crystallized out; (b) chromite is fused with soda ash and limestone and then treated with sulfuric acid; (c) electrolysis.

Grades: Technical; C. P.

Containers: 100-, 400-lb Drums.

Hazard: Highly toxic, corrosive to skin. Tolerance (as CrO_3), 0.1 milligram per cubic meter of air. Powerful oxidizing agent; may explode on contact with reducing agents; may ignite on contact with organic materials. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Chemicals (chromates; oxidizing agent, catalysts); chromium plating; intermediate; medicine (caustic); process engraving; anodizing; ceramic glazes; colored glass; metal cleaning; inks; tanning; paints; textile mordant.

Shipping regulations: (Rail) (solid) Yellow label; (solution) White label. (Air) (solid) Oxidizer label; (solution over 35%) Corrosive label.

chromic chloride (chromium chloride; chromium trichloride; chromium sesquichloride) (a) CrCl_3 or (b) $\text{CrCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: (a) Violet crystals. Sp. gr. 2.76; m.p. 1150°C; sublimes about 1300°C. Insoluble in water and alcohol. (b) Greenish-black or violet deliquescent crystals depending on whether or not chlorine is coordinated with the chromium. Sp. gr. 1.76; m.p. 83°C. Soluble in water; soluble in alcohol; insoluble in ether.

Derivation: (a) By passing chlorine over a mixture of

chromic oxide and carbon. (b) By the action of hydrochloric acid on chromium hydroxide.

Hazard: Toxic. Tolerance (as Cr), 0.5 mg per cubic meter in air.

Uses: Chromium salts; intermediates; textile mordant; chromium plating including vapor plating; preparation of sponge chromium; catalyst for polymerizing olefins.

chromic fluoride (chromium fluoride; chromium trifluoride) $\text{CrF}_3 \cdot 4\text{H}_2\text{O}$ or $\text{CrF}_3 \cdot 9\text{H}_2\text{O}$.

Properties: Fine green crystalline powder. Sp. gr. (anhydrous) 3.8; m.p. over 1000°C; b.p. (sublimes) 1100–1200°C. The hydrates are soluble in water and acids; insoluble in alcohol.

Derivation: Interaction of chromium hydroxide and hydrofluoric acid.

Grades: Technical; high purity (CrF_3).

Hazard: Toxic. Irritating to skin and eyes, especially in solution. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Printing and dyeing woolens; mothproofing woolen fabrics.

Shipping regulations: (Solid and solution): (Rail) Corrosive material, n.o.s., White label. (Air) Corrosive label.

chromic formate $\text{Cr}(\text{OH})(\text{HCOO})_2$.

Properties: Dark green liquid. Sp. gr. (20°C) 1.237; wt/gal 10.3 lb.

Hazard: Toxic by ingestion; strong irritant.

Uses: Tanning agent; textile mordant; synthesis.

chromic hydrate. See chromic hydroxide.

chromic hydroxide (chromic hydrate; chromium hydroxide; chromium hydrate) $\text{Cr}(\text{OH})_3$.

Properties: Green, gelatinous precipitate; decomposed to chromic oxide by heat. Insoluble in water; soluble in acids and strong alkalis.

Derivation: By adding a solution of ammonium hydroxide to the solution of a chromium salt.

Uses: Chromium salts and chromites; paint pigment; wool treatment.

chromic nitrate (chromium nitrate) $\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Purple crystals; soluble in alcohol and water. M.p. 60°C; decomposes 100°C.

Derivation: By the action of nitric acid on chromium hydroxide.

Hazard: Strong oxidant; may ignite organic materials on contact. May be explosive when shocked or heated.

Shipping regulations: Nitrates, n.o.s., (Rail) White label (Air) Oxidizer label.

chromic oxide (chromium oxide; chromia; chromium sesquioxide; green cinnabar) Cr_2O_3 .

Properties: Bright-green, crystalline powder; sp. gr. 5.04; m.p. 2435°C; b.p. 4000°C; insoluble in water, acids, and alkalis.

Derivation: (a) By heating chromium hydroxide; (b) by heating dry ammonium dichromate; (c) by heating sodium dichromate with sulfur and washing out the sodium sulfate.

Uses: Metallurgy; green paint pigment; ceramics; catalyst in organic synthesis; green granules in asphalt roofing; component of refractory brick.

chromic phosphate (chromium phosphate) (a) $\text{CrPO}_4 \cdot 6\text{H}_2\text{O}$; (b) $\text{CrPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: (a) Violet crystals; sp. gr. 2.12 (14°C); m.p. 100°C. (b) Green crystals. Soluble in acids; insoluble in water.

Derivation: (a) Interaction of solutions of chromium chloride and sodium phosphate; (b) by mixing chrome alum and disodium hydrogen phosphate.

Violet amorphous powder (not the hexahydrate) is formed which becomes crystalline on contact with water. On boiling it is converted into green crystalline hydrate.

Use: Paint pigment.

chromic sulfate (chromium sulfate) (a) $\text{Cr}_2(\text{SO}_4)_3$; (b) $\text{Cr}_2(\text{SO}_4)_3 \cdot 15\text{H}_2\text{O}$; (c) $\text{Cr}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$.

Properties: (a) Violet or red powder; (b) dark-green amorphous scales; (c) violet cubes. Sp. gr. (a) 3.012; (b) 1.867; (c) 1.70. (a) Insoluble in water and acids; (b) soluble in water; insoluble in alcohol; (c) soluble in water and alcohol.

Derivation: Action of sulfuric acid on chromium hydroxide, with subsequent crystallization.

Uses: Textile industries; green paints and varnishes; green ink; ceramics (glazes, green effects); the basic form (reduction of sodium dichromate) is used in tanning (q.v.).

chromite (chrome iron ore) FeCr_2O_4 . A natural oxide of ferrous iron and chromium, sometimes with magnesium and aluminum present. Usually occurs in magnesium- and iron-rich igneous rocks.

Properties: Color iron-black to brownish-black; streak dark brown; luster metallic to submetallic; sp. gr. 4.6; Mohs hardness 5.5. Low toxicity.

Grades: Metallurgical; refractory; chemical.

Occurrence: U.S.S.R.; South Africa; Rhodesia; Philippines; Cuba; Turkey.

Uses: Only commercial source of chromium and its compounds.

chromium Cr Metallic element of atomic number 24, group VIB of the Periodic Table; atomic weight 51.996; valences 2, 3, 6; four stable isotopes. Name derived from Greek for color.

Properties: Hard, brittle, semi-gray metal. Sp. gr. 7.1; m.p. 1900°C; b.p. 2200°C. Compounds have strong and varied colors. Cr ion forms many coordination compounds. Exists in active and passive forms, the latter giving rise to its corrosion resistance, due to a thin surface oxide layer that passivates the metal when treated with oxidizing agents. Active form reacts readily with dilute acids to form chromous salts. Soluble in acids (except nitric) and strong alkalis; insoluble in water.

Occurrence: USSR, So. Africa, Turkey, Philippines, Rhodesia.

Derivation: From chromite (q.v.), by direct reduction (ferrochrome); by reducing the oxide with finely divided aluminum or carbon; and by electrolysis of chromium solutions.

Grades (ore): Chromium ores are classified as (1) metallurgical, (2) refractory, and (3) chemical, and their consumption in the U.S. is in that order. (1) must contain a minimum of 48% Cr_2O_3 and have chromium-iron ratio of 3 to 1; (2) must be high in Cr_2O_3 and Al_2O_3 and low in iron; (3) must be low in SiO_2 and Al_2O_3 and high in Cr_2O_3 .

Forms available: (1) Chromium metal as lumps, granules, or powder; (2) high- or low-carbon ferrochromium (q.v.). Single crystals. High-purity crystals or powder run 99.97% pure.

Hazard: Elemental chromium and trivalent compounds are relatively nontoxic, but the hexavalent compounds have an irritating and corrosive effect on tissue, resulting in ulcers and dermatitis on prolonged contact. Tolerance for chromium dust and fume is 1 mg per cubic meter of air. It is a suspected carcinogen.

Uses: Alloying and plating element on metal and plastic substrates for corrosion resistance; chromium-containing and stainless steels (q.v.); protective coating for automotive and equipment accessories; nuclear and high-temperature research; constituent of inorganic pigments.

chromium 51. Radioactive chromium of mass number 51.

Properties: Half-life 26.5 days; radiation, gamma (0.32 MeV).

Grade: U.S.P. (as sodium chromate Cr 51 injection).

Hazard: Radioactive poison.

Uses: Diagnosis of blood volume, blood cell life and cardiac output; etc.

Shipping regulations: (Rail, Air) Consult regulations.

chromium acetate. See chromic acetate.

chromium acetylacetonate

$[\text{CH}_3\text{COCH}(\text{CH}_3)\text{O}]_3\text{Cr}$.

Properties: Purple powder or red-violet crystals; m.p. 216°C; b.p. 340°C, insoluble in water; soluble in acetone and alcohol.

Derivation: Reaction of chromium chloride, acetylacetonate and sodium carbonate.

Use: Reduction of detonation of nitromethane.

chromium ammonium sulfate (ammonium chromium sulfate; chrome ammonium alum)

$\text{CrNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Green powder or deep violet crystals; sp. gr. 1.72; m.p. 94°C. Soluble in water; slightly soluble in alcohol. The aqueous solution is violet when cold; green when hot.

Grades: Technical.

Uses: Mordant; tanning.

chromium boride One of several compounds of chromium and boron, e.g., CrB , CrB_2 , and Cr_3B_2 . They have high melting points, are very hard and corrosion-resistant, and may be suitable for use in jet and rocket engines.

Properties: CrB , may be crystalline; sp. gr. 6.2; m.p. 1550°C; Mohs hardness 8.5; resistivity 67 $\mu\text{-ohm cm}$ (20°C). CrB_2 , sp. gr. 5.15; m.p. 1850°C; hardness 2010 (Knoop); resists oxidation up to 1100°C. Cr_3B_2 , may be crystalline; sp. gr. 6.1; Mohs hardness 9+; resistivity 116 $\mu\text{-ohm cm}$ (20°C).

Uses: Metallurgical additives; high temperature electrical conductors; cermets; refractories; coatings resistant to attack by molten metals.

chromium bromide. See chromous bromide.

chromium carbide Cr_3C_2 .

Properties: Orthorhombic crystals; sp. gr. 6.65; microhardness, 2700 kg/sq mm (load 50 g); m.p. 1890°C; b.p. 3800°C; resistivity 95 $\mu\text{-ohm cm}$ (room temperature). Highest oxidation resistance at high temperatures of all metal carbides; also resistant to acids and alkalis.

Uses: Gage blocks and hot extrusion dies; in powder form, as spray coating material; components for pumps and valves.

chromium carbonate. See chromous carbonate.

chromium carbonyl. See chromium hexacarbonyl.

chromium chloride. See chromic chloride and chromous chloride.

chromium copper. A copper-chromium alloy containing 8-11% chromium. Used in the manufacture of hard steels for increased elasticity.

chromium dioxide Cr_2O_3 .

Properties: Black, semiconducting material. Sp. gr. 4.9. Acicular needle-like crystals having strong magnetic properties. Also in powder form.

Derivation: By heating chromic acid.

Use: Magnetic component in recording tapes (claimed to be superior to iron oxide for this purpose).

chromium fluoride. See chromic fluoride.

chromium hexacarbonyl (chromium carbonyl) $\text{Cr}(\text{CO})_6$

Properties: White crystalline solid; sp. gr. 1.77; m.p. 150-151°C (inert atmosphere); dec. 210°C (explosions). Slightly soluble in iodoform and carbon tetrachloride; insoluble in water, alcohol, ether or acetic acid. More stable than most metal carbonyls; decomposed by chlorine and fuming nitric acid but resists bromine, iodine, water, and cold conc. nitric acid. Decomposes photochemically when solutions are exposed to light.

Grade: 98% pure.

Hazard: Highly toxic by inhalation and ingestion. Explodes at 400°F.

Use: Intermediate.

Shipping regulations: (Rail, Air) Not specified. Consult authorities.

chromium hydrate. See chromic hydroxide.

chromium hydroxide. See chromic hydroxide.

chromium manganese antimonide. Brittle gray solid having magnetic properties when above a definite temperature. If the composition of the compound is intentionally changed, the temperature required also changes.

chromium naphthenate

Properties: Dark-green liquid or violet powder.

Derivation: By addition of chromium salts to solution of sodium naphthenate and recovery of the precipitate.

Grades: 6% chromium.

Hazard: Toxic by ingestion.

Use: Paints (anti-chalking agent).

chromium nitrate. See chromic nitrate.

chromium oxide. See chromic oxide.

chromium oxychloride. See chromyl chloride.

chromium phosphate. See chromic phosphate.

chromium potassium sulfate (chrome alum; potassium chromium sulfate; chrome potash alum) $\text{CrK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Dark, violet-red crystals; efflorescent; sp. gr. 1.813; m.p. 89°C; loses $10\text{H}_2\text{O}$ at 100°C. Soluble in water.

Derivation: By reducing potassium dichromate in dilute sulfuric acid with sulfurous acid.

Hazard: Toxic by ingestion.

Uses: Tanning (chrome-tan liquors); textile dye (mordant); photography (fixing bath); ceramics.

chromium sesquichloride. See chromic chloride.

chromium sesquioxide. See chromic oxide.

chromium steel. See steel, stainless; iron, stainless.

chromium sulfate. See chromic sulfate.

chromium trichloride. See chromic fluoride.

chromium trifluoride. See chromic acid.

chromium trioxide. See chromic acid.

chromogen. See chromophore.

"Chromegene."³⁰⁷ Trademark for mordant dyestuffs used on wool and leather. Characterized by very good fastness to light, fulling, etc.

"Chromol."²⁴⁴ Trademark for a series of raw oils emulsified with a non-ionic emulsifier and therefore stable to alum and salt. Used in the leather industry.

"Chromolan."²⁴³ Trademark for metalized acid dyes.

chromophore. A chemical grouping which when present in an aromatic compound (the chromogen) gives color to the compound by causing a displacement of, or appearance of, absorbent bands in the visible spectrum. Dyes are sometimes classified on the basis of their chief chromophores, e.g.; $-\text{NO}$, nitroso dyes; $-\text{NO}_2$, nitro dyes; $-\text{N}=\text{N}-$, azo dyes, etc.

chromosome. The heredity-bearing gene carrier of the living cell, derived from chromatin (q.v.) and consisting largely of nucleoproteins (DNA), together with other protein components (histones). See also deoxyribonucleic acid; gene.

"Chromosorb."²⁴⁷ Trademark for a series of screened calcined and flux-calcined diatomite aggregates. Available in non-acid washed, acid-washed, and acid-washed dimethyldichlorosilane treatments.

Grades: Chromosorb P, W, G for analytical use; Chromosorb A for preparative chromatography.

Containers: Glass and plastic bottles of various sizes dependent on grade.

Use: Supports in gas or liquid chromatography.

chromotropic acid. See 4,5-dihydroxy-2,7-naphthalenedisulfonic acid.

chromous bromide (chromium bromide) CrBr_2 .

Properties: White crystals; changes to yellow on heating. Oxidizes in moist air but stable in dry air. Sp. gr. 4.356; m.p. 842°C; soluble in water (blue color).

Hazard: Toxic by ingestion; irritant to skin and tissue.

Tolerance (as Cr), 0.5 mg per cubic meter in air.

chromous carbonate (chromium carbonate) CrCO_3 .

Properties: Grayish-blue amorphous mass; sp. gr. 2.75.

Soluble in mineral acids; slightly soluble in water containing carbon dioxide; insoluble in alcohol.

Hazard: Toxic by ingestion; irritant to skin and tissue.

Tolerance (as Cr), 0.5 mg per cubic meter in air.

chromous chloride (chromium chloride) CrCl_2 .

Properties: White, deliquescent needles; sp. gr. 2.878 (25°C); m.p. 824°C; active reducing agent; very soluble in water; insoluble in alcohol and ether.

Derivation: Reaction of the metal with anhydrous hydrogen chloride.

Hazard: Toxic. Tolerance (as Cr), 0.5 mg per cubic meter in air.

Uses: Reducing agent; oxygen absorbent.

chromous oxalate $\text{CrC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Yellow crystalline powder; sp. gr. 2.468; soluble in water; active reducing agent.

Hazard: Toxic by ingestion; irritant to skin and tissue.

Tolerance (as Cr), 0.5 mg per cubic meter in air.

"Chromoxane."³⁰⁷ Trademark of mordant dyestuffs. Used on wool; characterized by fairly good fastness to light, very good fastness to fulling, etc., and by relatively bright shade.

"Chromspun."²⁵⁶ Trademark for a solution-dyed acetate fiber.

chromyl chloride (chromium oxychloride; chlorochromic anhydride) CrO_2Cl_2 .

Properties: Mobile, dark-red liquid. B.p. 116°C; freeze-

ing point -96.5°C ; sp. gr. 1.911. Fumes in air; reacts vigorously with water to form chromic acid, chromic chloride, hydrochloric acid, and chlorine. Miscible with carbon tetrachloride, tetrachloroethane, carbon disulfide.

Derivation: By heating sodium dichromate and sodium chloride with sulfuric acid.

Grades: Technical.

Hazard: Toxic. Corrosive to tissue.

Uses: Organic oxidations and chlorinations; solvent for chromic anhydride; chromium complexes and dyes.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

chrysamine G $\text{C}_{26}\text{H}_{16}\text{N}_4\text{O}_6\text{Na}_2$.

Properties: Yellowish-brown powder. Very sparingly soluble in water.

Derivation: By coupling diazotized benzidine with salicylic acid.

Use: Yellow direct cotton dyestuff.

chrysanthemum monocarboxylic acid, ethyl ester

$(\text{CH}_3)_2\text{CCH}(\text{COOC}_2\text{H}_5)\text{CHCH}:\text{C}(\text{CH}_3)_2$.

Properties: Colorless to pale yellow, with pleasant ester odor; sp. gr. 0.924–0.927 ($25/25^{\circ}\text{C}$); insoluble in water; soluble in alcohols and ketones.

Containers: Tins; drums.

Hazard: May be toxic by ingestion.

Uses: Synthesis of perfumes, pharmaceuticals; insecticides; other organic chemicals.

See also cinerin I, pyrethrin I.

chrysarobin.

Properties: Microcrystalline orange-yellow powder; slight odor or odorless; tasteless. Soluble in chloroform and benzene; slightly soluble in ether and alcohol; very slightly soluble in water. Combustible.

Derivation: Extraction from araroba (goa powder) obtained from the Brazilian tree, *Andira araroba*.

Hazard: Irritating to eyes and mucous membranes.

Use: Medicine (external).

chrysazin. See 1,8-dihydroxyanthraquinone.

chrysene (1,2-benzphenanthrene) $\text{C}_{18}\text{H}_{12}$ (a tetracyclic hydrocarbon)

Properties: Crystals; sp. gr. 1.274 ($20/4^{\circ}\text{C}$); m.p. 254°C ; b.p. 448°C ; sublimes easily in a vacuum. Slightly soluble in alcohol, ether, glacial acetic acid. Insoluble in water.

Derivation: Distillation of coal tar.

Hazard: Carcinogenic agent. Tolerance, 0.2 mg per cubic meter in air.

Use: Organic synthesis.

chrysoidine (meta-diaminoazobenzene hydrochloride) $\text{C}_6\text{H}_5\text{NNC}_6\text{H}_3(\text{NH}_2)_2 \cdot \text{HCl}$.

Properties: Red-brown powder or large black shiny crystals with a green luster. Soluble in alcohol and water giving orange-brown solutions. Insoluble in ether; m.p. 117°C .

Uses: Orange dye for cotton and silk.

chrysolite. See olivine.

chrysophanic acid (1,8-dihydroxy-3-methylanthraquinone; chrysophanol) $\text{C}_{15}\text{H}_{10}\text{O}_4$.

Properties: Yellow crystals; m.p. 196°C ; sublimes. Slightly soluble in water and cold alcohol; soluble in hot alcohol, chloroform and ether.

Source: Rhubarb root, cascara sagrada, senna leaves, goa powder.

Derivation: Oxidation of chrysarobin and other synthetic methods.

Use: Medicine.

chrysotile. See asbestos.

chu. Abbreviation for centigrade heat unit. It is the amount of heat required to raise the temperature of one pound of water one centigrade degree from 15°C to 16°C . It is sometimes called a pcu (pound centigrade unit).

chymosin. See rennin.

chymotrypsin. An enzyme found in the intestine which catalyzes the hydrolysis of various proteins (especially casein) and protein digestion products to form polypeptides and amino acids.

Properties: White to yellowish-white, odorless, crystalline or amorphous powder. Soluble in water or saline solution.

Derivation: Crystallized from an extract of the pancreas gland of the ox.

Grade: N.F.

Use: Medicine.

chymotrypsinogen. A crystallizable enzyme occurring in the pancreas, which gives rise to chymotrypsin.

Use: Biochemical research.

ci. Abbreviation for curie (q.v.).

"Cibalan."⁴⁴³ Trademark for metal-complex dyes for wool and polyamide fibers.

"Cibanone."⁴⁴³ Trademark for anthraquinone vat dyes.

"Cibaphasol."⁴⁴³ Trademark for coacervate-forming colloidal product used in textile dyeing.

cigarette tar. The comparatively non-volatile residue from the burning of cigarette tobacco which appears in finely divided form in the smoke. Cigarette tar is known to contain minute traces of various aromatic ring compounds (especially benzo[a]pyrene) found in coal tar, some of which are known carcinogens (q.v.). Various forms of activated carbon are used in filters to adsorb the toxic components of the tars that find their way into the smoke. See also smoke (5).

ciguatoxin $\text{C}_{28}\text{H}_{42}\text{NO}_4\text{Cl}$. A complex toxic principle in bony fishes; has both fat- and water-soluble fractions. Ninhydrin test positive. It is a type of quaternary ammonium compound and one fraction is said to be an irreversible anticholinesterase. The pharmacology is unknown.

CIIT. Abbreviation for Chemical Industry Institute of Toxicology (q.v.).

"Cinaryl."²³³ Trademark for antimicrobial agents containing 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantan chloride.

cincholepidine. See lepidine.

cinchona bark. The bark of one of several species of *Cinchona* trees native to South America and cultivated in Indonesia, Peru, Ecuador, and western Africa. The best-known types are calisaya, loxa, and succirubra. It is used primarily as the source of natural quinine (q.v.), quinidine, (q.v.), cinchonidine, cinchonine, and related alkaloids formerly used as antimalarials (q.v.).

cinene. See dipentene.

cineol. See eucalyptol.

cinerin I $C_{20}H_{28}O_3$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemum monocarboxylic acid. See also cinerin II, pyrethrin I and II.

Properties: A viscous liquid, quickly oxidized in air; b.p. 200°C (0.1 mm). Insoluble in water; soluble in organic solvents; incompatible with alkalis.

Hazard: Toxic by ingestion.

Use: Household insecticide.

cinerin II $C_{21}H_{28}O_5$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemum dicarboxylic acid monomethyl ester. See also cinerin I, pyrethrin I and II.

Properties: A viscous liquid, quickly oxidized in air; b.p. 200°C (0.1 mm). Insoluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion.

Use: Household insecticide.

cinnabar (natural vermilion; liver ore) HgS . Natural mercuric sulfide, occurring in veins near recent volcanic rocks and hot springs.

Properties: Red, scarlet, reddish brown to blackish solid; streak scarlet; luster adamantine to dull earthy when impure; sp. gr. 8.10; hardness 2.5. Soluble in aqua regia. Has greater optical rotation than any other substance (+325°).

Occurrence: California, Nevada; Spain; Italy; Mexico; Yugoslavia.

Use: The only important ore of mercury.

cinnamaldehyde. See cinnamic aldehyde.

cinnamein. See benzyl cinnamate.

cinnamene. See styrene.

cinnamic acid (beta-phenylacrylic acid; 3-phenylpropenoic acid; cinnamyl acid) $C_6H_5CH:CHCOOH$.

Properties: White, crystalline scales; soluble in benzene, ether, acetone, glacial acetic acid, carbon disulfide, oils; insoluble in water. Congealing point 133°C (min); b.p. 300°C. Combustible.

Derivation: By heating benzaldehyde with sodium acetate in presence of a dehydrating agent (acetic anhydride) or by heating benzyl chloride with sodium acetate in an autoclave. Occurs naturally in tobacco and some balsams.

Grades: Technical; refined.

Containers: Glass bottles; cans; drums.

Uses: Medicine; perfumes; intermediate.

cinnamic alcohol (cinnamyl alcohol; phenylallylic alcohol; 3-phenyl-1-propen-1-ol; styryl carbinol) $C_6H_5CH:CHCH_2OH$.

Properties: White needles or crystals; hyacinth-like odor. Soluble in 3 volumes of 50% alcohol. Congealing point 33°C (min); (pure), as low as 24°C (tech.); b.p. 257°C. Combustible.

Derivation: (a) From oil of cassia or oil of cinnamon. Occurs as an ester. (b) Reduction of cinnamic aldehyde.

Method of purification: Recrystallization.

Grades: Technical; F.C.C.

Containers: 1-, 2-, 5-lb bottles; tin cans.

Uses: Perfumery, particularly for lilac and other floral scents; flavoring agent; soaps; cosmetics.

cinnamic aldehyde (cinnamaldehyde; 3-phenylpropenal; cinnamyl aldehyde) $C_6H_5CH:CHCHO$.

Properties: Yellowish oil; cinnamon odor, sweet taste. Thickens on exposure to air. Soluble in 5 volumes of 60% alcohol; very slightly soluble in water. Sp. gr.

1.048–1.052; refractive index 1.618–1.623; f.p. -8°C; b.p. 248°C. Combustible.

Derivation: (a) From Ceylon and Chinese cinnamon oils (b) By condensation of benzaldehyde and acetaldehyde.

Method of purification: Rectification.

Uses: Flavors; spice perfumes.

See also cassia oil.

cinnamic ether. Incorrect name for ethyl cinnamate.

cinnamon oil. See cassia oil.

cinnamoyl chloride (phenylacrylyl chloride) $C_6H_5CH:CHCOCl$.

Properties: Yellow crystals; m.p. 35°C; b.p. 170°C (58 mm); sp. gr. 1.1617 (45/4°C). Decomposes in water; soluble in hydrocarbons and esters.

Hazard: Skin irritant.

Use: Reagent for determination of water; chemical intermediate.

cinnamyl acetate $C_6H_5CH:CHCH_2OOCCH_3$.

Properties: Colorless liquid having a floral-spicy odor. Soluble in 4 volumes of 70% alcohol. Sp. gr. 1.048–1.052; refractive index 1.539–1.542. Combustible.

Uses: Perfumery (fixative); flavoring.

cinnamyl alcohol. See cinnamic alcohol.

cinnamyl aldehyde. See cinnamic aldehyde.

cinnamyl cinnamate (styracin) $C_9H_7O_2C_9H_9$.

Properties: Rectangular prismatic crystals; m.p. 40°C (min). Soluble in alcohol, ether, benzene.

Derivation: Esterification of cinnamic acid with cinnamic alcohol.

Use: Perfumery; flavoring.

cinnamyllic acid. See cinnamic acid.

"Ciodrin"¹²⁵ Trademark for dimethyl phosphate of alpha-methylbenzyl 3-hydroxy-cis-crotonate.

$(CH_3O)_2P(O)OC(CH_3):CHC(O)OCH(CH_3)C_6H_5$.

Properties: Light straw liquid with a mild ester odor; b.p. 275°F (0.03 mm). Miscible with xylene; soluble in ethanol, or acetone; slightly soluble in kerosene and water.

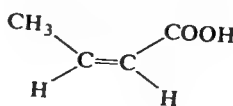

Hazard: Toxic by ingestion, inhalation, and skin absorption.

Use: Insecticide for external parasites on livestock.

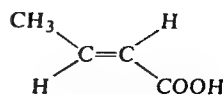

CIPC. See chloro-IPC.

"Circosol."⁴⁹⁴ Trademark for various grades of naphthenic oils which provide overall balance of non-staining and processing properties for most polymers. Aid processing and breakdown of rubber or polymer.

cis- (Latin, on this side). A prefix used in designating geometrical isomers in which there is a double bond between two carbon atoms. This prevents free rotation and thus two different spacial arrangements of substituent groups or atoms are possible. When a given atom or radical is positioned on one side of the carbon axis or backbone, the isomer is called *cis*; when it is in the opposite location relative to the carbon axis, the isomer is called *trans* (Latin, on the other side). This is indicated in the following formulas:

cis

trans

This is often called *cis-trans* isomerism. These prefixes are disregarded in alphabetizing chemical names.

"Cisdene."⁴⁵⁴ Trademark for a polybutadiene rubber.

citraconic acid (methylmaleic acid)

Properties: Hygroscopic colorless crystals. M.p. 91°C (dec); sp. gr. 1.62. Soluble in water, alcohol, ether; insoluble in benzene and naphtha. Low toxicity.

Derivation: By carefully heating citric acid.

Grades: Technical; C.P.

citraconic anhydride (methylmaleic anhydride) $\text{C}_5\text{H}_4\text{O}_3$.

Properties: Colorless liquid. M.p. 7–8°C; b.p. 213–214°C; sp. gr. 1.25 (15/4°C). Soluble in ether. Low toxicity.

Grades: Reagent.

Containers: Sealed tubules.

Uses: Reagent for alkalies, alcohols, and amines.

citral (geranial; geranialdehyde; 3,7-dimethyl-2,6-octadienal) $(\text{CH}_3)_2\text{CCHC}_2\text{H}_4\text{C}(\text{CH}_3)\text{CHCHO}$. Commercial material is a mixture of alpha and beta isomers.

Properties: Mobile pale yellow liquid; strong lemon odor; sp. gr. 0.891–0.897 (15°C); refractive index 1.4860–1.4900 (20°C); not optically active. Soluble in 5 volumes of 60% alcohol; soluble in all proportions of benzyl benzoate, diethyl phthalate, glycerin, propylene glycol, mineral oil, fixed oils, and 95% alcohol; insoluble in water. Combustible; nontoxic.

Derivation: Principal constituent of lemon grass oil and can be isolated by fractional distillation. Obtained synthetically by oxidation of geraniol, nerol, or linalool by chromic acid.

Grades: Technical; pure; F.C.C.

Containers: Glass bottles; tins; (synthetic) drums.

Uses: Perfumes; flavoring agent; intermediate for other fragrances.

citric acid (2-hydroxy-1,2,3-propanetricarboxylic acid) $\text{HOOCCH}_2\text{C}(\text{OH})(\text{COOH})\text{CH}_2\text{COOH} \cdot \text{H}_2\text{O}$.

Properties: Colorless translucent crystals or powder; odorless; strongly acid taste; hydrated form is efflorescent in dry air. Sp. gr. 1.542; m.p. 153°C (anhydrous form); decomposes before boiling. Very soluble in water and alcohol; soluble in ether. Combustible. Nontoxic.

Occurrence: In living cells, both animal and plant. See TCA cycle.

Derivation: By mold fermentation of carbohydrates, including deep fermentation; from lemon, lime, pineapple juice, molasses.

Grades: Both hydrous (hydrated) and anhydrous; technical; C.P.; U.S.P.; F.C.C.

Containers: Various, including bags, cartons, barrels, drums.

Uses: Preparation of citrates, flavoring extracts, confections, soft drinks, effervescent salts; acidifier; dispersing agent; medicines; antioxidant in foods (for details see regulations of Meat Inspection Division of USDA); sequestering agent; water-conditioning agent and detergent builder; cleaning and polishing stainless steel and other metals; alkyd resins; mordant; removal of sulfur dioxide from smelter waste gases; abscission of citrus fruit in harvesting; cultured dairy products.

citric acid cycle. See TCA cycle.

citrinin $\text{C}_{11}\text{H}_{14}\text{O}_6$. An antibiotic yellow pigment produced by *Penicillium citrinum* Thom and *Aspergillus*

niveus; m.p. 170–171°C (decomposes). Yellow crystals; insoluble in water; soluble in alcohol, dioxane, dilute alkali solutions.

"Citroflex."²⁹⁹ Trademark for a series of organic citrates.

"Citronel 'B' and 'C'."¹⁸⁸ Trademark for lemon oil substitutes for technical use.

citronellal $\text{C}_9\text{H}_{17}\text{CHO}$. 3,7-Dimethyloct-6(or 7)-enal.

Has both *d*- and *l*-isomers. The *d*-isomer is described. Properties: Colorless liquid; intense lemon-like odor; sp. gr. 0.847–0.850; optical rotation +8° to +11°; b.p. 205°C; refractive index (n_D 20/D) 1.4566. Slightly soluble in water; soluble in alcohol and ether. Combustible; nontoxic.

Derivation: From lemon grass, citronella oil and other oils.

Containers: Bottles; drums.

Uses: Soap perfumery; manufacture of hydroxycitronellal; flavoring.

citronellal hydrate. See hydroxycitronellal.

citronella oil.

Properties: Light yellowish essential oil, with rather pungent, citrus-like odor. Soluble in 80% alcohol. Sp. gr. 0.887–0.906; refractive index 1.468–1.483; solutions are levorotatory. Combustible.

Derivation: Steam-distilled from the grass of *Cymbopogon nardus*.

Constituents: Geraniol 60%, citronellol 15%, camphene and dipentene 15%; also linalool and borneol.

Grades: Ceylon; Java; Taiwan.

Containers: Tins; glass bottles; drums.

Hazard: Moderately toxic.

Uses: Medicine; insect repellent; perfumes for soaps and disinfectants; manufacture of citronellal, geraniol; denaturant for alcohol; pesticide, but may not be used on food crops.

citronellol (3,7-dimethyl-6(or 7)-octen-1-ol)

$\text{CH}_2\text{:C}(\text{CH}_3)(\text{CH}_2)_3\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{OH}$, the 7-octene form, which predominates. See also rhodinol.

Properties: Colorless liquid, having a somewhat rosy odor; sp. gr. 0.849–0.859; refractive index 1.456–1.458; optical rotation –1°30' to +5°; b.p. 244°C (760 mm). Soluble in two or more volumes of 70% alcohol; soluble in most oils. Combustible; low toxicity.

Occurrence: Citronella, geranium, rose, savin and other essential oils.

Derivation: From the oils above, or by reduction of citronellal or geraniol.

Containers: Bottles; drums.

Use: Perfumery (floral odors, mainly rose types); flavoring.

citronellyl acetate $\text{C}_{10}\text{H}_{19}\text{OOCCH}_3$.

Properties: Colorless liquid. Odor somewhat like that of bergamot oil. Sp. gr. 0.884–0.891; b.p. 119–121°C (15 mm); optical rotation usually slightly dextro, up to +1°; refractive index 1.450–1.452. Soluble in 9 volumes of 70% alcohol. Combustible; low toxicity. Derivation: Action of acetic anhydride upon citronellol.

Uses: Perfumery; flavoring.

citronellyl acetic ether. Incorrect name for citronellyl acetate.

citronellyl formate $\text{C}_{10}\text{H}_{19}\text{OOCH}$.

Properties: Colorless liquid; floral odor. Sp. gr. 0.890–

0.903 (25/25°C); refractive index 1.4430–1.4490 (20°C). One volume dissolves in 3 volumes 80% alcohol; soluble in most oils. Combustible; low toxicity. Grade: F.C.C.
Use: Flavoring.

citron yellow. See zinc yellow.

citrovorum factor. See folic acid.

citrulline $\text{NH}_2\text{CONH}(\text{CH}_2)_3\text{CHNH}_2\text{COOH}$. An arginine derivative; an amino acid found in watermelon juice in the L(+) form.

Properties: Crystals from methanol-water mixture; m.p. 222°C; soluble in water; insoluble in methanol and ethanol.

Use: Biochemical research.

citrus peel oils. Edible oils expressed from the peel or rind of grapefruit, lemon, lime, orange, and tangerine. Properties: Color, odor, and taste characteristic of source. Sp. gr. 0.84–0.89; refractive index 1.473–1.478; optically active; unsaponifiable. Soluble in alcohol, vegetable oils, mineral oil; orange and lemon are soluble in glacial acetic acid. Combustible. Nontoxic.

Constituents: Limonene, citral, and terpenes in varying percentages.

Containers: Cans, drums.

Uses: Flavoring agents in desserts, soft drinks, ice cream; odorants in perfumery and cosmetics; furniture polish (lemon oil).

Note: Terpene-free grades are available at much higher concentrations (from 15–30 times) than original oil. These grades have much lower optical rotation and less tendency to spoil on storage, since terpenes tend to oxidize to undesirable components such as carvone and *p*-cymene. See terpeneless oil.

citrus seed oils. Edible oils expressed from seeds of grapefruit, orange, lemon, lime, and tangerine reclaimed from cannery processing.

Properties: Nondrying; odor, color, and taste characteristic of source; bitter taste removed by alkali refining. Sp. gr. 0.91–0.92; saponification value 190–195; iodine no. 100–110; optically inactive; combustible. Nontoxic. May be bleached, deodorized or hydrogenated.

Constituents: Chiefly palmitic, oleic, and linoleic acids.

Containers: Cans, drums, tank cars.

Uses: Flavoring; food products; cosmetics; odorants in special soaps.

civet (zibeth).

Derivation: Unctuous secretion from the civet cat. An artificial type is also available.

Habitat: Malacca Islands; Ethiopia; East Indies.

Properties: Yellow to brown. Semi-solid. Strong unpleasant odor. Soluble in hot alcohol and ether; insoluble in water.

Containers: Bottles.

Use: Perfumery (fixative); cosmetics, to provide animal note which has become popular.

civettal. See 1,2,3,4-tetrahydro-6-methylquinoline.

Cl Symbol for chlorine; the molecular formula is Cl_2 .

"Cladkote."⁴¹ Trademark for a modified polyester composite of resins and siliceous reinforcing material which cures to a tough, chemical-resistant topping; suggested for use in food plants under acid conditions.

cladding. The process in which two metals are bonded by being rolled together at suitable pressure and temperature. Controlled explosion is also used. At

the interface each metal diffuses sufficiently into the other to form an alloy. Cladding is generally from 5 to 20% of total thickness, but may be heavier, depending on the properties desired. The base metal is usually carbon or low-alloy steel clad with stainless steel, nickel, or other protective metal. Nonferrous metals are also clad; copper clad with cupronickel is used for coinage.

"Clalite."¹⁵⁹ Trademark for a buffered sodium hydro-sulfite used to improve whiteness of coating clay in paper industry.

Clapeyron equation. The equation $dp/dT = \Delta H/T\Delta V$, derived from thermodynamics. It states that the change of vapor pressure of a liquid (expressed in ergs) with absolute temperature (°K) equals the heat of vaporization (in calories) per gram divided by the product of the absolute temperature and the increase in volume (*V*, in cubic centimeters when a specified quantity (a gram) of the liquid changes to vapor. Other consistent units may be used. The approximate Clapeyron equation $d \ln p/dT = \Delta H/RT^2$, expresses the same relation in a less exact form because in its derivation, it is assumed that ΔV is equal to the volume of vapor. This assumption (that the volume of liquid is negligibly small) is usually true within a few percent under ordinary conditions of temperature and pressure.

"Clarase."²¹² Trademark for a fungal alpha-amylase with strong liquefying and dextrinogenic activity together with considerable saccharogenic action.

Uses: Fruit juices and pectin; chocolate syrup; brewing.

"Claricol."³⁵⁴ Trademark for a crystal inhibitor and winterizing aid for edible and non-edible oils.

"Clarolite."⁴⁷¹ Trademark for a series of active clays used for bleaching of oils and removal of color bodies.

clary sage oil. See sage oil, clary.

classification. In chemical engineering parlance, the mechanical process of separating subdivided solids (crushed stone, cement, mineral aggregate, and the like) into two (or more) "classes," each containing a specific size range. The latter may vary from an inch or more in diameter to powders of considerable fineness. Customary classifying equipment includes so-called grizzlies, perforated metal and vibrating screens, sifters, sieves, and similar devices. A magnetic separator is often used in conjunction with the screen to remove tramp metal. A similar method is used in the food industry for size grading of certain fruits and vegetables, e.g., peas, berries, etc.

clathrate compound. An inclusion complex in which molecules of one substance are completely enclosed within the other, as argon within hydroquinone crystals. Urea adducts are inclusion complexes of the channel or canal type. In these, the complexing urea crystals wrap around the molecule of the other substance, usually a straight-chain unbranched aliphatic hydrocarbon. Similar complexes are formed with thiourea. See also inclusion complex.

Claude system. A process for the production of liquid air in which the compressed gas is made to perform work in an expansion engine and thus cool itself.

clay. A hydrated aluminum silicate. Generalized formula $\text{Al}_2\text{O}_3\text{SiO}_2 \cdot x\text{H}_2\text{O}$. Component of soils in varying percentages.

Properties: Fine, irregularly shaped crystals ranging from 150 microns to less than 1 micron (colloidal); color, reddish-brown to pale buff, depending on iron oxide content; sp. gr. about 2.50; insoluble in water

and organic solvents; odorless; absorbs water to form a plastic, moldable mass and in some cases forms a thixotropic gel (bentonite); refractory material; strong ion-exchange capability, important in soil chemistry and construction engineering. Nontoxic.

Derivation: Weathering of rocks.

Occurrence: Southeastern U.S.; Wyoming, Texas, Canada; England; France; U.S.S.R.

Types: Kaolinite, montmorillonite, attapulgite, illite, bentonite, halloysite.

Grades: Natural; refined; air-floated.

Containers: Multi-wall paper bags; tank cars.

Hazard: Dusts may be irritant to nose and throat; suspensions of dust are a fire hazard.

Uses: Ceramic products; refractories; colloidal suspensions; oil-well drilling fluids; filler for rubber and plastic products; films; paper coating; decolorizing oils; temporary molds; filtration; carrier in insecticidal sprays; catalyst support.

See also fullers earth, bentonite, ceramic, refractory, kaolin, slip clay; polyorganosilicate graft polymer.

cleaning agents, chemical. See detergent; solvent; trichloroethylene; abrasive.

"Clearate."⁴⁸ Trademark for a high grade soya lecithin. Used in foods, inks, cosmetics and paints.

cleave. (1) Of a crystal, to break or separate along definite planes defined by the crystal structure; it may cleave in one direction, as in mica, or in several.

(2) Of an alkene molecule, to divide into two compounds (aldehydes or ketones) at the double bond; this is usually done by ozone, followed by hydrolysis in the presence of powdered zinc.

Cleland's reagent. See dithiothreitol.

Cleveland Open Cup. See COC.

Cleve's acid. See 1-naphthylamine-6-sulfonic acid; or 1-naphthylamine-7-sulfonic acid; known also as Cleve's 1,6 acid and Cleve's 1,7 acid, respectively.

cliffstone Paris white. A special grade of whiting (q.v.) made from a hard grade of English chalk.

"Climelt."⁵⁶ Trademark for arc-cast molybdenum and tungsten metals and their respective alloys.

clinical chemistry. A subdivision of chemistry that deals with the behavior and composition of all types of body fluids, including the blood, urine, perspiration, glandular secretions, etc. It involves analysis and testing of these for content of numerous metabolic constituents as well as foreign materials; thus it also includes toxicological factors.

clinoptilolite. A natural inorganic zeolite (q.v.) used as a selective ion-exchange medium for removal of ammonia from plant waste water.

"Clopane Hydrochloride."¹⁰⁰ Trademark for cyclopentamine hydrochloride.

"Clorafin."²⁶⁶ Trademark for a series of chlorinated nonflammable paraffins. Used as plasticizers and lubricant additives.

"Cloran."³⁰⁵ Trademark for a reactive difunctional chlorinated carboxylic acid anhydride.

Uses: Reactive intermediate to produce flame retardant polymers.

chlorophene (USAN). See ortho-benzyl-para-chlorophenol.

"Clor-Tabs."²⁰⁴ Trademark for 70% available chlorine in tablet form.

cloud point. In petroleum technology, the temperature at which a waxy solid material appears as a diesel fuel is cooled. This material is harmful to engine performance.

clove oil (caryophyllus oil).

Properties: Pale-yellow liquid; darkens and thickens with age and exposure; strong aromatic odor; pungent and spicy taste. Soluble in ether and chloroform; soluble in 1 to 2 vols. and more of 70% alcohol; fresh, so-called extra-light oils in 2.5 to 3 vols. of 60% alcohol. Sp. gr. 1.038-1.060; b.p. 250-260°C; refractive index 1.5270-1.5350; optical rotation to -1° 10'. Nontoxic.

Derivation: Distilled from cloves, the unexpanded flowers of *Eugenia aromatica* (*Eugenia caryophyllata*).

Method of purification: Rectification.

Grades: Technical; U.S.P.; F.C.C.

Containers: Drums.

Uses: Medicine (local); flavoring; dentistry; perfumery; confectionery; soaps.

Cm Symbol for curium.

"CM."²⁸ Trademark for a flame-retardent composition based on ammonium sulfamate and modified to prevent afterglow and to improve penetration.

Properties: Fine, white granules; soluble in water; insoluble in dry cleaning solvents.

Uses: Treatment of fabrics, paper, paper products, and other cellulosic materials.

CMC. See carboxymethylcellulose.

CM-cellulose. Abbreviation for carboxymethylcellulose, used especially by biochemists.

CMHEC. Abbreviation for carboxymethyl hydroxyethyl cellulose.

CMP. Abbreviation for cytidine monophosphate. See cytidylic acid.

CMPP. Abbreviation for 2-(4-chloro-2-methylphenoxyl) propionic acid. See mecoprop.

CMRA. Abbreviation for Chemical Marketing Research Association (q.v.).

CMU. Abbreviation for chlorophenyldimethylurea. See monuron.

CNS. Abbreviation for central nervous system (as applied to the action of certain drugs).

Co Symbol for cobalt.

coacervation. An important equilibrium state of colloidal or macromolecular systems. It may be defined as the partial miscibility of two or more optically isotropic liquids, at least one of which is in the colloidal state. For example, gum arabic shows the phenomenon of coacervation when mixed with gelatin.

coagulant. A substance that induces coagulation (q.v.). Coagulants are used in precipitating solids or semisolids from solution, as casein from milk, rubber particles from latex, or impurities from water. Compounds that dissociate into strongly charged ions are normally used for this purpose. The blood contains the natural coagulant thrombin.

"Coagulant Aid."¹⁰⁸ Trademark for a series of polyelectrolytes and combinations of polyelectrolytes with other materials.

Uses: Clarification of water for municipal and industrial uses.

coagulation. Irreversible combination or aggregation of semisolid particles such as fats or proteins to form a clot or mass. This can often be brought about by addition of appropriate electrolytes, for example, by the addition of an acid to milk or of aluminum sulfate to turbid water. Mechanical agitation and removal of stabilizing ions, as in dialysis, also cause coagulation. The clotting of blood by thrombin (q.v.), the coagulation of rubber particles in latex by acetic acid and of egg-white by heat are additional instances. See also flocculation.

Coahran process. Recovery of acetic acid from pyro-ligneous acid by extracting with ether. It is an improved version of the Brewster process (q.v.), but is basically the same.

coal. A natural solid combustible material consisting chiefly of amorphous elemental carbon with low percentages of hydrocarbons, complex organic compounds and inorganic materials. Coal was formed from prehistoric plant life and occurs in layers or veins in sedimentary rocks. It is far more plentiful in the U.S. than petroleum and is an important source of heat and energy; its use as a fuel is increasing. In the U.S. it occurs chiefly in West Virginia and Kentucky, as well as in Wyoming and other western states. Much of it is too high in sulfur content to meet present pollution standards.

Coal is classified according to its heating value, expressed in Btu/lb, and its fixed carbon content.

	Fixed Carbon	Btu/lb
Anthracite	86-98%	13,500-15,600
Low to Medium Volatile Bituminous	69-86%	14,500-15,600
High Volatile Bituminous	46-69%	11,000-15,000
Subbituminous	46-60%	8,300-13,000
Lignite	46-60%	5,500-8,300

Coal is most frequently specified in terms of its proximate analysis, giving the percentages of moisture, volatile combustible matter, fixed carbon, and ash. An ultimate analysis gives the percentages of the various elements present (C, H, O, N, and S).

Coal is also an important source of chemical raw materials: pyrolysis (destructive distillation) yields coal tar and hydrocarbon gases, which can be upgraded by hydrogenation or methanation to synthetic crude oil and fuel gas, respectively; catalytic hydrogenation yields hydrocarbon oils and gasoline; gasification produces carbon monoxide and hydrogen (synthesis gas) from which ammonia and other products can be made. Numerous processes for adapting these reactions to large-scale production of fuel oil and gasoline are in the pilot-plant stage, though none has yet been commercially developed. Methane is being produced from coal mines on a commercial scale.

See also gasification; hydrogenolysis; hydrosolvation. *Note:* Pending the further development of alternative energy sources, coal is probably the safest and most abundant fuel available in the U.S. A large percentage can be obtained by surface or strip mining, though the necessary restoration of the environment (soil and plant life) is expensive. Improvements in safety are needed in order to realize full and safe production from deep mines.

coal gas (bench gas; coke-oven gas). A mixture of gases produced by the destructive distillation of bituminous coal in highly heated fire-clay or silica retorts or in by-product coke ovens.

Hazard: Flammable; highly toxic.

Uses: Directly in open hearth furnaces.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

coalescence. The union of two or more droplets of a liquid to form a larger droplet, brought about when the droplets approach one another closely enough to overcome their individual surface tensions. The combination of fine mercury droplets is an example. Coalescing agents are used to remove solid contaminants from hydrocarbons; coalescence may also be brought about by mechanical means in centrifuges.

coal, gasification. See gasification.

coal, hydrogenation. See hydrogenolysis; gasification.

coal oil. The crude oil obtained by the destructive distillation of bituminous coal; or the distillate obtained from this oil.

Hazard: Flammable, moderate fire risk.

coal tar.

Properties: Black, viscous liquid (or semi-solid), naphthalene-like odor; sharp burning taste; obtained by destructive distillation of bituminous coal, as in cokeovens; one ton of coal yields 8.8 gallons of coal tar. Combustible. Sp. gr. 1.18 to 1.23 (60/60°F). Soluble in ether, benzene, carbon disulfide, chloroform; partially soluble in alcohol, acetone, methanol, and benzene; only slightly soluble in water.

Coal tar may be hydrogenated under pressure to form a petroleum-like fuel suitable for residual use.

Coal-tar fractions obtained by distillation and the chemicals found in each are as follows: (1) light oil (up to 200°C); benzene, toluene, xylenes, cumenes, coumarone, indene; (2) middle oil (200-250°C) and (3) heavy oil (250-300°C): naphthalene, acenaphthene, methylnaphthalenes, fluorene, phenol, cresols, pyridine, picolines; (4) anthracene oil (300-350°C): phenanthrene, anthracene, carbazole, quinolines; and (5) pitch (q.v.). Typical yields: 5% light oil; 17% middle oil; 7% heavy oil; 9% anthracene oil; 62% pitch. Treatment with alkalis, acids, and solvents is necessary to separate the individual chemicals.

Grades: Crude, refined; U.S.P.

Containers: Tank cars; barrels.

Hazard: Toxic by inhalation.

Uses: Raw material for plastics, solvents, dyes, drugs, and other organic chemicals. The crude or refined product or fractions thereof are also used for waterproofing, paints, pipecoating, roads, roofing, insulation, as pesticides and sealants, and in medicine.

coal-tar distillate. The lighter fractions of coal tar. The terms coal tar light oil, coal tar naphtha, and coal tar oil are loosely defined and are sometimes regarded as synonymous.

Hazard: Flammable, dangerous fire risk. Toxic by inhalation and skin absorption.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also entries under naphtha.

coal-tar dye. A dye produced from the coal-tar hydrocarbons or their derivatives such as benzene, toluene, xylene, naphthalene, anthracene, aniline, etc. See also dye, synthetic.

Shipping regulations: (Air) Coal-tar dye, liquid, n.o.s., Corrosive label.

coal-tar light oil. See coal-tar distillate and light oil.

coal-tar naphtha. See coal-tar distillate and naphtha, solvent.

coal-tar oil. See coal-tar distillate.

coal-tar pitch. Dark brown to black amorphous residue left after coal tar is redistilled. It is composed almost entirely of polynuclear aromatic compounds and constitutes 48–65% of the usual grades of coal tar. Different grades have different softening points: roofing pitch softens at 65°C, electrode pitch at 110–115°C. Combustible.

Hazard: Volatile components (anthracene, phenanthrene, acridine) are carcinogenic agents. Tolerance, 0.2 mg per cubic meter in air.

Uses: Binder for carbon electrodes; base for paints and coatings; impregnation of fiber pipe for electrical conduits and drainage; foundry core compounds; briquetting coal; tar-bonded refractory brick; paving and roofing; plasticizers for elastomers and polymers; extenders; saturants; impregnants; sealants.

coating. A film or thin layer applied to a base material called a substrate. The coatings most commonly used in industry are metals, alloys, resin solutions, and solid/liquid suspensions on various substrates (metals, plastics, wood, paper, leather, etc.). They may be applied by electrolysis, vapor deposition, vacuum, or mechanical means such as brushing, spraying, calendering, and roller coating. Products such as cables and power cord are coated by extrusion.

A comparatively recent development in coatings technology involves the production in powder form of such thermosetting resins as acrylics, epoxies, and polyesters appropriately compounded; these are applied to auto bodies, machinery, and other industrial products by electrostatic spraying techniques. This process is claimed to minimize the pollution problems and waste encountered with solvent-based sprayed coatings.

See also protective coating; film; paint; vacuum deposition.

"Coat" Series.²³⁶ Trademark for a series of corrosion inhibitors that have the ability to attach themselves to the metal surface of oil production equipment. Selected polar organic salts, they are specially formulated to have the degree of oil solubility, water dispersibility and wetting needed for corrosion protection.

cobalamin (vitamin B₁₂). The antipernicious anemia vitamin. All vitamin B₁₂ compounds contain the cobalt atom in its trivalent state. There are at least three active forms: cyanocobalamin, hydroxocobalamin, nitrocobalamin (q.v.). Vitamin B₁₂ is a component of a coenzyme which takes part in the shift of carboxyl groups within molecules. As such it has an influence on nucleic acid synthesis, fat metabolism, conversion of carbohydrate to fat, and metabolism of glycine, serine, methionine and choline.

Source: Food source: Liver, eggs, milk, meats, and fish. Commercial source: Produced by microbial action on various nutrients (spent antibiotic liquors, sugar beet molasses, whey, etc.).

Uses: Medicine (blood and nerve treatment); nutrition; animal feed supplements.

cobalt Co Metallic element of atomic number 27, group VIII of the Periodic Table. Atomic weight

58.9332. Valences 2,3; no stable isotopes; there are several artificial radioactive isotopes, the most important being Co-60.

Properties: Steel-gray, shining, hard, ductile, somewhat malleable metal; ferromagnetic, with permeability two-thirds that of iron; has exceptional magnetic properties in alloys. Sp. gr. 8.9; m.p. 1943°C; b.p. 3100°C. Attacked by dilute hydrochloric and sulfuric acids; soluble in nitric acid. Corrodes readily in air. Hardness: cast, 124 Brinell; electrodeposited, 300 Brinell. An important trace element in soils and necessary for animal nutrition. Cobalt has unusual coordinating properties, especially the trivalent ion (coordination number 6). Noncombustible except as powder. Low toxicity.

Occurrence: Principal ores are smaltite, cobaltite, chloanthite, linnaeite. (Canada; Congo; Rhodesia; North Africa).

Derivation: From ore concentrates by roasting followed (a) by thermal reduction by aluminum, or (b) by electrolytic reduction of solutions of metal; (c) by leaching, with either ammonia or acid in an autoclave under elevated temperatures and pressures and subsequent reduction by hydrogen.

Forms available: Rondels (1 in. × ¾ in.); shot; anodes; 150 and finer mesh powder, to 99.6% purity; ductile strips (95% cobalt, 5% iron) and high purity strips, 99.9% pure; single crystals.

Containers: 500-lb kegs; drums.

Hazard: Dust is flammable and toxic by inhalation. Tolerance, 0.1 milligram per cubic meter of air.

Uses: Chemical (cobalt salts, oxidizing agent); electroplating; ceramics; lamp filaments; catalyst (sulfur removal from petroleum, Oxo process, organic synthesis); trace element in fertilizers; glass; drier in printing inks, paints and varnishes; colors; cermets. Principal use in alloys, especially cobalt steels for permanent and soft magnets and cobalt-chromium high-speed tool steels; cemented carbides; jet engines; coordination and complexing agent (see cobaltamine).

cobalt 57. Radioactive cobalt of mass number 57.

Properties: Half-life 267 days; radiation, gamma and K x-ray.

Derivation: Bombardment of a nickel target with protons.

Forms available: Cobaltous chloride in hydrochloric acid solution; cyanocobalamin cobalt-57 solution (U.S.P.).

Hazard: Radioactive poison.

Use: Medicine (diagnostic aid).

Shipping regulations: (Rail, Air) Consult regulations.

cobalt 58. Radioactive cobalt of mass number 58.

Properties: Half-life 72 days; radiation: positron, gamma, K x-ray.

Derivation: Bombardment of nickel 58 with neutrons.

Forms available: Cobaltous chloride in hydrochloric acid solution.

Hazard: Radioactive poison.

Use: Biological and medical research.

Shipping regulations: (Rail, Air) Consult regulations.

cobalt 60. Radioactive cobalt of mass number 60.

One of the most common radioisotopes.

Properties: Half-life 5.3 years; radiation, beta and gamma. Radiocobalt is available in larger quantities and is cheaper than radium.

Derivation: Pile irradiation of cobalt oxide, Co₂O₃, or of cobalt metal.

Forms available: Cobalt metal pellets or wire needles; cobaltous chloride in hydrochloric acid solution; solid cobaltic oxides; labeled compounds such as cyanocobalamin (U.S.P.).

Hazard: Radioactive poison.

Uses: Radiation therapy (cancer); radiographic testing of welds and castings; as a source of ions in gas-discharge devices; irradiation of meats; as the radiation source in liquid-level gages; for locating buried telephone and electrical conduits; portable radiation units; gamma irradiation for wheat and potatoes; as a research aid in studying the permeability of porous media to flow of oil, wearing quality of floor wax, oil consumption in internal combustion engines, wool dyeing, etc.

Shipping regulations: (Rail, Air) Consult regulations.

cobalt acetate. See cobaltous acetate.

cobaltamine. A coordination or complexing compound containing the group $[\text{Co}(\text{NH}_3)_6]^{3+}$ or its derivatives in which some of the ammonia has been replaced by other groups or ions. The names hexammine, pentammine, etc., are used to indicate the number of ammonia groups present in any case. Prepared by adding excess ammonia to a cobaltous salt, exposing to air so that oxygen is absorbed and boiling to oxidize the cobalt.

These compounds show none of the ordinary properties of cobalt. Different types of salts with various acid radicals are known. The ammonia in the amines may be replaced, molecule for molecule, by other nitrogen compounds such as hydroxylamine or ethylene diamine; by water; by ions such as hydroxyl, chloride, nitrate, etc.; or by groups such as nitro (NO_2). See coordination compound.

cobalt ammonium sulfate. See cobaltous ammonium sulfate.

cobalt arsenate. See cobaltous arsenate.

cobalt black. See cobaltic oxide.

cobalt bloom. See erythrite 2.

cobalt blue (Thenard's blue; cobalt ultramarine; azure blue).

Properties: Blue to green pigment of variable composition, consisting essentially of mixtures of cobalt oxide and alumina, approximating cobaltous aluminate, $\text{Co}(\text{AlO}_2)_2$. Cobalt blue is said to be the most durable of all blue pigments, being resistant to both weathering and chemicals.

Derivation: By heating alumina with (a) cobaltous oxide, or a material yielding this oxide on calcination; (b) cobalt phosphate; (c) cobalt arsenate. Greenish shades may be made by incorporating zinc oxide.

Grades: Technical (called genuine, to distinguish it from the imitation, which is ultramarine blue).

Containers: 250-lb barrels.

Uses: Pigments in oil or water; cosmetics (eyeshadows, grease paints).

cobalt bromide. See cobaltous bromide.

cobalt carbonate. See cobaltous carbonate, basic.

cobalt carbonyl. See cobalt tetracarbonyl.

cobalt chloride. See cobaltous chloride.

cobalt chromate. See cobaltous chromate.

cobalt chromate, basic. See cobaltous chromate.

cobalt difluoride. See cobaltous fluoride.

cobalt 2-ethylhexoate (cobalt octoate). Probably the cobaltous salt of 2-ethylhexoic acid, $\text{C}_8\text{H}_{17}\text{CH}(\text{C}_2\text{H}_5)\text{COOH}$.

Properties: Blue liquid, sp. gr. 1.013 (25°C).

Uses: Paint drier; whitener; catalyst.

cobalt-gold alloy. Made by a vapor deposition technique into magnetic films. Compositions range from 25-60% gold.

cobalt hydrate. See cobaltic hydroxide and cobaltous hydroxide.

cobalt hydroxide. See cobaltic hydroxide and cobaltous hydroxide.

cobaltic acetylacetonate $\text{Co}[\text{CH}_3\text{COCH}(\text{CH}_3)\text{O}]_3$.

Properties: Dark green or black crystals; sp. gr. 1.43; m.p. 241°C.

Derivation: Reaction of cobaltous carbonate with acetylacetonone and peroxide.

Use: Vapor plating of cobalt.

cobaltic boride CoB .

Properties: Crystalline prisms; sp. gr. 7.25 (18°C); m.p. > 1400°C. Decomposes in water; soluble in nitric acid.

Use: Ceramics.

cobaltic fluoride. See cobalt trifluoride.

cobaltic hydroxide (cobalt hydroxide; cobalt hydrate) $\text{Co}(\text{OH})_3$, actually considered to be $\text{Co}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Dark-brown powder; soluble in cold concentrated acids; insoluble in water and alcohol. Sp. gr. 4.46. Loses water at 100°C.

Derivation: Addition of sodium hydroxide to a solution of a cobaltic salt; action of chlorine on a suspension of cobaltous hydroxide; action of sodium hypochlorite on a cobaltous salt.

Use: Cobalt salts.

cobaltic oxide (cobalt oxide; cobalt black) Co_2O_3 . Sometimes incorrectly called cobalt peroxide.

Properties: Steel-gray or black powder. Soluble in concentrated acids; insoluble in water. Sp. gr. 4.81-5.60; m.p., decomposes at 895°C.

Derivation: By heating cobalt compounds at low temperature with excess of air.

Uses: Pigment; coloring enamels; glazing pottery.

cobalt iodide. See cobaltous iodide.

cobaltite (cobalt glance) CoAsS . Silver-white to gray mineral; metallic luster. Contains 35.5% cobalt. Sp. gr. 6-6.3; Mohs hardness 5.5.

Occurrence: Canada; Congo; Sweden.

Hazard: Dust or powder toxic when inhaled.

Use: An important cobalt ore; ceramics.

cobalt linoleate. See cobaltous linoleate.

cobalt molybdate. A molybdenum catalyst (a gray-green powder) used in petroleum technology, in reforming and desulfurization.

cobalt monoxide. See cobaltous oxide.

cobalt naphthenate. See cobaltous naphthenate.

cobalt neodecanoate. Deep blue paste containing 12% cobalt. Used as a drying additive for printing inks.

cobalt nitrate. See cobaltous nitrate.

cobaltocene (dicyclopentadienylcobalt) $(\text{C}_5\text{H}_5)_2\text{Co}$. A metallocene (q.v.).

Properties: Purple crystals; m.p. 172-173°C; soluble in hydrocarbons, highly reactive compound which is readily oxidized by air, water and dilute acids.

Containers: Supplied in aromatic solvents in bottles and steel drums.

Uses: Polymerization inhibitor of olefins up to 200°C; Diels-Alder reaction; catalyst; paint drier; oxygen stripping agent.

cobalto-cobaltic oxide (tricobalt tetraoxide) Co_3O_4 .

Properties: Steel-gray to black in anhydrous form. Insoluble in water, hydrochloric acid and nitric acid; soluble in sulfuric acid and fused sodium hydroxide; hygroscopic. Sp. gr. 6.07; changes to cobaltous oxide at 900–950°C.

Derivation: By heating strongly other cobalt oxides in air. Thus, the commercial oxides contain a substantial quantity of Co_3O_4 .

Uses: Ceramics; pigments; catalyst; preparation of cobalt metal; electronic chemicals.

cobalt octoate. See cobalt 2-ethylhexoate. See also soap (2).

cobalt oleate. See cobaltous oleate.

cobaltous acetate (cobalt acetate) $\text{Co}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$.

Properties: Reddish-violet, deliquescent crystals. Soluble in water, acids, and alcohol; sp. gr. 1.7043; m.p., loses H_2O at 140°C.

Derivation: Action of acetic acid on cobalt carbonate with subsequent crystallization.

Grades: Technical; pure crystalline; C.P.

Hazard: May not be used in food products (FDA).

Uses: Sympathetic inks; paint and varnish driers; catalyst; anodizing; mineral supplement in feed additives; foam stabilizer.

cobaltous aluminate. See cobalt blue.

cobaltous ammonium sulfate (cobalt ammonium sulfate) $\text{CoSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.

Properties: Ruby-red crystals; soluble in water; insoluble in alcohol; sp. gr. 1.902.

Derivation: Crystallization of cobaltous sulfate with ammonium sulfate.

Uses: Ceramics; cobalt plating; catalyst.

cobaltous arsenate (cobalt arsenate) $\text{Co}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Violet-red powder. Soluble in acids; insoluble in water. Sp. gr. 3.178 (15°C).

Derivation: Interaction of solutions of sodium arsenate and of a cobalt salt.

Grades: Technical.

Containers: Wooden kegs; boxes.

Hazard: Highly toxic.

Uses: Painting on glass and porcelain in light blue colors; coloring glass.

Shipping regulations: (Rail) Arsenical compounds, n.o.s., Poison label. (Air) Arsenates, Poison label.

See also erythrite.

cobaltous bromide (cobalt bromide) $\text{CoBr}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Red violet crystals. Soluble in water, alcohol, and ether. Anhydrous crystals are red. Sp. gr. 2.46; m.p. 47–48°C; loses $6\text{H}_2\text{O}$ at 130°C.

Derivation: By the action of bromine on cobalt, or of hydrobromic acid on cobaltous hydroxide or carbonate, followed by crystallization.

Grades: Technical; C.P.

Containers: Glass bottles.

Uses: In hygrometers; catalyst.

cobaltous carbonate CoCO_3 .

Properties: Red crystals; insoluble in water and ammonia; soluble in acids. Sp. gr. 4.13; m.p., decom-

poses. The cobalt carbonate of commerce is usually the basic salt (see following entry).

Derivation: By heating cobaltous sulfate with a solution of sodium bicarbonate.

Uses: Ceramics; trace element added to soils and animal feed; temperature indicator; catalyst.

cobaltous carbonate, basic $2\text{CoCO}_3 \cdot 3\text{Co}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

The cobalt carbonate of commerce.

Properties: Red violet crystals; soluble in acids; insoluble in cold water; decomposes in hot water. M.p., decomposes.

Derivation: By adding sodium carbonate to a solution of cobaltous acetate, followed by filtration and drying.

Uses: Manufacturing cobaltous oxide; cobalt pigments; cobalt salts; intermediate.

cobaltous chloride (cobalt chloride) (a) CoCl_2 ; (b) $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: (a) blue, (b) ruby-red crystals. Soluble in water and alcohol; also soluble in acetone. Sp. gr. (a) 3.348, (b) 1.924; m.p. (a) sublimes, (b) 86.75°C.

Derivation: By the action of hydrochloric acid on cobalt, its oxide, hydroxide or carbonate. Concentration gives (b) and dehydration (a).

Hazard: May not be used in food products (FDA).

Uses: Absorbent for ammonia; gas-masks; electroplating; sympathetic inks; hygrometers; in soils and animal feeds; vitamin B_{12} ; flux for magnesium refining; solid lubricant; dye mordant; catalyst; barometers; laboratory reagent; foam stabilizer.

cobaltous chromate (basic cobalt chromate; cobalt chromate). CoCrO_4 .

Properties: Brown or yellowish-brown powder. Variable composition. (Pure cobaltous chromate is CoCrO_4 ; gray-black crystals.) Soluble in mineral acids, in solution of chromium trioxide; insoluble in water.

Hazard: May be toxic by inhalation.

Use: Ceramics (tinting).

cobaltous citrate $\text{Co}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Rose-red amorphous powder; m.p. 150°C (–2H₂O). Slightly soluble in water; soluble in dilute acids.

Uses: Vitamin preparations; therapeutic agents.

cobaltous cyanide (a) $\text{Co}(\text{CN})_2 \cdot 2\text{H}_2\text{O}$, (b) $\text{Co}(\text{CN})_2$.

Properties: (a) buff crystals, (b) blue-violet powder; sp. gr. (b) 1.872; m.p. (b) 280°C. Insoluble in water; soluble in potassium cyanide, hydrochloric acid, ammonium hydroxide.

Hazard: Highly toxic.

Shipping regulations: (Rail) Cyanides, dry. Poison label. (Air) Poison label.

cobaltous ferrite CoOFe_2O_3 . A constituent of magnetically soft ferrites, which have high permeability, low coercive force, low magnetic saturation, and high resistivity. See also ferrite.

cobaltous fluoride (cobalt difluoride) CoF_2 .

Properties: Rose-red crystals or powder; sp. gr. 4.46; m.p. ca 1200°C; b.p. 1400°C. Soluble in cold water, hydrofluoric acid. Decomposes in hot water. Ammine complexes can be prepared from the hydrate.

Hazard: Toxic and irritant. Tolerance (as F), 2.5 mg per cubic meter of air.

cobaltous formate $\text{Co}(\text{CHO}_2)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Red crystals; sp. gr. 2.129 (22°C) m.p.

140°C ($-2\text{H}_2\text{O}$); decomposes 175°C. Soluble in cold water.

cobaltous hydroxide (cobalt hydroxide; cobalt hydrate) $\text{Co}(\text{OH})_2$.

Properties: Rose-red powder. Soluble in acids and ammonium salt solutions; insoluble in water and alkalies. Sp. gr. 3.597.

Derivation: Addition of sodium hydroxide to a solution of cobaltous salt.

Use: Cobalt salts; in preparation of paint and varnish driers; catalyst.

cobaltous iodide (cobalt iodide) $\text{CoI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Brownish-red crystals; loses iodine on exposure to air; sp. gr. 2.90; loses $6\text{H}_2\text{O}$ at 27°C. Soluble in water and alcohol. Anhydrous cobaltous iodide, CoI_2 , is in form of black crystals, sp. gr. 5.68; or in a yellow beta-modification which gives a colorless aqueous solution.

Derivation: Heating cobalt powder with hydrogen iodide. Anhydrous cobaltous iodide is prepared by heating cobalt in iodine vapor.

Hazard: Moderately toxic.

Use: In hygrometers; determination of water in organic solvents.

cobaltous linoleate (cobalt linoleate) $\text{Co}(\text{C}_{18}\text{H}_{31}\text{O}_2)_2$.

Properties: Brown, amorphous powder. Soluble in alcohol, ether and acids; insoluble in water. Combustible.

Derivation: By boiling a cobalt salt and sodium linoleate.

Use: Paint and varnish drier, especially enamels and white paints.

See also soap (2).

cobaltous naphthenate.

Properties: Brown, amorphous powder or bluish-red solid. Insoluble in water. Soluble in alcohol, ether, oils. Composition indefinite. Combustible.

Derivation: By treating cobaltous hydroxide or cobaltous acetate with naphthenic acid.

Uses: Paint and varnish drier; bonding rubber to steel and other metals.

cobaltous nitrate (cobalt nitrate) $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Red crystals; deliquescent in moist air. Soluble in most organic solvents. Sp. gr. 1.88 (25°C); m.p. 56°C.

Derivation: Action of nitric acid on metallic cobalt, cobalt oxide, hydroxide, or carbonate, with subsequent crystallization.

Uses: Sympathetic inks; cobalt pigments; catalysts; additive to soils and animal feeds; vitamin preparations; hair dyes; porcelain decoration.

Hazard: Moderately toxic; oxidizing agent; dangerous fire risk in contact with organic materials.

Shipping regulations: Nitrates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

cobaltous oleate (cobalt oleate) $\text{Co}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown, amorphous powder. Soluble in alcohol and ether; insoluble in water. M.p. 235°C. Combustible.

Derivation: By heating cobaltous chloride and sodium oleate, followed by filtration and drying.

Use: Paint and varnish driers.

See also soaps (2).

cobaltous oxalate CoC_2O_4 .

Properties: Reddish-white crystals; sp. gr. 3.021; insoluble in water; soluble in conc-ammonia.

Hazard: Toxic by ingestion.

Uses: Temperature indicator; catalysts (hydrated form).

cobaltous oxide (cobalt oxide; cobalt monoxide) CoO .

Properties: Grayish powder under most conditions; can form green-brown crystals. Soluble in acids and alkali hydroxides; insoluble in water and ammonium hydroxide. Sp. gr. 6.45; m.p. 1935°C. Low toxicity.

Derivation: Calcination of cobalt carbonate or its oxides at high temperature in a neutral or slightly reducing atmosphere.

Grades: Technical; ceramic.

Uses: Pigment in paints and ceramics; preparation of cobalt salts; catalyst; porcelain enamels; coloring glass; feed additive.

cobaltous perchlorate $\text{Co}(\text{ClO}_4)_2$.

Properties: Red needles; sp. gr. 3.327; soluble in water, alcohol, acetone.

Hazard: Fire and explosion risk in contact with organic materials. Strong oxidizing agent. Moderately toxic.

Use: Chemical reagent.

Shipping regulations: Perchlorates, n.o.s., (Rail) Yellow label. (Air) Oxidizer label.

cobaltous phosphate (cobalt phosphate)

$\text{Co}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Reddish powder; sp. gr. 2.769 (25°C); loses $8\text{H}_2\text{O}$ at 200°C; slightly soluble in cold water; soluble in mineral acids; insoluble in alcohol. Low toxicity.

Derivation: Interaction of solutions of cobalt salts and sodium phosphate.

Uses: Cobalt pigments; coloring glass; painting porcelain; animal feed supplement.

cobaltous resinate (cobalt resinate); principally cobalt abietate. See abietic acid.

Properties: Brown-red powder; insoluble in water; soluble in oils.

Derivation: See soap (2). The precipitated grade is higher in cobalt, more expensive, and more effective.

Grade: Fused; precipitated.

Use: Varnish drier.

Hazard: Spontaneously flammable in air; reacts strongly with oxidizing materials.

Shipping regulations: (precipitated) (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

cobaltous silicofluoride $\text{CoSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: Pale red crystals; sp. gr. 2.087; soluble in water.

Hazard: Toxic; irritant to tissue.

Use: Ceramics.

cobaltous succinate $\text{Co}(\text{C}_4\text{H}_4\text{O}_4) \cdot 4\text{H}_2\text{O}$.

Properties: Violet crystals; slightly soluble in cold water; soluble in alkalies; insoluble in alcohol.

Use: Vitamin preparations; therapeutic agents.

cobaltous sulfate (cobalt sulfate) (a) CoSO_4 ; (b) $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Red powder; soluble in water and methanol. Sp. gr. (a) 3.472; (b) 1.948; m.p. (a) 735°C; (b) loses $7\text{H}_2\text{O}$ at 420°C.

Derivation: Action of sulfuric acid on cobaltous oxide. Hazard: May not be used in food products (FDA).

Uses: Ceramics; pigments; glazes; in plating baths for cobalt; additive to soils and animal feeds; catalyst; foam stabilizer.

cobaltous tungstate (cobalt tungstate; cobalt wolframate) CoWO_4 .

Properties: Reddish-orange powder; insoluble in water; soluble in hot concentrated acids; sp. gr. 8.42. Low toxicity.

Derivation: By adding a sodium tungstate solution to a solution of a cobalt salt.

Use: Pigment; drier for enamels, inks, paints; electronic devices; antiknock agents.

cobalt oxide. See cobaltic oxide, cobaltous oxide, cobalto-cobaltic oxide. The commercial cobalt oxides are not usually definite chemical compounds but are mixtures of two or more cobalt oxides.

cobalt phosphate. See cobaltous phosphate.

cobalt potassium cyanide $K_3Co(CN)_6$.

Properties: Yellow crystals; sp. gr. 1.878 (25°C); m.p., decomposes; soluble in water; slightly soluble in alcohol.

Grades: Pure; electronic.

Hazard: Highly toxic.

Uses: Electronic research.

Shipping regulations: (Rail, Air) Cyanides, dry, Poison label.

cobalt potassium nitrite (cobalt yellow; potassium cobaltinitrate; Fischer's salt; potassium hexanitrocobaltate III) $K_3Co(NO_2)_6$.

Properties: Yellow, microcrystalline powder. Slightly soluble in water; insoluble in alcohol; m.p., decomposes at 200°C.

Derivation: By adding potassium nitrate and acetic acid to a solution of a cobalt salt.

Uses: Medicine; yellow pigment; painting on glass or porcelain.

cobalt resinate. See cobaltous resinate.

cobalt selenite $CoSe_2O_3 \cdot 2H_2O$. A blue-red powder; insoluble in water.

cobalt silicide. A semiconductor reported to have as much as 15% efficiency in converting heat to electricity in the temperature range 20–800°C.

cobalt soap. See cobaltous linoleate, cobaltous naphthenate, cobaltous oleate, cobaltous resinate; cobalt tallate.

cobalt sulfate. See cobaltous sulfate.

cobalt tallate. Cobalt derivative of refined tall oil; of varying composition. Used as a drier in paints and varnishes. Combustible. See soap (2).

cobalt tetracarbonyl (cobalt carbonyl; dicobalt octacarbonyl) $Co_2(CO)_8$.

Properties: Orange or dark brown crystals. White when pure. Sp. gr. 1.78; m.p. 51°C, decomposing above this temperature. Insoluble in water; soluble in organic solvents as alcohol, ether, and carbon disulfide.

Derivation: Combination of finely divided cobalt with carbon monoxide under pressure.

Hazard: Toxic by ingestion and inhalation.

Uses: Anti-knock gasoline; catalyst in Oxo process; high-purity cobalt salts.

cobalt titanate Co_2TiO_4 .

Properties: Greenish-black crystals; sp. gr. 5.07–5.12. Soluble in concentrated hydrochloric acid.

cobalt trifluoride (cobaltic fluoride) CoF_3 .

Properties: Light brown, free-flowing powder; sp. gr. 3.88 (25°C); no odor, except HF odor developed in moist air; stable in sealed containers; reacts readily with moisture in the atmosphere to form a dark, almost black powder; reacts with water to form a black, finely divided precipitate (cobaltic hydroxide).

Insoluble in alcohol and benzene. As a fluorinating agent, yields one atom of fluorine and reverts to the difluoride. The spent cobalt difluoride may be regenerated with elemental fluorine.

Hazard: Strong irritant to tissue. Tolerance (as F), 2.5 mg per cubic meter of air.

cobalt tungstate. See cobaltous tungstate.

cobalt ultramarine. See cobalt blue.

cobalt wolframate. See cobaltous tungstate.

cobalt yellow. See cobalt potassium nitrite.

"Cobanic."¹⁵⁵ Trademark for an alloy composed of nickel 55.0% and cobalt 45.0%.

Properties: M.p. 1500°C; sp. gr., 8.84; resistivity at 20°C, 11.0 microhm cm; tensile strength at 20°C, 85,000 lb/sq. in.

Uses: Electron tubes.

"Cobenium."¹⁵⁵ Trademark for a heat-treatable, high-cobalt alloy. Comprising cobalt, 40%; chromium, 20%; nickel, 15%; molybdenum, 7%; manganese, 2%; beryllium, 0.04%; carbon, 0.15%; iron, balance.

Properties: Corrosion-resistant; non-magnetic; resistant to set and fatigue; heat-treatable, high strength; high elasticity.

Uses: Springs; corrosion-resistant products.

"alpha Cobione."¹²³ Trademark for hydroxocobalamin, crystalline.

"Coblac."¹²³ Trademark for a series of carbon black-nitrocellulose dispersions, which make it possible to produce black lacquers without milling or grinding. Available in several types for pigmenting automotive lacquers, industrial lacquers, leather finishes, etc.

"Cobon."¹⁶⁹ Trademark for 2-nitroso-1-naphthol used for the colorimetric determination of cobalt. Sensitivity: 0.005 ppm cobalt.

COC. Abbreviation for Cleveland Open Cup, a standard method of flash point determination.

cocaine (methylbenzoylegonine) $C_{17}H_{21}NO_4$. An alkaloid.

Properties: Colorless to white crystals, or white crystalline powder. Soluble in alcohol, chloroform, and ether; slightly soluble in water (solution is alkaline to litmus). The hydrochloric acid solution is levorotatory. M.p. 98°C.

Derivation: By extraction of the leaves of Erythroxylon coca with sodium carbonate solution, treatment of the latter with dilute acid and extraction with ether, evaporation of the solvent; re-solution of the alkaloid and subsequent crystallization. Also synthetically from the alkaloid ecgonine.

Method of purification: Recrystallization.

Grades: Technical; N.F.

Hazard: Highly toxic; a habit-forming drug. Use restricted to physicians.

Use: Local anesthetic (medicine, dentistry), usually as the hydrochloride.

co-carboxylase (TPP; thiamine pyrophosphate chloride) $C_{12}H_{19}ClN_4O_7P_2S \cdot H_2O$. The coenzyme of the yeast enzyme carboxylase. It is the key substance in decarboxylation, an energy-producing reaction in the body.

Properties: Crystallizes from alcohol containing some

hydrochloric acid; m.p. 240–244°C (dec); soluble in water; dry substance very stable.
Use: Biochemical research; medicine.

cocculin. See picrotoxin.

cochineal (coccus). A red coloring matter consisting of the dried bodies of the female insects of *Coccus cacti*. The coloring principle is carminic acid $C_{22}H_{20}O_{13}$.

Grades: Technical; N.F.; silver grain; black grain.

Uses: Coloring food, medicinal products, toilet preparations; manufacture of red and pink lakes and carmine; indicator in analytical chemistry; inks; dyeing.

cocoa (cacao). Powder prepared from roasted cured kernels of ripe seed of *Theobroma cacao*. See also cacao bean.

Grade: Commercial; U.S.P.

Uses: Flavoring agent for pharmaceuticals; food products; beverage.

cocoa butter. See theobroma oil.

cocoa oil. See theobroma oil.

"Cocoloid."¹²² Trademark for an algin-carrageenan composition; a hydrophilic colloid.

Uses: Stabilizer for chocolate-milk products, sterilized cream, and other milk products.

coconut acid. Mixture of fatty acids derived from hydrolysis of coconut oil. Acid chain lengths vary from 6–18 carbons but are mostly 10, 12, and 14. Combustible; nontoxic.

Grades: Distilled; double-distilled.

Containers: Drums; tank cars.

Uses: Soaps; detergents; source of long-chain alkyl groups.

coconut cake (coconut palm cake; copra cake). The residual product from expression of oil from the seed of the coconut. See coconut oil meal.

coconut oil.

Properties: White, semi-solid fat containing C_{12} to C_{15} ; slight odor. Sp. gr. 0.92; saponification value 250–264; iodine value 7–10; sharp m.p. at 25°C (76°F). Soluble in alcohol, ether, chloroform, carbon disulfide; immiscible with water. Highly digestible; resists oxidative rancidity but is susceptible to that induced by molds and other microorganisms. Nondrying; nontoxic; combustible.

Chief constituents: Glycerides of lauric acid, as well as of capric, myristic, palmitic and oleic acids.

Derivation: Hydraulic press or expeller extraction from coconut meat, followed by alkali-refining, bleaching, and deodorizing.

Grades: Crude; refined; Ceylon; Manila.

Containers: Barrels; casks; tank cars.

Uses: Food products (margarine, hydrogenated shortenings); synthetic cocoa butter; soaps; cosmetics; emulsions; cotton dyeing; lubricating greases; synthetic detergents; medicine; dietary supplement; source of fatty acids, fatty alcohols, and methyl esters; base for laundering and cleaning preparations for soft leathers.

coconut oil meal. The dried and crushed form of coconut cake recovered from the hydraulic or expeller process of extraction of oil from the meat. The usual product of commerce contains 24.2% crude protein; 13.3% crude fiber; 35.7% nitrogen-free extract; 7.4% ether soluble (fat) and 6.0% ash. The total digestible nutrients approximate 72%.

Containers: Bulk or bags.

Uses: Animal feeds; fertilizer ingredient.

cocoonase. A proteolytic enzyme derived from silk moths; closely similar to trypsin; isoelectric point about 9.5, slightly less than for trypsin; pH about 8.0; molecular weight about 25,000. As secreted by the insect it is 80% pure. Identical with trypsin in catalytic specificity and mechanism of action.

cocoyl sarcosine. $C_{11}H_{23}CON(CH_3)CH_2COOH$. Yellow liquid; sp. gr. 0.970; m.p. 22–28°C. Combustible; nontoxic. Used as a detergent emulsifier.

"C-O-C-S."³⁵ Trademark for insecticides containing copper oxychloride sulfate. Used on fruits and vegetables.

C.O.D. Abbreviation for chemical oxygen demand. See oxygen consumed, biochemical oxygen demand (B.O.D.); dissolved oxygen (D.O.).

codehydrogenase I. See nicotinamide adenine dinucleotide.

codeine (methyilmorphine) $C_{18}H_{21}NO_3 \cdot H_2O$. A narcotic alkaloid.

Properties: Colorless or white crystals or powder. Effloresces slowly in dry air; affected by light; m.p. 154.9°C. Slightly soluble in water; soluble in alcohol and chloroform; levorotatory in acid and alcohol solutions.

Derivation: From opium by extraction and subsequent crystallization; also by the methylation of morphine.

Grades: Technical; N.F.

Hazard: Habit-forming narcotic; sale legally restricted.

Use: Medicine (analgesic); cough sirups (usually as the hydrochloride, phosphate, or sulfate).

cod-liver oil (morrhua oil)

Properties: Pale yellow viscous liquid; fixed, nondrying oil; slightly fishy odor and taste. Soluble in ether, chloroform, ethyl acetate, and carbon disulfide; slightly soluble in alcohol. Sp. gr. 0.918–0.927; saponification value 180–192; iodine value 145–180; maumene test 102–113; acid value 204–207. Combustible; nontoxic.

Chief constituents: Glycerides of palmitic, stearic acids; cholesterol, butyl alcohol esters, etc.

Derivation: From the livers of codfish (*Gadus morrhua*) and other species of *Galidae*. These are rendered by steam heat and the oil separated and chilled until the stearin solidifies, when it is pressed and the clear oil collected.

Method of purification: Filtration.

Grades: Pale; light-brown; dark-brown; N.F.

Uses: Medicine (for its vitamin A and D content; now largely replaced by synthetic products); chamois-leather tanning.

coenzyme. A comparatively low molecular weight organic substance which can attach itself to, and thus supplement, a specific protein to form an active enzyme system. Generally synonymous with the term prosthetic group. See also following entries.

coenzyme I. See nicotinamide adenine dinucleotide.

coenzyme A (CoA) $C_{21}H_{36}O_{16}N_7P_3S$. Essential for the formation of acetylcholine and for acetylation reactions in the body. It has been synthesized, and is built up from pantothenic acid, cysteamine, adenosine, and phosphoric acid.

coenzyme Q

$CH_3C_6(O)_2(OCH_3)_2[CH_2CH:C(CH_3)CH_2]_nH$. Found in animal organs and yeast. Is active in the citric acid cycle in carbohydrate metabolism. The n in the formula varies according to the source.

"CO Fatty Alcohols."⁴⁸⁷ Trademark for a series of primary straight chain fatty alcohols. "TA-1618" is principally C_{16} and C_{18} ; "Umbrex" is principally C_6 , C_8 and C_{10} .

Properties: Clear colorless liquids to waxy white solids. Sp. gr. 0.81–0.88. Combustible.

Containers: Tank cars and trucks.

Uses: Cosmetic ingredients, foamers, evaporation retardant, lubricants; chemical intermediates in cosmetics, detergents, dispersants, emulsifiers, lube oil additives, nonionic surfactants, plasticizers, solvents, wetting agents.

coffearine. See trigonelline.

coffinite $U(SiO_4)_{1-x}(OH)_{4x}$ (or $USiO_4$, with appreciable $(OH)_4$ in place of some SiO_4). A naturally occurring uranium mineral. Color black; sp. gr. 5.1; luster adamantine; commonly fine-grained and mixed with organic matter and other minerals.

Occurrence: Colorado, Utah, Wyoming, Arizona.

Use: Ore of uranium (Colorado).

cognac oil, green (wine yeast oil). Volatile oil obtained by steam distillation from wine lees. A green to bluish-green liquid with the characteristic aroma of cognac. Soluble in most fixed oils and in mineral oil. It is very slightly soluble in propylene glycol and insoluble in glycerine. Combustible. Low toxicity.

Grade: F.C.C.

Use: Flavoring agent.

"Coherex."⁴⁹⁹ Trademark for a dust inhibitor, consisting of a stable, concentrated emulsion, based on natural petroleum resins.

cohune oil. An edible nondrying oil, with properties similar to coconut and babassu oils. Its composition is 46% lauric acid, 16% myristic acid, and 10% oleic acid, balance mixed acids. Obtained from a palm native to Mexico and Central America. Combustible; nontoxic.

"Collife."³⁰⁸ Trademark for special epoxy resin encapsulation of random wound staters utilizing solventless epoxy resin formulations and rotational seasoning process.

coke. The carbonaceous residue of the destructive distillation (carbonization) of bituminous coal, petroleum, and coal-tar pitch. The principal type is that produced by heating bituminous coal in chemical recovery or beehive coke ovens (metallurgical coke), one ton of coal yielding about 0.7 ton of coke. It is used chiefly for reduction of iron ore in blast furnaces, and as a source of synthesis gas. Petroleum yields coke during the cracking process. Coke derived from petroleum residues and coal-tar pitch is used for refractory furnace linings in the electrorefining of aluminum and other high-temperature service; also for electrodes in electrolytic reduction of alumina to aluminum, as well as in electrothermal production of phosphorus, silicon carbide, and calcium carbide.

cola (kola; kola nuts; kola seeds; Soudan coffee; guru). Contains caffeine, theobromine.

Derivation: Seeds of *Cola nitida* or other species of *Cola*.

Habitat: West Africa; West Indies; India.

Containers: Bags.

Hazard: Moderately toxic.

Use: Soft drinks.

colamine. See ethanalamine.

colchicine $C_{22}H_{25}NO_6$. An alkaloid plant hormone.

Properties: Yellow crystals or powder; odorless or nearly so. Soluble in water, alcohol, and chloroform; moderately soluble in ether; affected by light; m.p. 135–150°C. Solutions are levorotatory.

Derivation: From *Colchicum autumnale* by extraction and subsequent crystallization. Has been synthesized.

Grades: Technical; U.S.P.

Hazard: Highly toxic; 0.02 gram may be fatal if ingested.

Use: Medicine; to induce chromosome doubling in plants.

cold flow. The permanent deformation of a material that occurs as a result of prolonged compression or extension at or near room temperature. Some plastics and vulcanized rubber exhibit this behavior; in metals it is known as creep.

cold rubber. Synthetic rubber produced by polymerization at relatively low temperatures; specifically, SBR or butadiene-styrene elastomers produced by polymerization at about 40°F compared with usual temperature of about 120°F. A special catalyst system is required.

colemanite. The ore of calcium borate ($Ca_2B_6O_{11} \cdot 5H_2O$). Sp. gr. 2.26–2.48. Used to replace boric acid in the manufacture of glass fibers. Mined in Turkey, it began to be imported into the U.S. in large volume in 1965 and is competitive with domestically produced B_2O_3 , derived from kernite.

"Colex."¹ Trademark for a finely powdered bone glue used for adhesion in water paints.

colistin $C_{45}H_{85}N_{13}O_{10}$. Antibiotic produced by a soil microorganism. Probably identical to polymyxin E and closely related chemically to polymyxin B, since it is a polypeptide composed of amino acids and a fatty acid. See polymyxin.

collagen. A fibrous protein comprising most of the white fiber in the connective tissues of animals and man, especially in the skin, muscles and tendons. The most abundant protein in the animal kingdom, it is rich in proline and hydroxyproline. The molecule is analogous to a three-strand rope, in which each strand is a polypeptide chain; it has a molecular weight of about 100,000. Glue made from the collagen of animal hides and skins is still widely used as an adhesive. So-called "soluble" collagen is that first formed in the skin; upon aging it becomes increasingly crosslinked and less hygroscopic. "Soluble" collagen is being used in the cosmetic industry as the basis for face creams, lotions and hair-dressing preparations. Special forms of collagen have been developed for dialysis membranes. Microcrystalline collagen is being used in prosthetic devices and other medical and surgical applications. Regenerated collagen, used in sausage casings, is made by neutralizing with acid collagen that has been purified by alkaline treatment. Collagen is converted to gelatin by boiling in water, which causes hydrolytic cleavage of the protein to a mixture of degradation products. See also gelatin.

2,4,6-collidine (2,4,6-trimethylpyridine) $(CH_3)_3C_5H_2N$. Properties: Colorless liquid. B.p. 170.4°C; freezing point –44.5°C; sp. gr. 0.913 (20/20°C); refractive index ($n_{20/D}$) 1.4981. Soluble in alcohol; slightly soluble in water. Combustible. Grades: Technical (97.5% purity).

Uses: Chemical intermediate; dehydrohalogenating agent.

collodion. A solution of pyroxylin (nitrocellulose) in ether and alcohol. U.S.P. specifications are pyroxylin 40 g, ether 750 ml and alcohol 250 ml.

Properties: Pale yellow, syrupy liquid; odor of ether. Immiscible with water. Flash point approx. 0°F.

Grades: Technical; U.S.P.

Uses: Cements; coating wounds and abrasions; solvent for drugs; corn removers; process engraving and lithography.

Hazard: Flammable; dangerous fire risk.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

See also nitrocellulose.

colloid chemistry. A subdivision of physical chemistry (q.v.) comprising the study of phenomena characteristic of matter when one or more of its dimensions lie in the range between 1 millimicron (nanometer) and 1 micron (micrometer). The science thus includes not only finely divided particles but also films, fibers, foams, pores, and surface irregularities. It is the dimension that is critical, rather than the nature of the material. Colloidal particles may be gaseous, liquid, or solid, and occur in various types of suspensions (imprecisely called solutions), e.g., solid/gas (aerosol), solid/solid, liquid/liquid (emulsion), gas/liquid (foam). In this size range, the surface area of the particle is so much greater than its volume that unusual phenomena occur; for example, the particles do not settle out of the suspension by gravity, and are small enough to pass through filter membranes. Macromolecules (proteins and other high polymers) are at the lower limit of this range; the upper limit is usually taken to be the point at which the particles can be resolved in an optical microscope. The first specific observations were made by Thomas Graham about 1860, and were extended by Ostwald, Hatchek, and Freundlich. Though the term is often used synonymously with surface chemistry, in a strict sense it is limited to the size range mentioned in at least one dimension, whereas surface chemistry is not. Natural colloidal systems include rubber latex, milk, blood, egg-white, etc. See also surface chemistry; colloid, protective; emulsion.

colloid, association. See association.

colloid mill. See homogenization.

colloid, protective. Any surface-active substance that prevents the dispersed phase of a suspension from coalescing by forming a thin layer on the surface of each particle. Thus in milk, the surface of the fat particles is coated with albumin, and in rubber latex the globules are kept from coagulating by a layer of protein.

"Colloisol."⁴⁴⁰ Trademark for a series of vat dyes for dyeing and printing textiles of cellulosic fibers.

cologne (toilet water). A scented alcohol-based liquid used as a perfume, after-shave lotion, or deodorant. Combustible.

Cologne brown. See Van Dyke brown.

colorant. Any substance that imparts color to another material or mixture. Colorants are either dyes or pigments. A colorant may either be (1) naturally present in a material (chlorophyll in vegetation), (2) admixed with it mechanically (dry pigments in paints), or (3) applied to it in a solution (organic dyes to fibers).

Note: A valid distinction between dyes and pigments is almost impossible to draw. Some have established it on the basis of solubility, others on physical form and method of application. Most pigments are insoluble, inorganic powders, the coloring effect being a result of their dispersion in a solid or liquid medium; most dyes, on the other hand, are soluble synthetic organic products which are chemically bound to, and actually become part of, the material to which they are applied. Organic dyes are usually brighter and more varied than pigments, but tend to be less stable to heat, sunlight and chemical effects. The term colorant applies to black and white, as well as to actual colors. Instruments for measuring, comparing and matching the hue, tone and depth of colors are called colorimeters. See also dye; pigment; colorimetry, food color; FD&C color.

"Colorex"¹ Trademark for titanium trichloride in aqueous solution with zinc chloride. Dark violet to black liquid.

Uses: Powerful reducing agent; dye stripper for textiles.

colorimetry. An analytical method based on measuring the color intensity of a substance or a colored derivative of it. For example, the yellow carotene content of butter can be determined by saponifying a sample of butter in an alkaline solution, extracting the carotene with ether, and measuring the intensity of yellow color in the ether extract. Colorimetric methods can be used for determining very minute amounts. They are applied in hospital laboratories for blood and urine analysis, food laboratories for determination of vitamins, preservatives, coloring matter, etc. In metallurgical laboratories, traces of metals in raw materials and finished products are determined.

colorless dye. Synonym for optical brightener (q.v.).

"Colorundum."²⁰⁵ Trademark for a balanced mixture of abrasive aggregates, mineral oxide color, and sealer for surfacing concrete floors, in a choice of colors.

"Columbia."²¹⁴ Trademark for activated carbons.

Properties: Hard, durable, inert pellets and granules. Ash content 0.5-6%. Unaffected by most chemical agents and conditions. Numerous grades available.

Uses: Solvent recovery; gas purification; air conditioning; gas separation; gas masks; catalyst carriers.

columbite. An ore of tantalum. See tantalite.

columbium Cb Alternate name for the element niobium. The latter name became official in 1949; columbium is still used by metallurgists.

"Coly-Mycin."⁵⁴⁶ Trademark for colistin in form of sulfate or methane sulfonate (colistimethate sodium).

"Combatex."⁴⁴³ Trademark for a cationic resin textile-finishing agent.

combination. A chemical reaction in which two substances unite to form a third; the reacting substances may be either elements or compounds, but the product is always a compound. Examples:

$$\text{Cu} + \text{Cl}_2 \rightarrow \text{CuCl}_2; 2\text{NH}_3 + \text{H}_2\text{SO}_4 \rightarrow (\text{NH}_4)_2\text{SO}_4$$
 Polymerization is a special case of combination; here complex organic molecules of the same kind unite to form chains or clusters of high molecular weight. See also polymerization.

combining number. See valence.

combining weight. See equivalent weight.

combustible material. Any substance that will burn, regardless of its autoignition point (q.v.), or whether

it is a solid, liquid, or gas. Although this definition necessarily includes all flammable materials (q.v.) as well, this fact is disregarded in official classifications. As usually defined, the term "combustible" refers to solids that are comparatively difficult to ignite and that burn relatively slowly, and to liquids having a flash point above 80°F (above 100°F, according to National Fire Protection Assn.).

It is difficult to generalize about the combustibility of solids, for the rate and ease of combustion may depend as much on their state of subdivision as on their chemical nature. Many metals in powder or flake form will ignite and burn rapidly, whereas most are noncombustible as bulk solids. Cellulose is combustible in the form of a textile fabric or as paper, but is flammable as fine fibers (cotton linters). A plastic that will burn at flame temperature will be a greater fire hazard as a foam than as a bulk solid because of the large surface area exposed to air and the thinness of the cell walls. Some polymers, such as nylon and polyvinylidene chloride, will melt and burn, but will not propagate flame; others, e.g., polyvinyl chloride and polystyrene, ignite at high temperature and evolve toxic fumes. Acrylics and cellulose-derived plastics, such as rayon and cellulose acetate, are readily combustible. This may be partially offset by use of fire-retardant chemicals. Glass is noncombustible in all forms.

Several definitions of combustible liquids are offered by various regulatory authorities. The National Fire Protection Association considers them as liquids having a flash point above 100°F (Tag Closed Cup). The Dept. of Transportation (DOT) defines them as those with a flash point above 80°F. The International Air Transport Authority (IATA) has defined them as liquids flashing from 80 to 101°F (Tag Open Cup). The Manufacturing Chemists Association (MCA) uses the range from 80 to 150°F (Tag Open Cup).

See also flammable material; hazardous material.

combustion. An exothermic oxidation reaction in which the heat evolved results from rupture of chemical bonds. In the case of organic fuels (wood, coal, petroleum, and their derivatives) the energy released was originally due to photosynthesis. Combustion may occur in an atmosphere of chlorine as well as of air. In pure oxygen combustion occurs with greatly increased intensity, and some substances may ignite spontaneously at room temperature. The products of combustion of organic compounds are carbon dioxide and water. One gallon of gasoline yields on complete burning approximately one gallon of water. Organic compounds differ greatly in their combustibility, ranging from those of almost explosive nature (carbon disulfide) to those which barely support combustion and are difficult to ignite (rubber). Oxygen itself is not combustible, but actively supports combustion. See also oxidation, respiration, ignition point, flash point. For further information consult National Fire Protection Institute, 470 Atlantic Ave., Boston, Mass.

comminution. Size reduction of materials by any of several means, e.g., grinding, cutting, shredding, chopping, etc. Solids can be reduced to a particle size approaching 1 micron in special fine-grinding equipment. Comminution of coal by chemical means is possible by use of a low-molecular weight compound such as sodium hydroxide or anhydrous ethanol, which penetrates the natural fault system

of the coal, resulting in fragmentation without mechanical crushing. This permits removal of sulfur from coal without burning or grinding. About 100 pounds of chemical are needed per ton of coal.

compatibility. The ability of two or more materials to exist in close and permanent association for an indefinite period. Liquids (solvents) are compatible if they are miscible in all proportions and do not undergo phase separation on standing. Thus water is compatible with alcohol but not with gasoline. Liquids and solids are compatible if the solid is soluble in the liquid, but not otherwise. Solids are compatible if they can exist in intimate contact for long periods with no adverse effect of one on the other.

"Compazine."⁷¹ Trademark for a brand of prochlorperazine, as the maleate or the edisylate.

complex compound. See coordination compound.

complexing agent. See ligand; chelate; ethylenediamine-tetraacetic acid.

complex ion. An ion which has a molecular structure consisting of a central atom bonded to other atoms by coordinate covalent bonds. See coordination compound.

component. One of the minimum number of substances required to state the composition of all phases of a system. In the absence of chemical reaction, any of the substances in a mixture. See also constituent.

composite. A mixture or mechanical combination on a macro scale of two or more materials that are solid in the finished state, are mutually insoluble, and differ in chemical nature. The major types are: (1) laminates (q.v.) of paper, fabric or wood (veneer) and a thermosetting material (resin, rubber, or adhesive); examples are tire carcasses, plywood, and electrical insulating structures. (2) Reinforced plastics (q.v.) principally of glass fiber and a thermosetting resin; other types of fibers such as boron, aluminum silicate, and silicon carbide may be used (see also whiskers). (3) Cermets (q.v.), which are mixtures of ceramic and metal powders, heat-treated and compressed. (4) Fabrics, i.e., woven combinations of wool or cotton and a synthetic fiber. (5) Filled composites in which a bonding material such as linseed oil, resin, or asphalt is loaded with a filler in the form of flakes or small particles; examples are linoleum, glass/flake-plastic mixtures for battery cases, and asphalt/gravel road-surfacing mixtures.

composting. Aerobic bacterial decomposition of solid organic wastes, both agricultural and urban, including sewage sludge. As much as 500 tons a day can be handled in the larger installations, the waste degrading quickly at low temperatures. The product can be used as a soil conditioner and for landfill. The waste is piled and turned frequently to provide aeration, while maintaining a high enough temperature in the pile to destroy pathogenic organisms. Volume of composted waste is from 20 to 60% of original volume.

compound. (1) A substance composed of atoms or ions of two or more elements in chemical combination. The constituents are united by bonds (q.v.) or valence forces. A compound is a homogeneous entity in which the elements have definite proportions by weight, and are represented by a chemical formula (q.v.). A compound has characteristic properties

quite different from those of its constituent elements; it can be decomposed by energy in the form of a chemical reaction (q.v.), of heat, or of an electric current. Example: Water is a *liquid* formed by chemical combination of two *gases*; it can be separated into hydrogen and oxygen by an electric current (electrolysis); in certain reactions it is split into its constituent ions (H and OH) (hydrolysis); it is not chemically changed by heat or cold. See also mixture; homogeneous; reaction.

(2) Loosely, a product formula (often proprietary) of various types, e.g., pharmaceuticals (a vegetable compound), rubber (a fast-curing compound), etc.

(3) Having two sets of lenses (compound microscope).

Compound 1080. Toxic. Use may be restricted. See sodium fluoroacetate.

"Compound 4072."¹²⁵ Trademark for 2-chloro-1-(2,4-dichlorophenyl)-vinyl diethyl phosphate.

compreg. A hardwood impregnated with a phenol-formaldehyde resin under heat and pressure.

"Compregnite."⁶⁵ Trademark for a phenol-formaldehyde liquid resin used for impregnation of wood to improve density and physical properties.

compressed gas. Any material or mixture that, when enclosed in a container, has an absolute pressure exceeding 40 psi at 70°F or, regardless of the pressure at 70°F, has an absolute pressure exceeding 140 psi at 130°F; or any flammable material having a vapor pressure exceeding 40 psi absolute at 100°F. (Vapor pressure determined by Reid method (ASTM)). Compressed gases include liquefied petroleum gases (q.v.), as well as oxygen, nitrogen, anhydrous ammonia, acetylene, nitrous oxide and fluorocarbon gases. Some of these are shipped in tonnage volume. For details on properties, containers and shipping regulations, see specific gas. For additional information consult Compressed Gas Association, 500 Fifth Avenue, New York, N.Y. Shipping regulations: (Flammable) (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes. (Nonflammable) (Rail) Green label. (Air) Nonflammable Gas label.

compression molding. Formation of a rubber or plastic article to a desired shape, either by placing the raw mixture in a specially designed cavity or bringing it into contact with a contoured metal surface. After the material is in place, heat and pressure are supplied by a hydraulic press, the time and temperature varying with the nature of the material. In the case of rubber products, vulcanization occurs simultaneously. Most plastic molding is now done by the injection method, which is more economically efficient. See also injection molding.

"Compresto."⁸⁴ Trademark for an electrical conductor consisting of layers of shaped pure aluminum wires concentrically stranded about a single round core wire.

Compton effect. One of the principal processes by which high energy electromagnetic radiation, or gamma rays, interact with or are absorbed by matter. In the Compton process, the gamma ray frees an electron in matter as if the electron was unbound, dividing the momentum of the gamma ray between the ejected electron and a new gamma ray of lower energy going off in a new direction.

"Conac S."²⁸ Trademark for N-cyclohexyl-2-benzo-

thiazole sulfenamide (q.v.). Used to accelerate the vulcanization of natural and synthetic rubber. "Conac T." Cyclic thiuram; yellow to greenish-yellow powder; sp. gr. 1.26; m.p. 96°C. Used as a delayed action accelerator for SBR.

"Conastron."⁴⁶⁴ Trademark for a high temperature and chemical-resistant coating, containing titanium metal powder and stainless steel flake in high temperature silicones and boron polymers.

"Concentals."³²⁵ Trademark for a series of highly sulfated organic compounds. Used in cotton softening and finishing operations.

concentration. The amount of a given substance in a stated unit of a mixture, solution, or ore. Common methods of stating concentration are per cent by weight or by volume; normality; or weight per unit volume, as grams per cubic centimeter or pounds per gallon. The concentration of an atom, ion or molecule in a solution may be indicated by square brackets, as [C⁺]. For radioactivity, the concentration is usually expressed as millicuries per milliliter (mc/ml), or millicuries per millimole (mc/mM).

conchiolin C₃₂H₉₈N₂O₁₁II. A natural bonding agent in the calcium carbonate structure of pearls.

conchoidal. A term adopted from mineralogy by chemists to describe a type of surface formed by fracturing a hard solid by impact. Certain materials present involuntarily curved fracture surfaces suggestive of the shape of the shells of bivalves (conch), from which the term is derived. Examples are glass, blown asphalt, and numerous minerals.

concrete.

(1) A conglomerate of gravel, pebbles, broken stone, blast-furnace slag or cinders, termed the aggregate, embedded in a matrix of either mortar or cement, usually standard Portland cement in the U.S. Reinforced concrete and ferro-concrete contain steel in various forms. Further information can be obtained from the American Concrete Institute, Detroit, Michigan. See cement, Portland. Uses: Building and road construction; radiation shielding.

(2) A waxy solid obtained from roses by extraction with non-polar solvents (benzene) after trace quantities of solvent have been removed. When the concrete is dewaxed by a properly chosen second solvent (alcohol), the desired essential oil remains. This is called an absolute. See also perfume.

concrete, cellular. A light-weight concrete foam which may be made in several ways:

- By addition of aluminum powder to the concrete mix and applying heat, which releases hydrogen;
- By whipping air into the mix containing an entraining agent.
- By adding preformed foam to the mix. Such foams are made from a foaming agent such as dried blood, a stabilizer, organic solvents, and a germicide.

See also foam.

condensation. (1) A chemical reaction in which two or more molecules combine, with the separation of water or some other simple substance. If a polymer is formed, the process is called polycondensation (ASTM). Phenolformaldehyde resin is an example of a condensation polymer. (2) The change of state of a substance from the vapor to the liquid (or solid) form.

conductance. The conductivity of an electrolytic solution, defined as the reciprocal of the resistance. It is usually used in connection with electrolytic solutions. See conduction (2).

"Conductex."¹³³ Trademark for a group of carbon blacks designed to provide high electrical conductivity where required in rubber, plastics, coatings etc.

conduction. (1) Transference of heat through a substance or from one substance to another when the two substances are in physical contact (thermal conduction). Crystalline solids (especially metals and alloys) are good thermal conductors because of their high density; liquids, such as water and glass, and high polymers, such as rubber and cellulose, usually are not.

(2) Transference of an electric current through a solid or liquid (electrical conduction). In metallic or electronic conductors, the current is carried by a flow of electrons from atom to atom, the atomic nuclei remaining stationary. This type of conduction is common to all metals and alloys, carbon and graphite, and certain solid compounds (manganese dioxide, lead sulfide). In electrolytic or ionic conductors, the current is carried by ions, as in solutions of acids, bases, and salts and in many fused compounds. In electrolytic conduction, as in metallic conduction, heat is generated, and a magnetic field is formed around the conductor; a transfer of matter also occurs. In a few materials, as solutions of alkali and alkaline earth metals in anhydrous liquid ammonia, both types of conduction take place simultaneously; such conductors are called mixed conductors. See also semiconductor; transference number.

conductivity. The property of a substance or mixture that describes its ability to transfer heat or electricity. It is the reverse of resistivity. See also conduction.

"Conflex."³³⁷ Trademark for a composite combining the electrical conductivity of copper and the elastic properties of spring steel. Used in fabricating rotating switches.

configuration. In an organic molecule, the location or disposition of substituent atoms or groups around asymmetric carbon atoms. This can be changed only by severing single covalent bonds.

conformation. The shapes or arrangements in three-dimensional space that an organic molecule can assume by rotating carbon atoms or their substituents around single covalent bonds. The conformation of a molecule is not fixed; though one or another shape may be more likely to occur, the number of conformational isomers is infinite. Conformational analysis involves the study of the preferred (or most likely) conformations of a molecule in the ground, transition, and excited states. Research on the conformations of cyclohexane and various sugars has contributed much to this aspect of stereochemistry.

Congo resin. A variety of copal fossil resin. The natural product is insoluble in organic solvents, but forms transparent gels with some alcohols and hot solvents. When thermally processed (cracked) it is soluble in all organic solvents, fatty acids, and vegetable oils. Its high acid number prevents its use in paints containing reactive pigments.

Uses: High-gloss varnishes; paints for metal surfaces; wrinkle finishes.

Congo red. Sodium diphenyl-bis- α -naphthylamine sulfonate $C_{32}H_{22}O_6N_6S_2Na_2$.

Properties: Brownish-red powder; soluble in water and alcohol; insoluble in ether; odorless; decomposes on exposure to acid fumes.

Derivation: Combination of tetraazotized benzidine and naphthionic acid.

Hazard: May have severe allergic reaction (anaphylactic shock). Possible carcinogen.

Uses: Dye; medicine (antidote); indicator; biological stain.

coniferin $C_{16}H_{22}O_8$. A glucoside contained in pine bark and other conifers. When decomposed it yields coniferyl alcohol which can be oxidized to vanillin. Used as a raw material for manufacture of synthetic vanillin.

coning oil. Usually an emulsified mineral oil used as lubricant for textile fibers in processing to the finished yarn. Fatty acid esters are often used for the oil-in-water emulsions.

conjugated double bonds. Two or more double bonds which alternate with single bonds in an unsaturated compound, as in the formula for butadiene-1,3 ($H_2C=CH-CH=CH_2$) or maleic acid (the $O=C-C=C-C=O$ skeleton).

conjugate layers. Two layers of a liquid system each composed of a different ternary mixture and in equilibrium with one another.

"Conjulin" Fatty Acids.⁵⁵⁰ Trademark for a fatty acid mixture containing principally oleic, linolenic, and 9,11-octadecadienoic acids. Used in alkyd resins, epoxy esters, driers.

"Conpernik."³⁰⁸ Trademark for an alloy of approximately equal proportions of iron and nickel having constant permeability over a range of low flux densities. It is used where constant inductance cores are required over a low range of inductions.

conservation of energy, law. (Also known as the first law of thermodynamics). See energy.

consistency. Resistance to flow of a material, usually a liquid. For Newtonian liquids, consistency and viscosity are synonymous. For non-Newtonian liquids, it qualitatively represents plastic flow. The term is used primarily by food technologists.

"Consol C."¹ Trademark for a chemically modified protein colloid derived from bones and hides. Used in the paper industry to improve interfiber bonding and filler retention.

constantan. Generic name for an alloy containing from 40 to 45% nickel and from 55 to 60% copper. Used in thermocouples and specialized heat-measuring devices.

constant-boiling mixture. See azeotropic mixture.

constant composition, law. See chemical laws (2).

constituent. Any of the elements or subgroups in a molecule of a compound. For example, nitrogen is a constituent of proteins; the carboxyl group is a constituent of fatty acids. See also component.

contact acid. Sulfuric acid made by the contact process (q.v.).

contact process. A process for manufacture of sulfuric acid and oleum, in which the sulfur dioxide from

the burning of sulfur, pyrites, or other sulfur sources is oxidized with air to sulfur trioxide by contact with a vanadium pentoxide catalyst. The sulfur trioxide is absorbed in high-strength sulfuric acid to give a product of 98 or 100% acid, or fuming sulfuric acid higher in sulfur trioxide content. Almost all the sulfuric acid produced in the U.S. is made by this process.

contact resin (impression resin, low-pressure resin). A synthetic thermosetting resin characterized by cure at relatively low pressure. The usual components are an unsaturated high molecular weight monomer such as an allyl ester, or a mixture of styrene or other vinyl monomer with an unsaturated polyester or alkyd. Cure requires heat and a catalyst as well as some pressure. The curing does not result in water formation as with phenol-formaldehyde resins.

container. This term refers not only to units used to pack chemical products for shipment but also to transport them. The factors that dictate their selection include size of shipment, compatibility of the product with container material, ease of storage and handling, and cost. Common containers are:

- tank cars, tank trucks, hopper cars (bulk chemicals)
- barges (petroleum products, petrochemicals, other chemicals)
- tankers (crude oil, refined products)
- pipelines (gases, liquid chemicals, etc.)
- 55-gal drums of steel, plastic, or fiberboard, with or without polyethylene lining.
- 5-, 15-, 30-gal metal cans and pails
- 5-gal plastic carboys
- 1-gal metal cans
- steel cylinders (compressed gases)
- multiwall paper bags (dry powders)
- glass and plastic bottles, vials, etc.
- wooden kegs, barrels, boxes, bales; burlap bags (bulk imports, such as gums, etc.)
- 76-lb flasks (mercury)

contaminant. Any substance accidentally or unwillingly introduced into air, water, or food products which has the effect of rendering them toxic or otherwise harmful. Examples are sulfur dioxide resulting from combustion of high-sulfur fuels; pesticide residues in vegetables, fish, or other food products; industrial dusts; and radioactive materials resulting from nuclear explosions. See also waste disposal; fallout; decontamination; food additive.

Note: Pesticide residues in foods are often referred to as unintentional additives.

"Continental."¹⁰⁴ Trademark for a series of channel blacks used in natural and synthetic rubber, paints, inks and plastics.

"Continex."¹⁰⁴ Trademark for furnace blacks. Used in rubber, plastics, paints, paper.

continuous distillation. Distillation in which a feed, usually of nearly constant composition, is supplied continuously to a fractionating column and the product is continuously withdrawn at the top, bottom, and sometimes at intermediate points.

continuous phase. See phase (2).

control. (1) In any chemical or other scientific experiment, the reference base with which the results are compared. This base is invariably a sample of identical constitution and prepared under the same conditions, from which all experimental variations are omitted. Thus the control represents known values, as far as any specific experiment is concerned. Such

a sample is often called a "blank." The use of a control is vital to significant interpretation of experimental data.

(2) Automatic: Maintenance of uniform physical conditions (temperature, pressure, power level, etc.) in a system by means of a sensing device operating on the feedback principle.

controlled atmosphere. See atmosphere, controlled; storage.

controlled-release. Descriptive of a compound manufactured in such a way that its effect will be kept uniform over an extended time period; this not only provides more effective control but also reduces the waste involved in using unnecessarily high concentrations. This principle has been applied successfully to fertilizers, pesticides, pharmaceuticals, flavors, and fragrances. It may involve (1) encapsulation of the agent, (2) incorporating it into a neutral matrix such as a rubber or plastic, (3) coating the particles with sulfur (fertilizers), (4) absorbing it into substrates of various types.

convection. The transfer of heat from one place to another by a moving gas or liquid. Natural convection results from differences in density caused by temperature differences. Thus warm air is less dense than cool air; the warm air rises relative to the cool air, and vice versa. Forced convection involves motion caused by pumps, blowers, or other mechanical devices.

converting. See fabrication.

"Convertit."¹⁷³ Trademark for a liquid invertase preparation.

cooking. (1) Conversion of a foodstuff from the raw, inedible state to a palatable and more readily digestible condition by application of heat, as in boiling, frying, roasting, or baking. One or more chemical and physical changes occur: (1) hydrolysis of collagen in the connective tissue of meats; (2) softening and partial hydrolysis of cellulose and starches to sugars in fruits and vegetables; (3) denaturation and coagulation of proteins in meat, resulting in a less tightly ordered structure and improved texture; (4) coagulation of egg albumin and wheat gluten (bakery products); (5) modification or "shortening" of wheat flour by added fats, which coat the particles to form a laminar structure, thus preventing formation of chains of gluten; (6) evolution of carbon dioxide by the action of leavening agents (yeast, baking powder), which causes "rising" or gas bubbles that are retained by the gluten to form a stable solid foam; (7) browning of meats and bakery products due to reaction of sugars and amino acids (non-enzymatic); (8) deactivation of enzymes and destruction of bacteria; (9) loss or deactivation of water-soluble vitamins in meat and vegetables.

(2) In the paper industry, digestion of wood pulp with such compounds as sodium sulfate, sodium hydroxide, and sodium sulfide to separate the lignin content from the cellulose. See also pulp, paper.

"Coolanol."⁵⁸ Trademark for coolant-dielectric fluids for electronic equipment.

coolant (heat-transfer medium; thermofor). Any liquid or gas having the property of absorbing heat from its environment and transferring it effectively away from its source. Coolants are used in all types of automobiles, as well as in chemical processing and nuclear engineering equipment. One of the most effective and cheapest coolants is water, which is al-

most universally used in automotive and ordinary reaction equipment. Air is also used. Where intense heating requires a more efficient medium, special coolants are used; liquid sodium in nuclear reactors, liquid hydrogen in high-thrust nuclear rocket engines; carbon dioxide, propylene glycol, and "Dowtherm" in chemical processing reactors. Methoxy propanol has been introduced for diesel engines. Some coolants provide antifreeze protection. See also antifreeze.

Coolidge, William D. (1873–1975). American physical chemist, born in Massachusetts. Received degree in electrical engineering at M.I.T. (1896) and doctorate in physics at Leipzig (1899). In 1905 he joined the General Electric Research Laboratory which had been established five years earlier. Here he invented the ductile tungsten filament and developed the use of tungsten in electrical switches and medical x-ray tubes. He also did pioneer research in experimental metallurgy and powder metallurgy. He also had a prominent part in evaluating uranium research (1941) and in setting up the Manhattan project. He was the recipient of many honors and awards, not the least of which was induction into the National Inventors Hall of Fame, in 1975.

coordination compound (complex compound). A compound formed by the union of a metal ion (usually a transition metal) with a nonmetallic ion or molecule called a ligand or complexing agent. The ligand may be either positively or negatively charged (such ions as Cl^- or NH_2NH_3^+), or it may be a molecule of water or ammonia. The most common metal ions are those of cobalt, platinum, iron, copper, and nickel, which form highly stable compounds. When ammonia is the ligand, the compounds are called amines. The total number of bonds linking the metal to the ligand is called its coordination number; it is usually 2, 4, or 6, and often depends on the type of ligand involved. All ligands have electron pairs on the coordinating atom, e.g., nitrogen, that can be either donated to or shared with the metal ions. The metal ion acts as a Lewis acid (electron acceptor) and the ligand as a Lewis base (electron donor). The bonding is neither covalent nor electrostatic, but may be considered intermediate between the two types. The charge on the complex ion is the sum of the charges on the metal ion and the ligands; for example, $4\text{NH}_3 + 2\text{Cl}^- + \text{Co}^{+3}$ forms the complex $[\text{Co}(\text{NH}_3)_4\text{Cl}_2]^+$. The brackets enclose the metal ion and the coordinated ligands. See also chelate; sequestration; metallocene.

coordination number (CN). The number of points at which ligands (q.v.) are attached to the metal ion in a complex. Common coordination numbers are 2, 4, and 6, exemplified by the ions $[\text{Ag}(\text{NH}_3)_2]^+$, $[\text{Ni}(\text{CN})_4]^{2-}$, and $[\text{PdCl}_6]^{2-}$.

copaiba oil.

Properties: Essential oil; colorless to yellowish or bluish; characteristic copaiba-balsam, pepperlike odor; bitter taste. Sp. gr. 0.88–0.91 (15°C); optical rotation -7 to -33° ; refractive index 1.494–1.500; insoluble in water; soluble in 5–6 vols 95% alcohol; soluble in ether, carbon disulfide. Combustible.

Chief constituent: Caryophyllene, a sesquiterpene.

Derivation: Distilled from copaiba balsam.

Grades: Technical; F.C.C.

Hazard: Moderately toxic.

Use: Medicine; flavoring.

copaiba resin. See balsam (3).

copaivic acid $\text{C}_{20}\text{H}_{30}\text{O}_2$. A monobasic acid derived from copaiba balsam.

copal. A group of fossil resins still used to some extent in varnishes and lacquers. Insoluble in oils and water. Most important types are Congo, kauri, and manila.

"Copeenblak."¹³³ Trademark for a series of carbon black dispersions in polyethylene for pigmenting cables and jackets, film and pipe stocks.

701. Pelletized polyethylene carbon black concentrate.

703. High quality colloidal dispersion of carbon black in polyethylene resin, in concentrated pellet form.

"Copel."¹⁶⁶ Trademark for 55-45 copper-nickel alloy used as a resistor material in the construction of electrical instruments where temperature coefficient of resistance must be very low.

copolymer. An elastomer produced by the simultaneous polymerization of two or more dissimilar monomers; as SBR synthetic rubber, from styrene and butadiene.

copper Cu Metallic element of atomic number 29, of group IB of the periodic system; atomic weight 63.546; valences 1, 2; two stable isotopes.

Properties: Distinctive reddish color; sp. gr. 8.96; m.p. 1083°C; b.p. 2595°C; ductile; excellent conductor of electricity. Complexing agent, coordination numbers 2 and 4. Dissolves readily in nitric and hot concentrated sulfuric acid; in hydrochloric and dilute sulfuric acid slowly but only when exposed to the atmosphere. More resistant to atmospheric corrosion than iron, forming a green layer of hydrated basic carbonate. Readily attacked by alkalis. A necessary trace element in human diet; a factor in plant metabolism. Essentially nontoxic in elemental form. Noncombustible except as powder.

Ores: Azurite, azurmalachite, chalcocite, chalcopryrite (copper pyrites), covellite, cuprite, malachite. Michigan, Arizona, Utah, Montana, New Mexico, Nevada; Mexico; Chile; Peru; Canada; Africa; U.S.S.R.

Derivation: Varies with the type of ore. With sulfide ores the steps may be (1) concentration (of low grade ores) by flotation and leaching, (2) roasting, (3) formation of copper "matte" (40–50% Cu), (4) reduction of matte to "blister" copper (96–98%), (5) electrolytic refining to 99.9+% copper.

Forms available: Ingots, sheet, rod, wire, tubing, shot, powder; high purity (impurities less than 10 ppm) as single crystals or whiskers.

Hazard: Toxic and flammable in finely divided form. Tolerance (fume) 0.1 mg per cubic meter; (dusts and mists) 1 mg per cubic meter.

Uses: Electric wiring; switches, plumbing, heating, roofing and building construction; chemical and pharmaceutical machinery; alloys (brass, bronze, Monel metal, beryllium-copper); electroplated protective coatings and undercoats for nickel, chromium, zinc, etc.; cooking utensils; corrosion-resistant piping; insecticides; catalyst; antifouling paints. Flakes used as insulation for liquid fuels. Whiskers used in thermal and electrical composites. For further information refer to Copper and Brass Fabricators Council, 225 Park Ave., New York, N.Y.

copper abietate (cupric abietate) $\text{Cu}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Green scales; soluble in alcohol, and in oils, with fine green color; insoluble in water.

Derivation: Heating copper hydroxide with abietic acid.

Hazard: Moderately toxic.

Uses: Preservative metal paint; fungicide.

copper acetate (cupric acetate; crystals of Venus; verdigris, crystallized) $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Greenish-blue, fine powder. Soluble in water, alcohol and ether. Sp. gr. 1.9; m.p. 115°C ; decomposes at 240°C .

Derivation: Action of acetic acid on copper oxide and subsequent crystallization.

Hazard: Moderately toxic.

Use: Pesticide; catalyst (synthetic rubber).

copper acetate, basic (copper subacetate; verdigris; verdigris, blue; verdigris, green).

Properties: Masses of minute silky crystals either pale green or bright blue in color. Blue variety, approximate formula $(\text{C}_2\text{H}_3\text{O}_2)_2\text{Cu}_2\text{O}$. Green variety, approximate formula $\text{CuO} \cdot 2\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$. Coppery taste. The green rust with which uncleaned copper vessels become coated and which is commonly termed verdigris is a copper carbonate and must not be confused with true verdigris. Apart from its impurities, verdigris is a variable mixture of the basic copper acetates.

Soluble in acids; insoluble in alcohol; very slightly soluble in water.

Derivation: Action of acetic acid on copper in the presence of air.

Hazard: Moderately toxic.

Uses: Paint pigment; insecticide; fungicide; mildew preventive; mordant in dyeing and printing fabrics; copper acetoarsenite.

copper acetoarsenite (cupric acetoarsenite; Paris green; king's green; Schweinfurt green; imperial green) $(\text{CuO})_3\text{As}_2\text{O}_3 \cdot \text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: Emerald-green powder. Soluble in acids; insoluble in alcohol and water. Toxic to many plants.

Derivation: By reacting sodium arsenite with copper sulfate and acetic acid.

Hazard: Highly toxic by ingestion.

Uses: Wood preservative; larvicide.

Shipping regulations: (Rail, Air) Poison label.

copper acetylacetonate (copper 2,4-pentanedione)

$\text{Cu}(\text{C}_5\text{H}_7\text{O}_2)_2$. Crystalline powder; slightly soluble in water and alcohol; soluble in chloroform. M.p. $> 230^\circ\text{C}$. Resistant to hydrolysis. A chelating non-ionizing compound.

copper amalgam.

Properties: Hard, brown leaflets. Contain 74% (approx) mercury and 24% (approx) copper. Soluble in nitric acid.

Use: Dental cement.

copper aminoacetate. See copper glycinate.

copper aminosulfate. See copper sulfate, ammoniated.

copper ammonium acetate (cuprous acetate, ammoniacal). Used in an absorption process for separating butadiene from C_4 streams at refineries, or from by-products of ethylene production.

copper arsenate. Probably the basic cupric arsenate.

Properties: Light blue, blue, or bluish-green powder. Variable composition. Contains 33% (approx) copper and 29% (approx) arsenic. Soluble in dilute acids, ammonium hydroxide; insoluble in alcohol, water.

Hazard: Highly toxic.

Uses: Insecticide; fungicide.

Shipping regulations: (Rail) Arsenical compounds n.o.s., Poison label. (Air) Arsenates, n.o.s., Poison label.

copper arsenite (cupric arsenite; copper orthoarsenite; Scheele's green) CuHAsO_3 ; or, $\text{Cu}_3(\text{AsO}_3)_2 \cdot 3\text{H}_2\text{O}$; variable.

Properties: Fine, light-green powder. Soluble in acids; insoluble in water and alcohol. M.p., decomposes.

Hazard: Highly toxic.

Uses: Insecticide; fungicide.

Shipping regulations: (Rail, Air) Poison label.

copper arsenite, ammoniacal. See chemonite.

copperas. See ferrous sulfate.

copperas, blue. See copper sulfate.

copperas, green. See ferrous sulfate.

copperas, white. See zinc sulfate.

copper benzoate $(\text{C}_6\text{H}_5\text{COO})_2\text{Cu} \cdot 2\text{H}_2\text{O}$.

Properties: Blue, crystalline, odorless powder; slightly soluble in cold water, acids, and alcohol. M.p. (loses H_2O) 110°C .

Derivation: Interaction of solutions of a benzoate and copper salt.

copper-beryllium. See beryllium-copper.

copper, blister. See blister copper.

copper blue. See mountain blue.

copper borate. See copper metaborate.

copper bromide (cupric bromide) CuBr_2 .

Properties: Black crystalline powder or crystals; deliquescent. Soluble in acetone, alcohol, water. M.p. 498°C ; sp. gr. 4.77 (25°C).

Uses: Photography (intensifier); organic synthesis (brominating agent).

copper carbonate (cupric carbonate; copper carbonate, basic; artificial malachite; mineral green. For the native mineral see malachite) $\text{Cu}_2(\text{OH})_2\text{CO}_3$.

Properties: Green powder. Soluble in acids; insoluble in water. Sp. gr. 3.7–4.0; decomposes at 200°C .

Derivation: By adding sodium carbonate to a solution of copper sulfate, filtering and drying.

Grades: Technical; C.P.

Hazard: Toxic by ingestion.

Uses: Pigments; pyrotechnics; insecticides; copper salts; coloring brass black; astringent in pomade preparations; antidote for phosphorus poisoning; smut preventive; fungicide; feed additive (in small amounts).

copper chloride (cupric chloride) (a) CuCl_2 ; (b) $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: (a) Brownish-yellow powder; hygroscopic; (b) green, deliquescent crystals. Soluble in water and alcohol. Sp. gr. (a) 3.386 (25°C); (b) 2.54 (25°C). (a) M.p. 620°C ; at 993°C decomposes to cuprous chloride. (b) Loses $2\text{H}_2\text{O}$ at 100°C .

Derivation: (a) By the union of copper and chlorine. (b) Copper carbonate is treated with hydrochloric acid and the product crystallized.

Grades: Technical; C.P.; reagent.

Hazard: Moderately toxic.

Uses: Isomerization and cracking catalyst; mordant in dyeing and printing fabrics; sympathetic ink; disinfectant; pyrotechnics; wood preservation; fungicides; metallurgy; preservation of pulpwood; de-

odorizing and desulfurizing petroleum distillates; photography; water purification; feed additive. See also cuprous chloride.

copper chromate (cupric chromate, basic) $\text{CuCrO}_4 \cdot 2\text{CuO} \cdot 2\text{H}_2\text{O}$.

Properties: Light chocolate-brown powder. Loses water at 260°C . Soluble in nitric acid; insoluble in water.

Derivation: Action of chromic acid on copper hydroxide.

Hazard: Toxic; a suspected carcinogen. Tolerance, 0.1 mg per cubic meter of air.

Uses: Mordant in dyeing; wood preservative.

copper cyanide (cupric cyanide) $\text{Cu}(\text{CN})_2$.

Properties: Green powder. Keep well stoppered! Soluble in acids and alkalis; insoluble in water.

Derivation: Addition of potassium cyanide to a solution of copper sulfate; cupric cyanide is precipitated. This can be dried, but is not stable.

Grade: Technical.

Containers: Glass bottles; special drums.

Hazard: Toxic. Tolerance (as CN), 5 mg per cubic meter of air.

Uses: Electroplating copper on iron; intermediates (introduction of the cyanide group in place of the amino radical in aromatic organic compounds).

Shipping regulations: (Air) Poison label. (Rail) Consult regulations.

See also cuprous cyanide.

copper, deoxidized (copper, oxygen-free) Copper metal specially treated (as by addition of phosphorus) to remove all or a part of the 0.05% oxygen normally present. It is more ductile than ordinary copper.

copper dichromate (cupric dichromate) $\text{CuCr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Brown-red crystals; soluble in water, alcohol, and ammonium hydroxide. Hygroscopic. Sp. gr. 2.286; loses $2\text{H}_2\text{O}$ at 100°C .

Hazard: Probably toxic.

copper dihydrazinium sulfate $\text{CuSO}_4(\text{N}_2\text{H}_4)_2 \cdot \text{H}_2\text{SO}_4$.

Properties: Bluish powder; m.p. above 300°C , starts to decompose at 140°C ; very slightly soluble in water, 250 ppm at 80°C .

Hazard: Moderately toxic by ingestion or inhalation. Skin and eye irritant.

Use: Foliage fungicide.

copper dimethyldithiocarbamate. See "Cumate."

copper, electrolytic. Copper refined by electrolysis. The purest form of copper available commercially.

copper ethylacetoacetate $\text{Cu}(\text{C}_6\text{H}_5\text{O}_3)_2$.

Properties: Blue-green powder; m.p. $192\text{--}193^\circ\text{C}$. Insoluble in water; soluble in most organic solvents.

Hazard: Moderately toxic.

Use: Fungicide intermediate.

copper ferrocyanide (cupric ferrocyanide) $\text{Cu}_2\text{Fe}(\text{CN})_6 \cdot 7\text{H}_2\text{O}$.

Properties: Reddish-brown powder; insoluble in water and acids; soluble in NH_4OH and KCN solutions. Low toxicity.

Uses: Pigment in paints and enamels; analytical test for traces of copper; inorganic osmotic membranes.

copper fluoride (cupric fluoride) $\text{CuF}_2 \cdot 2\text{H}_2\text{O}$. The anhydrous form, CuF_2 , is also available.

Properties: Blue crystals. Slightly soluble in water; soluble in acids and alcohol. Sp. gr. 2.93 (25°C).

Derivation: (1) By decomposing copper carbonate with hydrofluoric acid and subsequent crystallization; (2) fluorination of copper hydroxyfluoride at 525°C .

Grade: Technical.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Ceramics; enamels; welding and brazing fluxes; additive to cast iron; high-energy batteries.

copper fluosilicate (copper silicofluoride; cupric fluosilicate; cupric silicofluoride) $\text{CuSiF}_6 \cdot 4\text{H}_2\text{O}$.

Properties: Blue, hygroscopic crystals. Soluble in water; slightly soluble in alcohol. Sp. gr. 2.158; decomposed by heat.

Derivation: Interaction of copper hydroxide and hydrofluosilicic acid.

Method of purification: Crystallization.

Grades: Technical.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Dyeing and hardening white marble; treating grape vines for "white disease."

copper glance. See chalcocite.

copper gluconate (cupric gluconate)

$[\text{CH}_2\text{OH}(\text{CHOH})_4\text{COO}]_2\text{Cu}$.

Properties: Odorless, light blue, fine, crystalline powder. Soluble in water; insoluble in acetone, alcohol, and ether. Low toxicity.

Grades: Pharmaceutical; F.C.C.

Containers: Cans; 25-lb fiber drums.

Uses: Medicine; feed additive; nutrient; dietary supplement.

copper glycinate (copper aminoacetate)

$(\text{NH}_2\text{CH}_2\text{COO})_2\text{Cu}$.

Properties: Blue triboluminescent crystals; m.p. 130°C . Slightly soluble in water and alcohol; insoluble in hydrocarbons, ethers and ketones.

Grades: Anhydrous; hydrate.

Uses: Catalyst for rapid biochemical assimilation of iron; electroplating baths.

copper hemioxide. See copper oxide, red.

copper hydrate. See copper hydroxide.

copper hydroxide (cupric hydroxide; copper oxide; hydrated; copper hydrate) $\text{Cu}(\text{OH})_2$.

Properties: Blue powder. Soluble in acids and ammonium hydroxide; insoluble in water. Sp. gr. 3.368; m.p., decomposes.

Derivation: Interaction of a solution of a copper salt with an alkali.

Grade: Technical.

Hazard: Moderately toxic.

Uses: Copper salts; mordant; cuprammonium rayon; pigment; staining paper; feed additive; pesticide and fungicide.

copper 8-hydroxyquinoline. See copper 8-quinolinolate.

"**Copper Inhibitor 50.**"²⁸ Trademark for 50% dialcylalpropylenediamine, and 50% aromatic solvent. Used to prevent catalytic action of copper on oxidation of natural and synthetic rubbers.

Hazard: Flammable, moderate fire risk.

copper iodide. See cuprous iodide.

"Copperized CZC Chromated Zinc Chloride."²⁸ Trademark for a wood preservative and flame retardant containing cupric chloride, zinc chloride, and sodium dichromate.

copper lactate (cupric lactate) $\text{Cu}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Greenish-blue crystals or granular powder; soluble in water and ammonium hydroxide.

Hazard: Toxic by ingestion.

Uses: Source of copper in copper plating; fungicides.

copper mercury iodide. See mercuric cuprous iodide.

copper metaborate (copper borate; cupric borate) $\text{Cu}(\text{BO}_2)_2$.

Properties: Bluish-green, crystalline powder; insoluble in water; soluble in acids. Sp. gr. 3.859.

Derivation: Interaction of copper hydroxide and boric acid.

Grades: Technical; C.P.

Hazard: Toxic by ingestion.

Uses: Oil pigments; painting on porcelain; insecticides (especially wheat-rust compounds).

copper methane arsenate $\text{CH}_3\text{AsO}_3\text{Cu}$.

Properties: Greenish solid.

Derivation: Reaction of disodium methyl arsenate with copper salts.

Hazard: Highly toxic by ingestion.

Use: Algicide.

Shipping regulations: (Rail) Arsenical compounds, n.o.s., Poison label. (Air) Arsenates, n.o.s., Poison label.

copper molybdate CuMoO_4 . Crystals; density 3.4 g/cc; m.p. ca. 500°C. Insoluble in water.

Grade: 99.98% pure. Electronic and optical equipment.

Uses: Paint pigment and protective coatings; corrosion inhibitor.

copper monoxide. See copper oxide, black.

copper naphthenate.

Properties: Green-blue solid. High germicidal power. Soluble in gasoline, benzene, and mineral oil distillates.

Derivation: Addition of solution of cupric sulfate to aqueous solution of sodium naphthenate.

Grades: 6, 8, 11½% copper.

Containers: 1- to 55-gal drums.

Hazard: Moderately toxic by ingestion. Flammable, moderate fire risk (solution).

Uses: Wood, canvas, and rope preservative; insecticide; fungicide; antifouling paints.

See also soap (2).

copper nitrate (cupric nitrate) (a) $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$; (b) $\text{Cu}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Blue, deliquescent crystals. Soluble in water and alcohol. Sp. gr. (a) 2.32 (25°C); (b) 2.074. M.p. (a) 114.5°C; (b) loses $3\text{H}_2\text{O}$ at 26.4°C; (a) decomposes 170°C.

Derivation: By treating copper or copper oxide with nitric acid. The solution is evaporated and product recovered by crystallization.

Grades: Technical; C.P.

Hazard: Moderately toxic. Oxidizing material; in contact with organic materials it may cause violent combustion or explosion.

Uses: Medicine; preparation of light-sensitive papers; analytical reagent; dyes; insecticide for vines; coloring copper black; electroplating; production of burnished effect on iron; paints, varnishes, enamels; pharmaceutical preparations; textiles; catalyst.

Shipping regulations: Nitrates, n.o.s. (Rail) Yellow label. (Air) Oxidizer label.

copper nitrite. (copper nitrite, basic; cupric nitrite) $\text{Cu}(\text{NO}_2)_2 \cdot 3\text{Cu}(\text{OH})_2$; variable.

Properties: Green powder. Decomposes at 120°C. Soluble (with decomposition) in dilute acids, ammonium hydroxide; slightly soluble in water.

copper nitrite, basic. See copper nitrite.

copper octoate. See soap (2).

copper oleate (cupric oleate) $\text{Cu}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown powder or greenish-blue mass. Soluble in ether; insoluble in water. Combustible.

Derivation: Interaction of copper sulfate and sodium oleate.

Hazard: Moderately toxic.

Uses: Medicine; preserving fish nets and marine lines; fungicide; insecticide; ore flotation agent.

See also soap (2).

copper oxide, black (cupric oxide; copper monoxide)

CuO . For native black copper oxide see tenorite.

Properties: Brownish-black powder. Soluble in acids; difficultly soluble in water. Sp. gr. 6.32; decomposes at 1026°C.

Derivation: Ignition of copper carbonate or copper nitrate.

Grades: Technical; C.P.

Hazard: Toxic by ingestion.

Uses: Ceramic colorant; reagent in analytical chemistry; insecticide for potato plant; catalyst; purification of hydrogen; batteries and electrodes; aromatic acids from cresols; electroplating; solvent for chromic iron ores; desulfurizing oils; rayon; medicine; paints.

copper oxide, hydrated. See copper hydroxide.

copper oxide, red. (cuprous oxide; copper protoxide; copper hemioxide; copper suboxide) Cu_2O . For the native ore see cuprite.

Properties: Reddish-brown octahedral crystals. Soluble in acids and ammonium hydroxide; insoluble in water. Sp. gr. 5.75-6.09; m.p. 1235°C; b.p. 1800°C.

Derivation: (a) Oxidation of finely divided copper. (b) Addition of bases to cuprous chloride. (c) Action of glucose on cupric hydroxide.

Grades: Technical; C.P.; 97% min (for pigments); also USN Type I (97%); USN Type II (90%).

Hazard: Toxic by ingestion.

Uses: Copper salts; ceramics; porcelain red glaze; red glass; electroplating; antifouling paints; fungicide.

copper oxinate. See copper 8-quinolinolate.

copper oxychloride (cupric oxychloride) composition variable, possibly $3\text{CuO} \cdot \text{CuCl}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$.

Properties: Bluish-green powder. Soluble in acids, ammonia; insoluble in water.

Hazard: Toxic by ingestion.

Use: Pigment; pesticide; fungus control in grapevines.

copper 2,4-pentanedione. See copper acetylacetonate.

copper phenolsulfonate (copper sulfocarbonate)

$[\text{C}_6\text{H}_4(\text{OH})\text{SO}_3]_2\text{Cu} \cdot 6\text{H}_2\text{O}$.

Properties: Green prismatic crystals. Soluble in water and alcohol. Combustible.

Derivation: Interaction of barium phenolsulfonate and copper sulfate.

Use: Medicine.

copper phosphate (copper orthophosphate) $\text{Cu}_3(\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$.

Properties: Light-blue powder. Soluble in acids, ammonium hydroxide; insoluble in water.

Hazard: Toxic by ingestion.

Uses: Analysis; medicine; fungicide.

copper phosphide Cu_3P_2 .

Properties: Grayish-black, metallic powder. Insoluble in water; soluble in nitric acid; insoluble in hydrochloric acid. Sp. gr. 6.67.

Derivation: By heating copper and phosphorus.

Hazard: Dangerous; spontaneously flammable and toxic phosphine is evolved on reaction with water.

Use: Manufacturing phosphor-bronze.

copper phthalate $\text{C}_8\text{H}_4\text{O}_4\text{Cu}$.

Properties: Fine blue powder; assay, minimum 95%; insoluble or very slightly soluble in common organic solvents or water. Combustible.

Hazard: Toxic by ingestion.

Use: Fungicide.

copper phthalocyanine blue. See Pigment Blue 15.**copper phthalocyanine green.** See Pigment Green 7.**copper potassium ferrocyanide** (potassium copper ferrocyanide) $\text{K}_2\text{CuFe}(\text{CN})_6 \cdot \text{H}_2\text{O}$.

Properties: Brownish-red powder. Insoluble in water. Used for pigment. Low toxicity.

copper protoxide. See copper oxide, red.**copper pyrites.** See chalcopyrite.**copper 8-quinolinolate** (copper-8; copper oxinate; copper 8-hydroxyquinoline) $\text{Cu}(\text{C}_9\text{H}_6\text{ON})_2$.

Properties: Yellow-green nonhygroscopic, odorless powder. Insoluble in water. Somewhat soluble in weak acids, soluble in strong acids. Insoluble in most organic solvents, but somewhat soluble in pyridine and quinoline. Solubilized copper-8 refers to the product formed by heating copper-8-quinolinolate with certain organic acids (naphthenic, lactic, stearic, etc.) or their salts. In such products the copper-8-quinolinolate does not settle out on standing, even after dilution with various solvents.

Derivation: From 8-quinolinol and copper salt such as copper acetate.

Grade: 10% active salt (1.8% Cu), solubilized.

Containers: Drums.

Hazard: May be toxic.

Uses: Fungicide and mildew-proofing of fabrics; analysis for copper.

copper resinate (cupric resinate).

Properties: Green powder. Soluble in ether and oils; insoluble in water. Combustible.

Derivation: By heating copper sulfate and rosin oil and filtering and drying the precipitate.

Hazard: Moderately toxic.

Uses: Antifouling paints; insecticide.

See also soaps (2).

copper ricinoleate $\text{Cu}(\text{C}_{17}\text{H}_{32}\text{OHCOO})_2$. Green plastic solid; soluble in water and aliphatic hydrocarbons; partially soluble in alcohols and glycols; soluble in ketones and aromatic hydrocarbons. Softening point 64°C . Combustible.

Hazard: Toxic by ingestion.

Uses: Fungicides; insecticides.

copper scale. A coating formed on copper after heating, composed of cupric and cuprous oxides.**copper selenate** (cupric selenate) $\text{CuSeO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Light-blue crystals. Soluble in acids, ammonium hydroxide, water; insoluble in alcohol. Sp. gr. 2.559. Loses $4\text{H}_2\text{O}$ at $50\text{--}100^\circ\text{C}$.

copper silicate. A complex mixture precipitated by solutions of copper salts from sodium silicate solutions. Used in pigments, catalysts and insecticides.

copper silicide. See silicon-copper.**copper silicofluoride.** See copper fluosilicate.**copper sodium chloride** (sodium copper chloride) $\text{CuCl}_2 \cdot 2\text{NaCl} \cdot 2\text{H}_2\text{O}$.

Properties: Light-green crystals. Soluble in water.

copper sodium cyanide. See sodium-copper cyanide.**copper stearate** (cupric stearate) $\text{Cu}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: Light blue powder. Soluble in ether, chloroform, benzene and turpentine; insoluble in water. M.p. 125°C . Combustible.

Derivation: By the interaction of copper sulfate and sodium stearate.

Hazard: Moderately toxic.

Uses: Bronzing plaster statues; paint; see also soaps (2).

copper subacetate. See copper acetate, basic.**copper suboxide.** See copper oxide, red.**copper sulfate** (cupric sulfate; blue vitriol; blue stone; blue copperas) $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$.

Properties: Blue crystals or blue crystalline granules or powder, slowly efflorescing in air; white when dehydrated; nauseous metallic taste. Soluble in water, methanol; slightly soluble in alcohol and glycerol. Sp. gr. 2.284.

Derivation: Action of dilute sulfuric acid on copper or copper oxide (often as oxide ores) in large quantities, with evaporation and crystallization.

Method of purification: Recrystallization.

Grades: Technical; C.P.; N.F.; also sold as monohydrate. Available as crystals or powder.

Containers: Multiwall paper sacks; drums.

Hazard: Toxic by ingestion.

Uses: Agriculture (soil additive, pesticides, Bordeaux mixture); feed additive; germicides; textile mordant; leather industry; pigments; electric batteries; electroplated coatings; copper salts; reagent in analytical chemistry; medicine; wood preservative; preservation of pulp wood and ground pulp; process engraving and lithography; ore flotation; petroleum industry; synthetic rubber; steel manufacture; treatment of natural asphalts. The anhydrous salt is used as a dehydrating agent.

copper sulfate, ammoniated (cupric ammonia sulfate; ammonio-cupric sulfate; copper aminosulfate) $\text{Cu}(\text{NH}_3)_4\text{SO}_4 \cdot \text{H}_2\text{O}$.

Properties: Dark blue, crystalline powder; decomposes in air; soluble in water; insoluble in alcohol.

Derivation: By dissolving copper sulfate in ammonium hydroxide and precipitating with alcohol.

Hazard: Toxic by ingestion.

Uses: Calico printing; manufacturing copper arsenate; insecticide; treating fiber products.

copper sulfate, tribasic $\text{CuSO}_4 \cdot 3\text{Cu}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: Aqua colored powder of extremely fine particle size; water-insoluble; stable in storage; forms essentially neutral water dispersion.

Hazard: Toxic by ingestion.

Uses: A fixed copper fungicide. Also micronutrient for plants. Compatible with DDT, arsenicals, organic insecticides, sulfur and cryolite. Used as spray or dust. Does not inhibit photosynthesis.

copper sulfide (cupric sulfide) CuS .

Properties: Black powder or lumps. Soluble in nitric acid; insoluble in water. Occurs as the mineral covellite. Sp. gr. 3.9–4.6; decomposes 220°C .

Derivation: By passing hydrogen sulfide gas into a solution of a copper salt.

Hazard: Toxic by ingestion.

Uses: Antifouling paints; dyeing with aniline black.

See also cuprous sulfide.

copper sulfocarbolate. See copper phenolsulfonate.

copper sulfocyanide. See cuprous thiocyanate.

copper tallate. See soaps (2).

copper trifluoroacetylacetonate

$\text{Cu}[\text{OC}(\text{CH}_3)_2\text{CHCO}(\text{CF}_3)]_2$.

Properties: Solid; m.p. $188\text{--}190^\circ\text{C}$.

Hazard: May be toxic.

Uses: Metal analysis standards, vapor phase deposition of metals, laser studies.

copper tungstate (cupric tungstate) $\text{CuWO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Light-green powder; soluble in ammonium hydroxide; slightly soluble in acetic acid; insoluble in alcohol and water.

copper, yellow. See chalcopyrite.

copper zinc chromate. Variable in composition. Used as a fungicide.

"Coppralyte."²⁸ Trademark for a group of products for electroplating copper.

"Coprantine."⁴⁴³ Trademark for dyes requiring after-treatment with copper compounds.

copra oil. The name applied to lower grades of coconut oil (q.v.).

"Co-Ral."¹⁸¹ Trademark for O,O-diethyl-O-3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl phosphorothioate.

"Coral."²⁷⁸ Trademark for a stereospecific polyisoprene rubber consisting essentially of cis-1, 4-polyisoprene.

Properties: Similar to those of natural rubber, both unvulcanized and vulcanized.

Use: Replacement for natural rubber.

coral. Skeletons of the coral polyps found in the warmer oceans and consisting mainly of calcium carbonate colored with ferric oxide. Coral rock is porous. It occurs in the form of reefs east of Australia, and at other locations in the southwest Pacific. It has been found to be the habitat of organisms that are rich in prostaglandins (q.v.).

Hazard: Toxic; will infect open wounds.

Uses: Building stone; cement; road and air field construction; jewelry, etc.

"Coramine."³⁰⁵ Trademark for nikethamide.

"Coray."⁵¹ Trademark for a series of general-purpose naphthenic base oils that serve as lubricants, in process applications, and as components in proprietary formulations.

"Corcel" 46^{19a} Trademark for cellular glass microspheres in the form of fine white powder, obtained by beneficiation of a natural siliceous earth; has high water absorption value, low thermal conductivity, bulk density of 3 to 4.5 lb/cubic foot. Used as filler for plastics, thermal insulating material, admixture for concrete, surface coatings and catalyst carrier.

"Cordex."⁷⁴ Trademark for a cordage oil solution of copper naphthenate containing 8% copper metal.

Use: Fungicide.

cordite. A smokeless powder which is a mixture of nitrocellulose and nitroglycerin with about 5% petrolatum added to thicken and stabilize the mixture. Materials are dissolved in acetone and mixed. Evaporation of the excess acetone leaves a gelatinous mass which is extruded into cords.

Shipping regulations: (Rail, Air) Not listed. Consult regulations.

"Corephen 10."⁴⁷⁰ Trademark for phenol formaldehyde condensation product; used as vehicle in highly acid-resistant paints.

"Coresinblak No. 3."¹³³ Trademark for a paste consisting of a jet black impingement carbon thoroughly dispersed in an alkyd resin. Composition: 18% carbon black, 32% alkyd resin, and 50% solvent. Compatible with most medium and short oil alkyds.

Containers: 40- and 400-lb metal drums.

Use: For making high grade enamels, both air dry and baking.

"Corexit."²⁹ Trademark for a nonionic surfactant designed to disperse oil slicks on sea water. Can be applied in spray form. Claimed to be nontoxic to marine organisms.

"CoRezyn."⁴⁶³ Trademark for a variety of polymer resins tailored for specific uses, and for materials used with the polymers in making finished products.

"Corgard."²⁰ Trademark for a borosilicate glass armored with an opaque, filament-wound laminate of glass fiber and a modified polyester resin.

"Corial Bottom."³⁰⁷ Trademark for a series of leather-finishing agents consisting of plasticized acrylic resin emulsion; 40–41% solids.

coriander oil.

Properties: An essential oil. Colorless or slightly yellowish liquid; aromatic odor; warm, spicy taste. Soluble in alcohol, ether, and chloroform. Sp. gr. 0.863–0.878; refractive index 1.4665 (20°C); optical rotation $+8$ to $+15^\circ$. May be irritating when ingested. Combustible.

Chief known constituents: Linalool; pinene.

Derivation: Distilled from the fruit of *Coriandrum sativum*.

Grades: Technical; U.S.P.; F.C.C.

Containers: Tins; glass bottles.

Use: Flavoring (gin).

coriandrol. See *d*-linalool.

Cori ester. See glucose 1-phosphate.

cork. A form of cellulose comprising the light outer bark of the oak tree known as *Quercus suber*. It grows naturally in southern Europe and northern Africa and has been cultivated in southwestern U.S. Its special properties are extreme lightness, relative imperviousness to water, resilient structure, and low rate of heat transfer. These account for its usefulness as bottle stoppers, insulation, wallboard, life preservers, gaskets, and sound-deadening insertions. Specific gravity about 0.4. Combustible; nontoxic.

corkboard. A mixture of ground cork and paper pulp formed into thick sheets for insulating purposes.

"Corlar."²⁸ Trademark for chemical resistant finishes having a base of polyamide catalyzed epoxy resins.

corn oil (maize oil).

Properties: Pale yellow liquid; characteristic taste

and odor. Insoluble in water; soluble in ether, chloroform, amyl acetate, benzene, and carbon disulfide and slightly soluble in alcohol. Sp. gr. 0.914–0.921; saponification value 188–193; iodine value 102–128. Flash point 490°F. Combustible. Nontoxic and non-drying. Moderate tendency to spontaneous heating. Chief constituents: linoleic and oleic acids (unsaturated), palmitic and stearic (saturated).

Derivation: The germ of common corn (Indian corn, Zea mays) is removed from the grain and pressed.

Grades: Crude; refined; U.S.P.; technical.

Containers: Drums; tank cars.

Uses: Foodstuffs; soap; lubricants; leather dressing; factice; margarine; salad oil; hair dressing; solvent.

cornstarch. A carbohydrate polymer derived from corn of various types; composed of 25% amylose and 75% amylopectin; a white powder which swells in water. It is the most widely used starch in the U.S. The so-called waxy variety (made from waxy corn) contains only branched amylopectin molecules. Its chief uses are as a source of glucose; in the food industry as a filler in baking powder and thickening agent in various food products and in adhesives and coatings. It has been proposed as an additive to plastics to promote rapid degradation in such products as bottles and waste containers. See also starch.

corn steep liquor. The dilute aqueous solution obtained by soaking corn kernels in warm 0.2% sulfur dioxide solution for 48 hours as the first step in the recovery of corn starch, corn oil, and gluten from corn. The solution contains mineral matter as well as soluble organic material extracted from the corn. It is used as a growth medium for penicillin and other antibiotics, and it is also concentrated and used as an ingredient of cattle feeds.

corn sugar. See dextrose.

corn syrup. See glucose syrup.

"Corobex."¹⁵⁹ Trademark for a series of organotin salt compounds, phenylmercuric salt compounds and quaternary compounds used as bacteriostatic and fungistatic finish in the textile, plastics, and rubber industries.

Hazard: Probably toxic by ingestion.

corona. An electrical discharge effect which causes ionization of oxygen and the formation of ozone. It is particularly evident near high-tension wires and in spark-ignited automotive engines. The ozone formed can have a drastic oxidizing effect on wire insulation, cable covers and hose connections; for this reason such accessories are made of oxidation-resistant materials such as nylon, neoprene, and other synthetics.

"Corragel."⁹⁹ Trademark for a colloidal clay that functions as a unique starch adhesive additive.

corresponding states (reduced states). Two substances are in corresponding states when their pressures, volumes (or densities) and temperatures are proportional, respectively, to their critical pressures, volumes (or densities) and temperatures. If any two of these ratios are equal, the third must also be equal. This principle has been useful in the development of physical and thermal properties of substances.

corrosion. (1) The electrochemical degradation of metals or alloys due to reaction with their environment; it is accelerated by the presence of acids or

bases. In general, the corrodability of a metal or alloy depends upon its position in the activity series (q.v.). Corrosion products often take the form of metallic oxides; in the case of aluminum and stainless steel, this is actually beneficial, for the oxide forms a strongly adherent coating which effectively prevents further degradation. Hence these metals are widely used for structural purposes. The rusting of iron is a familiar example of corrosion, which is catalyzed by moisture. Acidic soils are highly corrosive; sulfur is a corrosive agent in automotive fuels and in the atmosphere (as SO₂). Sodium chloride in the air at locations near the sea is also strongly corrosive, especially at temperatures above 70°F. Copper, nickel, chromium, and zinc are among the more corrosion-resistant metals, and are widely used as protective coatings for other metals. (See also tarnish). Excellent corrosion-resistant alloys are stainless steel (18 Ni-8Cr), monel metal (66 Ni-34Cu) and duralumin. See also protective coatings; paints.

(2) The destruction of body tissues by strong acids and bases. See corrosive material.

"Corrosion Inhibitor CS."¹⁰⁸ Trademark for a synergistic combination of sodium nitrate-borax and organic inhibitors; used to prevent corrosion of ferrous and non-ferrous metal and alloy surfaces in low-make-up closed cooling and heating systems.

"Corrosion Inhibitor NPA."²¹⁹ Trademark for nonyl-phenoxyacetic acid.

corrosive sublimate. Obsolete term for mercuric chloride.

corrosive material. Any solid, liquid, or gaseous substance that burns, irritates, or destructively attacks organic tissues, most notably the skin and, when taken internally, the lungs and stomach. Among the more widely used chemicals that have corrosive properties are the following:

acetic acid, glacial	hydrofluoric acid
acetic anhydride	nitric acid
bromine	potassium hydroxide
chlorine	sodium hydroxide
fluorine	sulfuric acid
hydrochloric acid	

See also toxic materials

"Corrosol."⁵²⁶ Trademark for phosphoric acid-type metal conditioners and rust removers used to remove rust from steel and prepare it for further processing or prepare normally nonreceptive zinc and aluminum surfaces for paint.

"Cortate."³²¹ Trademark for deoxycorticosterone acetate.

"Cortef."³²⁷ Trademark for hydrocortisone.

corticoid hormone. A hormone produced or isolated from the cortex (external layer) of the adrenal gland. Corticoid hormones now used in medicine include cortisone, hydrocortisone, deoxycorticosterone, fludrocortisone, prednisone, prednisolone, methyl prednisolone, triamcinolone, dexamethasone, corticotropin (ACTH), and aldosterone. Some occur naturally in adrenal extract; others are modifications of the natural hormones. All are now made synthetically. They are derivatives of cyclopentanophenanthrene.

See also cortisone, ACTH.

corticosterone $C_{21}H_{30}O_4$. One of the less active adrenal cortical steroid hormones.

Properties: Crystalline plates; m.p. 180–182°C. Soluble in organic solvents; insoluble in water.

Derivation: Isolation from adrenal cortex extract; synthesis from deoxycholic acid.

Use: Biochemical research.

corticotropin. See ACTH.

"Cortifan."³²¹ Trademark for hydrocortisone (q.v.).

cortisol. See hydrocortisone.

cortisone (11-dehydro-17-hydroxycorticosterone)

$C_{21}H_{28}O_5$. An adrenal cortical steroid hormone. It affects carbohydrate and protein metabolism.

Properties: White crystalline solid; m.p. 220–224° (dec). Dextrorotatory in solutions. Slightly soluble in water; sparingly soluble in ether, benzene, and chloroform; fairly soluble in methanol, ethanol, and acetone.

Derivation: From adrenal gland extract (usually from cattle) (historical method); synthetically, from bile acids, from other steroids or sapogenins.

Hazard: May have damaging side effects, e.g., sodium retention.

Use: Medicine (usually as acetate salt) in treatment of acute arthritis, Addison's disease, inflammatory diseases of eyes and skin, and others.

"Cortogen" Acetate.³²¹ Trademark for cortisone acetate.

"Cortone."¹²³ Trademark for cortisone (q.v.).

"Cortril."²⁹⁹ Trademark for hydrocortisone (q.v.).

corundum (emery) Al_2O_3 . Natural aluminum oxide, sometimes with small amounts of iron, magnesium, silica, etc.

Occurrence: New York; Greece; Asia Minor.

Hazard: Slight, by inhalation. A nuisance dust.

Use: Various polishing and abrasive operations; grinding wheels.

See also aluminum oxide; diaspore; sapphire.

corynine. See yohimbine.

cosmetic. Any preparation in the form of a liquid, semi-liquid, paste, or powder applied to the skin to improve its appearance, and for cleaning, softening or protecting the skin or its adjuncts, but without specific medicinal or curative effects; they include hairsprays, shampoos, nail polish, deodorants, shaving creams, facial creams, dusting powders, rouge, etc. Detergents such as common soap and bactericidal agents are not themselves classed as cosmetics, though they may be components of cosmetic mixtures. A partial list of cosmetic ingredients is the following:

- animal fats (lanolin)
- vegetable oils, waxes
- alcohols (glycerol, glycols)
- surfactants (alkyl sulfonates)
- UV blocking agents (PABA)
- pnehylenediamine
- aluminum chlorohydrate
- FDC organic dyes
- talc (magnesium silicate)
- essential oils
- inorganic pigments
- chlorophyllins
- nitrocellulose lacquers
- steroid hormones

Knowledge of the structure and function of the skin is essential for proper cosmetic formulation (cosmeticology). All ingredients must be tested for possible toxic effects, since the skin is an important means of access for poisons. Addition of proteins to cosmetic preparations is of questionable value.

"Cosmo."⁵²⁸ Trademark for imitation flavors made from essential oils and synthetic chemicals with alcohol and propylene glycol as solvents.

cosmochemistry. See astrochemistry; chemical planetary.

"Cosol."²¹ Trademark for high-boiling coal-tar solvents for use in alkyd resin enamels and synthetic lacquers.

"Costyreneblak."¹³³ Trademark for a series of carbon black-polystyrene dispersions. Used for coloring polystyrene scrap. Available in chip form in several grades.

cotton. Staple fibers, surrounding the seeds of various species of *Gossypium*. Both Egyptian and Sea Island cotton have unusually long staple (about 2 inches). Cotton is the major textile fiber and an important source of cellulose, which constitutes 88–96% of the fiber. So-called "absorbent cotton" is almost pure cellulose.

Properties: Tenacity, 3 to 6 g per denier (dry), 4 to 8 g per denier (wet); elongation 3–7%; sp. gr. 1.54; moisture regain 7% (70°F, 65% relative humidity); yellows slowly at 250°F, decomposes about 300°F; low permanent set; decomposed by acids; swells in caustic but is undamaged. Soluble in cuprammonium hydroxide. Subject to mildew. May be dyed by direct, vat, azoic, sulfur, and basic dyes. Combustible.

Sources: United States; Brazil; Egypt; India.

Hazard: Moderately toxic and flammable in the form of dust or linters; fiber ignites readily. Tolerance (dust), 0.2 mg per cubic meter of air.

Uses: Apparel; industrial and household fabrics; automobile tires; upholstery; medicine.

Shipping regulations: (as lintens, hulls, or oily waste) (Rail) Yellow label. Not acceptable by express. (Air) Not acceptable. See also cellulose.

cotton, acetylated. Cotton fibers, threads, or fabrics treated with acetic anhydride, acetic acid, and perchloric and catalyst to improve the heat, rot, and mildew resistance by forming a surface coating of cellulose acetate.

Hazard: Ignites readily; not self-extinguishing.

cotton, aminized. A cotton fabric produced by reacting 2-aminoethylsulfuric acid with the cellulose of the fabric in a strongly alkaline solution. The treated cotton can take acid wool dyes and can be made rot-resistant and water-repellent.

cotton, cyanoethylated. Cotton treated with acrylonitrile; it is passed through a caustic bath, which induces mild swelling of the fiber and catalyzes the subsequent reaction with acrylonitrile. The fabric is then neutralized with acetic acid, washed and dried. The treatment leaves 3–5% nitrogen attached to the cellulose polymer. The cyanoethylated fiber is claimed to have permanent rot- and mildew-resistance, greater retention of strength after exposure to heat, improved receptiveness to dyes, and higher abrasion- and stretch-resistance.

cotton lintens. Short fleecy fibers which adhere to cottonseed after it has been passed once through a cotton-gin. They are removed from the seed by a second ginning.

Hazard: Flammable, dangerous fire risk.

Uses: Rayon manufacture; cellulosic plastics; nitro-cellulose lacquers; soil-cement binder in road construction; explosives.

Shipping regulations: (Rail, Air) Consult regulations.

cotton, mercerized. Cotton which has been strengthened by passing through a 25 to 30% solution of sodium hydroxide under tension, and then washed with water while under tension. This causes the fibers to shrink, increases their strength and attraction for colors, as well as imparting luster. A process using liquid ammonia for this purpose has been introduced in the U.K.

cotton oil (cotton spraying oil). A compounded oil sprayed (in the form of a fine-mist) onto cotton to condition the fibers for yarn-making operations. Used to lubricate the fibers, to reduce static, "fly," and dust and generally improve the suppleness and strength of the fibers.

cottonseed. The seed of the cotton plant, *Gossypium hirsutum*. It contains about 22% crude fiber, 20% protein, 20% oil, 10% moisture, and 24% nitrogen-free extract; also contains from 1 to 2% of toxic pigment gossypium (q.v.); specially processed kernels are free of this principle.

Hazard: Generates dangerous amounts of heat if piled or stored wet or hot. Powerful allergen; may cause asthma and other respiratory difficulty on inhalation.

Uses: Source of cottonseed oil and meal; cotton linters; source of nutritional protein after removal of gossypol by centrifugation.

Shipping regulations: (Air) Consult regulations.

cottonseed meal (cottonseed cake). The pulverized cottonseed press cake. Depending on the extractive process, varying percentages of protein will remain in the meal and it is normally sold with 36 to 45% protein content. The 42% product contains approximately 42% crude protein; 6% crude fiber; 25% nitrogen-free extract; 10% ether extract (fat) and 7% ash. The total digestible nutrient averages 79%. The ash is high in potash and phosphate; some types contain the toxic principle gossypium (q.v.).

Containers: Bulk or bags.

Uses: Animal feeds; fertilizer ingredient; filler for plastics.

cottonseed oil.

Properties: Pale yellow or yellowish-brown to dark ruby-red or black-red, fixed, semi-drying oil depending on the nature and condition of the seed. The pure oil is odorless and has a bland taste. Soluble in ether, benzene, chloroform and carbon disulfide; slightly soluble in alcohol. Sp. gr. 0.915–0.921; solidification range 31–35°C; saponification value 190–198; iodine value 109–116. Flash point 486°F. Combustible.

Chief constituents: Glycerides of palmitic, oleic and linoleic acids.

Derivation: From cotton seeds by hot-pressing or solvent extraction.

Grades: Crude; refined; prime summer yellow; bleachable; U.S.P.

Containers: Drums; tank cars.

Uses: Leather dressing; soap stock; lubricant; glycerol; base for cosmetic creams; hydrogenated to semisolid for use in food products; waterproofing compositions.

Cottrell, Frederick G. (1877–1948). A native of California, Cottrell obtained his doctorate from Liebig in 1902. His major contribution to industrial chemistry was his discovery of a practical method of dust elimination by electrical precipitation. Used in factory stacks and other large units, this process has contributed greatly to purifying the atmosphere of industrial areas. The principle involves charging a suspended wire with electricity. This creates a field which ionizes the surrounding air, the particles assuming the charge on contact and then moving to the wall of the stack where they are electrically discharged and precipitated.

coumaphos. Generic name for O,O-diethyl-O-(3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl)phosphorothioate; $C_9H_3O_2(CH_3)_2ClOPS(OC_2H_5)_2$.

Properties: Crystals; m.p. 95°C. Insoluble in water; soluble in aromatic solvents. Cholinesterase inhibitor.

Hazard: Toxic. Use may be restricted.

Uses: Insecticide; anthelmintic.

coumarin (cumarin; benzopyrone; tonka bean compound) $C_9H_6O_2$. A lactone.

Properties: Colorless crystals, flakes or powder; fragrant odor similar to vanilla; bitter, aromatic burning taste; m.p. 69°C; b.p. 290°C. Soluble in 10 vols of 95% alcohol, in ether, chloroform, and fixed volatile oils; slightly soluble in water. Combustible.

Derivation: (a) By heating salicylic aldehyde, sodium lactate and acetic anhydride; (b) fine grades are isolated from Tonka beans.

Hazard: Toxic. Use in food products prohibited (FDA).

Uses: Deodorizing and odor-enhancing agent; pharmaceutical preparations.

coumarone (benzofuran). C_8H_6O . A bicyclic ring compound derived from coal-tar naphtha; the parent substance of coumarone-indene resins (q.v.).

coumarone-indene resin. A thermosetting resin derived by heating a mixture of coumarone and indene (q.v.) with sulfuric acid, which induces polymerization. At room temperature it is soft and sticky; on heating it hardens to a resinous solid. Soluble in hydrocarbon solvents, pyridine, acetone, carbon disulfide and carbon tetrachloride; insoluble in water and alcohol. Combustible; nontoxic. Said to have been the first synthetic polymer.

Uses: Adhesives, printing inks, floor tile binder, friction tape. See also "Cumar," "Nevidene," "Paradene."

countercurrent. Descriptive of a process in which a liquid and a vapor stream, or two streams of immiscible liquids or a liquid and a solid, are caused to flow in opposite directions and past or through one another with more or less intimate contact, so that the individual substances present are more or less completely transferred to that stream in which they are more soluble or stable under the conditions existing. The streams leaving such a process are usually of higher purity that can be attained otherwise at equal cost (see extraction, liquid-liquid). Distillation with a fractionating column is also a typical countercurrent process, in which rising vapor is purified by contact with descending liquid (reflux). Leaching, washing and chemical reaction are frequently carried out in a countercurrent manner.

count. (1) The external indication given by a radiation detector such as a Geiger counter of the amount

of radioactivity to which the detector is exposed. The background counts are those which come from a source external to that being measured.

(2) The number of warp and filler threads in a linear inch of a textile fabric, e.g., the count of a sheeting may be 80×60 .

coupling. (1) The combination of an amine or phenol with a diazonium compound to give an azo compound, the reaction of which azo dyes are prepared; thus meta-phenylenediamine $C_6H_4(NH_2)_2$ couples with benzene diazonium chloride $C_6H_5N_2Cl$ to produce the dye chrysoidine $C_6H_5N_2C_6H_3(NH_2)_2$.

(2) Oxidative coupling (q.v.).

(3) An agent, e.g., a vinyl silane, used to protect fiberglass laminates from effects of water absorption.

(4) A condensation polymerization of amino acids to form proteins; it can be done synthetically only by suppressing certain active sites on the amino acid molecules.

covalent bond. See bond, chemical.

"Covarnishblak."¹¹³³ Trademark for a series of dry powders consisting of carbon black dispersed in a hydrocarbon fossil resin. Used for pigmenting alkyd and oleoresinous enamels and coloring rubber cements. Can be dissolved in the vehicle by simple stirring.

covering power. See opacity.

Cox chart. A special semilogarithmic plot of vapor pressure vs. temperature especially useful for the petroleum hydrocarbons. The graph corresponding to each separate hydrocarbon is a straight line. All the lines appear to intersect at a point outside the chart.

C.P. Abbreviation for chemically pure, an accepted grade of drugs and fine chemicals that contain no detectable impurities.

"CP-40."⁶² Trademark for chlorination derivatives of paraffin wax.

Uses: Rendering fabrics waterproof and fire retardant; fire-retardant paints; plasticizer and extender for certain plastic materials; etc.

"CPA-1800."²⁴⁴ Trademark for a compound containing fluorine compounds and trivalent chromium.

Uses: In the electroplating industry as an additive to chromium plating solutions, acts as catalyst to improve performance.

"C-P-B."²⁴⁸ Trademark for dibutyl xanthogen disulfide.

Properties: Amber-colored, free-flowing liquid; sp. gr. 1.15; soluble in acetone, benzene, gasoline, and ethylene dichloride; insoluble in water.

Use: Accelerator for pure gum hand-made druggists sundries and medical supplies, bathing shoes, bathing caps, novelties, and cold-cure cements.

"CP" Bond.³⁰ Trademark for custom-tailored dry polyvinyl alcohol-based adhesive blends.

"CPDA."⁵⁰⁵ Trademark for the dianhydride of 1,2,3,4-cyclopentanetetracarboxylic acid. Available in both granular and fine ground forms.

CPR. Abbreviation for cyclonene-pyrethrin-rotenone. Applied to various insecticide formulations containing as active ingredients approximately 10 parts piperonyl cyclonene, 5 parts rotenone, and 1 part pyrethrin.

"CPTA."⁵⁰⁵ Trademark for 1,2,3,4-cyclopentanecarboxylic acid.

Cr Symbol for chromium.

"CR-39."¹⁷⁷ Trademark for allyl diglycol carbonate, an optical plastic.

Properties: Clear optical plastic highly resistant to impact and abrasion. Furnished as a clear liquid. Thermosetting.

Uses: Ophthalmic lenses, shields, instrument panels, marine and aircraft glazing.

cracking. The decomposition by heat, with or without a catalyst, of petroleum or heavy petroleum fractions, with production of gasoline, fuel oil, or other products. If no catalysts are used the process is called thermal cracking. Steam cracking of naphtha to ethylene and other petrochemicals is widely practiced. The term is also applied to other thermal decomposition processes; thus ammonia (NH_3) may be cracked to nitrogen and hydrogen, and natural gas hydrocarbons such as methane (CH_4) are cracked into carbon and hydrogen, or into other hydrocarbons.

See also hydrocracking, reforming, catalysis.

"Crag."²¹⁴ Trademark for agricultural chemicals including:

(1) Fly Repellent (active ingredient, butoxy polypropylene glycol). Colorless liquid, 100% active material.

(2) Fungicide 974 (active ingredient, 3,5-dimethyltetrahydro-1,3,5,2H-thiadiazine-2-thione). Wettable powder, 85% active material. Toxic and irritant.

(3) Glyodin Solution (active ingredient, 2-heptadecyl glyoxaldine acetate) 34% active solution.

(4) Herbicide-1 (SES) (active ingredient, sodium 2,4-dichlorophenoxyethyl sulfate). Water-soluble powder, 90% active material. Tolerance, 10 mg per cubic meter of air.

crambe seed oil. A vegetable oil obtained from the seeds of the crambe, a plant related to mustard and rape. Growth and processing techniques have been studied by the Agricultural Research Service of USDA. The plant can be grown on marginal and strip-mined land; its high content of erucic acid and the high protein content of its meal make it economically attractive; the oil itself is useful as an industrial lubricant, especially for molds for continuous steel casting.

cream of tartar. See potassium bitartrate.

creatine (N-methyl-N-guanylglycine; (alpha-methylguanido)acetic acid) $HN:C(NH_2)N(CH_3)CH_2COOH$. A nitrogenous acid widely distributed in the muscular tissue of the body.

Properties: (monohydrate) Prisms from water; anhydrous at $100^\circ C$; decomposes $303^\circ C$; slightly soluble in water; insoluble in ether.

Source: Commercially isolated from meat extracts.

Grades: Technical; C.P.

Use: Biochemical research.

creatinine $C_4H_7N_3O$. The anhydride of creatine (q.v.); a metabolic waste product.

Properties: Leaflets from water; decomposes about $270^\circ C$; soluble in water; slightly soluble in alcohol; nearly insoluble in ether, acetone, and chloroform.

Use: Biochemical research.

creep. See cold flow.

creosol (2-methoxy-4-methylphenol; 4-methylguaiacol) $CH_3O(CH_3)C_6H_3OH$. One of the active constituents of creosote, derived from beechwood tar.

Properties: Colorless to yellow liquid. Sp. gr. 1.092 (25°C); m.p. 5.5°C; b.p. 220°C; slightly soluble in water; soluble in alcohol, benzene, chloroform, ether, acetic acid.

creosote carbonate.

Properties: Clear, colorless or yellowish, viscous liquid; slight creosote odor and taste. Soluble in alcohol; insoluble in water.

Derivation: Mixture of carbonates of various constituents of creosote.

Use: Medicine.

creosote, coal-tar (creosote oil; liquid pitch oil; tar oil).

Properties: Yellowish to dark green-brown, oily liquid; clear at 38°C or higher; naphthenic odor; frequently contains substantial amounts of naphthalene and anthracene; distilling range 200–400°C; flash point 165°F (closed cup); soluble in alcohol, benzene, and toluene; immiscible with water. Combustible.

Derivation: Fractional distillation of coal-tar.

Method of purification: Rectification.

Grades: Technical; crude; refined.

Containers: Drums; tank cars.

Hazard: Toxic by inhalation of fumes; skin and eye irritant. Use may be restricted.

Uses: Wood preservative (ties, telephone poles, marine piling, etc.); disinfectants.

para-cresidine. See 5-methyl-ortho-anisidine.

"Creslan."⁵⁷ Trademark for an acrylic fiber.

cresol (methyl phenol; hydroxymethylbenzene)

$\text{CH}_3\text{C}_6\text{H}_4\text{OH}$. A mixture of isomers obtained from coal tar or petroleum.

Properties: Colorless, yellowish, or pinkish liquid; phenolic odor; sp. gr. 1.030–1.047; wt/gal 8.66–8.68 lb; flash point approx. 180°F; m.p. 11–35°C; b.p. 191–203°C. Soluble in alcohol, glycol, and dilute alkalies. Combustible.

Derivation: Coal tar (from coke and gas works); also synthetic.

Grades: Various, depending on phenol content, or other properties. N.F. grade contains not more than 5% phenol.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic and irritant; corrosive to skin and mucous membranes; absorbed through skin. Tolerance, 5 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Disinfectant; phenolic resins; tricresyl phosphate; ore flotation; textile scouring agent; organic intermediate, mfg. of salicylaldehyde, coumarin, and herbicides; surfactant; synthetic food flavors (para isomer only).

Shipping regulations: (Air) Poison label.

See also cresylic acids.

meta-cresol (meta-cresylic acid; 3-methylphenol)

$\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: Colorless to yellowish liquid; phenol-like odor. Soluble in alcohol, ether, and chloroform; soluble in water. Sp. gr. 1.034; m.p. 12°C; b.p. 203°C; wt/gal 8.66 lb flash point 187°F. Combustible. Autoignition temp. 1038°F.

Derivation: By fractional distillation of crude cresol (from coal tar); also synthetically.

Method of purification: Rectification.

Grade: Technical (95–98%).

Toxicity, uses, see cresol.

ortho-cresol (ortho-cresylic acid; 2-methylphenol)

$\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: White crystals; phenol-like odor. Soluble in alcohol, ether, chloroform, and hot water. Sp. gr. 1.047; m.p. 30.9°C; flash point 178°F. Autoignition temp. 1110°F; b.p. 191°C; lb/gal 8.68. Combustible.

Derivation: (a) By fractional distillation of crude cresol from coal tar. (b) Interaction of methanol and phenol.

Method of purification: Crystallization.

Grades: According to freezing point: 25°, 29°, 30°, 30.5°C, etc.

Toxicity, uses, see cresol.

para-cresol (para-cresylic acid; 4-methylphenol)

$\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.

Properties: Crystalline mass; phenol-like odor. Soluble in alcohol, ether, chloroform, and hot water; wt/gal 8.67 lb. Sp. gr. 1.039; b.p. 202°C; m.p. 35.26°C; flash point 187°F. Combustible. Autoignition temp. 1038°F.

Derivation: (a) By fractional distillation of crude cresol. (b) From benzene by the cumene process (see phenol).

Method of purification: Crystallization.

Grades: Technical; 98%; 99.0% min purity or 34°C min F.P.

Toxicity, uses, see cresol.

cresolphthalein $\text{C}_6\text{H}_4\text{COOC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. An acid-

base indicator, changes from colorless to red between pH 8.2 and 9.8. See also indicator.

cresol purple $\text{C}_6\text{H}_4\text{SO}_2\text{OC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. Meta-

cresolsulfonphthalein, an acid-base indicator, showing color change from red to yellow over the range pH 1.2 to 2.8 and from yellow to purple over the range pH 7.4 to 9.0. See also indicator.

cresol red $\text{C}_6\text{H}_4\text{SO}_2\text{OC}(\text{C}_6\text{H}_3(\text{OH})\text{CH}_3)_2$. Ortho-cresol-

sulfonphthalein, an acid-base indicator, changes from red to yellow between pH 0.2 and 1.8 and from yellow to red between pH 7.0 and 8.8. See also indicator.

cresotic acid (cresotinic acid; hydroxytoluic acid)

$\text{CH}_3\text{C}_6\text{H}_3(\text{OH})\text{COOH}$. Ten possible isomers; most common is 2-hydroxy-3-methylbenzoic acid, also known as ortho-cresotic acid or ortho-homosalicic acid. The description which follows is of this isomer.

Properties: White crystals or powder; m.p. 166°C; b.p. about 250°C; insoluble in water; soluble in alcohol and ether. Combustible.

Derivation: Treatment of ortho-cresol with caustic and carbon dioxide under pressure.

Containers: Fiber cans; drums.

Uses: Dye intermediate; research on plant growth inhibition.

"Crestalkyd."²⁶³ Trademark for a group of oil-modified alkyd resins. Oil length from 30% to 80%, A.V. < 15.

Uses: High-quality paints, lacquers, enamels, and varnishes. Plasticizing resin for nitrocellulose and similar finishes.

"Crestapol."²⁶³ Trademark for a series of plasticizers for polyvinyl chloride; also a designation for specialty polyesters used in dispersing media.

meta-cresyl acetate (meta-tolyl acetate)

Properties: Colorless oily liquid; odor similar to phenol; b.p. near 112°C; distills with steam; insoluble in water; soluble in common organic solvents. Combustible.

Use: Medicine.

ortho-cresyl acetate (ortho-tolyl acetate)

Properties: Liquid; b.p. 83–85°C (10 mm); 208°C (760 mm). Nearly insoluble in cold, soluble in hot water; soluble in organic solvents. Combustible.

Use: Flavoring.

para-cresyl acetate (para-tolyl acetate)

Properties: Colorless liquid; floral odor. Soluble in 2.5 vols of 70% alcohol; in most fixed oils; insoluble in glycerol. Sp. gr. 1.0532 (15°C); optical rotation (100 mm) 0°; refractive index 1.500 to 1.504; acid value 0.7; ester value 341.6. Combustible.

Grades: Technical; F.C.C.

Uses: Perfumery; flavoring.

cresyl diglycol carbonate (diethylene glycol bis(cresyl-carbonate)) $\text{C}_{20}\text{H}_{22}\text{O}_7$

Properties: Colorless liquid of low volatility. Sp. gr. 1.19 (20/4°C); boiling point approximately 250°C (2 mm); flash point 475°C; refractive index 1.523 (20°C). Insoluble in water (very stable to hydrolysis). Widely soluble in organic solvents. Compatible with many resins and plastics. Combustible. Low toxicity.

Uses: Plasticizer.

cresyl diphenyl phosphate (cresyl phenyl phosphate) $(\text{CH}_3\text{C}_6\text{H}_4)(\text{C}_6\text{H}_5)_2\text{PO}_4$. Probably seldom a pure compound, but a mixture of ortho, meta, and para-cresyl and phenyl phosphates.

Properties: Clear transparent liquid; very slight odor; insoluble in water; soluble in most organic solvents except glycerol. Sp. gr. 1.20 (20/20°C); f.p. –38°C; boiling range 235–255°C (4 mm). Flash point 450°F. Combustible.

Uses: Plasticizer; extreme-pressure lubricant; hydraulic fluids; gasoline additive; food packaging.

ortho-cresyl-alpha-glyceryl ether. See mephenesin.

cresylic acids. Commercial mixtures of phenolic materials boiling above the cresol range. An arbitrary standard in use for cresylic acids is that 50% must boil above 204°C. If the boiling point is below 204°C, the material is called cresol (q.v.). Cresylic acid varies widely according to its source and boiling range.

A typical commercial cut, b.p. 220–250°C, has the composition meta, para-cresols, 0–1%; 2,4- and 2,5-xyenols, 0–3%; 2,3- and 3,5-xyenols, 10–20%; 3,4-xyenol, 20–30%, and C_9 phenols, 50–60%. Excellent electrical insulators.

Derivation: Petroleum; coal tar. Imported cresylic acid is derived from coal tar (gas works); also made synthetically.

Containers: 5-, 55-gal drums; tank trucks; tank cars.

Hazard: Corrosive to skin; absorbed by skin.

Uses: Phosphate esters, phenolic resins, wire enamel solvent, plasticizers, gasoline additives, laminates, coatings for magnet wire for small electric motors. Disinfectants, metal-cleaning compounds, phenolic resins, flotation agents, surfactants, chemical intermediates, oil additives; solvent refining of lubricating oils, scouring compounds, pesticides.

Shipping regulations: (Air) Poison label.

para-cresyl isobutyrate (para-tolyl isobutyrate)

Low toxicity.

Use: Flavoring.

cresyl phenyl phosphate. See cresyl diphenyl phosphate.**cresyl silicate** $(\text{CH}_3\text{C}_6\text{H}_4\text{O})_4\text{Si}$.

Properties: Colorless liquid; b.p. 450°C.

Derivation: Reaction of cresol and silicon tetrachloride.

Use: Heat-transfer fluid.

cresyl-para-toluene sulfonate (tolyl-para-toluene sulfonate) $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_3\text{C}_6\text{H}_4\text{CH}_3$.

Properties: Brown, oily liquid; faint odor; sp. gr. 1.207; flash point 365°F; m.p. 68.70°C. Combustible.

Derivation: From reaction of para-toluenesulfonyl chloride with para-cresol.

Hazard: May be toxic.

Use: Plasticizer.

“C.R.I.”²³⁹ Trademark for a concentrated rust-inhibiting germicide containing 12.5% (by weight) alkyl (mostly C_{12} , C_{14} , C_{16} but ranging from C_8 to C_{18}) dimethylbenzylammonium chloride as active ingredient. Inert ingredients are 40% 2-hydroxypropylamine nitrate, water (47.5%), and Fastusol Turquoise Blue.

critical constant. A maximum or minimum value for a physical constant which is characteristic of a substance, e.g., the critical temperature of a gas is the temperature above which it cannot be liquefied by an increase in pressure.

criticality The state of a nuclear reactor when it is sustaining a chain reaction. (Atomic Energy Commission).

critical mass. The minimum mass of fissionable material (U-235 or plutonium) that will support a self-sustaining chain reaction. A critical assembly (nuclear reactor) is a system of fissionable material and moderator sufficient to sustain a chain reaction at a low and controllable power level. See also fission, nuclear.

critical solution temperature. The temperature above or below which two liquids are miscible in all proportions. Some pairs of liquids have both an upper and a lower critical solution temperature, that is, they can exist in two phases only in a medium temperature range.

crocein acid (croceic acid; Bayer's acid; 2-naphthol-8-sulfonic acid) $\text{C}_{10}\text{H}_6\text{OHOSO}_3\text{H}$.

Derivation: Sulfonation of beta-naphthol at a low temperature and recrystallization from a salt.

Containers: 100-lb fiber drums (sodium salt).

Use: Dye intermediate.

Crocein Scarlet MOO. See Brilliant Crocein.**crocetin** $\text{C}_{20}\text{H}_{24}\text{O}_4$. A dicarboxylic carotenoid derived from saffron.

Properties: Red rhomboid crystals; soluble in pyridine and dilute sodium hydroxide; slightly soluble in water and organic solvents; m.p. 285°C. Combustible; nontoxic.

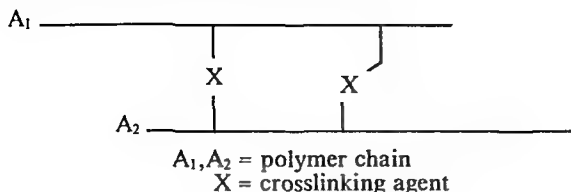

Uses: Experimental treatment of arteriosclerosis by increasing oxygen diffusion through arterial walls, thus decreasing build-up of cholesterol.

“Crolyn.” Trademark for chromium dioxide (q.v.).

“Cromophthal.”⁷⁴⁴³ Trademark for pigments of the azo and vat classes.

“Cronar.”⁷²⁸ Trademark for a series of polyester photographic film.

cross-linking. Attachment of two chains of polymer molecules by bridges composed of either an element, a group, or a compound which join certain carbon atoms of the chains by primary chemical bonds, as indicated in the schematic diagram:

Cross-linking occurs in nature in substances made up of polypeptide chains, which are joined by the disulfide bonds of the cystine residue, as in keratins, insulin, and other proteins. Polysaccharide molecules can also cross-link to form stable gel structures (dextran). This can also be effected artificially, either by addition of a chemical substance (cross-linking agent) and exposing the mixture to heat, or by subjecting the polymer to high-energy radiation. Examples are: (1) vulcanization of rubber with sulfur or organic peroxides; (2) cross-linking of polystyrene with divinylbenzene; (3) cross-linking of polyethylene by means of high-energy radiation or with an organic peroxide; (4) cross-linking of cellulose with dimethylol carbamate (10% solution) in durable-press cotton textiles. Cross-linking has the effect of changing a plastic from thermoplastic to thermosetting. Thus it also increases strength, heat- and electrical resistance, and especially resistance to solvents and other chemicals. See also vulcanization; polyethylene (cross-linked); keratin.

cross-section. (1) A measure of the probability that a nuclear reaction will occur. Usually measured in barns, it is the apparent (or effective) area presented by a target nucleus (or particle) to an oncoming particle or other nuclear radiation, such as a photon or gamma radiation. (Atomic Energy Commission). Also called capture cross-section.

(2) A section made by a plane cutting through a solid, usually at right angles. Tissue cross-sections are widely used for microscopic observation.

crotonaldehyde (2-butenal; crotonic aldehyde; beta-methyl acrolein) $\text{CH}_3\text{CH}:\text{CHCHO}$. Commercial crotonaldehyde is the trans isomer.

Properties: Water-white, mobile liquid; pungent, suffocating odor; turns to a pale yellow color in contact with light and air. A lachrymator. Very soluble in water; miscible in all proportions with alcohol, ether, benzene, toluene, kerosene, gasoline, solvent naphtha. Sp. gr. 0.8531 (20/20°C); b.p. 102°C; flash point 55°F; f.p. -69°C; vapor pressure 30 mm (20°C).

Derivation: Aldol condensation of two molecules of acetaldehyde.

Grades: Technical; 87% water-wet form.

Hazard: Flammable, dangerous fire risk. Toxic; especially irritating to the eyes and skin. Tolerance, 2 ppm in air.

Uses: Intermediate for n-butyl alcohol and 2-ethylhexyl alcohol; solvent; preparation of rubber accelerators; purification of lubricating oils; insecticides; tear gas; fuel-gas warning agent; organic synthesis; leather tanning; alcohol denaturant.

Shipping regulations: (Rail) Red label. (Air) Flam-

mable Liquid label. Not acceptable on passenger planes.

crotonic acid (2-butenic acid; beta-methacrylic acid) $\text{CH}_3\text{CH}:\text{CHCOOH}$. Exists in cis and trans isomeric forms, the latter being the stable isomer used commercially. The cis form melts at 15°C and is sometimes called isocrotonic acid.

Properties: White crystalline solid; sp. gr. 0.9730; m.p. 72°C; b.p. 185°C; soluble in water, ligroin, ethanol, toluene, acetone. Flash point (190°F (C.O.C.)). Combustible.

Derivation: Oxidation of crotonaldehyde.

Grade: 97%.

Containers: Glass bottles; fiber drums.

Hazard: Strong irritant to tissue.

Uses: Synthesis of resins, polymers, plasticizers, drugs.

Shipping regulations: (Air) Corrosive label.

crotonic aldehyde. See crotonaldehyde.

croton oil (tigilium oil).

Properties: Brownish-yellow liquid. Sp. gr. 0.935-0.950 (25°C); refractive index (n_{40/D}) 1.470-1.473. Soluble in ether, chloroform and fixed or volatile oils; slightly soluble in alcohol.

Chief constituents: Glycerides of stearic, palmitic, myristic, lauric and oleic acids and croton resin, a vesicant.

Derivation: By expression from the seeds of Croton tigilium.

Hazard: Toxic; strong skin irritant; ingestion of small amounts may be fatal.

Use: Medicine.

crotonolic acid. See tiglic acid.

crotonylene (2-butyne; dimethylacetylene)

$\text{CH}_3\text{C}:\text{CCH}_3$.

Properties: Liquid; b.p. 27°C; flash point 64°F.

Hazard: Flammable, dangerous fire risk. Moderate explosion hazard.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

crotyl alcohol (2-buten-1-ol, 3-methylallyl alcohol)

$\text{CH}_3\text{CH}:\text{CHCH}_2\text{OH}$.

Properties: Clear, stable liquid; sp. gr. 0.8550 (20/20°C); boiling range 121-126°C; flash point (TOC) 113°F. Partially soluble in water (17%), wholly soluble in alcohol and ether. Combustible.

Hazard: Toxic by ingestion. Strong eye and skin irritant. Moderate fire risk.

Uses: Chemical intermediate; source of monomers; herbicide and soil fumigant.

crown filler. A mineral filler, usually calcium sulfate or carbonate or a mixture thereof used in paper manufacture.

crown glass. See glass, optical.

cryochemistry. That branch of chemistry devoted to the study of reactions occurring at extremely low temperatures (-200°C and lower). It permits synthesis of compounds that are too unstable or too reactive to exist at normal temperatures.

cryogenics. Study of the behavior of matter at temperatures below -200°C. The use of the liquefied gases, oxygen, nitrogen and hydrogen at about -260°C is standard industrial practice. Examples: Use of liquid nitrogen for quick-freezing of foods, and of liquid oxygen in steel production. Some elec-

tronic devices and specialized instruments, such as the cryogenic gyro, operate at liquid helium temperatures (about 4°K). Many lasers and computer circuits require low temperatures. See also superconductivity.

cryolite (Greenland spar, icetone) Na_3AlF_6 . A natural fluoride of sodium and aluminum, or made synthetically from fluorspar, sulfuric acid, hydrated alumina and sodium carbonate.

Properties: Colorless to white; sometimes red, brown or black; luster vitreous to greasy; hardness 2.5; sp. gr. 2.95–3.0. Refractive index 1.338; m.p. 1000°C; soluble in fused aluminum and ferric salts.

Occurrence: Greenland (only commercial source); Colorado; U.S.S.R.

Derivation: Synthetic product is made by fusing sodium fluoride and aluminum fluoride.

Uses: Electrolyte in the reduction of alumina to aluminum; ceramics; insecticide; binder for abrasives; electric insulation; explosives; polishes.

"Cryovac."³¹¹ Trademark for a light, shrink-film, transparent packaging material based on polyvinylidene chloride. Used especially for meats and other perishables.

cryptocyanine (1,1'-diethyl-4,4'-carbocyanine iodide) $\text{C}_{25}\text{H}_{25}\text{N}_2\text{I}$.

Properties: Solid; m.p. 250.5–253°C.

Use: Organic dye solution used as a chemical shutter in laser operation.

See also cyanine dye.

cryptopine $\text{C}_{21}\text{H}_{23}\text{NO}_3$.

Properties: White crystalline alkaloid. Soluble in chloroform and boiling alcohol; insoluble in water and ether. M.p. 217–221°C.

Derivation: From opium, by extraction and crystallization.

Method of purification: Recrystallization.

Hazard: Highly toxic. A narcotic drug.

Use: Medicine.

cryptoxanthin (provitamin A; hydroxy-beta-carotene) $\text{C}_{40}\text{H}_{56}\text{O}$. A carotenoid pigment with vitamin A activity.

Properties: Garnet-red prisms with metallic luster; m.p. 170°C; soluble in chloroform, benzene, and pyridine; slightly soluble in hydrocarbon solvents, alcohol and methanol.

Occurrence: In many plants, egg yolk, butter, blood serum.

Uses: Nutrition; medicine.

crystal. The normal form of the solid state of matter.

Crystals have characteristic shapes and cleavage planes due to the arrangement of their atoms, ions, or molecules, which comprise a definite pattern called a lattice. Crystals may be face-centered, body-centered, cubic, orthorhombic, monoclinic, prismatic, etc.; they have flat surfaces, sharp edges, and a definite angle between a given pair of surfaces. The form of a crystal is called its "habit." One of the most important features of a crystal is its optical properties, chief of which is its index of refraction, i.e., the extent to which a beam of light is deflected on passing through the crystal. Depending on the manner of light transmission, a crystal may be isotropic or anisotropic (q.v.). Anisotropic crystals can polarize light (see also optical isomerism, optical rotation). Crystals also have electrical and magnetic properties now being used in computers and other electronic devices. Crystals are almost always imperfect and contain impurities (atoms of

other elements). These are utilized in semiconductors (q.v.). For methods of growing crystals see nucleation.

Single crystals are used in masers, lasers, semiconductors, miniaturized components, computer memory systems, and as "whiskers" (q.v.). Many metals are now available in large single crystal form, and such natural crystals as ruby, garnet, sapphire, etc. are used in the foregoing applications. See also crystallization; nucleation; liquid crystal.

crystal, liquid. See liquid crystal.

crystallite. That portion of a crystal whose constituent atoms, ions, or molecules form a perfect lattice, without strains or other imperfections. Single crystals may be quite large, but crystallites are usually in the microscopic range. See also crystal.

crystallization. The phenomenon of crystal formation by nucleation (q.v.) and accretion. The freezing of water into ice is one of the commonest examples of crystallization in nature. Industrially, it is used as a means of purifying materials by evaporation and solidification. The sugar of commerce is made in this way. Similarly, salt cake is derived from crystallization of natural brines (Searles Lake). Nucleated crystallization is also used to form polycrystalline ceramic structures. See also crystal.

crystallography. The study of the crystal formation of solids, including x-ray determination of lattice structures, crystal habit, and the shape, form, and defects of crystals. When applied to metals, this science is called metallography (q.v.).

crystal violet. See methyl violet.

"Crystamet."⁴²⁸ Trademark for sodium metasilicate pentahydrate.

"Crystarose"¹⁸⁸ Trademark for a highly purified grade of trichloromethylphenylcarbinyl acetate.

"Crystex."⁷¹ Trademark for a rubber-insoluble sulfur used as vulcanizing agent in natural and synthetic rubbers; 85% of the sulfur is insoluble at the usual milling temperatures. This metastable form is converted to the stable soluble sulfur at usual vulcanizing temperatures.

"Crysticillin."⁴¹² Trademark for procaine penicillin G.

"Crystic."²⁶³ Trademark for a series of unsaturated polyester resins. Available in several grades as well as self-extinguishing and thixotropic types.

Use: Low-pressure laminating for glass fiber reinforced plastics, potting, casting, embedding, and coating.

"Crystodigin."¹⁰⁰ Trademark for digitoxin. U.S.P.

"Crystolon."²⁴⁹ Trademark for silicon carbide.

cs. Abbreviation for centistoke.

Cs Symbol for cesium.

"CS-137."³⁰⁴ Trademark for a barium-sodium organic-complex vinyl stabilizer.

Properties: Creamy-white paste, sp. gr. 1.54; refractive index 1.48.

Containers: Supplied as a 70% solids paste in DOP. Metal drums containing 60 lb net.

Uses: Stabilizer for transparent organosols and solution coatings to impart superior light and weathering resistance.

C₂S. Abbreviation for dicalcium silicate, as used in cement. See cement, Portland.

C₃S. Abbreviation for tricalcium silicate, as used in cement. See cement, Portland.

"CSC."³¹⁹ Trademark for choline chloride aqueous solutions and choline chloride feed supplements.

C-stage resin (resite). The fully cross-linked phenol-formaldehyde type resin which is infusible and insoluble in all solvents. See A-stage resin; phenol-formaldehyde resin.

CTC. Abbreviation for chlortetracycline (q.v.).

CTFE. See chlorotrifluoroethylene.

CTP. Abbreviation for cytidine triphosphate (q.v.).

Cu Symbol for copper.

cuam. Abbreviation for cuprammonium, the copper ammonium radical.

cube root. A powdered insecticidal preparation containing 5% rotenone (q.v.).

"Cubex."³⁰⁸ Trademark for an oriented silicon-iron alloy in rolled sheet form for use as cores for transformers and other inductive devices. The alloy sheet comprises cube grains with faces parallel to the sheet surface. In one form the sheet is doubly oriented with two directions of easy magnetization parallel to the surface of the sheet. One direction of easy magnetization is parallel to the rolling direction and the second is perpendicular to the rolling direction.

cubic centimeter. See milliliter.

"Cubidow."²³³ Trademark for compacted salt comprising either or both calcium and sodium chloride.

"Cubond."²⁹⁶ Trademark for a copper brazing paste. Consists of metallic copper powder on cuprous oxide pigments of high purity in organic or petroleum vehicles which impart satisfactory suspension properties.

"Cubor Dusts."¹⁴⁷ Trademark for insecticides containing 0.75 and 1.0% pure rotenone.

cue-lure. Generic name for 4-(para-hydroxyphenyl)-2-butanone acetate, $\text{CH}_3\text{COCH}_2\text{CH}_2\text{C}_6\text{H}_4\text{OOCCH}_3$. Liquid; boiling range 117–124°C. Insoluble in water; soluble in most organic solvents.
Use: Insect attractant.

cuen. Abbreviation for cupriethylenediamine.

cullet. Broken or waste glass added to the batch in glass manufacture.

"Culofix."³⁰⁰ Trademark for dye fixatives of fatty or resin cationic type for application to dyed textiles.

cumaldehyde. See cuminic aldehyde.

"Cumar."¹⁷⁵ Trademark for a series of neutral, stable, synthetic resins of the coumarone-indene type, manufactured from selected distillates of tar. See also coumarone-indene resin.
Uses: Softener and tackifier in varnishes, floor tile, rubber products, printing ink, adhesives, and waterproofing materials; leather, electrical, radio, paper, and other industries.

"Cumate."⁶⁹ Trademark for preparation of copper dimethyldithiocarbamate $[(\text{CH}_3)_2\text{NC}(\text{S})\text{S}]_2\text{Cu}$. Properties: Dark brown powder, sp. gr. 1.75; melts above 325°C; moderately soluble in acetone, benzene, chloroform; insoluble in water, alcohol, gasoline.

Uses: In SBR, primary accelerator; secondary accelerator with thiazoles. In butyl rubber, primary accelerator. For molded and extruded goods.

cumene (isopropylbenzene) $\text{C}_6\text{H}_5\text{CH}(\text{CH}_3)_2$.

Properties: Colorless liquid. Soluble in alcohol, carbon tetrachloride, ether and benzene; insoluble in water. Sp. gr. 0.8620; b.p. 152.7°C; wt/gal 7.19 lb (25°C); freezing point -96°C; refractive index 1.489 (25°C); flash point 115°F. Autoignition temp. 795°F. Combustible.

Derivation: (a) Alkylation of benzene with propylene (phosphoric acid catalyst); (b) distillation from coal-tar naphtha fractions or from petroleum.

Grades: Technical; research; pure.

Containers: Drums; tank cars; tank trucks.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Moderate fire risk. Tolerance, 50 ppm in air. Narcotic in high concentrations.

Uses: Production of phenol, acetone, and alpha-methylstyrene; solvent.

cumene hydroperoxide (alpha, alpha-dimethylbenzyl hydroperoxide) $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)_2\text{OOH}$.

Properties: Colorless to pale yellow liquid, slightly soluble in water; readily soluble in alcohol, acetone, esters, hydrocarbons. Chlorinated hydrocarbons. Flash point 175°F. Combustible.

Derivation: A solution or emulsion of cumene is oxidized with air at about 130°C.

Hazard: Toxic by inhalation and skin absorption. Strong oxidizing agent; may ignite organic materials.

Uses: Production of acetone and phenol; polymerization catalyst, particularly in redox systems, used for rapid polymerization.

Shipping regulations: (Rail) Yellow label. (Air) (solution exceeding 96%) Not acceptable; (solution not exceeding 96% in nonvolatile solvent) Organic Peroxide label.

cumic alcohol. See cuminic alcohol.

cumic aldehyde. See cuminic aldehyde.

cumidine (para-isopropylaniline) $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{NH}_2$.

Properties: Colorless liquid; sp. gr. 0.957 (20/4°C); f.p. -63°C; b.p. 225°C. Insoluble in water; soluble in alcohol and ether. See also pseudocumidine.

cuminic alcohol (para-isopropylbenzyl alcohol; cuminy alcohol; cumic alcohol) $\text{CH}_2\text{OH}(\text{C}_6\text{H}_4)\text{CH}(\text{CH}_3)_2$. Found in caraway seed.

Properties: Colorless liquid; caraway-like odor; aromatic taste; sp. gr. 0.981 (15°C); b.p. 248°C; refractive index (n_D²⁴) 1.522. Insoluble in water; miscible with alcohol, ether. Low toxicity. Combustible.

Hazard: Moderate fire risk.

Use: Flavoring.

cuminic aldehyde (cumic aldehyde; cumaldehyde; para-isopropylbenzaldehyde) $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{CHO}$.

Properties: Colorless to yellow liquid with a cumin odor; sp. gr. 0.986 (22°C); b.p. 235°C. Insoluble in water; soluble in alcohol and ether. Combustible.

Hazard: Moderate fire risk.

Use: Perfumery; flavoring.

cumin oil.

Properties: Colorless or yellowish, limpid liquid; characteristic odor of cumin; sharp, spicy taste. Soluble in alcohol, ether and chloroform. Sp. gr. 0.900–0.930; optical rotation +4° to +8°; refractive index 1.497–1.509 (20°C). Combustible; low toxicity.

Chief known constituents: Cumene; cumic aldehyde.
Derivation: Distilled from the fruit of *Cuminum cyminum*.
Grades: Technical; F.C.C.
Uses: Medicine; flavoring; perfumery.

cumulene. A chain of up to 6 double-bonded carbon atoms derived from acetylene.

cumyl phenol $C_6H_5C(CH_3)_2C_6H_4OH$.

Properties: White to tan crystals with characteristic phenol odor. Solidifying point $72.0^\circ C$; density 1.115 g/ml ($25^\circ C$); distillation range $188.9-190.9^\circ C$ (10 mm); flash point $320^\circ F$. Combustible.

Uses: Intermediate for resins, insecticides, lubricants.

"Cunife."¹⁶⁶ Trademark for a ductile permanent magnet material composed of 60% copper, 20% nickel and 20% iron. Forms available: wire, strip, finished magnets.

"Cunilate."⁷⁸ Trademark for "solubilized copper-8-quinolinolate." One type contains 10% copper-8-quinolinolate with 2-ethylhexoic acid and an aromatic solvent as carrier, with 40% total solids. Combustible.

Properties: Sp. gr. 0.9542-0.9545 at $77^\circ F$; flash point $110^\circ F$; color, greenish yellow; pH 5.5-6.0.

Containers: Steel drums.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Fungicidal treatment of fabrics, wood (by immersion or pressure), cotton rope and other materials as well as in combination with water repellents and auxiliary chemicals.

"Cumimene."⁷⁸ Trademark for a series of metal complexes of dehydroabietyl amine 8-hydroxyquinolates.
Uses: Fungicide and bactericide used in vinyl plasticizers, rubber, cordage fibers, textiles, etc.

"Cunisil-647."³²⁴ Trademark for an alloy containing 97.50% copper, 1.90% nickel, and 0.60% silicon. This high-strength, corrosion-resistant alloy is available in round rod, with or without the final precipitation-hardening heat treatment. Used in electrical equipment.

cupellation process. A process for freeing silver, gold or other nonoxidizing metals from base metals which can be oxidized. The metallic mixture is placed in a cupel, which is a shallow, porous cup, and roasted in a blast of air. The base metal oxides are absorbed in the cupel, leaving the pure metal to be decanted.

cupferron (ammonium nitroso-beta-phenylhydroxylamine) $C_6H_5N(NO)ONH_4$.

Properties: Creamy-white crystals; m.p. $163-164^\circ C$. Soluble in water, alcohol and ether.

Derivation: By treating an ethereal solution of beta-phenylhydroxylamine with dry ammonia gas and amyl nitrite.

Use: Reagent in analytical chemistry.

cuprammonium process. A minor process for making rayon by dissolving cellulose in an ammoniacal copper solution and reconverting it to cellulose by treatment with acid. Relatively pure alpha-cellulose (from cotton linters or treated wood pulp) is dissolved in a solution of ammonia and copper hydroxide or basic copper sulfate until the cellulose content reaches 7-10%. During an aging period, absorption of atmospheric oxygen causes degradation of the cellulose and reduces the viscosity of the solution. When the proper viscosity has been attained, the solution is filtered, deaerated, and extruded into a bath of di-

lute sulfuric acid. The fibers are closely similar to those made by the viscose process, which is the major method of rayon production.

cupreine (hydroxycinchonine) $C_{19}H_{22}O_2N_2 \cdot 2H_2O$. One of the cinchona alkaloids.

Properties: Colorless crystals; m.p. (anhydrous) $198^\circ C$. Soluble in alcohol; slightly soluble in water, chloroform, ether, benzene.

Derivation: From cuprea bark *Remijia pedunculata*.

Use: Medicine.

cupric. Form of the word copper used in naming copper compounds in which the copper has a valence of 2. See the corresponding compound under copper.

cupric chromate, acid. See "Celcure."

cupric chromate, basic. See copper chromate.

cupriethylene diamine. Purple liquid; ammoniacal odor. Dissolves cellulose products.

Hazard: Strong irritant to tissue. Toxic.

Shipping regulations: (solution) (Rail) White label. (Air) Corrosive label.

cuprite (copper ore, ruby; red oxide of copper) Cu_2O . Crimson, scarlet, vermilion, deep or brownish-red, secondary mineral; adamantine or dull luster; brownish-red streak. Soluble in nitric and concentrated hydrochloric acids. Sp. gr. 5.85-6.15; Mohs hardness 3.5-4.

Occurrence: United States; England; Germany; France; Siberia; Australia; China; Peru; Bolivia.

Use: Source of copper.

"Cuprochrome."¹⁵⁵ Trademark for an electronic tube alloy of 98.2% copper and 1.8% chromium.

cupronickel. An alloy of copper and nickel used in coinage, condenser and heat-exchanger tubes. Most types contain from 10-30% nickel. Strongly corrosion-resistant, especially to seawater.

"Cupron."¹⁵⁸ Trademark for an alloy of 55% copper and 45% nickel (constantan).

Forms: Wire, ribbon; strip.

Uses: Rheostats and controls; resistors for electrical instruments.

cuprotungsten. An alloy of copper and tungsten.

cuprous. Form of the word copper used in naming copper compounds in which the copper has a valence of 1.

cuprous acetate, ammoniacal. See copper ammonium acetate.

cuprous acetylide Cu_2C_2 .

Properties: Amorphous red powder. A salt of acetylene. Derivation: Reaction of acetylene with aqueous solution of cuprous salts.

Hazard: Severe explosion risk when shocked or heated.

Uses: Detonators and other explosive devices.

Shipping regulations: (Rail, Air) Explosives, n.o.s., Not acceptable.

cuprous chloride $CuCl$ or Cu_2Cl_2 .

Properties: White cubical crystals; sp. gr. 4.14; m.p. $430^\circ C$; b.p. $1490^\circ C$; becomes greenish on exposure to air, and brown on exposure to light. Slightly soluble in water; soluble in acids, ammonia, ether.

Derivation: Copper and cupric chloride solution or copper and hydrochloric acid in air.

Grades: Technical; reagent; single crystals.

Hazard: Toxic by ingestion.

Uses: Catalyst; preservative and fungicide; desulfuriz-

ing agent; decolorizing agent in petroleum industry; absorbent for carbon monoxide.

cuprous cyanide $\text{Cu}_2(\text{CN})_2$ or CuCN .

Properties: Cream-colored powder; insoluble in water; soluble in sodium cyanide and potassium cyanide, in hydrochloric acid and ammonium hydroxide; sp. gr. 2.9; m.p. 475°C .

Containers: 100-lb drums.

Hazard: Highly toxic.

Use: Copper and brass cyanide electroplating solutions.

Shipping regulations: (Rail) Cyanides of copper, etc., Poison label. (Air) Cyanides, dry, Poison label.

cuprous iodide CuI .

Properties: White to brownish-yellow powder. Soluble in ammonia and potassium iodide solutions; insoluble in water. Sp. gr. 5.653 at 15°C ; b.p. 1290°C ; m.p. 606°C .

Derivation: Interaction of solutions of potassium iodide and copper sulfate.

Hazard: Moderately toxic in greater than trace amounts.

Use: Feed additive; in table salt as source of dietary iodine (up to 0.01%).

cuprous oxide. See copper oxide, red.

cuprous sulfide. Cu_2S .

Properties: Black powder or lumps; soluble in nitric acid and ammonium hydroxide; insoluble in water. Occurs as the mineral chalcocite. Sp. gr. 5.52–5.82; m.p. about 1100°C .

Derivation: By heating cupric sulfide in a stream of hydrogen.

Grades: Technical; single crystals.

Hazard: Moderately toxic.

Uses: Antifouling paints; solar cells.

cuprous sulfite $\text{Cu}_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in ammonium hydroxide, hydrochloric acid (with decomposition); insoluble in water. Sp. gr. 3.83.

cuprous thiocyanate (copper sulfocyanide) CuSCN .

Properties: Yellow-white powder. Insoluble in water; soluble in ammonia; sp. gr. 2.843; m.p. 1084°C .

Hazard: Moderately toxic.

Uses: Manufacture of organic chemicals, antifouling paints; printing textiles.

"Curafos."¹⁰⁸ Trademark for food grade sodium hexametaphosphate and sodium tripolyphosphate used for curing, preventing undesirable color change, and loss of moisture in meat.

"Curalon."²⁴⁸ Trademark for a series of urethane curatives.

"Curalon L." A mixture of hindered aromatic primary diamines.

"Curalon M." p,p'-Methylene bis-(ortho-chloroaniline).

curare. A highly toxic mixture of about 40 alkaloids occurring in several species of South American trees. Its action is on the central nervous system, and derivatives are used to some extent in medicine for treatment of cardiac disease. See also snake venom.

curative. (1) Any substance or agent that effects a fundamental and desirable change in a material. See curing.

(2) Any substance that combats disease by killing bacteria or that restores health by chemical means.

"Curavis."¹⁰⁸ Trademark for a dry, pulverized, food grade, polymeric phosphate composition exhibiting high viscosity in water solution. For use in the meat packing industry.

curcumin (tumeric yellow; 1,7-bis(4-hydroxymethoxyphenyl)-1,6-heptadiene-3,5-dione)
[$\text{CH}_3\text{OC}_6\text{H}_3(\text{OH})\text{CH}:\text{CHCO}$]: CH_2 .

Properties: Orange-yellow needles, m.p. 183°C . Soluble in water and ether; soluble in alcohol. C.I. 75300.

Derivation: The coloring principle from curcuma.

Uses: Dye; analytical reagent; food dye; biological stain. As an acid-base indicator it is brownish-red with alkalis, yellow with acids (pH range 7.4–8.6); also an indicator for boron.

"Cure-Set."⁶⁵ Trademark for a two-component adhesive (special latex and a catalyst vulcanizer) for bonding rubber and vinyl tile in on-grade installation where moisture may be a problem.

curie (abbreviation ci.). The official unit of radioactivity, defined as exactly 3.70×10^{10} disintegrations per second. This decay rate is nearly equivalent to that exhibited by one gram of radium in equilibrium with its disintegration products. A millicurie (mc) is 0.001 curie. A microcurie (μc) is one millionth curie.

Curie, Marie S. (1867–1934). Born in Warsaw, Poland, she and her husband Pierre made an intensive study of the radioactive properties of uranium. They isolated polonium in 1898 from pitchblende ore. By devising a tedious and painstaking separation method they obtained a salt of radium in 1912, receiving the Nobel prize in physics for this achievement in 1903, jointly with Becquerel. In 1911, Mme. Curie alone received the Nobel prize in chemistry. Her work laid the foundation of radioactive elements which culminated in control of nuclear fission. (See also Rutherford).

curing. Conversion of a raw product to a finished and useful condition usually by application of heat and/or chemicals which induce physicochemical changes. Many food products require aging under specified temperature conditions. The more common types of curing are as follows:

(a) Meats: use of sodium chloride, sugars, sodium nitrite, sodium nitrate, ascorbic acid; these not only act as preservatives but also aid in color retention. Some types are smoked subsequently. Conversion of collagen to gelatin occurs as a result of "hanging" meat for several days.

(b) Leather: treatment of hides and skins with tanning agents of vegetable or mineral origin; this converts the protein structure into a firm and durable product as a result of complexing reactions. See also tanning.

(c) Tobacco: Exposure for several days to temperatures from 100 to 150°F to discharge the chlorophyll and reduce water content.

(d) Cheese: Precipitated casein of many varieties which is aged for many weeks at moderate temperature (40 to 50°F). The process is also called ripening.

(e) Rubber: addition of sulfur and accelerator, followed by exposure to heat which effects cross-linking. This converts the material from a thermoplastic to a thermosetting product. High-energy radiation can also be used. See also vulcanization.

curium Cm Synthetic radioactive element of atomic number 96; atomic weight 244. See also actinide elements. Valences 3, 4. Isotopes available: 244, and 242 (gram quantities).

Properties: Silvery white metal; sp. gr. 13.5; m.p. 1340°C; chemically reactive, more electropositive than aluminum. An alpha emitter. Biologically it is a bone-seeking element. Forms compounds such as CmO_2 , Cm_2O_3 , CmF_3 , CmF_4 , CmOH_3 , CmCl_3 , CmBr_3 , CmI_3 , $\text{Cm}_2(\text{C}_2\text{O}_4)_3$.

Uses: Thermoelectric power generation for instrument operation in remote locations on earth or in space vehicles.

"Curona."¹⁷³ Trademark for sodium isoascorbate as a curing aid in cured and comminuted meat products. It is used as an anti-oxidant in the meat packing industry for preserving the natural color of meat products, to shorten processing time and reduce shrinkage.

current density. In an electroplating bath or solution, the electric current per unit area of the object or surface being plated. Expressed in amperes per square centimeter, or more usually, amperes per square decimeter.

cutting fluid. A liquid applied to a cutting tool to assist in the machining operation by washing away the chips or serving as a lubricant or coolant. Commonly used cutting fluids are: water; water solutions or emulsions of detergents and oils; mineral oils; fatty oils; chlorinated mineral oils; sulfurized mineral grades are available.

"CWS."⁵⁸ Trademark for fumaric acid, food and technical grades.

"Cyamon."⁵⁷ Trademark for an ammonium nitrate blasting agent designed for safe handling in the field. It is not sensitive to a blasting cap, rifle slug, primacord, flame or impact of heavy steel weights.

"Cyan."⁵⁷ Trademark for a series of blue and green phthalocyanine pigments.

"Cyana."⁵⁷ Trademark used in connection with the textile finishes obtained by applying "Aerotex" Resins and similar products.

"Cyanamer."⁵⁷ Trademark for an acrylic polymer.

cyanamide.

(1) (cyanogenamide; carbodiimide) $\text{HN}:\text{C}:\text{NH}$ or $\text{N}:\text{CNH}_2$.

Properties: Deliquescent crystals; m.p. 42°C; sp. gr. 1.08. Very soluble in water, alcohol, ether. Flash point 285°F; combustible.

Derivation: From calcium cyanamide and sulfuric acid.

Hazard: Moderately toxic.

(2) Calcium cyanamide (q.v.)

cyanic acid. See isocyanic acid.

cyanide pulp. The mixture obtained by grinding crude gold and silver ore and dissolving the precious metal content in sodium cyanide solution.

cyanine dye. One of a series of dyes consisting of two heterocyclic groups (usually quinoline nuclei) connected by a chain of conjugated double bonds containing an odd number of carbon atoms. Example: cyanine blue $\text{C}_7\text{H}_7\text{NC}_5\text{H}_5:\text{CHC}_5\text{H}_5\text{NC}_7\text{H}_7$. They include the isocyanines, merocyanines, cryptocyanines, and dicyanines.

Use: Sensitizers for photographic emulsions.

cyanacetamide (malonamide nitrile; propionamide trile) $\text{CNCH}_2\text{CONH}_2$.

Properties: White crystals; b.p., decomposes; m.p. 119°C; soluble in water and alcohol. Flash point 419°F. Combustible.

Derivation: Ammonolysis of cyanoacetic ester or dehydration of ammonium cyanoacetate.

Uses: Organic pharmaceutical synthesis; plastics.

cyanoacetic acid (malonic nitrile) CNCH_2COOH .

Properties: White crystals; hygroscopic. Soluble in water, alcohol and ether. M.p. 66.1–66.4°C; decomposed at 160°C.

Derivation: Interaction of sodium chloroacetate and potassium cyanide solution.

Use: Organic synthesis.

cyanoacrylate adhesive. An adhesive based on the alkyl 2-cyanoacrylates. (See, for example, methyl 2-cyanoacrylate.) The latter are prepared by pyrolyzing the poly(alkyl)-2-cyanoacrylates produced when formaldehyde is condensed with the corresponding alkyl cyanoacetates. These adhesives have excellent polymerizing and bonding properties. To prevent premature polymerization, inhibitors are added. Supplied commercially as "Eastman 910."

"Cyanobrik."²⁸ Trademark for 98% sodium cyanide in 1-oz. pillow-shaped, briquette form.

Hazard: Highly toxic.

cyanocarbon. Any of a class of compounds in which the cyanide radical ($-\text{CN}$) replaces hydrogen in organic compounds, as in tetracyanoethylene, $(\text{CN})_2\text{C}:\text{C}(\text{CN})_2$. The compounds are quite reactive and form colored complexes with aromatic hydrocarbons. See also nitrile.

"Cyanocel."⁵⁷ Trademark for chemically modified (cyanoethylated) cellulose.

cyanocobalamin $\text{C}_{63}\text{H}_{88}\text{CoN}_{14}\text{O}_{14}\text{P}$. One of the active forms of vitamin B_{12} (q.v.). A grade using radioactive cobalt is also available for use as diagnostic aid. Properties: Dark red crystals or red powder. Very hygroscopic; odorless and tasteless. Slightly soluble in water; soluble in alcohol; insoluble in acetone and ether.

Grade: U.S.P.

Containers: Vials; tins; drums.

Uses: Vitamin; food supplement; medicine.

2-cyanoethyl acrylate $\text{CH}_2=\text{CHCOOCH}_2\text{CH}_2\text{CN}$.

Properties: Liquid. Sp. gr. 1.0690; b.p., polymerizes when heated; f.p. -16.9°C; lb/gal 8.9; flash point 255°F (COC); soluble in water; combustible.

Uses: Forms polymers, copolymers for viscosity index improvers; adhesives; textile finishes and sizes. See also cyanoacrylate adhesive.

cyanoethylation. Process for introducing the group, $-\text{OCH}_2\text{CH}_2\text{CN}$, into an organic molecule by reaction of acrylonitrile with a reactive hydrogen, such as that on a hydroxyl or amino group.

cyanoethyl sucrose (CES)

$\text{C}_{12}\text{H}_{14}\text{O}_3(\text{OH})_{0.7}(\text{OC}_2\text{H}_4\text{CN})_{7.3}$.

Properties: Clear, very viscous, pale yellow liquid. Sp. gr. 1.20 (20/20°C); f.p. sets to a glass at -10°C; b.p. greater than 300°C; flash point over 375°F; combustible; refractive index (n 25°C/D) 1.615. Viscosity decreases very rapidly when heated. Has high volume resistivity, low power factor, unusually high dielectric constant.

Uses: Capacitor impregnation, phosphor binding in electroluminescent panels, modification of electrical properties in coatings.

cyanosformic chloride CNCOCI .

Properties: Oily liquid. B.p. 126–128°C (750 mm).

Derivation: Reaction between phthaloyl chloride and the amide of ethyl oxalate.

"Cyanogas."⁵⁷ Trademark for a pesticide containing not less than 42% calcium cyanide (q.v.); evolves hydrocyanic acid gas on exposure to atmospheric moisture.

Hazard: Highly toxic.

cyanogen (dicyan; oxalonitrile) C_2N_2 .

Properties: Colorless gas; pungent penetrating odor; burns with a purple-tinged flame. Soluble in water, alcohol and ether. Sp. gr. 1.8064 (air = 1); f.p. -28°C; b.p. -20.7°C.

Derivation: (a) Potassium cyanide solution is slowly dropped into copper sulfate solution; (b) mercury cyanide is heated.

Grades: Technical; pure.

Containers: (Liquefied) cylinders.

Hazard: Highly toxic. Flammability limits in air 6 to 32%. Store away from light and heat. Tolerance, 10 ppm in air.

Uses: Organic synthesis; welding and cutting metals; fumigant; rocket propellant.

Shipping regulations: (Rail) Poison gas label. Not accepted by express. (Air) Not acceptable.

cyanogenamide. See cyanamide (1).**cyanogen bromide** (bromine cyanide) CNBr .

Properties: Crystals; penetrating odor; slowly decomposed by cold water. Corrodes most metals. Soluble in alcohol, benzene, ether; sparingly soluble in water. Sp. gr. 2.02; b.p. 61.3°C (750 mm); m.p. 52°C; vapor density 3.6.

Derivation: (a) Action of bromine on potassium cyanide. (b) Interaction of sodium bromide, sodium cyanide, sodium chlorate, and sulfuric acid.

Hazard: Highly toxic. Strong irritant to skin and eyes. Uses: Organic synthesis; parasiticide; fumigating compositions; rat exterminants; cyaniding reagent in gold extraction processes.

Shipping regulations: (Rail, Air) Poison label.

cyanogen chloride CNCl .

Properties: Colorless gas or liquid. Soluble in water, alcohol and ether. Sp. gr. 1.2; b.p. 12.5°C; f.p. -65°C; vapor density 2.1. Min. purity 97 mole %.

Derivation: Action of chlorine on moist sodium cyanide suspended in carbon tetrachloride and kept cooled to -3°C, followed by distillation.

Containers: Cylinders (as liquefied gas).

Hazard: Highly toxic by inhalation or ingestion; strong irritant to eyes and skin.

Uses: Organic synthesis; tear gas; warning agent in fumigant gases.

Shipping regulations: (Rail) Containing less than 0.9% water. Poison gas label. Not accepted by express. (Air) Not acceptable.

cyanogen fluoride (fluorine cyanide) CNF .

Properties: Colorless gas. Forms a white, pulverulent mass if cooled strongly and sublimates at -72°C. Insoluble in water.

Derivation: Interaction of silver fluoride and cyanogen iodide.

Containers: Glass containers (eventually, under the influence of light, it attacks the glass).

Hazard: Toxic by inhalation or ingestion; strong ir-

ritant to eyes and skin. Tolerance (as F), 2.5 mg per cubic meter of air.

Uses: Organic synthesis; tear gas.

cyanogen iodide (iodine cyanide) CNI .

Properties: Colorless needles; very pungent odor; acid taste. Soluble in water, alcohol, and ether; m.p. 146.5°C; sp. gr. 2.84.

Derivation: By heating a metal cyanide with iodine.

Containers: Glass bottles.

Hazard: Toxic by inhalation or ingestion; strong irritant to eyes and skin.

Use: Taxidermists' preservatives.

"Cyanogran."²⁸ Trademark for a 98% sodium cyanide in granular form. White crystalline solid crushed to pass 100% through 10 mesh, retained on 50 mesh.

Hazard: Highly toxic by inhalation or ingestion; strong irritant to eyes and skin.

cyanoguanidine. See dicyandiamide.

ciano(methylmercuri)guanidine (methylmercury dicyandiamide) $\text{CH}_3\text{HgNHC}(\text{NH})\text{NHCN}$. Crystals; m.p. 136°C; soluble in water.

Hazard: Highly toxic by inhalation or ingestion. Strong skin irritant.

Uses: Seed fungicide and disinfectant.

Shipping regulations: (Rail, Air) Mercury compounds, solid, Poison label.

3-cyanopyridine $\text{C}_5\text{H}_4\text{NCN}$.

Properties: Colorless liquid. B.p. 206.2°C; m.p. 49.6°C; soluble in water.

Hazard: Probably toxic.

Containers: Drums; tank cars.

Uses: Organic synthesis.

4-cyanopyridine $\text{C}_5\text{H}_4\text{NCN}$.

Properties: Colorless liquid. B.p. 195.4°C; m.p. 78.5°C; partially soluble in water; soluble in most organic solvents.

Hazard: Probably toxic.

Containers: Drums; tank cars.

Uses: Organic synthesis.

cyanuramide. See ammeline.**cyanurdiamide**. See ammeline.**cyanuric acid** (tricarbimide; tricyanic acid)

$\text{HOCNC}(\text{OH})\text{NC}(\text{OH})\text{N} \cdot 2\text{H}_2\text{O}$. See also isocyanuric acid, the ketone isomer.

Properties: White crystals; odorless; slight bitter taste. Soluble in water and hot mineral acids. Insoluble in alcohol and acetone; solubility in water, 0.2 g/100 ml. Sp. gr. 1.768; decomp. to cyanic acid at 320°C. Low toxicity.

Uses: Intermediate for chlorinated bleaches; selective herbicide; whitening agents.

cyanuric chloride (2,4,6-trichloro-1,3,5-triazine)

$\text{C}_3\text{N}_3\text{Cl}_3$ (cyclic).

Properties: Crystals with pungent odor; sp. gr. 1.32; m.p. 146°C; b.p. 194°C (764 mm). Soluble in chloroform, carbon tetrachloride, hot ether, dioxane, ketones. Very slightly soluble in water (hydrolyzes in cold water). Low toxicity.

Use: Chemical synthesis; dyestuffs; herbicides; optical brighteners.

cyanurtriamide. See melamine.

"Cyclaine."¹²³ Trademark for an anesthetic consisting of hexylcaine hydrochloride.

cyclamate. Group name for synthetic nonnutritive sweetening agents derived from cyclohexylamine or cyclamic acid; the series includes sodium, potassium, and calcium cyclamates. As a result of a study made on laboratory animals in 1970, which indicated that these compounds cause incidence of genetic damage in chick embryos and cancer in rats from high dosage of cyclamates, their use in beverages and food products was banned in the U.S. More recent research has failed to confirm the carcinogenicity of these compounds in laboratory animals, even at levels up to 240 times human intake. Notwithstanding these results, FDA has not withdrawn its ban on use of cyclamates as food additives or as table-top sweeteners, in view of the continuing uncertainty about its safety (1976). The subject is still controversial (1976). See also sweetener, nonnutritive.

cyclamen alcohol. The alcohol corresponding to cyclamen aldehyde (q.v.), used as a stabilizer of cyclamen aldehyde.

cyclamen aldehyde (methyl para-isopropylphenylpropyl aldehyde) $(\text{CH}_3)_2\text{CHC}_6\text{H}_4\text{CH}(\text{CH}_3)\text{CH}_2\text{CHO}$. Properties: Colorless liquid; floral odor. Sp. gr. 0.949–0.959; refractive index 1.507–1.520. Soluble in 1 volume of 80% alcohol; in most oils.

Grades: F.C.C.
Use: Perfumery; soap perfumes; flavoring.

cyclamic acid. USAN name for cyclohexanesulfamic acid (cyclohexylsulfamic acid) $\text{C}_6\text{H}_{11}\text{NHSO}_3\text{H}$. Properties: Odorless, white crystalline solid with a sweet-sour taste; m.p. 178–181°C. Strong, stable acid, soluble in water and alcohol; insoluble in oils. Hazard: May be carcinogenic.

Uses: Nonnutritive sweetener; acidulant.
See also cyclamate.

cyclothrin 3-(2-cyclopentenyl)-2-methyl-4-oxo-2-cyclopentenyl ester of chrysanthemum monocarboxylic acid. See also furethrin, barthrin, ethythrins. Properties: Viscous brown liquid, soluble in petroleum solvents and other common organic solvents. Formulated principally as liquid for spray applications corresponding to natural pyrethrins. Hazard: Moderately toxic by inhalation and ingestion. Uses: Insecticide with applications similar to allethrin and other analogs.

cyclic compound. An organic compound whose structure is characterized by one or more closed rings; it may be mono-, bi-, tri-, or polycyclic depending on the number of rings present. There are three major groups of cyclic compounds: (1) alicyclic, (2) aromatic (also called arene), and (3) heterocyclic. For more detailed information, consult specific entries, and see also organic compound.

cyclizine hydrochloride (1-diphenylmethyl-4-methylpiperazine hydrochloride) $(\text{C}_6\text{H}_5)_2\text{CHC}_4\text{H}_8\text{N}_2\text{CH}_3 \cdot \text{HCl}$. Properties: White crystalline powder or small colorless crystals. Odorless or nearly so; bitter taste; m.p. 285°C with decomposition; slightly soluble in water, alcohol, chloroform; insoluble in ether; pH (2% solution) 4.5–5.5. Grade: U.S.P.

Use: Medicine (antiemetic).

cycloaliphatic epoxy resin (cycloalkenyl epoxides). A polymer prepared by epoxidation of multicycloalkenyls (polycyclic aliphatic compounds containing carbon-carbon double bonds) with organic peracids such as peracetic acid. Resistant to high temperatures.

Uses: Space vehicles; outdoor electrical installations in polluted and humid atmospheres; high-temperature adhesives.

cyclobarbitol [5-(1-cyclohexenyl)-5-ethylbarbituric acid; tetrahydrophenobarbital] $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}_3$.

Properties: White crystals or crystalline powder; odorless; bitter taste; m.p. 170–174°C; soluble in alcohol or ether; very slightly soluble in cold water or benzene. Derivation: Hydrogenation of phenobarbital with colloidal palladium in alcohol as a catalyst. Hazard: See barbiturate.

Use: Medicine.

cyclobutane (tetramethylene) C_4H_8 .

Properties: Colorless gas. Sp. gr. 0.7083 (11°C); b.p. 13°C; f.p. –80°C. Insoluble in water; soluble in alcohol and acetone. Derivation: From petroleum.

Hazard: Flammable. Dangerous fire risk.

cyclobutene (cyclobutylene) C_4H_6 .

Properties: Gas; sp. gr. 0.733; b.p. 2.0°C. Derivation: From petroleum.

Hazard: Flammable. Dangerous fire risk.

“Cyclocel.”⁹⁹ Trademark for a reforming catalyst for gasolines and naphthas. Developed primarily for the cyclo-version process which incorporates catalyst reactivation facilities. Mesh grades 4/8, 4/10.

cyclocitrylideneacetone. See ionone.

cyclocumarol $\text{C}_{20}\text{H}_{18}\text{O}_4$. A synthetic blood anticoagulant.

Properties: White, crystalline powder with slight odor. M.p. 164–168°C. Insoluble in water; slightly soluble in alcohol.

Use: Medicine.

“Cyclodex.”⁷⁴ Trademark for water-dispersible driers with certified metal content of cobalt, lead, or manganese.

cycloheptane (heptamethylene; suberane) C_7H_{14} .

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.809; b.p. 117°C; f.p. –12°C; aniline equivalent –6; flash point below 100°F. Grades: Technical.

Hazard: Moderately toxic; narcotic action by inhalation. Flammable, dangerous fire risk.

Use: Organic synthesis.

cycloheptanone (suberone) $\text{C}_7\text{H}_{12}\text{O}$.

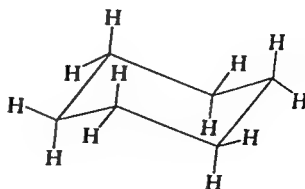

Properties: Colorless liquid; peppermint odor; b.p. 179°C; sp. gr. 0.95; insoluble in water; soluble in alcohol. Combustible.

Hazard: Moderately toxic.

Uses: Research; intermediate.

5-[1-cyclohepten-1-yl]-5-ethylbarbituric acid. See heptabarbitol.

cyclohexane (hexamethylene; hexanaphthene; hexahydrobenzene) C_6H_{12} . Structure: A typical alicyclic hydrocarbon. It may exist in two modifications, called the “boat” and the

Chair

Boat

"chair," as shown. This is due to slight distortion of the bond angles, in accordance with the modified version of Baeyer's strain theory.

Properties: Colorless, mobile liquid. Pungent odor. Sp. gr. 0.779 (20/4°C); b.p. 80.7°C; f.p. 6.3°C; refractive index 1.4263; aniline equiv. 7. Insoluble in water. Soluble in alcohol, acetone, benzene. Flash point (98% grade) -1°F (closed cup). Autoignition temp. 500°C. Flammable limits in air, 1.3 to 8.4%.

Derivation: (a) Catalytic hydrogenation of benzene. (b) Constituent of crude petroleum.

Grades: 85, 98, 99.86%; spectrophotometric.

Containers: Special metal cans and drums; tank cars; pipelines.

Hazard: Flammable, dangerous fire risk. Moderately toxic by inhalation and skin contact. Tolerance, 300 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Manufacture of nylon; solvent for cellulose ethers, fats, oils, waxes, bitumens, resins, crude rubber; extracting essential oils; chemical (organic synthesis, recrystallizing medium); paint and varnish remover; glass substitutes; vapor has been used as lubricant for steel (experimental).

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

1,4-cyclohexanebis(methylamine) $C_6H_{10}(CH_2NH_2)_2$. The commercial product is about 40% cis and 60% trans.

Properties: Clear liquid; sp. gr. 0.9419 (20/4°C); b.p. 239–244°C. Soluble in all proportions in water, alcohol, and most other organic solvents. Combustible; low toxicity.

Uses: Intermediate; resins.

cyclohexanecarboxylic acid. See hexahydrobenzoic acid.

1,2-cyclohexanedicarboxylic anhydride. See hexahydrophthalic anhydride.

1,4-cyclohexanedimethanol (CHDM) $C_6H_{10}(CH_2OH)_2$. Cis and trans isomers are known and are present in the commercial product in about 30 to 70%.

Properties: Liquid; b.p. 286.0°C (735 mm, cis-isomer), 283°C (735 mm, trans-isomer); m.p. 41–61°C; sp. gr. (super-cooled) 1.0381 (25/4°C); flash point 330°F (COC); refractive index (n 20/D) 1.4893. Soluble in water; ethyl alcohol. Combustible.

Uses: Polyester films and protective coatings; reduction of reaction time in esterification.

cyclohexanesulfamic acid. See cyclamic acid.

cyclohexanol (hexahydrophenol) $C_6H_{11}OH$.

Properties: Colorless, oily liquid, camphor-like odor; hygroscopic. Sparingly soluble in water; miscible with most organic solvents and oils. Sp. gr. 0.937 (37/4°C); m.p. 23°C; b.p. 160.9°C; wt/gal approximately 8 lb; flash point 154°F; refractive index 1.465 (22°C). Combustible; autoignition temp. 572°F.

Derivation: Phenol is reduced with hydrogen over active nickel at 160 to 170°F. The cyclohexanone is removed by condensing with benzaldehyde in the presence of alkali.

Grades: Technical (contains freezing inhibitor).

Containers: Drums; tank cars.

Hazard: Toxic by skin absorption and inhalation. Tolerance, 50 ppm in air. Narcotic in high concentrations.

Uses: Soap making, to incorporate solvents and phenolic insecticides; source of adipic acid for nylon; textile finishing; solvent; blending agent; lacquers; paints and varnishes; finish removers; dry cleaning; emulsified products; leather degreasing; polishes; plasticizers; plastics; germicides.

cyclohexanol acetate (cyclohexanyl acetate)

$CH_3COOC_6H_{11}$.

Properties: Colorless liquid. Odor resembling that of amyl acetate. Miscible with most lacquer solvents and diluents, and with halogenated and hydrogenated hydrocarbons. Soluble in alcohol; insoluble in water; sp. gr. 0.966; b.p. 177°C. Combustible.

Hazard: Narcotic in high concentrations.

Uses: Solvent for nitrocellulose, cellulose ether; bitumens, metallic soaps, basic dyes, blown oils, crude rubber, many natural and synthetic resins and gums; lacquers.

cyclohexanone (pimelic ketone; ketoexamethylene) $C_6H_{10}O$.

Properties: Water-white to pale yellow liquid with acetone- and peppermint-like odor. Slightly soluble in water. Miscible with most solvents. B.p. 156.7°C; f.p. -47°C; sp. gr. 0.948; flash point 111°F; refractive index (n 20/D) 1.4507; vapor pressure (212°F) 136 mm. Autoignition temp. 788°F. Combustible.

Derivation: By passing cyclohexanol over copper with air at 280°F; also by oxidation of cyclohexanol with chromic acid or oxide.

Containers: Cans; drums; tank cars.

Hazard: Moderate fire risk. Toxic by inhalation and skin contact. Tolerance, 50 ppm in air.

Uses: Organic synthesis, particularly of adipic acid and caprolactam (about 95%); polyvinyl chloride and its copolymers, and methacrylate ester polymers; wood stains; paint and varnish removers; spot removers; degreasing of metals; polishes; leveling agent in dyeing and delustering silk; lube oil additive; general solvent.

cyclohexanone peroxide (1-hydroperoxycyclohexyl 1-hydroxycyclohexyl peroxide)

$C_6H_{10}(OOH)OOC_6H_{10}OH$.

Properties: Grayish paste; insoluble in water; soluble in most organic solvents.

Hazard: Dangerous fire risk in contact with organic materials. Strong oxidizing agent.

Shipping regulations: (Rail) (up to 85%) Yellow label. (Air) (not over 50%) Organic Peroxide label; (50–85%) Organic Peroxide label. Not acceptable on passenger planes. (Over 85%) Not acceptable.

cyclohexanyl acetate. See cyclohexanol acetate.

cyclohexene (1,2,3,4-tetrahydrobenzene) C_6H_{10} .

Properties: Colorless liquid. Sp. gr. 0.811 (20/4°C); b.p. 83°C; f.p. -103.7°C; refractive index 1.445 (25°C); flash point 11°F; aniline equivalent 10; wt/gal 6.7 lb (25°C). Soluble in alcohol; insoluble in water.

Grades: Technical 95%; 99%; research 99.9 mole %.

Containers: Tank cars; barges.

Hazard: Moderately toxic by inhalation. Tolerance, 330 ppm in air. Flammable, dangerous fire risk.

Uses: Organic synthesis; catalyst solvent; oil extraction.

Shipping regulations: Flammable liquid, n.o.s. (Rail)
Red label. (Air) Flammable Liquid label.

3-cyclohexene-1-carboxaldehyde (1,2,3,6-tetrahydrobenzaldehyde)

Properties: Liquid; sp. gr. 0.9721; b.p. 164.2°C; f.p. -100°C; lb/gal 8.1 (20°C); flash point 135°F; slightly soluble in water. Combustible.

Containers: Drums.

Hazard: Strong irritant to tissue.

Uses: Intermediates; improves water resistance of textiles.

Shipping regulations: (Air) Corrosive label.

cyclohexene oxide $\text{C}_6\text{H}_{10}\text{O}$.

Properties: Colorless liquid with a strong odor; b.p. 129-130°C; sp. gr. 0.967 (25/4°C); refractive index (n 25/D) 1.4503; flash point 81°F. Soluble in alcohol, ether, acetone; insoluble in water.

Grade: 98% pure.

Hazard: Flammable, dangerous fire risk. Moderately toxic.

Use: Chemical intermediate.

cyclohexenylethylbarbituric acid. See cyclobarbital.

cyclohexenylethylene. See vinylcyclohexene.

cyclohexenyltrichlorosilane. $\text{C}_6\text{H}_9\text{SiCl}_3$.

Properties: Colorless liquid. B.p. 202°C; sp. gr. 1.263 (25/25°C); refractive index (n 25/D) 1.488; flash point (COC) 200°F. Readily hydrolyzed by moisture, with liberation by hydrochloric acid. Combustible.

Grades: Technical.

Hazard: Strong irritant; corrosive to skin.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not accepted on passenger planes.

cycloheximide. Generic name for 3-[2-(3,5-dimethyl-2-oxocyclohexyl)-2-hydroxyethyl]glutarimide.

By-product in the manufacture of streptomycin.

Properties: Crystals; m.p. 115.5-117°C. Slightly soluble in water; soluble in acetone, alcohol, and chlorinated solvents.

Hazard: Moderately irritant.

Uses: Fungicide; antibiotic; abscission of citrus fruit in harvesting.

cyclohexylamine (hexahydroaniline; aminocyclohexane) $\text{C}_6\text{H}_{11}\text{NH}_2$.

Properties: Colorless liquid, with unpleasant odor. B.p. 134.5°C; sp. gr. 0.8647 (25/25°C); f.p. -18°C. Strong organic base; pH of 0.01% aqueous solution 10.5; forms an azeotrope with water, b.p. 96.4°C. Miscible with most solvents. Flash point 90°F (open cup). Autoignition temp. 560°F.

Grades: Technical (98%).

Containers: Drums; tank cars.

Hazard: Flammable; moderate fire risk; toxic by ingestion, inhalation, skin absorption. Tolerance, 10 ppm in air.

Uses: Boiler-water treatment; rubber accelerator; intermediate.

cyclohexylbenzene. See phenylcyclohexane.

N-cyclohexyl-2-benzothiazolesulfenamide (benzothiazyl-2-cyclohexylsulfenamide) $\text{C}_6\text{H}_4\text{SNCSNHC}_6\text{H}_{11}$.

Properties: Cream-colored powder; sp. gr. 1.27; melt-

ing range 93-100°C. Insoluble in water; soluble in benzene.

Use: Rubber accelerator.

cyclohexyl bromide $\text{C}_6\text{H}_{11}\text{Br}$.

Properties: A liquid, not more than faintly yellow, having a penetrating odor. Sp. gr. 1.32-1.34 (25/25°C); refractive index 1.4926-1.4936 (25°C).

cyclohexyl chloride $\text{C}_6\text{H}_{11}\text{Cl}$.

Properties: Colorless liquid. F.p. -43°C; b.p. 142°C; flash point 89°F; sp. gr. 0.992.

Hazard: Flammable, moderate fire risk.

2-cyclohexylcyclohexanol $\text{C}_6\text{H}_{11}\text{C}_6\text{H}_{10}\text{OH}$.

Properties: Colorless liquid; freezing point 29°C; b.p. 271-277°C; sp. gr. 0.977 (25/25°C); lb/gal 8.13; refractive index 1.495 (25°C); flash point 255°F. Soluble in methanol and ether. Slightly soluble in water. Combustible.

2-cyclohexyl-4,6-dinitrophenol. See dinitrocyclohexylphenol.

cyclohexyl isocyanate $\text{C}_6\text{H}_{11}\text{NCO}$. Used to form cyclohexyl carbamates or ureas for agricultural chemicals or pharmaceutical use.

Hazard: Toxic.

Shipping regulations: (Air) Poison label. Not accepted on passenger planes.

cyclohexyl methacrylate $\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{COOC}_6\text{H}_{11}$.

Properties: Colorless monomeric liquid with pleasant odor. B.p. 210°C; refractive index (20°C) 1.4578; sp. gr. (20/20°C) 0.9626; viscosity (25°C) 5.0 centipoises; insoluble in water. Combustible.

Uses: Optical lens systems; dental resins; encapsulation of electronic assemblies.

1-cyclohexyl-2-methylaminopropane. See propylhexedrine.

para-cyclohexylphenol $\text{C}_6\text{H}_{11}\text{C}_6\text{H}_4\text{OH}$.

Properties: Crystals; m.p. 120°C (min). Combustible.

Grades: Technical.

Hazard: May be toxic.

Use: Intermediate for resins and organic synthesis.

cyclohexylphenyl-1-piperidinepropanol hydrochloride. See trihexyphenidyl hydrochloride.

N-cyclohexylpiperidine $\text{C}_6\text{H}_{11}\text{NC}_5\text{H}_{10}$. Yellow liquid; refractive index (n 20/D) 1.4856. Combustible.

Use: Intermediate.

cyclohexyl stearate $\text{C}_6\text{H}_{11}\text{OOC}_{17}\text{H}_{35}$.

Properties: Pale yellow powder; sp. gr. 0.882 at 30/15.5°C; m.p. 26-28°C. Soluble in benzene, toluene and acetone; insoluble in water.

Uses: Plasticizer for natural and synthetic resins.

cyclohexylsulfamic acid. See cyclamic acid.

N-cyclohexyl para-toluenesulfonamide

Properties: Yellow-brown fused mass; relatively light-stable; m.p. 86°C; b.p. 350°C. Combustible. Low toxicity. Soluble in alcohol, esters, ketones, aromatic hydrocarbons and vegetable oils; insoluble in water. Combustible with a wide variety of resins including most of the cellulosic and vinyl resins.

Use: Resin plasticizer.

cyclohexyl trichlorosilane $\text{C}_6\text{H}_{11}\text{SiCl}_3$.

Properties: Colorless to pale yellow liquid. B.p. 206°C; sp. gr. 1.226 (25/25°C); refractive index (n 25/D) 1.4759; flash point (COC) 185°F. Readily hydrolyzed by moisture, with liberation of hydrochloric acid. Combustible.

Derivation: By Grignard reaction of silicon tetrachloride and cyclohexylmagnesium chloride.

Grade: Technical.

Containers: 1-, 10-lb bottles; 100-lb drums.

Hazard: Toxic by ingestion and inhalation; strong irritant to tissue.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Cyclolube."⁵⁰⁰ Trademark for a series of oils composed principally of cycloparaffins. Used as plasticizers for nonpolar polymers, lubricants for polar polymers and extenders for relatively saturated polymers.

cyclomethycaine (3-(2-methylpiperidine)propyl-para-cyclohexyloxybenzoate) $C_{22}H_{33}NO_3$.

Properties: White, odorless, crystalline powder; sparingly soluble in water, alcohol, and chloroform and very slightly soluble in acetone, ether and dilute acids.

Use: Medicine.

cyclomethycaine sulfate $(C_{22}H_{33}NO_3)_2 \cdot H_2SO_4$.

Properties: Crystals; somewhat soluble in water.

Use: Medicine (topical anesthetic).

cyclonite (sym-trimethylene trinitramine; hexahydro-1,3,5-trinitro-sym-triazine; trinitrotrimethylenetrinitramine; cyclotrimethylenetrinitramine; RDX)

$N(NO_2)CH_2N(NO_2)CH_2N(NO_2)CH_2$.

Properties: White crystalline solid; sp. gr. 1.82; m.p. 203.5°C. Soluble in acetone; insoluble in water, alcohol, carbon tetrachloride, and carbon disulfide; slightly soluble in methanol and ether.

Derivation: Reaction of hexamethylenetetramine with concentrated nitric acid.

Containers: Special lined drums.

Hazard: High explosive, easily initiated by mercury fulminate. Toxic by inhalation and skin contact. Tolerance, 1.5 mg per cubic meter of air.

Use: Explosive, 1.5 times as powerful as TNT.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable. Legal label name, cyclotrimethylene-trinitramine.

3-cyclooctadiene C_8H_{12} . Intermediate for such compounds as suberic acid.

1,5-cyclooctadiene $HC:CH(CH_2)_2:CH:CHCH_2CH_2$. A butadiene dimer.

Properties: Liquid; freezing point -56.39°C; distillation range 301-303°F (technical); b.p. 149.34°C (pure); sp. gr. 0.88328 (20/4°C); lb/gal 7.38; vapor pressure 0.50 psia (100°F); refractive index 1.4933 (20/D); flash point 100°F. Combustible.

Derivation: Catalytic dimerization of butadiene.

Grades: Technical 95%; 99%; 99.8 mole %.

Hazard: Moderate fire risk.

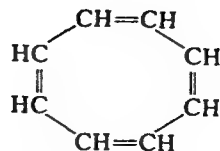

Uses: Resin intermediate; third monomer in EPT rubber.

cyclooctane C_8H_{16} .

Properties: Colorless liquid. Sp. gr. 0.835; b.p. 148°C; m.p. 14°C. Combustible.

cyclooctatetraene C_8H_8 .

Properties: Colorless liquid; f.p. -7°C; b.p. 140°C; sp. gr. 0.943 (0/4°C); refractive index 1.5394 (n_D 20/D). It behaves like an aliphatic hydrocarbon, is

relatively reactive and resinifies on standing in air. Combustible.

Derivation: Polymerization of acetylene by Reppe process developed about 1940 in Germany.

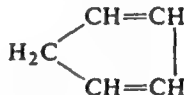

Uses: Organic research.

cycloolefin. An alicyclic hydrocarbon having two or more double bonds, e.g., the very reactive and widely used cyclopentadiene derived from coal tar, as well as cyclohexadiene and cyclooctatetraene, containing six and eight carbon atoms, respectively. The latter has four double bonds and is a polymer of acetylene.

cycloparaffin. An alicyclic hydrocarbon in which three or more of the carbon atoms in each molecule are united in a ring structure, and each of these ring carbon atoms is joined to two hydrogen atoms, or alkyl groups. The simplest members are cyclopropane (C_3H_6), cyclobutane (C_4H_8), cyclopentane (C_5H_{10}), cyclohexane (C_6H_{12}), and derivatives of these such as methylcyclohexane (C_7H_{14}).

Hazard: All members of the cycloparaffin series are narcotic, and may cause death through respiratory paralysis. For most of the members there appears to be a narrow range between the concentrations causing deep narcosis and those causing death.

1,3-cyclopentadiene.

Colorless liquid with sp. gr. 0.805 and b.p. 42.5°C; insoluble in water; soluble in alcohol, ether and benzene.

Derivation: From coal tar and cracked petroleum oils.

Hazard: Decomposes violently at high temperatures. Moderately toxic. Tolerance, 75 ppm in air.

Uses: Chemical intermediate; organic synthesis; starting material for synthetic prostaglandin; chlorinated insecticides; formation of sandwich compounds by chelation; e.g., cyclopentadienyl iron dicarbonyl dimer $[C_5H_5Fe(CO)_2]_2$.

cyclopentamine hydrochloride (1-cyclopentyl-2-methylaminopropane hydrochloride)

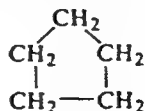

$C_5H_9CH_2CH(CH_3)NHCH_3 \cdot HCl$.

Properties: White, crystalline powder. Mild characteristic odor and bitter taste. M.p. 113.0-116.0°C. Freely soluble in water, alcohol and chloroform; soluble in benzene; slightly soluble in ether. pH (1% solution) about 6.2.

Grade: N.F.

Use: Medicine.

cyclopentane (pentamethylene) C_5H_{10} .

Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.7445 (20/4°C); b.p. 49.27°C; f.p. -94°C; refractive index 1.406 (20/D); flash point -35°F.

Derivation: From petroleum.

Grades: Technical; 95%, 99%; research.

Hazard: Moderately toxic by ingestion and inhalation. Flammable, dangerous fire risk.

Use: Solvent for cellulose ethers; motor fuel; azeotropic distillation agent.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

1,2,3,4-cyclopentanetetracarboxylic acid $C_5H_6(COOH)_4$.
Properties: Crystalline powder; m.p. 195–196°C; soluble in water but insoluble in most organic solvents. Uses: Curing agent for resins; imparts thermal stability and high-temperature properties.

1,2,3,4-cyclopentanetetracarboxylic acid, dianhydride $C_5H_6(C_2O_3)_2$.

Properties: White solid; m.p. 220–221°C; moderately soluble in dimethyl formamide, butyrolactone, and dimethylsulfoxide, but only slightly soluble in acetone. Insoluble in hydrocarbons.

Uses: Curing agent for epoxy resins.

cyclopentanol (cyclopentyl alcohol)

Properties: Colorless, viscous liquid; pleasant odor; sp. gr. 0.946 (20/4°C); refractive index 1.4575 (20°C); b.p. 139–140°C; flash point 124°F. Slightly soluble in water; soluble in alcohol. Combustible.

Hazard: Moderate fire risk.

Uses: Perfume and pharmaceutical solvent; intermediate for dyes, pharmaceuticals and other organics.

cyclopentanone C_5H_8O .

Properties: Water-white, mobile liquid; distinctive ethereal odor, somewhat like peppermint; b.p. 125–126°C (630 mm); sp. gr. 0.943; refractive index 1.437; flash point (closed cup) 87°F. Insoluble in water; soluble in alcohol and ether.

Hazard: Flammable, moderate fire risk. Narcotic in high concentrations.

Use: Intermediate for pharmaceuticals, biologicals, insecticides, and rubber chemicals.

cyclopentanone oxime C_5H_8NOH . Nearly colorless and odorless crystalline solid; m.p. 56°C; b.p. 196°C; soluble in water, alcohol. Used as intermediate in synthesis of amino acids, proline and ornithine.

cyclopentene $\text{CH}=\text{CHCH}_2\text{CH}_2\text{CH}_2$.

Properties: Colorless liquid; sp. gr. 0.772; b.p. 44°C; f.p. -135.21°C; refractive index (20/D) 1.4225; flash point below 0°F.

Grades: Technical; research (99.89 mole %).

Hazard: Moderately toxic; narcotic action. Flammable, dangerous fire risk.

Use: Organic synthesis; polyolefins; epoxies; cross-linking agent.

cyclopentenyl acetone [1-(1-cyclopentenyl)-2-propanone] $C_5H_7CH_2COCH_3$.

Properties: Clear, colorless liquid; ketone odor; b.p. 170°C; refractive index 1.4545–1.4550 at 25°C. Combustible.

3-(2-cyclopentenyl)-2-methyl-4-oxo-2-cyclopentenyl ester of chrysanthemum monocarboxylic acid. See cyclethrin.

1-(1-cyclopentenyl)-2-propanone. See cyclopentenyl acetone.

cyclopentylacetone (1-cyclopentyl-2-propanone)

Properties: Liquid; sp. gr. 0.893 (25/25°C); b.p. 180–184°C; refractive index 1.4420 (25°C). Combustible.

cyclopentyl alcohol. See cyclopentanol.

cyclopentyl bromide (bromocyclopentane) C_5H_9Br .

Properties: Clear, mobile liquid with sweet aromatic odor. B.p. 137–138°C; sp. gr. 1.3866 (20/4°C); wt/gal 11.6 lb (20°C); refractive index (n_D 20/D) 1.4885; flash point (closed cup) 108°F. Insoluble in water. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Organic synthesis (pharmaceuticals).

1-cyclopentyl-2-methylaminopropane hydrochloride.

See cyclopentamine hydrochloride.

cyclopentyl phenyl ketone $C_5H_9COC_6H_5$.

Properties: Colorless to light yellow liquid; b.p. 145–146°C (15 mm). Soluble in most common organic solvents; insoluble in water. Combustible.

Use: Pharmaceutical intermediate.

1-cyclopentyl-2-propanone. See cyclopentyl acetone.

cyclopentylpropionic acid $C_5H_9CH_2CH_2COOH$.

Properties: Liquid; b.p. 130–132°C (12 mm); flash point 116°F; insoluble in water. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Use: Intermediate; wood preservatives.

cyclopentylpropionic acid chloride. See cyclopentylpropionyl chloride.

cyclopentylpropionyl chloride (cyclopentylpropionic acid chloride) $C_5H_9CH_2CH_2COCl$.

Properties: Liquid; b.p. 81–82°C (10 mm); flash point 104°F; soluble in water; combustible.

Hazard: Moderate fire risk. Moderately toxic.

Use: Intermediate.

"Cyclophos."¹ Trademark for colorless crystalline, hydrated sodium polyphosphate. Cyclic compound. F.C.C. grade. Coagulates albumin and certain other proteins. Soluble in water.

Use: Precipitation of proteins.

cyclopropane (trimethylene) C_3H_6 .

Properties: Colorless gas of characteristic odor resembling that of solvent naphtha and having a pungent taste. Sp. gr. 0.72–0.79; b.p. -32.9°C; f.p. -126.6°C. Soluble in alcohol and water. Autoignition temp. 928°F.

Derivation: Reaction of zinc dust with methylene chloride.

Grades: Technical; U.S.P.; 99.5% min.

Containers: Steel cylinders.

Hazard: Highly flammable. Forms flammable and explosive mixtures with air or oxygen. Explosive limits in air, 2.4 to 10.3 % by volume. Moderately toxic by inhalation; narcotic in high concentration.

Uses: Organic synthesis; anesthetic.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

cyclopropanespirocyclopropane. See spiropentane.

cyclosilane. See silane.

"Cyclo Sol."¹²⁵ Trademark for a series of hydrocarbon solvents composed of 50 to 99% aromatic hydrocarbons.

Hazard: Flammable, dangerous fire risk.

"Cyclotene."²³³ Trademark for a synthetic aromatic chemical, methylcyclopentenolone; used in soap, cosmetic perfumery, and flavor compounding.

cyclotrimethylenetrinitramine. Legal label name for cyclonite (q.v.).

cycloversion. A process using bauxite as a catalyst for (1) desulfurization, (2) reforming, and (3) cracking of petroleum to form high-octane gasoline.

cyclyd. A coined term referring to the cyclic alkyd coatings prepared from "Polycyclol 1222" (q.v.); used in baking metal primers and air-drying maintenance paints.

"Cycocel"⁵⁷ Trademark for a plant growth regulator (2-chloroethyltrimethyl ammonium chloride), said to be effective for cereal grains, tomatoes and peppers.

"Cycolac,"⁵²⁵ Trademark for a series of acrylonitrile-butadiene-styrene polymers. See ABS resin. Especially suitable for metal plating. Also used for stiletto heels and telephone handsets.

"Cycolon,"⁵²⁵ Trademark for medium-impact material possessing most of the properties of ABS resins (q.v.).

Uses: Automotive parts, housewares, toys, refrigeration parts.

"Cycoloy"⁵²⁵ Trademark for a family of alloys of ABS and other thermoplastic resins, providing a high-performance balance of properties.

Uses: Automotive, sporting goods, electrical/electronics markets.

"Cycopol"¹¹ Trademark for a group of copolymer resins including styrenated alkyds, acrylonitrile-modified styrenated alkyd, vinyl toluene type, special acrylic type resins.

Uses: Vehicle for solvents, hammer finishes, coil coatings, metal decorating.

"Cycovin"⁵²⁵ Trademark for alloys of ABS and PVC, providing a family of materials with flame-retardant properties in addition to the balanced features of ABS.

Uses: Instructional and electrical applications.

"Cyfor,"⁵⁷ Trademark for rosin size for use in paper manufacture.

"Cygon,"⁵⁷ Trademark for a systemic insecticide whose active ingredient is O,O-dimethyl S-(N-methylcarbamolymethyl)phosphorodithioate.

See dimethoate.

"Cykelin,"⁶⁴ Trademark for dicyclopentadiene copolymers of linseed oil that produce vehicles of quick hard dry and excellent water resistance.

Uses: Varnishes, enamels, aluminum paints, cold-cut varnishes, reinforcement oil.

"Cyklosit,"⁴⁷⁰ Trademark for cyclized rubber; used primarily in printing inks.

"Cymel,"⁵⁷ Trademark for a series of synthetic resins based on melamine-formaldehyde filled with alpha-cellulose, cellulose, chopped fabric, glass fiber, asbestos fiber.

cymene (cymol; isopropyltoluene; methylpropylbenzene) $\text{CH}_3\text{C}_6\text{H}_4\text{CH}(\text{CH}_3)_2$. The ortho-, meta, and para isomers are known.

Properties: Colorless, transparent liquids; aromatic odor. Combustible. Sp. gr.: Ortho 0.8748, meta 0.862, para 0.8551; f.p.: Ortho -182°C, meta -25°C, para -73.5°C; b.p.: Ortho 177°C, meta 175.6°C, para 176.5°C; refractive index, para 1.489 (20°C). Solu-

ble in alcohol, ether, and chloroform; insoluble in water. Flash point (para) 117°F (closed cup).

Derivation: Mixed cymenes are produced from toluene by alkylation. Para-cymene occurs in several essential oils, and is made from monocyclic terpenes by dehydrogenation. These terpenes can be made from turpentine, or obtained as a by-product from the sulfite digestion of spruce pulp in paper manufacture.

Method of purification: Washing with sulfuric acid, water, and alkali.

Grade: Technical.

Containers: Drums; glass bottles.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Solvents; synthetic resin manufacture; metal polishes; organic synthesis (oxidation to hydroperoxides used as catalysts for synthetic rubber manufacture. Cymene alcohols are made by hydrogenating the hydroperoxides.) Pure para-cresol and carvacrol are made from para-cymene.

"Cynol,"⁵⁷ Trademark for a series of rewetting, softening and defoaming agents used in the manufacture of paper. Available in liquid form.

"Cynorex,"¹³⁴ Trademark for bright cyanide copper plating additive.

"Cypan,"⁵⁷ Trademark for a synthetic organic chemical used to modify and control the properties of oil well drilling fluids.

"Cypip,"⁵⁷ Trademark for diethylcarbazine medicated premix; used in veterinary medicine.

"Cyprex,"⁵⁷ Trademark for dodine.

"Cyrea,"⁵⁷ Trademark for a urea feed compound.

"Cyron,"⁵⁷ Trademark for a synthetic sizing material for the paper industry. "Cyron" permits sizing of alkaline as well as acid paper and may be added either to the pulp or as a coating.

Cys Abbreviation for cysteine.

cysteamine. See 2-aminoethanethiol.

cysteine (alpha-amino-beta-thiolpropionic acid; beta-mercaptopalane) $\text{HSCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A non-essential amino acid derived from cystine, occurring naturally in the L(+) form.

Properties: Colorless crystals; soluble in water, ammonium hydroxide, and acetic acid; insoluble in ether, acetone, benzene, carbon disulfide, and carbon tetrachloride.

Derivation: Hydrolysis of protein; degradation of cystine. Found in urinary calculi.

Uses: Biochemical and nutrition research; reducing agent in bread doughs (up to 90 ppm). Available commercially as L(+)-cysteine hydrochloride.

cystine (beta, beta'-dithiobisalanine; di[alpha-amino-beta-thiolpropionic acid]) $\text{HOOCCH}(\text{NH}_2)\text{CH}_2\text{SSCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A non-essential amino acid.

Properties: White crystalline plates; soluble in water; insoluble in alcohol. Optically active.

DL-cystine, m.p. 260°C.

D(+)-cystine, m.p. 247-249°C.

L(-)-cystine, m.p. 258-261°C with decomposition; the naturally occurring form.

Derivation: Hydrolysis of protein (keratin); organic synthesis. Occurs as small hexagonal crystals in urine.

Grade: F.C.C.

Use: Biochemical and nutrition research; nutrient and dietary supplement.

"Cystokon."³²⁹ Trademark for a 30% solution of sodium acetrizoate.

cytidine $C_9H_{13}N_3O_5$. The nucleoside consisting of D-ribose and cytosine.

Properties: White, crystalline powder; soluble in water, acid, alkali; insoluble in alcohol.

Derivation: From yeast ribonucleic acid. Also available as the hemisulfate, $(C_9H_{13}N_3O_5)_2 \cdot H_2SO_4$.

cytidine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (CMP; see cytidylic acid), the diphosphate (CDP) and the triphosphate (CTP).

cytidylic acid (cytosylic acid; cytidinephosphoric acid; cytidine monophosphate; CMP) $C_9H_{14}N_3O_8P$. The monophosphoric ester of cytosine; i.e., the nucleotide containing cytosine, D-ribose and phosphoric acid. The phosphate may be esterified to either the 2,3, or 5 carbon of ribose yielding cytidine-2'-phosphate, cytidine-3'-phosphate, and cytidine-5'-phosphate, respectively.

Properties: (cytidine-3'-phosphate): White, crystalline powder; odorless; mild sour taste; m.p.: crystals from 50% alcohol, 230–233°C (with decomposition); crystals from water, 227°C (with decomposition). Soluble in water and dilute alkalies; slightly soluble in 50% alcohol; insoluble in alcohol and other organic solvents.

Derivation of commercial product: From yeast nucleic acid by hydrolysis. The 5'-monophosphate is made synthetically by phosphorylation and hydrolysis of isopropylidene cytidine.

Use: Biochemical research.

cytochemistry. The branch of biochemistry devoted to study of the chemical composition of cells and cell membranes, including chromosomes, genes, and the complex reactions involved in cell growth and replication, as well as the mechanism of enzyme activity. See also molecular biology.

cytochrome. A class of iron-porphyrin proteins (see porphyrin) of great importance in cell metabolism. They are pigments occurring in the cells of nearly

all animals and plants. Several types have been identified; cytochrome C is the most abundant and has been obtained in pure forms. The cytochromes and cytochrome oxidase have important functions in cell respiration. The latter is an iron-porphyrin-containing protein which is an important enzyme in cell respiration. It catalyzes the oxidation of cytochrome C and is reduced itself in the reaction; it is then reoxidized by oxygen.

cytokinins. See kinins.

"Cytomel."⁷¹ Trademark for a brand of liothyronine.

cytoplasm. The extra-nuclear components of the living cell, containing mitochondria, plastids, spherosomes, etc. This, together with the nucleus, constitutes the protoplasm (q.v.). The chemical constituents are chiefly proteins, plus a high percentage of water.

"Cytosar."³²⁷ Trademark for cytosine arabinoside (q.v.).

cytosine $C_4H_5N_3O$. 2-Oxo-4-aminopyrimidine. A pyrimidine found in both ribonucleic and deoxyribonucleic acids, and certain coenzymes.

Properties: (monohydrate): Lustrous platelets; decomposes at 320–325°C. Slightly soluble in water and alcohol; insoluble in ether.

Derivation: Isolation following hydrolysis of nucleic acids; organic synthesis.

Use: Biochemical research.

cytosine arabinoside (Ara-C). A drug synthesized in 1969 at Salk Institute; it is useful in combating myelocytic leukemia in adults, and has been approved by FDA as a prescription drug.

cytosine monophosphate. See cytidylic acid.

cytosylic acid. See cytidylic acid.

"Cytrel"³⁵² Trademark for a tobacco substitute derived from cellulose. It is free from nicotine, and has from 15 to 30% of the tar content of tobacco.

"Cytrol" Amitrole-T.⁵⁷ Trademark for 3-amino-1,2,4-triazole liquid formulation herbicide.

"Cyuram."⁵⁷ Trademark for tetramethylthiuramdisulfide pellets. Rubber accelerator.

"Cyzine."⁵⁷ Trademark for 10% 2-acetyl-amino-5-nitrothiazole feed supplement.

D

d- Prefix indicating that a substance is dextrorotatory. A plus sign (+) is now preferred.

D Symbol for deuterium.

D- Prefix indicating the right-handed enantiomer of an optical isomer.
See also glyceraldehyde; asymmetry; enantiomer.

2,4-D (2,4-dichlorophenoxyacetic acid)

Properties: White to yellow crystalline powder; difficultly soluble in water or oils; soluble in alcohols. Stable; m.p. 138°C; b.p. 160°C (0.4 mm).

Derivation: Reaction of 2,4-dichlorophenol and chloroacetic acid in aqueous sodium hydroxide.

Forms available: Sodium salt (60–85% acid), amine salts (10–60% acid); esters (10–45% acid). These forms are dispersible in water or oils (esters) and can be applied as sprays.

Grade: Technical.

Containers: Bags; 100- and 250-lb drums; (butyl, isopropyl esters) tank cars.

Hazard: Moderately toxic and irritant. Tolerance, 10 mg per cubic meter of air. Use may be restricted.

Uses: Selective weed killer and defoliant.

DAA. Abbreviation for diacetone acrylamide (q.v.).

"DABCO."⁴⁷² Trademark for triethylenediamine (q.v.).

"Dacamine."²⁴⁴ Trademark for a combination of N-oleyl 1,3-propylene diamine salt or 2,4-dichlorophenoxyacetic acid. Herbicide.

"Dacolyte."²⁸ Trademark for an addition agent for acid copper plating solution for heavy deposits. Dark brown, amorphous, fine powder; sharp odor.

"Daconate."²⁴⁴ Trademark for a monosodium methyl-arsenate and inert organic compound. Used in post-emergence weed control.

Hazard: Toxic by ingestion.

"Dacote."²⁴⁴ Trademark for a precipitated calcium carbonate with high brightness and opacifying power. Used especially in and on paper.

"Dacovin."²⁴⁴ Trademark for a compound of PVC resins. Used in production of rigid pipe, blow-molding bottles, rigid film and sheet and a variety of rigid molded products.

"Dacron."²⁸ Trademark for a polyester fiber made from polyethylene terephthalate. Available as filament yarn, staple, tow, and fiberfill. See also dimethyl terephthalate, terephthalic acid.

Properties: Sp. gr. 1.38; tensile strength (psi) 4 to 5 grams/denier (about 50 to 60 thousand psi); break elongation 10–36%; moisture regain 0.4%; high elastic recovery; good insect resistance; difficult to ignite; self-extinguishing; soluble in meta-cresol (hot) trifluoroacetic acid, and ortho-chlorophenol; m.p. 250°C.

Derivation: Reaction of dimethyl terephthalate and

ethylene glycol. The resulting polymer is melt-extruded through a spinneret and stretched.

Uses: Textile fabrics and suitings, often combined with wool and other fibers; cordage; fire hose, etc.

"Dacthal."²⁴⁴ Trademark for a composition of dimethyl ester 2,3,5,6-tetra-chloroterephthalic acid. Commonly known as DCPA. Used in pre-emergence weed control.

dactinomycin. USAN for actinomycin D, $\text{C}_{62}\text{H}_{86}\text{N}_{12}\text{O}_{16}$, an antibiotic produced from *Streptomyces*. Used in medicine.

"dag" Dispersions.⁴⁶ Trademark for a series of dispersions useful as lubricants. Most are colloidal. The base types are: graphite-water, graphite-oil, graphite-solvent, molybdenum disulfide resin-bonded solid film (with alkyd, epoxy or phenolic resin solutions), and some special types.

DAHQ. See 2,5-di-tert-amylhydroquinone.

Dakin's solution. An aqueous solution containing 0.5% sodium hypochlorite, used as an antiseptic, especially for wound treatment.

"Dalamar."²⁸ Trademark for an azo yellow pigment.

dalapon. Generic name for 2,2-dichloropropionic acid, $\text{CH}_3\text{CCl}_2\text{COOH}$. The sodium salt (sodium 2,2-dichloropropionate), is commonly used.

Properties: (free acid): Liquid; b.p. 185–190°C (760 mm); 90–92°C (14 mm); sp. gr. 1.389 (22.8/4°C). Very soluble in water and alcohol; soluble in ether. (sodium salt): Crystals; decompose 174–176°C; salty taste. Corrosive to iron. Soluble in water; aqueous solutions hydrolyze above 70°C.

Hazard: Moderately toxic; strong irritant to eyes and skin.

Use: Herbicide.

"Dalar."²⁸ Trademark for a polyester resin of the polyethylene terephthalate type, used for plastic bottles for carbonated beverages.

"Dalbon."²⁴⁴ Trademark for dispersions formulated for industrial coatings from "Dalvor" polyvinyl fluoride resin. Used to protect surfaces from attack by chemicals and various weather and severe use conditions.

"Dalpac."²⁶⁶ Trademark for several grades of butylated hydroxytoluene (di-tert-butyl-para-cresol). Supplied as flakes, powder, or liquid.

Uses: Antioxidant in food, animal feed, and nonfood industrial uses.

"Dalpad."²³³ Trademark for a coalescing agent, a stable, low-odor, low-temperature film-forming aid for polyvinyl acetate and acrylic latex paints.

dalton. A unit of mass introduced in comparatively recent years. It designates 1/16th of the mass of oxygen-16, the lightest and most abundant isotope

of oxygen. Since this is 15.9949, the dalton is equivalent to 0.9997 mass unit.

Dalton, John (1766–1844). The first theorist since the Greek philosopher Democritus to conceive of matter in terms of small particles. The founder of the atomic theory on which all succeeding chemical investigation has been based (1807). His essential concept of the indivisibility of the atom was not called into question until 1910, when radioactive decay was established by Rutherford. Dalton's theories relating to pressures of gases and atomic combinations led to the basic generalizations stated in the law of multiple proportions, the law of constant composition, and the law of conservation of matter. Dalton's law of partial pressures states that in any mixture of gases each constituent exerts its pressure independently, as if the other constituents were absent, and that the solubility of mixed gases in a liquid is proportional to the partial pressure of each. (See Priestley; chemical laws).

"Dalvor."²⁴⁴ Trademark for polyvinyl fluoride, a thermoplastic fluorocarbon polymer.

"Dalyde."³⁴⁸ Trademark for dibromosalicylaldehyde, (q.v.), used in medicine.

dammar. A group of tree-derived resins soluble in hydrocarbon and chlorinated solvents; partially soluble in alcohols; insoluble in water. Used in colorless and overprint varnishes, cellulosic lacquers, alkylid baking enamels, and paper and textile coatings.

danthron. See 1,8-dihydroxyanthraquinone.

"Dantoin."⁷³ Trademark for a series of hydantoin compounds (q.v.).

DAP. (1) Abbreviation for diallyl phthalate. (2) Abbreviation for diammonium phosphate. See ammonium phosphate, dibasic.

"Dapon."⁵⁵ Trademark for a series of diallyl phthalate resins. Used for molding compounds, prepreps, and coatings.

dapsone. USAN and U.S.P. name for 4,4'-sulfonyldianiline (q.v.).

"Daran."³¹¹ Trademark for polyvinylidene chloride latexes; used as barrier coatings for packaging papers, paperboards, plastic films, and specialty saturants.

"Daratak."³¹¹ Trademark for polyvinyl acetate homopolymer emulsions; used in adhesives and specialty coatings.

"Darco."⁸⁹ Trademark for activated carbon. Available in various grades for use in sugar refining; removal of impurities from electroplating solutions; purification of drycleaning solvents; drug and chemical purification; and purification and decolorization of animal and vegetable oils, fats, and waxes.

"Darex."³¹¹ Trademark for styrene-butadiene latexes and related vehicles.
Uses: Textile coatings, rug backings, saturants, shoe products, coatings, paints, and adhesives.

"Dariloid."³²² Trademark for a series of milk-soluble algin compositions.

"Darvan."³¹¹ Trademark for a series of anionic surfactants used as dispersants, emulsion stabilizers and latex stabilizers.

"Darvon"¹⁰⁰. Trademark for *d*-propoxyphene hydrochloride, an analgesic drug.

DAS. Abbreviation for 4,4'-diamino-2,2'-stilbenedisulfonic acid.

dating, chemical. See chemical dating.

daughter element. The element formed when another element undergoes radioactive decay. The latter is called the parent. The daughter may or may not be radioactive.

daunorubicin. See anticancer agent.

"Davco."²⁴¹ Trademark for nitrogen solutions used as fertilizers.

Davy, Sir Humphry (1778–1829). Born in Cornwall, Davy was the first to isolate the alkali metals and recognize the identity of chemical and electrical energy. A pioneer in the science of electrochemistry, he carried out basic studies of electrolysis of salts and water, and his application of electricity to the decomposition of molten caustic potash led to the isolation of metallic potassium.

"Dawsterol."⁵⁰² Trademark for a vegetable oil solution of vitamin D₃ for food fortification.

"Daxad."³¹¹ Trademark for anionic, polymer-type dispersing agents. Supplied as light-colored powders or aqueous solutions. Effective dispersant for aqueous suspensions of insoluble dyestuffs, polymers, clays, tanning agents and pigments.

Uses: Manufacture of dyestuff pastes; textile backings, latex paints and paper coatings, retanning and bleaching of leather; dye resist in leather dyeing; dispersion of pitch in paper manufacture; pre-floc prevention in the manufacture of synthetic rubber.

"Daxan."²⁴⁴ Trademark for a concentrated (minimum 95% available chlorine), dry form of chlorine specially formulated for disinfection of swimming pools.

"Daxtron."²³³ Trademark for herbicides containing salt formulations of 2,3,5,6-tetrachloro-4-pyridinol.

2,4-DB. Abbreviation for 2,4-dichlorophenoxybutyric acid.

DBCP. Abbreviation for 1,2-dibromo-3-chloropropane.

DBM. Abbreviation for dibutyl maleate.

DBMC. Abbreviation for 4,6-di-*tert*-butyl-*meta*-cresol.

"DB" Oil.²⁰² Trademark for a castor oil specially refined to minimum acidity and moisture content for dielectric and sonar applications, and for urethane polymers.

DBP. Abbreviation for dibutyl phthalate.

"dbpc."¹¹ Trademark for 2,6-di-*tert*-butyl-*para*-cresol, in technical, food and feed grades.

DBS. Abbreviation for dibutyl sebacate.

DCA. Abbreviation for deoxycorticosterone acetate.

DCB. Abbreviation for 1,4-dichlorobutane.

"DC Filtrol."²¹⁷ Trademark for an acid-activated clay used as a purifying agent in the recovery of drycleaning solvents.

DCHP. Abbreviation for dicyclohexyl phthalate.

DCO. Abbreviation for dehydrated castor oil. See castor oil, dehydrated.

DCP. Abbreviation for dicapryl phthalate.

DCPA. Abbreviation for dimethyl 2,3,5,6-tetrachloroterephthalate.

DCPC. Abbreviation for dichlorophenyl methyl carbinol. See di(para-chlorophenyl)ethanol.

DDB. Abbreviation for dodecylbenzene.

DBSA. Abbreviation for dodecylbenzenesulfonic acid.

DDD. Abbreviation for dichlorodiphenyldichloroethane. See TDE.

DDDM. Abbreviation for 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane. See dichlorophene.

DDE. Abbreviation for dichlorodiphenyldichloroethylene, $(\text{ClC}_6\text{H}_4)_2\text{C}=\text{CCl}_2$. It is a degradation product of DDT, found as an impurity in DDT residues.

DDH. Abbreviation for dichlorodimethylhydantoin.

"DDI Diisocyanate."²⁵⁹ Trademark for an intermediate made from a 36-carbon dimer aliphatic dibasic acid; exact structure is a complex mixture of isomers. May be used for reaction with diamines to give polyureas with highly desirable properties; also a source of polyurethanes.

DDM. (1) Abbreviation for diaminodiphenylmethane (q.v.).

(2) Abbreviation for n-dodecyl mercaptan.

DDNP. Abbreviation for diazodinitrophenol.

DDP. Abbreviation for dodecyl phthalate.

DDQ. See 2,3-dichloro-5,6-dicyanobenzoquinone.

DDS. Abbreviation for diaminodiphenylsulfone. See sulfonyldianiline.

DDT (dichlorodiphenyltrichloroethane; dicophane; chlorophenothane; 1,1,1-trichloro-2,2-bis(chlorophenyl)ethane) $(\text{ClC}_6\text{H}_4)_2\text{CHCCl}_3$.

Properties: Colorless crystals or white to slightly off-white powder. Odorless or with slight aromatic odor. Insoluble in water; soluble in acetone, ether, benzene, carbon tetrachloride, kerosene, dioxane, and pyridine. Not compatible with alkaline materials. Derivation: Condensing chloral or chloral hydrate with chlorobenzene in presence of sulfuric acid.

Grades: Technical; purified; aerosol; U.S.P. as chlorophenothane.

Containers: Bottles; tins; bags; fiber drums.

Hazard: Though not particularly toxic to humans under ordinary conditions, DDT is not biodegradable and is ecologically damaging. For the latter reasons agricultural use of DDT was prohibited in the U.S. in 1973, though its manufacture for export is permitted. Claims of human carcinogenicity have not been proved. DDT can be used for a few specialized purposes, e.g., to combat the tussock moth. Tolerance, 1 mg per cubic meter of air; 5 ppm in foods.

Uses: Insecticide, especially for tobacco and cotton; pesticide (tussock moth).

DDVP. Abbreviation for dimethyl dichlorovinyl phosphate. See dichlorovos.

D.E. Abbreviation for dextrose equivalent (q.v.).

DEA. Abbreviation for diethanolamine; also abbreviation for Drug Enforcement Administration, a government agency replacing the Bureau of Narcotics.

DEAC. Abbreviation for diethylaluminum chloride.

"Deacidite."¹⁸⁴ Trademark for a commercial grade anion exchanger consisting of a porous aliphatic polyamine weak base. Used in streptomycin conversion and strong acid adsorption.

Deacon process. A method of converting hydrogen chloride (HCl) to chlorine by oxidation of HCl with oxygen at 400 to 500°C over a copper salt catalyst: $2\text{HCl} + \text{O}_2 \rightarrow \text{Cl}_2 + \text{H}_2\text{O}$. It is a means of producing chlorine without caustic and of utilizing the large amounts of by-product HCl from the chlorination of organic compounds. When conducted in the presence of an organic compound which reacts with the chlorine formed it is known as oxychlorination, e.g., $\text{CH}_2=\text{CH}_2 - 2\text{HCl} + \frac{1}{2}\text{O}_2 \rightarrow \text{CH}_2\text{ClCH}_2\text{Cl} + \text{H}_2\text{O}$.

DEAE. Abbreviation for diethylaminoethyl-.

DEAE-cellulose (diethylaminoethyl cellulose). A cellulose ether containing the group $(\text{C}_2\text{H}_5)_2\text{NCH}_2\text{CH}_2$ -bound to the cellulose in an ether linkage. An anionic ion-exchange material. Use: Chromatography.

DEAE-dextran. A diethylaminoethyl ether of dextran; an electropositively charged polymer.

deanol. See 2-dimethylaminoethanol.

"Dearborn Red."¹⁴¹ Trademark for azo color pigments, light, medium, and deep red shades. Used in paints and enamels.

deblooming agent. A substance added to mineral oils to mask fluorescence. Nitronaphthalene and yellow coal-tar dyes are among the products so used.

Debye, Peter J. M. (1884-1966). A Dutch chemist and physicist who received the Nobel Prize in 1936 for his pioneer studies of molecular structure by x-ray diffraction methods. The interference patterns are still called Debye-Sherrer rings. He also made outstanding contributions to knowledge of polar molecules and to fundamental electrochemical theory. (See also Debye-Huckel theory).

Debye-Hückel theory. A theory advanced in 1923 for quantitatively predicting the deviations from ideality of dilute electrolytic solutions. It involves the assumption that every ion in a solution is surrounded by an ion atmosphere of opposite charge. Results deduced from this theory have been verified for dilute solutions of strong electrolytes, and it provides a means of extrapolating the thermodynamic properties of electrolytic solutions to infinite dilution.

DEC. Abbreviation for beta-diethylaminoethyl chloride hydrochloride.

decaborane $\text{B}_{10}\text{H}_{14}$.

Properties: Colorless crystals; stable indefinitely at room temperatures; decomposes slowly into boron and hydrogen at 300°C; density (25.4°C) 0.94; m.p. 99.7°C; sp. gr. 0.78 (100°C); b.p. 213°C. Autoignition temp., 147°C. Slightly soluble in cold water; hydrolyzes in hot water; soluble in benzene, hexane, toluene.

Derivation: By-product of the pyrolysis of diborane.

Grades: Technical 95%; high purity 99%.

Hazard: Highly toxic. Tolerance, 0.05 ppm in air. Absorbed by skin. May explode in contact with heat or flame, or with oxygenated and halogenated solvents. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Polymer synthesis; corrosion inhibitor; fuel addi-

tive; stabilizer; rayon delustrant; mothproofing agent; dye stripping agent; reducing agent; fluxing agent; oxygen scavenger; propellant.

Shipping regulations: (Rail) Yellow label. (Air) Flammable Solid label. Not acceptable on passenger planes.

decachloro-1,1'-bis-2,4-cyclopentadienyl. See bis (pentachloro-2,4-cyclopenta dien-1-yl).

decachloro-octahydro-1,2,4-metheno-2H-cyclobuta-[cd]-pentalen-2-one $C_{10}H_6O$.

Properties: Solid; m.p. 359°C (dec.). Soluble in oxygenated solvents such as acetone; fairly soluble in organic solvents.

Uses: Insecticide; fungicide.

decaglycerol. See polyglycerol.

decahydronaphthalene $C_{10}H_{18}$. Cis- and trans- forms are known.

Properties: Colorless liquid; aromatic odor. Insoluble in water; soluble in alcohol and ether. Cis: Sp. gr. (20/4°C) 0.8927; f.p. -43.2°C ; b.p. 194.6°C ; refractive index (n 20/D) 1.48113. Trans: Sp. gr. (20/4°C) 0.8700; f.p. -31.5°C ; b.p. 185.5°C ; refractive index (n 20/D) 1.46968. Flash point 136°F (closed cup). Autoignition temp. 482°F . Combustible. Derivation: By treatment of naphthalene in a fused state (above 100°C) with hydrogen in the presence of a copper or nickel catalyst.

Grade: Technical.

Containers: 1-, 2-, 5-, 10-, 50-gal drums.

Hazard: Moderate fire risk. Moderately toxic; irritant to eyes and skin.

Uses: Solvent for oils, fats, waxes, resins, rubber, etc.; substitute for turpentine; cleaning machinery; stain-remover; shoe creams; floor waxes, etc.; cleaning fluids; lubricants.

Δ -decalactone. Artificial flavoring for margarine. Approved by FDA.

"**Decalin.**"²⁸ Trademark for decahydronaphthalene.

"**Decalco.**"¹⁸⁴ Trademark for a commercial grade cation exchanger consisting of a synthetic aluminosilicate gel (inorganic).

Uses: Water softening, separation of amino acids; radioactive waste treatment; milk treatment.

decamethonium bromide (decamethylenebis(trimethylammonium bromide))

$(\text{CH}_3)_3\text{NBr}(\text{CH}_2)_{10}\text{NBr}(\text{CH}_3)_3$.

Properties: Crystals; decomposes $255\text{--}267^{\circ}\text{C}$. Soluble in water and alcohol; very slightly soluble in chloroform; insoluble in ether.

Use: Medicine (anesthetic).

decamethylene-bis(4-aminoquinaldinium acetate). See dequalinium.

decamethylenebis(trimethylammonium bromide). See decamethonium bromide.

n-decanal (capraldehyde; capric aldehyde; n-decyl aldehyde; aldehyde C-10) $\text{CH}_3(\text{CH}_2)_8\text{CHO}$.

Properties: Colorless to light yellow liquid; floral-fatty odor; sp. gr. 0.831–0.838 (15°C); refractive index (n 20/D) 1.427–1.431. Soluble in 80% alcohol, fixed oils, volatile oils, mineral oil; insoluble in water and glycerol. Combustible. Low toxicity.

Derivation: Occurs in lemongrass, citronella, orange, and many other oils. Synthetically by oxidation of the corresponding alcohol or reduction of the acid.

Grades: Technical; F.C.C.

Containers: Cans; drums.

Use: Perfumery; flavoring.

n-decane (decyl hydride) $\text{CH}_3(\text{CH}_2)_8\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.7298; b.p. 174°C ; f.p. -30°C ; refractive index (n 20/D) 1.4114; flash point 111°F (closed cup). Autoignition temp. 482°F . Soluble in alcohol; insoluble in water. Combustible.

Grades: Technical; 95%; 99%; research.

Containers: Bottles; drums.

Hazard: Moderate fire risk. Narcotic in high concentrations.

Uses: Organic synthesis; solvent; standardized hydrocarbon; jet fuel research.

decanedioic acid. See sebacic acid.

decanoic acid. See capric acid.

1-decanol (n-decyl alcohol; alcohol C-10)

$\text{CH}_3(\text{CH}_2)_8\text{CH}_2\text{OH}$.

Properties: Colorless, water-white liquid. Sweet odor; sp. gr. 0.829; b.p. 232.9°C ; m.p. 6°C ; flash point (open cup) 180°F ; refractive index (n 20/D) 1.4372. Insoluble in water (25°C); soluble in alcohol and ether. Combustible. Low toxicity.

Derivation: Reduction of coconut oil fatty acids; from C_9 olefin and synthesis gas, by the Oxo process.

Grades: Technical; high purity.

Containers: Drums; tank cars.

Uses: Plasticizers; detergents; synthetic lubricants; solvents; perfumes; flavorings.

decanoyl chloride (sometimes called caproyl chloride)

$\text{CH}_3(\text{CH}_2)_8\text{COCl}$. Available in bottles; carboys and drums. Intermediate; polymerization initiator.

decanoyl peroxide $\text{CH}_3(\text{CH}_2)_8\text{C}(\text{O})\text{OOC}(\text{O})(\text{CH}_2)_8\text{CH}_3$.

Properties: Soft white granules; m.p. $38\text{--}42^{\circ}\text{C}$ (dec.); insoluble in water and alcohol; soluble in ether and benzene.

Hazard: Strong oxidizing agent; fire risk in contact with organic materials.

Use: Polymerization catalyst.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Peroxides, organic, solid, n.o.s., Organic Peroxide label.

"**Decanox.**"¹⁵⁴ Trademark for decanoyl peroxide (q.v.).

decarboxylase One of a group of enzymes in the living cell that removes carbon dioxide from various carboxylic acids without oxidation.

decay. Spontaneous disintegration of an unstable atomic nucleus, e.g., uranium, radium, with emission of alpha, beta, and gamma radiation and eventual formation of another element of lower atomic weight. See radioactivity; half-life.

1-decene. See decylene.

"**Dechlorane.**"⁶² Trademark for perchloropentacyclodecane.

"**Decholin.**"²⁷² Trademark for dehydrocholic acid (q.v.).

"**Declomycin.**"³¹⁵ Trademark for demethylchlortetracycline hydrochloride (q.v.).

decoction. Pharmaceutical term for a liquid produced by boiling one or more drugs in water and filtering.

decoic acid. See capric acid.

decolorizing agent. Any material that removes color by a physical or chemical reaction. Charcoals, blacks, clays, earths or other materials of highly adsorbent character used to remove undesirable color, as from sugar, vegetable and animal fats and oils, etc. Also refers to bleaches involving a chemical reaction for removing color.

decomposition. (1) A fundamental type of chemical change. In simple decomposition, one substance breaks down into two simpler substances, e.g., water yields hydrogen and oxygen. In double decomposition, two compounds break down and recombine to form two different compounds, e.g.,
 $2\text{HCl} + \text{CaCO}_3 \rightarrow \text{CaCl}_2 + \text{H}_2\text{CO}_3$.

In some cases heat is absorbed, and in others it is evolved. Decomposition may also be induced by radiation (sunlight), as in the breakdown of chlorine-containing fluorocarbons in the upper atmosphere and of biodegradable polymer structures (also called photodecomposition or photolysis); and by bacterial action (degradation, q.v.).

(2) Conversion of a carbonaceous raw material into carbon and volatile organic compounds by exposure to high temperature in the absence of air, i.e., without combustion. Thermal decomposition products of coal are coke, coal tar and coal gas; similarly hydrocarbon mixtures are obtained from shale oil. The term thermal decomposition is virtually synonymous with pyrolysis and destructive distillation.

decontamination. Removal of radioactive poisons from skin, clothing, equipment, etc. Skin can often be decontaminated by washing with soap and water; application of titanium dioxide paste or a saturated solution of potassium permanganate followed by a rinse of 5% sodium bisulfite is approved procedure. Contaminated clothing should not be sent to commercial laundries nor burned in open incinerators. Water, steam, and detergents are effective on painted or metal surfaces.

"Decroline."³⁰⁷ Trademark for a series of stripping agents consisting of zinc sulfoxylate formaldehyde.

decyl acetate (acetate C-10) $\text{CH}_3(\text{CH}_2)_9\text{OOCCH}_3$.

Properties: Liquid with floral orange-rose odor; b.p. 187–190°C; sp. gr. 0.862–0.864; refractive index 1.426. Soluble in 80% alcohol, ether, benzene, glacial acetic acid; insoluble in water. Combustible.

Grades: Technical.

Use: Perfumery.

n-decyl alcohol. See 1-decanol.

n-decyl aldehyde. See n-decanal.

n-decylamine $\text{CH}_3(\text{CH}_2)_9\text{NH}_2$.

Properties: Water-white liquid; amine odor; boiling range 215–221°C; sp. gr. 0.797 (20/20°C); refractive index 1.437 (20°C); flash point 210°F. Combustible.

Hazard: May be toxic and irritant.

decyl carbinol. See 1-undecanol.

decylene (1-decene) $\text{C}_{10}\text{H}_{20}$ or $\text{H}_2\text{C}:\text{CH}(\text{CH}_2)_8\text{CH}_3$.

Properties: Colorless liquid; sp. gr. 0.7396 (20/4°C); b.p. 172°C; f.p. –66.3°C; refractive index (n_D 20) 1.4220. Soluble in alcohol; insoluble in water. Combustible.

Grades: Technical; high purity.

Use: Organic synthesis of flavors, perfumes, pharmaceuticals, dyes, oils, resins.

decyl hydride. See n-decane.

decylic acid. See capric acid.

decyl mercaptan $\text{C}_{10}\text{H}_{21}\text{SH}$.

Properties: Liquid, f.p. –26°C; b.p. 114°C (13 mm); sp. gr. 0.8410 (20/4°C); refractive index 1.4536 (n_D 20). Combustible; strong odor.

Grade: 95% (min) purity.

Hazard: Toxic by ingestion and inhalation.

Uses: Intermediate; synthetic rubber processing.

decyl-octyl methacrylate

Containers: Drums.

Uses: Monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.

"DeeGee".²¹² See "Dee O."

"Deenax."²⁹ Trademark for di-tert-butyl-para-cresol (DBPC), an oxidation inhibitor used especially in waxes and natural fats.

"Dee O."²¹² Trademark for a glucose oxidase enzyme system catalyzing the reaction of glucose to gluconic acid with the uptake of oxygen.

Uses: Beverages; salad dressing and other oxygen sensitive foods; analytical; stabilizing egg solids by desugaring whites, yolks or whole eggs.

deet. See N,N-diethyl-meta-toluamide.

"DEF."¹⁸¹ Trademark for S,S,S-tributyl phosphorotriothioate (q.v.).

defecation. Purification; used specifically of the industrial clarification of sugar solutions.

deflagration. Very rapid autocombustion of particles of explosive as a surface phenomenon. Initiated by contact of a flame or spark, but may be caused by impact or friction. Deflagration is a characteristic of low explosives. See also detonation.

defoaming agent. A substance used to reduce foaming due to proteins, gases, or nitrogenous materials, which may interfere with processing. Examples are 2-octanol, sulfonated oils, organic phosphates, silicone fluids, dimethylpolysiloxane, etc. For restrictions on their use in foods, see FDA regulations.

defoliant. An herbicide (q.v.) that removes leaves from trees and growing plants. They may be either organic or inorganic. Some examples: (organic) phenoxyacetic acids, trichloropicolinic acid, carbamates, and nitro compounds; (inorganic) arsenic compounds, cyanides, thiocyanates, and chlorates. Several of the more persistent types have been used in military operations.

DEG. (1) Abbreviation for diethylene glycol. (2) Abbreviation for diethanoglycine.

DEGN. Abbreviation for diethylene glycol dinitrate.

degradation. A type of decomposition characteristic of high molecular weight substances such as proteins, polymers, branched-chain sulfonates, etc. It may result from oxidation, heat, solvents, bacterial action, or in the case of body proteins from infectious microorganisms. See also biodegradability; decomposition.

degras. Crude wool grease obtained by solvent-washing of wool. It is a dark brown semisolid with strong, unpleasant odor and high water-absorbing capacity. A type known as moellen degreas is a by-product of tanning chamois leather with various fish oils. The chief use of degreas is as the source of lanolin; minor uses are in leather dressing and printing inks. Available in several grades (neutral, common, and technical).

"deGreen."¹ Trademark for a cotton defoliant of which the active ingredient is S,S,S-tributyl phosphorotrithioate (q.v.).

degree of polymerization (D.P.). The number of monomer units in an average polymer molecule in a given sample; for natural cellulose it is about 3000, but in most polymers it is still higher. It can be controlled by appropriate processing techniques. D.P. is an important factor in plastics technology, as it directly affects the viscosity of solutions and properties of the end product.

See also polymerization; shortstopping agent.

"D.E.H."²³³ Trademark for a variety of polyamines and polyamides suitable for curing epoxy resins.

dehumidification. The removal of moisture (water vapor) from air. Also sometimes extended to analogous processes of removing a vapor from a gas mixture.

"Dehybor."⁴⁴¹ Trademark for anhydrous sodium tetraborate (q.v.).

"Dehydratine."²⁰⁵ Trademark for bituminous water barrier coatings.

dehydration. Removal of 95% or more of the water from a material, usually a foodstuff, by exposure to high temperature by various means. Its primary purpose is to reduce the volume of the product, increase its shelf-life, and lower transportation costs. Special equipment for dehydration includes tunnel dryers, vacuum (shelf) dryers, drum dryers, etc., in which the bulk product is exposed to a hot-air environment. Another method is spray-drying, in which a liquid product is ejected from a nozzle into hot air; dried milk and egg-white are prepared in this way. The term dehydration is not applied to loss of water by evaporation or sun-drying. See also drying.

"Dehydrite."¹⁶ Trademark for anhydrous granular magnesium perchlorate (q.v.).

dehydroabietic acid $C_{20}H_{28}O_2$. Solid; used as a basis for thermoplastic resins.

dehydroabietylamine $C_{19}H_{27}NH_2$ (having a phenanthrene ring system). A rosin-derived compound. See abietic acid.

dehydroacetic acid (DHA; methylacetopyranone)

Properties: Colorless, odorless, tasteless crystals. M.p. 108.5°C. Soluble in acetone, alcohol, and ether; insoluble in water; highly reactive; combustible. Derivation: (a) By action of N-bromosuccinimide on ketene dimer; (b) by strong heating of acetoacetic ester.

Grades: Technical; F.C.C.

Hazard: Moderately toxic by ingestion.

Uses: Fungicide and bactericide; plasticizer; chemical intermediate.

dehydroascorbic acid

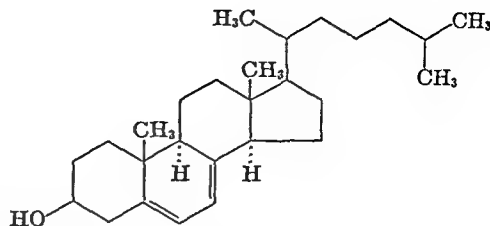

Properties: Needles; m.p. 225° (dec); soluble in water at 60°C.

Derivation: Synthesized from ascorbic acid.

Uses: Nutrition; medicine.

7-dehydrocholesterol (provitamin D₃) $C_{27}H_{44}O \cdot H_2O$. A sterol found in the skin of man and animals which forms vitamin D₃ upon ultraviolet irradiation.

Properties: Slender platelets from ether-methanol; m.p. 150°C; insoluble in H₂O; soluble in organic solvents.

Uses: Nutrition; medicine; biochemical research.

See also cholecalciferol.

dehydrocholic acid $C_{24}H_{34}O_5$. A polycyclic compound. Properties: White, fluffy, odorless powder with bitter taste; m.p. 231–240°C. Almost insoluble in water; slightly soluble in ether and alcohol; soluble in chloroform, glacial acetic acid, and solutions of alkali hydroxides and carbonates.

Derivation: Oxidation of cholic acid.

Grade: N.F.

Hazard: May have toxic reactions.

Uses: Medicine; pharmaceutical intermediate.

dehydrocyclodimerization. A method of converting paraffin (straight-chain) hydrocarbons containing from 3 to 5 carbon atoms into aromatic (ring-type) hydrocarbons. Its main steps are: (a) removal of hydrogen from the paraffins; (b) dimerization of the resulting olefins; (c) aromatization of the dimerized olefins and diolefins; (d) isomerization or trans-alkylation to C₈ to C₁₀ alkyl benzene isomers. Metallic catalysts are essential in some or all of these steps. The process is not in large-scale use.

dehydroepiandrosterone. See dehydroisoandrosterone.

dehydrogenase. An enzyme which catalyzes oxidation by the removal of hydrogen. See oxidase.

dehydrogenation. The process whereby hydrogen is removed from compounds by chemical means. Dehydrogenation of primary alcohols yields the group of compounds called aldehydes (q.v.). It is considered to be a form of oxidation, as two hydrogen atoms, each of which contains an electron, have been removed, as in the reaction $CH_3CH_2OH \rightarrow CH_3CH=O + H_2$.

11-dehydro-17-hydroxycorticosterone. See cortisone.

dehydroisoandrosterone (dehydroepiandrosterone) $C_{19}H_{28}O_2$. An androgenic steroid; a metabolic product of the adrenal steroid hormones, with about one-third of the androgenic activity of androsterone (q.v.).

Properties: Dimorphous: Needles with m.p. 140–141°C; leaflets with m.p. 152–153°C; precipitated by digitonin; soluble in benzene, alcohol, and ether. Sparingly soluble in chloroform and petroleum ether. Also available as the acetate salt.

Derivation: Isolated from male urine; synthesis from cholesterol or sitosterol.

Uses: Medicine; biochemical research.

"Dehydrol."¹⁴¹ Trademark for dehydrated castor oil used as a drying oil in the manufacture of varnishes and alkyd resins.

3-dehydroretinol (vitamin A₂) $C_{20}H_{27}OH$.

Properties: Golden yellow oil (may be a mixture of stereoisomers). Readily affected by oxygen.

Derivation: From pike liver oils.

Use: Nutrition.
See also vitamin A.

dehydrothio-para-toluidine $\text{CH}_3\text{C}_6\text{H}_4\text{SC}(\text{C}_6\text{H}_4\text{NH}_2)_2\text{N}$.
Properties: Long, yellowish iridescent needles. Solutions have a violet-blue fluorescence. M.p. 191°C ; b.p. 434°C . Soluble in alcohol; very slightly soluble in water.

Derivation: By heating para-toluidine and primuline base with sulfur and separation from the primuline base by distillation in vacuo.

Uses: Dyestuffs; intermediate.

deicing compound. See calcium chloride; sodium chloride; alcohol.

de-inking. The removal of printing inks from paper by use of strong alkaline solutions such as soda-ash liquor, caustic soda or lime which dissolve varnish and free the ink carbon. Removal of the carbon is accomplished by use of colloidal agents such as talc or bentonite and by mechanical agitation with water.

"Dekatyl."²⁸ Trademark for a series of dyes for dyeing and printing 65% "Dacron" polyester fiber and 35% cotton.

deKhotinsky cement. A thermoplastic adhesive mixture of shellac and pine tar. It is not attacked by water, sulfuric acid, nitric acid, hydrochloric acid, carbon disulfide, benzene, gasoline, or turpentine; very little affected by ether, chloroform, alkalis, but readily dissolved by ethyl alcohol.

"Delac."²⁴⁸ Trademark for a series of delayed action rubber accelerators.

"Delactol."⁵⁰³ Trademark for a vegetable oil solution of vitamin D_2 ; used in dairy products.

"Delamin."²⁶⁶ Trademark for a series of fatty amines.

P. Technical grade, high molecular weight, primary amine derived from 18-carbon fatty acids of tall oil origin.

80. A low-cost flotation reagent designed especially for beneficiation of phosphate and other nonmetallic ores; consists principally of stearyl and oleyl amines.

100. A high molecular primary amine designed for flotation of silica and silicate minerals; derived from 18-carbon fatty acids.

delhi hard. A ferrous alloy (sp. gr. 7.75; m.p. 1500°C) containing in addition to iron 16.5 to 18% chromium, 1 to 1.1% carbon, 0.75 to 1% silicon, 0.35 to 0.5% manganese. It is resistant to cold ammonium hydroxide in all concentrations, and to mine and sea waters and moist sulfurous atmospheres.

deliquescent. Tending to absorb atmospheric water vapor and become liquid. The term refers specifically to water-soluble chemical salts in the form of powders, which dissolve in the water absorbed from the air. Such salts should be kept closely stoppered or otherwise enclosed. See also hygroscopic.

"Delnav."²⁶⁶ Trademark for technical grade of 2,3-para-dioxanedithiol S,S-bis(O,O-diethylphosphorodithioate).

"Delrin."²⁸ Trademark for a type of acetal resin. White and colors available. Also supplied as pipe and fittings. Thermoplastic.
Containers: 50-lb bags; pipe in 20-ft lengths, or coils of 500 ft.

Uses: Injection-molded and extruded parts, door handles, bushings, other mechanical items; underground pipe; automotive parts.

"Delsan."²⁸ Trademark for fungicide-insecticide seed treatment containing 60% thiram and 15% dieldrin.
Hazard: Toxic by ingestion and inhalation.

delta acid. See 2-naphthylamine-7-sulfonic acid.

"Delyl."²²⁷ Trademark for a mixture of isopropyl esters of lauric, myristic and palmitic acids. "Delyl Extra" is predominantly isopropyl myristate; "Delyl Prime," isopropyl palmitate.

Uses: Replaces vegetable or mineral oils in cosmetics; emollient and auxiliary emulsifying agent.

delustrant. A substance used to produce dull surfaces on a textile fabric; chiefly used are barium sulfate, clays, chalk, etc. They are applied in the finishing coat. See also weighting agent.

"Delvex."¹⁰⁰ Trademark for dithiazanine iodide (q.v.).

demecarium bromide $\text{C}_{32}\text{H}_{52}\text{Br}_2\text{N}_4\text{O}_4$.

Properties: White, slightly hygroscopic powder; decomposes 162 – 167°C . Freely soluble in water, alcohol; sparingly soluble in acetone; insoluble in ether. Aqueous solutions are neutral, stable and may be sterilized by heat.

Use: Medicine.

"Demerol" Hydrochloride.¹⁶² Trademark for meperidine hydrochloride (q.v.).

11-demethoxyreserpine. See deserpidine.

demethylchlortetracycline hydrochloride

$\text{C}_{21}\text{H}_{21}\text{ClN}_7\text{O}_8 \cdot \text{HCl}$.

Properties: Yellow crystalline powder; odorless and has a bitter taste. Partially soluble in water and slightly soluble in alcohol.

Grade: N.F.

Use: Medicine (antibiotic).

demeton. Generic name for a mixture of O,O-diethyl O-2-(ethylthio)ethyl phosphorothioate (demeton-O), and O,O-diethyl S-2-(ethylthio)ethyl phosphorothioate (demeton-S). See also "Systox." A cholinesterase inhibitor.

Properties (of mixture): Pale yellow liquid; b.p. 134°C ; (2 mm); sp. gr. 1.118. Slightly soluble in water; soluble in most organic solvents.

Hazard: Highly toxic; absorbed by skin. Tolerance, 0.1 mg per cubic meter of air. Use may be restricted.

Use: Systemic insecticide (absorbed by plant, which then becomes toxic to sucking and chewing insects).
Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail) Poison label. (Air) Poison label. Not acceptable on passenger planes.

Note: Approved by EPA as substitute for certain uses of DDT.

demineralization. Removal from water of mineral contaminants, usually present in ionized form. The methods used include ion-exchange techniques, flash distillation, or electrodialysis (q.v.). Acid mine wastes may be purified in this way, thus aiding the pollution problem. See also desalination; water conditioning.

Democritus (about 465 B.C.). A Greek philosopher, the first thinker of record to conceive of matter as existing in the form of small, indivisible particles, which he called atoms. However, this concept was

overshadowed by Aristotle's theories and it was not until some 2000 years later that it was developed by John Dalton in England—an astonishing length of dormancy for one of the most creative ideas in the history of science. (See also Dalton).

demulsification. The process of destroying or "breaking" an unwanted emulsion, especially water-in-oil types occurring in crude petroleum. Both chemical and physical means are used: addition of polyvalent ions to neutralize electrical charges, or of a strong acid; physical means include heating, centrifuging or use of high-potential alternating current. See also emulsion; nonylphenol.

demurrage. A fee imposed on shippers of chemicals and other products by the railroads for retaining freight cars at loading docks for more than 24 hours. Until recently the retention time allowed was 48 hours.

"D.E.N."²³³ Trademark for a series of epoxy novolacs for multi functional resins for all uses where maximum chemical or heat resistance is required.

denatonium benzoate. USAN for benzyldiethyl-[(2,6-xylylcarbonyl)methyl]ammonium benzoate ("Bitrex"); a bitter-tasting compound approved as a denaturant for alcohol.

denaturant. See alcohol, denatured.

denaturation. A change in the molecular structure of globular proteins that may be induced by bringing a protein solution to its boiling point, or by exposing it to acids or alkalis or to various detergents. Denaturation reduces the solubility of proteins and prevents crystallization. It involves rupture of hydrogen bonds, so that the highly ordered structure of the native protein is replaced by a looser and more random structure. It is usually irreversible, but in some cases is reversible, depending on the protein and the treatment involved. See also degradation.

denatured alcohol. See alcohol, denatured.

denier. A unit used in the textile industry to indicate the fineness of a filament. If 9000 meters of a filament weighs 1 gram, the filament is 1 denier; if 10,000 meters weighs 1 gram, the filament is 1 grex. Sheer women's hosiery usually runs from 15 to 20 denier.

"Densitol" Brominated Sesame Oil.³ Trademark for an oil used to adjust specific gravity of citrus oils to provide cloud in beverages.

density. Weight per unit volume, usually expressed in grams per cubic centimeter or in pounds per cubic foot or gallon. Apparent density is the weight of a unit volume of powder, usually expressed as grams per cubic centimeter, determined by a specified method. (M.P.A. definition, M.P.A. Standard 9-50T). Bulk density is an alternate term for apparent density. See also specific gravity; current density.

"Denzox."⁴⁶⁸ Trademark for lead-free zinc oxide. Used in ceramics.

"Deo-Base."⁴⁵ Trademark for light petroleum distillate; superfine grade of kerosine without its objectionable odor.

deodorant. A substance used to remove or mask an unpleasant odor. It may or may not have a distinctive odor of its own. Deodorants act (1) by adsorption (activated carbon, charcoal, chlorophyllin); (2) by replacement (pine oil or other perfume); (3) by neutralization (aluminum chlorohydrate); and (4) by oxidation or hydrogenation e.g., of fish oils. The cosmetic industry supplies a wide variety of deodor-

ants and antiperspirants chiefly based on neutralization. Mouth washes and breath "sweeteners" often contain calcium iodate, thymol, peppermint, or similar substance to mask or replace odors. See also odor; cosmetic.

deoxidizer. An agent which removes oxygen from a compound or from a molten metal.

deoxy-. Preferred prefix indicating replacement of hydroxyl by hydrogen in the parent compound. The meaning is the same as that of desoxy- and the two prefixes are used interchangeably.

deoxyanisoin (4'-methoxy-2-(para-methoxyphenyl)acetophenone) $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_2\text{C}_6\text{H}_4\text{OCH}_3$.

Properties: Off-white to buff, crystalline powder with a sweet, faint cinnamon-like odor; m.p. 110–112°C. Use: Intermediate.

deoxybenzoin (alpha-phenylacetophenone; benzyl phenyl ketone) $\text{C}_6\text{H}_5\text{CH}_2\text{COC}_6\text{H}_5$.

Properties: Colorless crystals; m.p. 53–60°C; slightly soluble in hot water; soluble in alcohols and ketones. Uses: Intermediate.

deoxycholic acid (desoxycholic acid) $\text{C}_{24}\text{H}_{40}\text{O}_4$. A bile acid; contains one less hydroxyl group than cholic acid.

Properties: Crystals; m.p. 172–173°C. Not precipitated by digitonin. Practically insoluble in water and benzene; slightly soluble in chloroform and ether; soluble in acetone and solutions of alkali hydroxides and carbonates; freely soluble in alcohol. Also available as sodium salt.

Derivation: Isolation from bile; organic synthesis.

Grades: Technical; F.C.C. (as desoxycholic acid).

Uses: Medicine; precursor for organic synthesis of cortisone; emulsifying agent in foods (up to 0.1%).

deoxycorticosterone (4-pregnen-21-ol-3,20-dione; 11-deoxycorticosteroid) $\text{C}_{21}\text{H}_{30}\text{O}_3$. An adrenal cortical steroid hormone. Active in causing the retention of salt and water by the kidney.

Properties: Crystalline plates; m.p. 141–142°C. Freely soluble in alcohol and acetone.

Derivation: From adrenal cortex extract; synthesis from other steroids.

Use: Medicine (usually as acetate or pivalate).

deoxyribonuclease. One of a group of enzymes which cause the splitting of deoxyribonucleic acids. Pancreatic deoxyribonuclease, the most widely studied, cleaves the acid at the 3'-phosphate bond. Other deoxyribonucleases cleave the 5'-phosphate bond.

deoxyribonucleic acid (DNA). A complex sugar-protein polymer or nucleoprotein (q.v.) which contains the complete genetic code for every enzyme in the cell. It occurs as a major component of the genes, which are located on the chromosomes in the cell nucleus. The DNA molecule is a unique and vastly intricate structure; it is comprised of from 3000 to several million nucleotide units arranged in a double helix containing phosphoric acid, 2-deoxyribose, and the nitrogenous bases adenine, guanine, cytosine, and thymine. The spiral consists of two chains of alternating phosphate and deoxyribose units in continuous linkages. The nitrogenous bases project toward the axis of the spiral and are joined to the chains by hydrogen bonds. Adenine always unites with thymine, and cytosine with guanine. The complementarity of the bases on the joined chains allows each chain to act as a template for replication of the other when the chains are separated, thus producing two new strands of DNA. The sequence of the bases on the

chains varies with the individual, and it is this sequence that governs the genetic code. DNA works in conjunction with ribonucleic acid (RNA). Synthesis of self-replicating DNA was reported late in 1967. See also ribonucleic acid; gene; nucleic acid; genetic code; replication; recombinant DNA.

D-deoxyribose $\text{CH}_2\text{OHCHOHCHOHCH}_2\text{CHO}$. A five-carbon-atom sugar that is unusual because there is no oxygen atom attached to the second carbon atom. It is a constituent of deoxyribonucleic acid (q.v.).

"Deoxy-Sol."⁵⁵² Trademark for an aqueous solution of hydrazine; used for boiler feed treatment.

2,4-DEP Tris-(2,4-dichlorophenoxy) ethyl phosphite. An herbicide.

DEP. Abbreviation for diethyl phthalate.

DEPC. Abbreviation for diethylpyrocarbonate (q.v.).

Department of Transportation (DOT). The Federal agency which has been responsible since 1967 for the regulation and control of transportation of hazardous materials.

"Depban."²³³ Trademark for paraffin inhibitors for use in oil-well equipment.

DEPC. Abbreviation for gamma-diethylaminopropyl chloride hydrochloride.

"Dependip."²⁰⁰ Trademark for a petroleum solvent prepared by straight-run overhead distillation. Properties: Water-white; sp. gr. 0.758 (60°F); wt/gal 6.31 lb (60°F); flash point (TOC) 52°F; considered non-toxic.

Hazard: Flammable, dangerous fire risk.

Use: Solvent in rubber-dipping cement.

dephlegmation. Partial condensation of vapor from a distillation operation to produce a liquid richer in higher-boiling constituents than the original vapor. The residual vapor is richer in the lower-boiling constituents.

depilatory. A substance used to remove hair from skin. Sulfides are largely used for this purpose. The leather industry uses large amounts of sodium sulfide for unhairing hides. The cosmetic industry also offers various sulfide preparations for removing unsightly body hair.

"Depilin."⁵⁷ Trademark for a series of organic de-hairing agents for dehairing hides in the leather industry.

dequalinium. Short for decamethylene-bis(4-amino-quinaldinium acetate), an antibiotic oral antiseptic.

"D.E.R."²³³ Trademark for a series of epoxies, including liquid resins, solid resins and solutions, flexible resins, and flame-retardant resins.

"Deraspan."²³³ Trademark for a group of epoxy resins and curing agents.

"Dergon."³⁰⁰ Trademark for a series of liquid detergents used for textile scouring.

"Dergopal."³⁰⁰ Trademark for a series of fluorescent whitening agents for natural and synthetic textile fibers. Different members applied to specific fibers. Includes both coumarin and stilbene types.

"Deriphat."²⁵⁹ Trademark for a series of amphoteric surfactants.

Uses: Cosmetic and detergent formulations.

"Deronil."³²¹ Trademark for a brand of dexamethasone.

derris root. The root of the shrubs *Derris elliptica* and *D. malaccensis*. Chief active constituent is rotenone (q.v.). Used as an insecticide.

DES. Abbreviation for diethylstilbestrol.

desalination (desalting). Any of several processes for removing dissolved mineral salts from ocean water and other brines. The most important are: (1) Distillation (q.v.), with reuse of vapors by compressive distillation or multiple-effect evaporation. Solar distillation has been in use on the Greek islands for some years. (2) Electrodialysis (q.v.), an ion-exchange method more efficient for purification of brackish water than sea-water (see demineralization). (3) Reverse osmosis, which uses pressure applied to the surface of a saline solution which is separated from pure water by a semipermeable membrane which ions cannot easily penetrate. (See also osmosis). The pressure forces the water component of the solution through the membrane, thus effectively separating the components of the solution. Membranes used are cellulose acetate or graphitic oxide. This method is planned for use in a desalination plant proposed for the brackish waters of the lower Colorado River, and is said to be the world's largest. It is also used in a Potomac River installation. (4) Flash distillation (q.v.) appears to be the most effective method so far developed for sea water desalination, accounting for about 90% of world production capacity.

There are about 350 desalination plants in the U.S. producing over 65 million gallons of fresh water a day. Development is under control of the Office of Saline Water, Dept. of the Interior.

"Desicite."²¹⁷ Trademark of adsorbent used for static dehumidification in protective packaging of metal equipment, food, and pharmaceuticals.

desiccant. A hygroscopic substance such as activated alumina, calcium chloride, silica gel, or zinc chloride. Such substances adsorb water vapor from the air and are used to maintain a dry atmosphere in containers for food packaging, chemical reagents, etc. See also molecular sieve.

"Desicote."²⁷⁴ Trademark for a mixture of hydrophobic monomers stabilized in chlorinated hydrocarbon and aromatic solvents. Rapidly decomposes on contact with sorbed water on glass surfaces, leaving surface water-repellent.

Derivation: Mixed silanes.

Grades: Green label (approved for U.S. Parcel Post); yellow label (approved for Railway Express); red label (special precautions required for shipment).

Note: The Green label is the commercial stock in general use.

Containers: Two-ounce glass bottles with heavy molded cap and special cap liners packed in friction top steel can with absorbent filler to conform to safety requirements, approved by U.S. Post Office.

Hazard: Moderately toxic; skin irritant.

Uses: May be used safely on the most delicate glassware such as absorption cells of "Pyrex," "Vycor,"

and fused silica and which will not give any interference in the visible or ultraviolet range; also for pH-sensitive glass electrodes and the like.

Shipping regulations: See above, Grades.

desiodothyroxine. See thyronine.

"Desmocoll."⁴⁷⁰ Trademark for a series of isocyanate-modified polyesters for adhesive application.

"Desmodur."⁴⁷⁰ Trademark for a group of isocyanates and isocyanate prepolymers for urethane coatings, foams, adhesives, etc.

"Desmophen."⁴⁷⁰ Trademark for a group of polyesters and polyethers for crosslinking with isocyanates.

desorption. The process of removing an adsorbed material from the solid on which it is adsorbed. See adsorption. Desorption may be accomplished by heating, by reduction of pressure, by the presence of another more strongly adsorbed substance, or by a combination of these means.

desoxy-. See deoxy-.

desoxycholic acid. F.C.C. name for deoxycholic acid.

"Desoxyin."³ Trademark for methamphetamine hydrochloride.

destructive distillation. An operation in which a highly carbonaceous material, such as coal, oil shale, or tar sands is subjected to high temperature in the absence of air or oxygen, resulting in decomposition to solids, liquids and gases. As the solid end product is carbon, the term carbonization is often used. Other terms with the same general meaning as destructive distillation are pyrolysis and thermal decomposition. Destructive distillation of coal is carried out in the temperature range of 350 to 1000°C, yielding coal tar, coal gas, and char (coke, carbon). The coal tar is then distilled into various fractions; it may also be hydrogenated to produce synthetic petroleum. Fuel gas can be obtained from shale oil by destructive distillation. See also pyrolysis; thermal decomposition.

"Destun."¹⁵⁸ Trademark for perfluidone (q.v.).

"Detamide" 95.⁴²⁸ Trademark for N,N-diethyl-metaltoluamide.

detergent. Any substance that reduces the surface tension of water; specifically, a surface-active agent which concentrates at oil-water interfaces, exerts emulsifying action, and thus aids in removing soils. The older and still widely used types are the common sodium soaps of fatty acids, which are relatively weak. The much stronger synthetic detergents are classed as anionic, cationic, or nonionic, depending on their mode of chemical action. The latter functions by a hydrogen bonding mechanism. The most widely used group comprises linear alkyl sulfonates (LAS), often aided by "builders" (q.v.). LAS are preferable to alkyl benzene sulfonates (ABS), because they are readily decomposed by microorganisms (biodegradable). LAS are straight-chain compounds having ten or more carbon atoms in the chain; the branched-chains characteristic of ABS resist decomposition; these have been largely replaced by LAS because of water pollution. Replacement of LAS with linear C₁₂ to C₁₈ alcohols may be expected. See surface tension; emulsion; wetting agent; soap (1); alkylate (3); biodegradability; eutrophication; builder.

"Dethdiet."³⁴² Trademark for red squill rodenticide concentrates.

Hazard: Toxic by ingestion.

"Dethmor"³⁴² Trademark for warfarin rodenticide concentrates (q.v.).

Hazard: Highly toxic by ingestion.

detonation. The extremely rapid, self-propagating decomposition of an explosive accompanied by a high pressure-temperature wave that moves at from 1000 to 9000 meters per second. May be initiated by mechanical impact, friction, or heat. Detonation is a characteristic of high explosives, which vary considerably in their sensitivity to shock, nitroglycerin being one of the most dangerous in this respect. See also explosive, high; deflagration.

deuterium (heavy hydrogen). Symbol D. An isotope of hydrogen whose nucleus contains one neutron and one proton, and is therefore twice as heavy (at. wt. 2.014) as the nucleus of normal hydrogen. The ratio in nature is 1 part deuterium to 6500 parts normal hydrogen. See deutron.

Properties: Almost identical with hydrogen. Sp. gr. (H = 1) 2.0; f.p. -254.5°C (121 mm); b.p. -249.5°C. Ignition point 1085°F. Noncorrosive, nontoxic.

Derivation: Electrolysis of high purity heavy water. Grades: 98, 99.5 atom %.

Containers: High-pressure steel cylinders.

Hazard: Highly flammable and explosive. Explosive range 4 to 74%.

Uses: Bombardment of atomic nuclei; tracer element. See also deuterio-; heavy water.

Shipping regulations: (Rail) Red Gas label. (Air) Flammable Gas label. Not accepted on passenger planes.

deuterium oxide. See heavy water.

deutero- (deuterated). Prefix indicating that one or more of the hydrogens in a compound is the deuterium isotope. Example: deutero-borane solution, used for labeling olefinic unsaturation. The adjective form, deuterated, has the same meaning. Deuterated ethylene, sometimes written ethylene-1,1-d₂, has the formula CH₂:CD₂.

deutron (deuton). A nuclear particle having mass 2 and a positive charge of 1; identical with the nucleus of the deuterium atom.

Devarda's metal (Devarda's alloy).

Properties: Gray powder. Contains copper, aluminum, and zinc in the proportion of 50:45:5. Slightly soluble in hydrochloric acid.

Grade: Reagent (20-mesh and finer).

Use: Analysis (testing for nitrogen).

developer. (1) A term applied in the dyeing industry to certain organic compounds which, in combination with some other organic compound already deposited upon the fiber, will develop a colored compound, or if united with a dye already upon the fiber, will form a new coloring matter possessing a more desirable or a faster color.

(2) A substance used in photography to convert a latent image to a visible one by chemical reduction of a silver compound to metallic silver more rapidly in the portions exposed to light than in those not exposed. Such reducing agents as hydroquinone, pyrogallol, and para-phenylenediamine are used. See also photographic chemistry.

"Devlex."²³³ Trademark for oxazolidinone polymers.

devitrification. Unwanted crystallization of silica on heating or cooling. The term is used largely in the glass industry. The tendency to devitrify results from the unstable nature of glasses. It usually occurs if the melt is cooled too slowly.

devulcanization. Technically a misnomer, since vulcanization is irreversible. The term is used to describe the softening of a vulcanizate caused by heat and chemical additives during reclaiming.

dew point. Temperature at which air is saturated with moisture, or in general the temperature at which a gas is saturated with respect to a condensable component.

dexamethasone (9- α -fluoro-16- α -methylprednisolone) $C_{22}H_{29}FO_5$. A corticosteroid.

Properties: Crystals; m.p. 262–264°C. Insoluble in water; somewhat soluble in organic solvents.

Grade: N.F.

Use: Medicine and veterinary medicine.

"Dexedrine."⁷¹ Trademark for dextroamphetamine sulfate.

"Dexet."²³³ Trademark for aluminous cement, and related ingredients for use chiefly in oil wells.

"Dexon."¹⁸¹ Trademark for para-dimethylaminobenzenediazo sodium sulfonate (q.v.).

dextran (macrose). Certain polymers of glucose which have chain-like structures and molecular weights up to 200,000. Produced from sucrose by *Leuconostoc* bacteria; occurs as slimes in sugar refineries, on fermenting vegetables or in dairy products. Clinical dextran is standardized to a low molecular weight (75,000); is made by partial hydrolysis and fractional precipitation of the high molecular weight particles.

Properties: Stable to heat and storage. Soluble in water, making very viscous solutions. Solutions can be sterilized. Combustible; nontoxic.

Uses: Blood plasma substitute or expander; confections; lacquers; oil-well drilling muds; filtration gel; food additive.

dextranase. An enzyme reported to be effective in reducing dental caries.

dextran sulfate. See sodium dextran sulfate.

"Dextrid."²³⁶ Trademark for an organic polymer used for control of filtration, mud rheology and solids in drilling muds. Stabilized against microbiological degradation. A low percentage controls filtration without appreciable viscosity increase.

dextrin (starch gum). A group of colloidal products formed by the hydrolysis of starches. Industrially it is made by treatment of various starches with dilute acids or by heating dry starch. The yellow or white powder or granules are soluble in water and insoluble in alcohol and ether.

Uses: Adhesives; thickening agent; sizing paper and textiles; substitute for natural gums; food industry; glass-silvering compositions, printing inks; felt manufacture; substitute for lactose in penicillin manufacture.

"Dextrinase" A.²¹² Trademark for a fungal amylase which converts starches and dextrans to maltose and dextrose.

Uses: Syrups and other products high in reducing sugars.

dextromethorphan hydrobromide. (*d*-3-methoxy-N-methylmorphinan hydrobromide)

$C_{15}H_{25}NO \cdot HBr \cdot H_2O$.

Properties: Practically white crystals or crystalline powder possessing a faint odor; slightly soluble in

water; freely soluble in alcohol and chloroform; insoluble in ether. Specific rotation 200 mg/10 ml solution +26 to +28°; pH (1 in 50 solution) 5.2–6.5.

Grade: N.F.

Use: Medicine.

dextrorotatory. Having the property when in solution of rotating the plane of polarized light to the right or clockwise. Dextrorotatory compounds are given the prefix *d* or (+) to distinguish them from their levorotatory, *l* or (–) isomers. The plus sign (+) is now preferred.

See optical rotation.

dextrose. See glucose, which is the preferred term.

dextrose equivalent (D.E.). The total amount of reducing sugars expressed as dextrose that is present in a corn syrup, calculated as a percentage of the total dry substance. The usual technique for determining D.E. in the corn products industry is the volumetric alkaline copper method. See also glucose syrup.

DDDT (difluorodiphenyltrichloroethane)

$(FC_6H_4)_2CHCCl_3$. Fluorine analog of DDT.

Properties: A low-melting white solid; m.p. 45.5°C. Odor resembling ripe apples; does not have broad killing power of DDT toward all insects but is more effective against flying insects, especially house flies.

Derivation: By condensing chloral and fluorobenzene in the presence of sulfuric acid or chlorosulfonic acid.

Uses: Insecticide.

"DFL No. 3."²⁸ Trademark for a solution of buffered phosphate esters, used as a lubricant release agent and corrosion inhibitor for synthetic rubber driers.

DFP. Abbreviation for diisopropyl fluorophosphate.

DHA. Abbreviation for dihydroxyacetone.

"DHA."²³³ Trademark for fungicides comprised of dehydroacetic acid and its salts.

"DHP-MP."²⁰³ Trademark for 1,4-bis(2-hydroxypropyl) 2-methylpiperazine.

DHS. Abbreviation for dihydrostreptomycin.

Di Symbol for didymium.

di- Prefix meaning two. See also bi-

"Diabestos."²¹⁸ Trademark for a filteraid of "Dicalite" diatomite and selected asbestos fibers.

"Diabinese."²⁹⁹ Trademark for chloropropamide.

"Diablo."²⁴⁴ Trademark for a group of chemically inert liquids containing 70% chlorine. Used in flammable compounds to impart flame retardance.

diacetic acid. See acetoacetic acid.

diacetin (glyceryl diacetate)

$CH_3O(OCCH_3)CHOHCH_2O(OCCH_3)$.

Properties: Hygroscopic liquid. It is a mixture of isomers. Sp. gr. 1.18; b.p. 259°C (approx); refractive index 1.44. Miscible with water, benzene, and alcohol; the commercial mixture gels about –30°C. Combustible. Low toxicity.

Derivation: Heating one mole of glycerin with two moles of glacial acetic acid.

Grades: Technical

Uses: Plasticizer and softening agent; solvent for cellulose derivatives, "Glyptal" resins, shellac.

diacetone acrylamide (DAA). A vinyl monomer.

Properties: White, crystalline solid; purity 99+%; highly soluble in water and most organic solvents; polymerizes readily. (The DAA homopolymer is insoluble in water).

Containers: Fiber drums; car lots.

Uses: Imparts water tolerance and vapor permeability to copolymer films; latex and water-based coating compositions; adhesion improver for cellulose, concrete, glass; cross-linking agent in polyester resins; color photography.

diacetone alcohol (diacetone; 4-hydroxy-4-methylpentanone-2; 4-hydroxy-2-keto-4-methylpentane)

$\text{CH}_3\text{COCH}_2\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless liquid, pleasant odor; sp. gr. 0.9406 at 20/20°C; b.p. 169.1°C; flash point (commercial grades) 55°F (O.C.); wt/gal 7.8 lb (20°C); viscosity 0.032 poise (20°C); f.p. -42.8°C; refractive index 1.42416 (20°C). Autoignition temp. 1118°F.

Miscible with alcohols, aromatic and halogenated hydrocarbons, esters, and water. A constant-boiling mixture with water has b.p. 99.6°C and contains approx. 13% diacetone alcohol.

Derivation: Condensation of acetone.

Grades: Technical; acetone-free; reagent.

Hazard: Flammable. Dangerous fire risk. Toxic and irritant. Tolerance, 50 ppm in air. Flammable limits in air, 1.8 to 6.9%.

Containers: Drums; tank cars.

Uses: Solvent for nitrocellulose, cellulose acetate, various oils, resins, waxes, fats, dyes, tars; lacquers, dopes, coating compositions; wood preservatives; stains; rayon and artificial leather; imitation gold leaf; dyeing mixtures; antifreeze mixtures; extraction of resins and waxes; preservative for animal tissue; metal-cleaning compounds; hydraulic compression fluids; stripping agent (textiles); laboratory reagent. The technical grade, containing acetone, has greater solvent power.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

diacetonyl sulfide (CH_3COCH_2)₂S.

Properties: Crystals; b.p. 136-137°C (15 mm); m.p. 47°C.

Derivation: Interaction of chloroacetone and hydrogen sulfide gas.

diacetyl (biacetyl; butanedione; diketobutane; dimethyl diketone; dimethylglyoxal) $\text{CH}_3\text{COCOCH}_3$.

Properties: Yellow liquid; strong odor. Soluble in water, alcohol, and ether. Sp. gr. 0.990 (15/15°C); m.p. ≥ 3 to $\geq 4^\circ\text{C}$; b.p. 88-91°C; refractive index (n 18/D) 1.3933; flash point below 80°F.

Derivation: Special fermentation of glucose; synthesis from methyl ethyl ketone.

Grades: Technical; flavor grade; F.C.C.

Hazard: Flammable, dangerous fire risk.

Use: Aroma carrier in food products.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

diacetylaminoozotoluene (4-ortho-tolylazo-ortho-diacetotoluene) $[\text{CH}_3\text{C}_6\text{H}_4\text{N}:\text{NC}_6\text{H}_3(\text{CH}_3)\text{N}(\text{CH}_3\text{CO})_2]$.

Properties: Crystalline powder. Color varies from yellowish-red, through rose to red. Acted upon by atmospheric water vapor. Soluble in alcohol, chloroform, and ether; also in fats, oils, and greases; insoluble in water.

Constants: M.p. 74-76°C.

Use: Medicine (external).

diacetyl dihydroxydiphenylisatin $\text{C}_{24}\text{H}_{19}\text{O}_5\text{N}$.

Properties: White, odorless, tasteless, crystalline

powder; m.p. 241-242°C. Soluble in alcohol, ether, and benzene.

Use: Medicine.

diacetylene. An unsaturated hydrocarbon containing two triple bonds, with the type formula $\text{C}_n\text{H}_{2n-6}$. The simplest is butadiyne or biacetylene $\text{HC}\equiv\text{CC}\equiv\text{CH}$, a gas which boils at 10°C. Combustible. Low toxicity. Hazard: Ignites spontaneously in contact with moist silver salts.

1,2-diacetylene. See acetonylacetone.

1,1'-diacetyl ferrocene ($\text{C}_5\text{H}_4\text{COCH}_3$)₂Fe. Red crystalline solid; m.p. 122-124°C. Used as an intermediate. See ferrocene.

diacetylmethane. See acetylacetone.

diacetylmorphine (diacetylmorphine; heroin)

$\text{C}_{17}\text{H}_{17}\text{NO}(\text{C}_2\text{H}_3\text{O})_2$.

Properties: White, odorless, bitter crystals or crystalline powder. Soluble in alcohol. M.p. 173°C.

Derivation: By acetylation of morphine.

Hazard: Highly toxic, habit-forming narcotic; 1/6th grain may be fatal. Cannot be legally sold in U.S.

diacetyl peroxide. See acetyl peroxide.

"Diadem Chrome."²³² Trademark for a series of chrome dyestuffs suitable for application by the after-chrome method.

"Di-Ademil."⁴¹² Trademark for hydroflumethiazide (q.v.).

"Diagnex Blue."⁴¹² Trademark for azuresin.

"Diak."²⁸ Trademark for a series of rubber accelerators used to vulcanize "Viton" fluoroclastomer and polyacrylate elastomers.

dialdehyde starch. See starch dialdehyde.

dialkylchloroalkylamine hydrochloride. A group of amine salts having the formula $\text{RCl}\cdot\text{HCl}$, when R represents such groups as $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2$ — (beta dimethylaminoethyl chloride hydrochloride); $(\text{CH}_3)_2\text{NCH}_2\text{CH}(\text{CH}_3)$ — (beta-dimethylaminoisopropyl chloride hydrochloride), etc. Used in organic synthesis.

"Diall."¹⁷⁵ Trademark for a series of diallyl phthalate thermosetting molding compounds.

Properties: Excellent electrical resistance; high physical strength; flame resistance; good dimensional stability; resistance to virtually all solvents and most chemicals; outstanding colorfastness in sunlight and heat; fungus resistant.

Grades: Mineral-filled, synthetic fiber-filled and glass fiber-filled.

di-allate. See 2,3-dichloroallyl diisopropylthiocarbamate.

diallyl adipate $\text{C}_3\text{H}_5\text{OOC}(\text{CH}_2)_4\text{COOC}_3\text{H}_5$.

Properties: Liquid; color-maximum #100 Pt-Co, characteristic odor; sp. gr. (20°C) 1.025. Combustible.

Use: Monomer.

diallylamine (di-2-propenylamine) $(\text{CH}_2=\text{CHCH}_2)_2\text{NH}$.

Properties: Liquid; sp. gr. (20°C) 0.7889; b.p. 112°C; f.p. -100°C; refractive index (n 20/D) 1.4404. Soluble in water. Combustible. Low to moderate toxicity.

Derivation: From allylamine.

Containers: Drums; tank cars.

Use: Intermediate.

diallylbarbituric acid (5,5-diallylbarbituric acid)

$\text{C}_{10}\text{H}_{12}\text{N}_2\text{O}_3$.

Properties: White, odorless, crystals or crystalline

- powder; slightly bitter taste; soluble in alcohol or ether; slightly soluble in water; m.p. 171–173°C.
Hazard: Moderately toxic. See barbiturate.
Use: Medicine (sedative).
- diallyl chloredate $(C_3H_5OOC)_2C_7H_2Cl_6$. Solid; f.p. 29.5°C; viscosity (20°C) 4.0 cp; sp. gr. (20°C) 1.47. Used as a monomer for allyl resins, especially in flame-retardant compositions.
- diallyl cyanamide $(H_2C:CHCH_2)_2NCN$.
Properties: Liquid; f.p. less than -70°C; b.p. 222°C; sp. gr. 0.90.
Hazard: Yields cyanide fumes on heating.
Use: Organic intermediate; polymers.
- diallyl diglycolate $(C_3H_5OOCCH_2)_2O$.
Properties: Liquid; color-maximum #100 Pt-Co; characteristic odor; sp. gr. (20°C) 1.1113.
Use: Monomer.
- diallyldimethylammonium chloride. See "Cat-floc."
- diallyl isophthalate $C_6H_4(COOH_2C:CHCH_2)_2$.
Properties: Monomer is liquid; color-maximum #175 Pt-Co; mild characteristic odor; sp. gr. (20°C) 1.124. Prepolymer is solid; sp. gr. (25°C) 1.256.
Uses: Molding and laminating; cross-linker for polyesters.
- diallyl maleate $C_3H_5OOCCH:CHCOOC_3H_5$.
Properties: Colorless or straw-colored liquid. B.p. 109–110°C (3 mm); sp. gr. 1.077 (20°C); refractive index (n_D 20/D) 1.4699. Polymerizes readily when exposed to light or temperatures above about 50°C. Combustible.
Hazard: Moderately toxic by ingestion; irritant to skin.
Uses: Polymers and copolymers; insecticide formulations.
- diallylmelamine $(C_3H_5)_2NCNC(NH_2)NC(NH_2)N$.
Properties: White crystalline solid; m.p. 142°C; sp. gr. 1.24 (30°C). Combustible.
Hazard: Moderately toxic by ingestion; irritant to skin. Evolves cyanide on heating.
Use: Monomer for resins.
- diallyl phosphite $(CH_2:CHCH_2O)_2PHO$. Water-white liquid; f.p. 0°C; b.p. 62°C (1 mm); refractive index (n_D 25/D) 1.444; sp. gr. 1.080 (25/15°C). Combustible.
Hazard: May be toxic.
Use: Synthesis of organophosphorus compounds.
- diallyl phthalate (DAP) $C_6H_4(COOCH_2CH:CH_2)_2$.
The name is also used for the polymer.
Properties: Nearly colorless oily liquid; limited solubility in gasoline, mineral oil, glycerin, glycols and certain amines. Soluble in most other organic liquids. Insoluble in water. Sp. gr. 1.120 (20/20°C); f.p. -70°C (viscous liquid); boiling range 158–165°C (4 mm); odor mild, lachrymatory; flash point 330°F; viscosity 13 cp (20°C). Combustible. Low toxicity.
Containers: Drums; tank cars.
Uses: Primary plasticizer which will polymerize if not inhibited; a monomer which will polymerize with heat and catalyst. Forms low-pressure laminates with various fillers such as glass cloth, paper, etc. for electrical insulation.
- diallyl sulfide. See allyl sulfide.
- dialysis. The separation of small molecules from macromolecules in a solution by means of a semiper-

meable membrane, such as parchment or collodion. The rates of diffusion of the small and the large molecules are so widely different that the former will readily pass through the membrane, whereas the latter will penetrate with extreme difficulty. For example, the diffusion rates are about 2.3 for sodium chloride, 7 for cane sugar, and from 50 to 100 for proteins and other macromolecules. This differential led Thomas Graham to define substances that would pass through the membrane easily as crystalloids, and those having a tendency to be retained by the membrane as colloids. See also colloid chemistry; electrodialysis; Graham.

"Diam."²⁵⁰ Trademark for a series of fatty diamines, $RNH(CH_2)_3NH_2$.

Uses: Corrosion inhibitors, petroleum additives, asphalt emulsifiers and chemical intermediates.

diamantane. See adamantane.

diamide hydrate. See hydrazine hydrate.

diamine. See hydrazine.

3,6-diaminoacridine. See acriflavine.

3,6-diaminoacridinium hydrogen sulfate. See proflavine sulfate.

meta-diaminoazobenzene hydrochloride. See chrysoidine.

diaminoazoxytoluene (azoxytoluidine)

$C_6H_3(CH_3)(NH_2)_2N_2OC_6H_3(NH_2)(CH_3)$.

Properties: Yellow or orange crystals. M.p. 168°C; soluble in alcohol; insoluble in water. Combustible.
Derivation: By alkaline reduction of para-nitro-orthotoluidine.

Use: Dye intermediate.

diaminobenzene. See phenylenediamine.

3,3'-diaminobenzidine (3,3',4,4'-biphenyltetramine)

$(H_2N)_2C_6H_3C_6H_3(NH_2)_2$. Solid; m.p. 178–180°C.

Hazard: Probably toxic.

Use: Copolymerized with diphenyl isophthalate to make high-temperature-resistant polybenzimidazoles (q.v.).

1,3-diaminobutane $NH_2CH_2CH_2CHNH_2CH_3$.

Properties: Water-white liquid; amino odor; boiling range 143–150°C; sp. gr. 0.858 (20/20°C); refractive index 1.450 (20°C); flash point 125°F. Combustible.
Hazard: Moderate fire risk.

alpha, epsilon-diaminocaproic acid. See lysine.

diaminochrysazin $(NH_2)_2(OH)C_{14}H_4O_2$. 1,8-diamino-4,5-dihydroxyanthraquinone.

Use: Colorimetric determination of boron.

trans-1,2-diaminocyclohexanetetraacetic acid monohydrate (CDTA) $C_6H_{10}[N(CH_2COOH)_2]_2 \cdot H_2O$.

Properties: White, crystalline solid; m.p. 200–220°C. Very slightly soluble in water and insoluble in most common organic solvents. Partially soluble in dimethylformamide and dimethylsulfoxide upon heating. Forms stable complexes.

Use: Chelating agent similar to ethylenediaminetetraacetic acid.

diaminodiethyl sulfide $S(CH_2CH_2NH_2)_2$.

Properties: Mobile, colorless liquid with amine-like odor. Miscible with water and benzene; insoluble in aliphatic hydrocarbons. B.p. 230–240°C; sp. gr. 1.054 (25°C). Combustible.

1,8-diamino-4,5-dihydroxyanthraquinone. See diamino-chrysazin.

diaminodihydroxyarsenobenzene dihydrochloride. See arspenamine.

di-para-aminodimethoxydiphenyl. See dianisidine.

diaminodiphenic acid (benzidinedicarboxylic acid)
 $C_6H_3(CO_2H)NH_2 \cdot C_6H_3(CO_2H)NH_2$.

Properties: White crystals; soluble in alcohol and ether; insoluble in water.

Derivation: By boiling meta-nitrobenzaldehyde with caustic soda, reducing with zinc dust and acidifying.

Hazard: Probably toxic. See benzidine.

Use: Dyestuff.

para-diaminodiphenyl. See benzidine.

diaminodiphenylamine $HN(C_6H_4NH_2)_2$.

Properties: Yellowish crystals; soluble in alcohol and ether; insoluble in water. M.p. 158°C.

Uses: Dye intermediate; detection of hydrogen cyanide.

diaminodiphenylethylene. See para-diaminostilbene.

para,para'-diaminodiphenylmethane (4,4'-methylene-dianiline; MDA) $H_2NC_6H_4CH_2C_6H_4NH_2$.

Properties: Crystals from water or benzene; m.p. 92–93°C; b.p. 398–399°C (78 mm). Slightly soluble in cold water. Very soluble in alcohol, benzene, ether. Flash point 440°F. Combustible.

Hazard: Reported to cause toxic hepatitis.

Uses: Determination of tungsten and sulfates; polymer and dye intermediate; corrosion inhibitor; epoxy resin hardening agent; isocyanate resins; polyamides.

4,4'-diaminodiphenyl sulfone. See sulfonyldianiline.

diaminodiphenylthiourea (diaminothiocarbanilide)
 $(NH_2C_6H_4NH)_2CS$.

Properties: Colorless plates or crystalline solid; soluble in alcohol and ether; sparingly soluble in water. M.p. 195°C.

Derivation: By boiling para-phenylenediamine with carbon disulfide.

diaminodiphenylureadisulfonic acid

$CO(NHC_6H_4NH_2SO_3H)_2$.

Properties: Colorless, needle-like crystals; slightly soluble in water.

Derivation: Action of phosgene upon either para-phenylenediaminesulfonic acid or 4-nitroaniline-3-sulfonic acid.

Use: Dye manufacture.

3,3'-diaminodipropylamine. See 3,3'-imino-bispropylamine.

diaminoditolyl. See tolidine.

para,para'-diaminoditolylmethane.

$NH_2C_7H_6CH_2C_7H_6NH_2$.

Properties: Glistening, crystalline plates; soluble in alcohol and ether; m.p. 149°C.

Derivation: By heating formaldehyde and orthotoluidine.

1,2-diaminoethane. See ethylenediamine.

6,9-diamino-2-ethoxyacridine lactate monohydrate. See ethodin.

di-para-aminoethoxydiphenyl. See ethoxybenzidine.

diaminoethyl ether tetraacetic acid

$(HOOCCH_2)_2NCH_2CH_2OCH_2CH_2N(CH_2COOH)_2$.

Slightly soluble in water; purity, 98% min. Used as a chelating agent.

1,6-diaminohexane. See hexamethylenediamine.

3,6-diamino-10-methylarcredinium chloride. See acriflavine.

diaminonaphthalene. See naphthylenediamine.

1,5-diaminopentane. See cadaverine.

2,4-diaminophenol $C_6H_3OH(NH_2)_2$.

Properties: Colorless crystals; m.p. 78–80°C with decomposition. Soluble in alcohol and ether.

Derivation: By reduction of 2,4-dinitrophenol.

Hazard: May be toxic or skin irritant.

Uses: Photographic developer; organic synthesis.

2,5-diaminophenol $C_6H_3OH(NH_2)_2$.

Properties: Colorless crystals; m.p. 68°C; soluble in water.

Derivation: By reduction of 2,5-dinitrophenol.

Hazard: May be toxic or skin irritant.

Use: Organic synthesis.

2,4-diaminophenol hydrochloride (amidol)

$C_6H_3(NH_2)_2OH \cdot 2HCl$.

Properties: Grayish-white crystals; soluble in water; slightly soluble in alcohol.

Derivation: By interaction of dinitrophenol with iron and hydrochloric acid.

Hazard: May be toxic or skin irritant.

Uses: Photographic developer; dyeing furs and hair; analytical reagent.

2,4-diamino-6-phenyl-s-triazine. See benzoguanamine.

1,2-diaminopropane (propylenediamine)

$NH_2CH_2CH(NH_2)CH_3$.

Properties: Colorless, very hygroscopic, strongly alkaline liquid. Very soluble in water. Ammoniacal odor. Sp. gr. 0.8732 (20/20°C); refractive index 1.4460 (n_D 20/D); flash point 160°F; b.p. 117°C. Combustible.

Grades: Technical; 75%; 90%; 98% solution.

Hazard: Strong irritant to skin and tissue. Moderate fire risk.

Uses: Synthesis of medicinals, dyes, rubber accelerators; electroplating; analytical reagent.

Shipping regulations: (Air) Corrosive label. Label name propylene diamine.

1,3-diaminopropane (1,3-propanediamine)

$NH_2CH_2CH_2CH_2NH_2$.

Properties: Water-white mobile liquid; amine odor. Sp. gr. 0.8881 (20/20°C); b.p. 139.7°C; f.p. –12°C; refractive index 1.459 (20°C); flash point 120°F (TOC). Completely soluble in water, methanol, and ether. Combustible.

Hazard: Moderate fire risk. Strong irritant to eyes and skin.

Use: Intermediate.

2,6-diaminopyridine $NC_5H_3(NH_2)_2$.

Properties: Crystals; m.p. 120.8°C; b.p. 285°C (760 mm); soluble in water. Combustible.

Derivation: From 2-aminopyridine.

para-diaminostilbene (diaminodiphenylethylene)

$C_6H_4(NH_2)CH=CHC_6H_4(NH_2)$.

Properties: Colorless needles or plates; soluble in alcohol and ether; insoluble in water. M.p. 227°C. Combustible.

Derivation: Reduction of dinitrostilbene.

4,4'-diamino-2,2'-stilbenedisulfonic acid (DAS)

$C_6H_4(NH_2)(SO_3H)CH=CHC_6H_4(SO_3H)(NH_2)$.

Properties: Yellowish microscopic needles; soluble in alcohol and ether; insoluble in water.

Derivation: Boiling sodium salt of para-nitrotoluene-ortho-sulfonate in water with caustic soda and reduction with zinc dust.

Hazard: Toxic by ingestion.

Use: Dyestuffs.

diaminothiocarbanilide. See diaminodiphenylthiourea.

di- α -amino-beta-thiolpropionic acid. See cystine.

diaminotoluene. See toluene-2,4-diamine.

4,6-diamino-meta-toluenesulfonic acid. See meta-tolyl-enediaminesulfonic acid.

4,6-diamino-s-triazine-2-ol. See ammeline.

2,5-diaminovaleric acid. See ornithine.

diammonium ethylenedisithiocarbamate

$\text{NH}_4\text{S}_2\text{CNH}(\text{CH}_2)_2\text{NHCS}_2\text{NH}_4$.

Properties: M.p. 72.5°C; very soluble in water.

Grades: 42% solution in water.

Hazard: May be toxic.

Uses: Fungicide; intermediate; corrosion inhibitor.

See also nabam.

diammonium hydrogen phosphate. See ammonium phosphate, dibasic.

diammonium phosphate. See ammonium phosphate, dibasic.

diamond. An allotropic form of carbon (q.v.), crystallized isometrically; consists of carbon atoms covalently bound by single bonds only in a predominantly octahedral structure. This accounts for its extreme hardness (Mohs 10) and great stability. It has a high refractive index (2.42); sp. gr. 3.50; coefficient of friction 0.05. M.p. 3700°C; b.p. 4200°C. The purest diamonds used for gems are mined in South Africa; lower grades in Brazil, Venezuela, India, Borneo, Arkansas; also made synthetically by heating carbon and a metal catalyst in an electric furnace at about 3000°F under high pressure. See also diamond, industrial.

diamond, industrial. Low-grade diamonds (bort and carbonado), as well as those made synthetically in an electric furnace (3000°F, 1.3 million psi).

Uses: Oil-well drill bits; primary grinding of steel; wire-drawing dies; glass and metal cutting. As dust, in abrasive wheels.

diamond pyramid hardness. See hardness.

"Diamox."³¹⁵ Trademark for acetazolamide (q.v.).

diamthazole dihydrochloride $\text{C}_5\text{H}_7\text{N}_3\text{OS} \cdot 2\text{HCl}$. 6-(2-Diethylaminoethoxy)-2-dimethylaminobenzothiazole dihydrochloride.

Properties: Crystals; decomposes 269°C. Soluble in water, ethanol and methanol.

Use: Topical therapy (medicine); antifungal agent.

di-n-amyamine (di-n-pentylamine) $(\text{C}_5\text{H}_{11})_2\text{NH}$.

Properties: Colorless liquid; b.p. 202–3°C (745 mm); very slightly soluble in water, soluble in alcohol and ether. Sp. gr. 0.77–0.78 (20°C); refractive index 1.430 (20°C). Flash point 124°F. Combustible.

Derivation: From reaction of amyl chloride and ammonia.

Containers: Drums; tank cars.

Hazard: Moderate fire risk. May be toxic.

Uses: Rubber accelerators; flotation reagents; dyestuffs and corrosion inhibitors; solvent for oils, resins, and some cellulose esters.

N,N-diamylaniline (mixed isomers) $\text{C}_6\text{H}_5\text{N}(\text{C}_5\text{H}_{11})_2$.

Properties: Dark amber liquid. Sp. gr. 0.898 (20°C);

boiling range 276–292°C; faint aniline odor; flash point 260°F. Combustible.

Hazard: May be toxic.

di-tert-amyl disulfide

$\text{CH}_3\text{CH}_2\text{C}(\text{CH}_3)_2\text{SSC}(\text{CH}_3)_2\text{CH}_2\text{CH}_3$.

Properties: Liquid; sp. gr. 0.931 (15.5/15.5°C); vacuum distillation range 86–102°C; refractive index 1.495 (20°C); flash point 220°F. Combustible.

diamylene $\text{C}_{10}\text{H}_{20}$.

Properties: Colorless liquid; f.p. below –50°C; b.p. 150°C; flash point 118°F (open cup); sp. gr. 0.77; low toxicity. Combustible.

Hazard: Moderate fire risk.

Uses: Solvent; organic synthesis.

2,5-di(tert-amyl)hydroquinone (DAHQ; 2,5-di(tert-pentyl)hydroquinone) $(\text{C}_5\text{H}_{11})_2\text{C}_6\text{H}_2(\text{OH})_2$.

Properties: Buff powder; m.p. 176°C; sp. gr. 1.05 (25°C). Slightly soluble in water; soluble in alcohol and benzene.

Uses: Antioxidant for uncured rubber and for unsaturated resins and oils; food packaging; polymerization inhibitor.

diamyl maleate $(\text{CHCOOC}_5\text{H}_{11})_2$.

Properties: Water-white liquid. Sp. gr. 0.981 (20°C); boiling range 263–300°C; odor faintly alcoholic; flash point 270°F. Combustible.

diamyl phenol (1-hydroxy-2,4-diamylbenzene)

$(\text{C}_5\text{H}_{11})_2\text{C}_6\text{H}_3\text{OH}$. Commercial form is a mixture of isomers including both secondary amyl and tertiary amyl groups mainly in 2,4 positions.

Properties: Light straw-colored liquid with mild phenolic odor; miscible with both aliphatic and aromatic hydrocarbons; insoluble in water and 10% aqueous alkalis. Boiling range (ASTM 5–95%) 280–295°C; sp. gr. 0.930 (20°C); wt/gal 7.8 lb (20°C); flash point (TOC) 260°F. Combustible.

Containers: Drums; tank cars; tank trucks.

Hazard: May be toxic and irritating to skin.

Uses: Synthetic resins; lubricating oil additives; rust preventives; plasticizers; synthetic detergents; antioxidants and antiskinning agents; rubber chemicals; rodenticide; fungicide.

diamyl phthalate $\text{C}_6\text{H}_4(\text{COOC}_5\text{H}_{11})_2$.

Properties: Colorless, nearly odorless oily liquid. Sp. gr. (20°C) 1.022; wt/gal 8.52 lb (20°C); refractive index (25°C) 1.488; b.p. 342°C; f.p. less than –55°C; flash point (closed cup) 357°F. Combustible. Low toxicity.

Derivation: By esterification of phthalic anhydride with amyl alcohol in the presence of approximately 1% concentrated sulfuric acid as catalyst.

Use: Plasticizer.

diamyl sulfide (amyl sulfide) $(\text{C}_5\text{H}_{11})_2\text{S}$. A mixture of isomers.

Properties: Yellow liquid; sp. gr. 0.85–0.91 (20/20°C); distillation range 170–180°C; flash point (open cup) 185°F; refractive index 1.477 (19°C). Combustible. Obnoxious odor.

Hazard: Moderately toxic and irritant by inhalation, ingestion and skin absorption.

Uses: Organic sulfur compounds by addition reactions; flotation agent in metallurgical processes; odorant.

"Dianabol."³⁰⁵ Trademark for methandrostenolone (q.v.).

dianhydrosorbitol. See sorbide.

1,4,3,6-dianhydrosorbitol. See isosorbide.

dianisidine (di-para-aminodi-meta-methoxydiphenyl; 3,3'-dimethoxybenzidine) $[C_6H_3(OCH_3)NH_2]_2$.

Properties: Colorless crystals; soluble in alcohol and ether; insoluble in water. M.p. 137°C. Flash point 403°F. Combustible.

Derivation: The methyl ether of ortho-nitrophenol is reduced by zinc dust and caustic soda to the hydrazo compound, which is then rearranged with hydrochloric acid.

Hazard: May be toxic. See anisidine, benzidine.

Use: Dye intermediate.

dianisidine diisocyanate (3,3'-dimethoxybenzidine 4,4'-diisocyanate) $[OCN(CH_3O)C_6H_3]_2$.

Properties: Grey to brown powder; m.p. 112°C min; soluble in ketones and esters.

Hazard: Toxic by inhalation and ingestion at high temperatures. Skin irritant.

Uses: Polymers and adhesive systems; high-strength backbone or cross-linking intermediate.

di-para-anisyl-para-phenetylguanidine hydrochloride (acoin; guanacaine)

$C_{21}H_{25}O_6N_4NC(NHC_6H_4OCH_3)_2 \cdot HCl$.

Properties: White crystalline powder; incompatible with iodine and alkaline iodides. Soluble in water and alcohol. M.p. 176°C.

Use: Medicine (local).

diaphenadione. An anticoagulant drug that has been found to reduce blood cholesterol in experimental animals.

diaphragm cell. A type of electrolytic cell for the production of caustic soda and chlorine from sodium chloride brine. The cell contains anode and cathode compartments separated by a porous diaphragm or membrane to prevent mixing of the solutions. Asbestos fibers are usually used for this diaphragm, though a recent development is a plastic material made from perfluorosulfonic acid (see "Nafion"). The brine is fed continuously to the anode compartment, where chlorine is released at the graphite anode, and flows through the diaphragm to the steel cathode, where hydrogen is liberated. Caustic soda accumulates in the liquid and is continuously drained from the cathode compartment. The Hooker cell and the Dow cell are two widely used types of diaphragm cell.

"Di-Aqua."²⁴⁴ Trademark for sodium alkyl aryl sulfonate in which the alkyl aryl portion is substantially all dodecylbenzene. Available in 40% and 80% active strengths, both in powder and flake form, also 40% beads.

Uses: Wetting agent; detergent; emulsifier.

"Diaron."³⁶ Trademark for powdered melamine adhesives.

"Diasan."³⁷⁰ Trademark for a quaternary ammonium bacteriostate for textile sanitizing.

diaspore $Al_2O_3 \cdot H_2O$. A natural hydrous aluminum oxide, occurring in bauxite (q.v.), and with corundum and dolomite.

Properties: White, gray, yellowish, and greenish; luster vitreous to pearly; sp. gr. 3.35-3.45; Mohs hardness 6.5-7.

Occurrence: Arkansas, Missouri, Pennsylvania; Switzerland; U.S.S.R.; Czechoslovakia.

Uses: Refractory; abrasive.

diastase, malt. A commercial mixture containing amylolytic enzymes.

Properties: Yellowish-white amorphous powder, or

syrupe liquid. Soluble in water; almost insoluble in alcohol. Nontoxic.

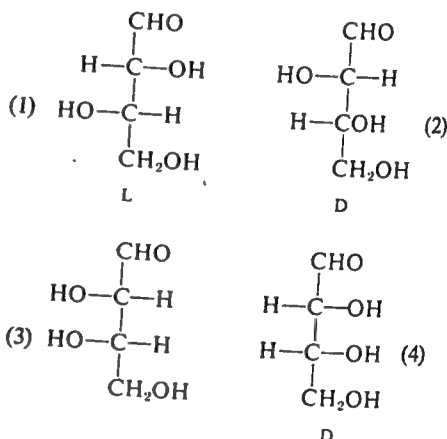

Derivation: The filtrate from the mash of malted grain is concentrated at low temperatures in vacuum. The sugar acts as preservative. The diastase hydrolyzes starch to malt sugar.

Uses: Desizing of textiles; calico printing; finishing of textiles; medicine; bread-making; malted foods.

See also amylase.

"Diastazyme."³⁰⁹ Trademark for liquid enzyme of malt origin. Used for sizing starch-sized fabrics.

diastereoisomer. In any group of four optical isomers occurring in compounds containing two asymmetric carbon atoms, such as 4-carbon sugars, there are two pairs of enantiomers (structures which are mirror images of each other), indicated by the letters D and L. The two D and the two L isomers are not mirror images, and these are called diastereoisomers. For example, in the structures below, (1) and (2) are enantiomers, and so are (3) and (4); (1) and (3) and (2) and (4) are diastereoisomers:

See also optical isomer; enantiomer; epimer; anomer.

diatomaceous earth (diatomite; kieselguhr).

Properties: Soft bulky solid material (88% silica) composed of skeletons of small prehistoric aquatic plants related to algae (diatoms). They have intricate geometric forms. Available as light-colored blocks, bricks, powder, etc. True sp. gr. 1.9 to 2.35; bulk density from 5 to 15 lb per cubic foot. Insoluble in acids except hydrofluoric; soluble in strong alkalies. Absorbs 1.5 to 4 times its weight of water; also has high oil absorption capacity. Poor conductor of sound, heat, and electricity. Noncombustible.

Occurrence: Western U.S., Europe; Algeria; U.S.S.R.

Grades: Natural; chemical; airfloat.

Containers: Bulk; bags; multiwall paper sacks.

Hazard: Moderate risk from inhalation of dust. Otherwise nontoxic.

Uses: Filtration, clarifying, and decolorizing; insulation; absorbent; mild abrasive; drilling mud thickener; extender in paints, rubber and plastic products; ceramics; paper coating; anticaking agent in fertilizers; asphalt compositions; chromatography.

diatomic. Descriptive of a gas whose molecules are composed of two atoms, e.g., oxygen, nitrogen, chlorine, hydrogen. Gases in which the element is present as single atoms are called monatomic, e.g., argon, neon.

diatrizoate sodium. See sodium diatrizoate.

4-diazabicyclo[2.2.2]octane

Properties: Crystals, hygroscopic; m.p. 158°C; b.p. 174°C; forms crystalline hydrate; sublimes easily; soluble in water and organic solvents.

Uses: Possible catalyst for urethane foams and coatings; chemical intermediate.

Diazald.TM Trademark for N-methyl-N-nitrosopara-toluenesulfonamide.

diazepam **USAN** name for 7-chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one, $\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{O}$. Listed in N.D.

Properties: Slightly yellowish crystalline powder; practically no odor. M.p. 131.5–134.5°C. One gram of diazepam dissolves in about 350 ml of water, in about 15 ml of 95% ethanol or in about 2 ml of chloroform.

Hazard: Central nervous system depressant. Toxic in high concentrations. Manufacture and dosage restricted.

Use: Medicine (tranquilizer).

"Diazine."TM Trademark for a group of direct dyes, applied to cotton, diazotized and then coupled onto phenols or amines.

1,3-diazine (pyrimidine, miazine)

Properties: Liquid or crystalline mass with a penetrating odor; melting point 20–22°C; b.p. 123–124°C; soluble in water, alcohol, and ether.

See also pyrimidine.

diazinon. Generic name of an insecticide, O,O-diethyl O-(2-isopropyl-4-methyl-6-pyrimidinyl) phosphorothioate $[(\text{CH}_3)_2\text{CHC}_4\text{N}_2\text{H}(\text{CH}_3)\text{O}]\text{PS}(\text{OC}_2\text{H}_5)_2$.

Properties: Colorless liquid; b.p. 83–84°C (0.002 mm); slightly soluble in water, freely soluble in petroleum solvents, alcohol and ketones. More stable in alkaline than neutral or acid solutions.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail) Organic phosphate compound, liquid, n.o.s., Poison label. (Air) No label required.

diazaminobenzene (diazobenzeneanilide; 1,3-diphenyl-triazene; benzencazoanilide) $\text{C}_6\text{H}_5\text{NNHC}_6\text{H}_5$.

Properties: Golden-yellow scales. Soluble in alcohol, ether, and benzene; insoluble in water. M.p. 96°C; explodes when heated to 150°C.

Derivation: Interaction of nitrous acid and an alcoholic solution of aniline.

Hazard: Explodes on heating to 150°C. Dangerous!

Uses: Organic synthesis; dyes; insecticide.

Shipping regulations: Consult authorities. Not listed.

4,4'-diazaminodibenzamidine

Properties: (trihydrate) Yellow powder; m.p. 203°C (with decomposition); soluble in water at pH 6.1; solutions are unstable.

Use: Veterinary medicine.

diazobenzeneanilide. See diazaminobenzene.

para-diazobenzenesulfonic acid $\text{C}_6\text{H}_4\text{SO}_3\text{N}_2$.

Properties: White or slightly red crystals, or white paste. Soluble in water and ether; insoluble in alcohol.

Derivation: From sulfanilic acid, sodium nitrite and sulfuric acid.

Hazard: Explodes when shocked or heated.

Uses: Dyestuffs; reagent.

Shipping regulations: Consult authorities. Not listed.

para-diazodimethylaniline zinc chloride double salt (para-dimethylaminobenzene diazonium chloride, zinc chloride double salt; para-diazotized aminodimethylaniline zinc chloride double salt) $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl} \cdot \text{ZnCl}_2$.

Properties: Yellow to orange (light-sensitive) crystals.

Specifications: Moisture content 5–20%; zinc 17–23%; chloride 31–35%.

Containers: Bottles; fiber drums.

Hazard: May be toxic and irritant.

Uses: Rapid diazotype coupler, used in coatings for light-sensitive paper.

2-diazo-4,6-dinitrobenzene-1-oxide. See diazodinitrophenol.

diazodinitrophenol (2-diazo-4,6-dinitrobenzene-1-oxide; 5,7-dinitro-1,2,3-benzoxadiazole; DDNP) $(\text{NO}_2)_2\text{C}_6\text{H}_2\text{ON}_2$ (bicyclic).

Properties: Yellow, crystalline compound; darkens rapidly by exposure to sunlight. Specific gravity 1.6. Soluble in nitrobenzene, acetone, acetic acid, and nitroglycerin. Desensitized by water.

Derivation: Diazotization of picramic acid in aqueous solution with sodium nitrite and hydrochloric acid.

Hazard: Explodes when shocked or heated. Dangerous! An initiating explosive.

Use: Primary charge in blasting caps.

Shipping regulations: (Rail) Consult regulations. Not accepted by express. (Air) Not accepted.

para-diazodiphenylamine sulfate.

$(\text{C}_6\text{H}_5\text{NHC}_6\text{H}_4\text{N}_2)_2\text{SO}_4$. Yellow-green solid with unpleasant odor. Sensitive to light; soluble in water.

Used as a light sensitive diazo compound for coating on reproduction paper, giving direct positive prints of various colors with different developers or coupling agents.

1,2-diazole. See pyrazole.

diazomethane (azimethylene). $\text{H}_2\text{C}=\text{N}=\text{N}^+$

Properties: Yellow gas at room temp.; f.p. –145°C; b.p. –23°C; sp. gr. 1.45.

Hazard: Highly toxic by inhalation; strong irritant. Tolerance, 0.2 ppm in air. Severe explosion risk when shocked; may explode on contact with alkali metals, rough surfaces, or heat (100°C).

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

1-diazo-2-naphthol-4-sulfonic acid $\text{C}_{10}\text{H}_7\text{N}_2\text{OSO}_3\text{H}$.

Properties: Yellow needles in paste or dry form. Slightly soluble in water. Also available as sodium salt, m.p. 168°C. Combustible.

Derivation: Diazotization of 1-amino-2-naphthol-4-sulfonic acid and filtering of the diazo compound.

Hazard: May explode if heated above 100°C.

Uses: Azo dyes; valuable chrome dyestuff component. Shipping regulations: (Rail, Air) Not listed. Consult authorities.

"Diazopon AN."TM Trademark for a nonionic dispersing and stabilizing agent consisting of polyoxyethylated fatty alcohol.

Properties: Clear, oily, yellow liquid; sp. gr. 1.03–1.04; soluble in water; stable to strong acids; alkalis and metallic ions.

Uses: Dispersing and stabilizing agent in the naphthol dyeing process to improve fastness to rubbing. Used in dissolving fast color salts, it has a stabilizing effect on the diazonium compound.

diazotization. The reaction of a primary aromatic amine with nitrous acid in the presence of excess mineral acid to produce a diazo ($-N=N-$) compound. Widely used in organic synthesis, especially production of dyes.

diazotizing salts. See sodium nitrite.

"Diazyme."²¹² Trademark for an amyloglucosidase which splits starch almost completely to glucose.

DIBA. See diisobutyl adipate.

DIBAC. Abbreviation for diisobutylaluminum chloride.

"Dibactol."⁴³⁰ Trademark for myristyldimethylbenzylammonium chloride (q.v.).

DIBAL-H. Abbreviation for diisobutylaluminum hydride (q.v.).

diabasic. See monobasic.

dibenzanthrone (violanthrone) $C_{34}H_{16}O_2$. Violet-blue vat dye.

Properties: Bluish-black powder. Soluble in nitrobenzene, conc. sulfuric acid.

Derivation: From benzanthrone.

Use: Intermediate.

3,3'-dibenzanthronyl (also called the 13,13'-compound) $C_{34}H_{18}O_2$.

Properties: Dark yellow needles. Soluble in conc. sulfuric acid. M.p. 412°C.

Use: Intermediate.

4,4'-dibenzanthronyl (also called the 2,2'-compound) $C_{34}H_{18}O_2$.

Properties: Yellow needles. Soluble in nitrobenzene; slightly soluble in benzene, alcohol, ether. M.p. 320°C.

Use: Intermediate.

2,3,6,7-dibenzoanthracene. See pentacene.

dibenzocycloheptadienone $C_{15}H_{12}O$. A tricyclic compound; light yellow to amber solid. M.p. 28.5°C; b.p. 203–204°C (7 mm); sp. gr. 1.1635 (20°C); refractive index (n 20/D) 1.6324. Soluble in alcohol and most organic solvents. Insoluble in water. Combustible.

Use: Intermediate.

dibenzofuran. See diphenylene oxide.

"Dibenzo G-M-F."²⁴⁸ Trademark for dibenzoyl-para-quinonedioxime, $(C_6H_5COON)_2C_6H_4$.

Properties: Brownish gray powder; sp. gr. 1.37; starts to decompose above 200°C; good storage stability. Insoluble in acetone, benzene, gasoline, ethylene dichloride and water.

Grades: Available in superdispersing grades.

Uses: Non-sulfur vulcanizing agent; in tire-curing bags, gaskets and wire insulation to impart heat resistance.

See also benzoyl peroxide.

dibenzopyran. See xanthene.

dibenzopyrone. See xanthone.

dibenzopyrrole. See carbazole.

dibenzothiophene $C_6H_4C_6H_4S$.

Properties: Colorless crystals; m.p. 97–98°C. Combustible.

Uses: Cosmetics and pharmaceuticals; intermediate.

dibenzoyl. See benzil.

trans-1,2-dibenzoyl ethylene $C_6H_5COCHCHCO_2C_6H_5$.

Properties: Yellow orange crystals; m.p. 111°C; soluble in glacial acetic acid, ethyl acetate, benzene and chloroform; sparingly soluble in alcohol; insoluble in water and petroleum ether. Combustible.

Containers: Polyethylene-lined fiber drums.

Uses: Enzyme inhibitor, bactericide and intermediate.

dibenzoylmethane (1,3-diphenyl-1,3-propanedione) $C_6H_5COCH_2CO_2C_6H_5$.

Properties: Crystals; m.p. 80°C; b.p. 219–221°C (18 mm). Partially soluble in alcohol; soluble in ether, chloroform, and aqueous sodium hydroxide. Combustible.

Use: Colorimetric determination of uranium.

dibenzoyl peroxide. See benzoyl peroxide.

dibenzoyl-para-quinonedioxime. See "Dibenzo G-M-F."

2,4-dibenzoylresorcinol $C_6H_5COC_6H_2(OH)_2CO_2C_6H_5$.

Properties: Light yellow crystals; nearly odorless; m.p. 125–128°C; soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.

Use: Light absorber, best at 280–370μ.

dibenzyl. See sym-diphenylethane.

N,N-dibenzylamine $HN(CH_2C_6H_5)_2$.

Properties: Colorless to light yellow liquid; b.p. 300°C (partial decomp.); m.p. –26°C; ammonia-like odor; combustible; sp. gr. 1.017 (20°C); refractive index 1.5730–1.5740 (n 25/D); distilling range 168–172°C (10 mm); partially soluble in water, acetone, benzene and gasoline.

Hazard: Toxic by ingestion, inhalation.

Uses: Intermediate; rubber activator.

N,N-dibenzyl-para-aminophenol

$(C_6H_5CH_2)_2NC_6H_4OH$.

Properties: Brown powder. Soluble in acetone, benzene, anhydrous methanol. M.p. not lower than 110°C.

N,N-dibenzylaniline $C_6H_5N(CH_2C_6H_5)_2$.

Properties: Yellowish-white crystals. Soluble in alcohol and ether; insoluble in water. M.p. 70°C; b.p. above 300°C.

Hazard: Probably toxic. See aniline.

dibenzyl disulfide (benzyl disulfide)

$C_6H_5CH_2SSCH_2C_6H_5$.

Properties: Pink solid; odor similar to benzaldehyde. M.p. 70–72°C. Dissolves in most organic solvents; very slightly soluble in water. Combustible.

Use: Antioxidant and antisludging agent for petroleum oils; extreme-pressure lube oils and greases.

dibenzyl ether. $C_6H_5CH_2OCH_2C_6H_5$.

Properties: Colorless, unstable liquid. Faint, almond odor. Insoluble in water; soluble in most organic solvents. Sp. gr. 1.035; b.p. 298–300°C; flash point 275°F. Combustible.

Grade: Technical.

Hazard: Irritant and narcotic in high concentrations.

Uses: Plasticizer for various resins; perfumery (solvent for nitro-musks); flavoring.

"Dibenzylne."⁷¹ Trademark for phenoxybenzamine hydrochloride (q.v.).

N,N-dibenzylmethylamine $\text{CH}_3\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_2$.

Properties: Colorless to light yellow liquid; sp. gr. 0.99 (25°C); refractive index 1.5560–1.5590 (25°C); distilling range: 152–158°C (11 mm). Partially soluble in water; soluble in organic solvents. Combustible. Containers: 200-lb, 400-lb steel drums.

Uses: Intermediate; oil-soluble rust inhibitor; cutting oils; hydraulic fluids; lubricants.

dibenzyl sebacate $\text{C}_6\text{H}_5\text{CH}_2\text{OOC}(\text{CH}_2)_8\text{COOCH}_2\text{C}_6\text{H}_5$.

Properties: Light straw-colored liquid; m.p. 28°C; b.p. 265°C (4 mm); sp. gr. 1.055 (30/20°C); complete nonvolatility; gives excellent low-temperature flexibility. Flash point 450°F. Combustible.

Containers: Drums; tank cars.

Use: Plasticizer, especially for plastic linings for containers.

dibenzyl succinate. See benzyl succinate.**2,5-dibiphenylloxazole (BBO)** $\text{C}_{27}\text{H}_{21}\text{NO}$.

Properties: Crystalline solid, m.p. 237–239°C.

Grade: Purified.

Use: Scintillation counter or as wavelength shifter in solution scintillators.

diborane (diboron hexahydride; boroethane) B_2H_6 .

Properties: Colorless gas with repulsive odor. B.p. -92.5°C; f.p. -165°C; density 0.18 g/ml (17°C). Soluble in carbon disulfide; decomposes in water. Highly reactive; flash point -130°F. Autoignition temp. 100–125°F.

Derivation: (a) From boron trichloride or bromide and hydrogen; (b) by reaction of lithium aluminum hydride and boron trichloride in ether solution.

Grades: Technical 95%; high purity 99+%.

Containers: Steel cylinders.

Hazard: Highly flammable; dangerous fire risk. Highly toxic by inhalation; strong irritant. Tolerance, 0.1 ppm in air. Reacts violently with oxidizing materials. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Synthesis of organic boron compounds and metal borohydrides; polymerization catalyst for ethylene; fuel for air-breathing engines, and rockets; reducing agent; doping agent in electronics.

Shipping regulations: (Air) Not acceptable. (Rail) Not listed. Consult authorities.

"Dibromantin."¹⁰⁹ Trademark for 1,3-dibromo-5,5-dimethylhydantoin (q.v.).**"Dibrom"** 8 Emulsive.²⁵³ Trademark for an insecticide, the active ingredient of which is 60% naled. (q.v.).**dibromoacetylene (dibromomethyne)** $\text{BrC}\equiv\text{CBr}$.

Properties: Heavy, colorless liquid. Disagreeable odor. Soluble in most organic solvents. Sp. gr. (approx.) 2; m.p. 76–76.5°C.

Derivation: (a) Interaction of magnesium dibromoacetylene and in ethereal solution of cyanogen bromide. (b) Interaction of tribromoethylene and alcoholic potash.

Hazard: Explodes on contact with oxygen or on heating! Dangerous! Highly toxic by inhalation and injection; strong irritant.

Use: Organic synthesis (halogenated ethylene).

Shipping regulations: (Rail) Not listed. Consult regulations. (Air) Explosives, n.o.s. Not acceptable.

9,10-dibromoanthracene $\text{C}_{14}\text{H}_8\text{Br}_2$ (tricyclic).

Properties: Yellow crystals. Soluble in chloroform; slightly soluble in alcohol and ether; insoluble in water. M.p. 221°C; b.p., sublimes.

Derivation: Bromination of anthracene.

Use: Organic synthesis.

ortho-dibromobenzene (benzene dibromide) $\text{C}_6\text{H}_4\text{Br}_2$.

Properties: Heavy liquid with pleasant, aromatic odor. B.p. 225.5°C; freezing point 7.13°C; sp. gr. 1.9767 (25/4°C); refractive index (n_{20/D}) 1.6155. Combustible. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and n-heptane; insoluble in water.

Derivation: Interaction of benzene with an excess of bromine in presence of iron.

Uses: Solvent for oils; motor fuels; top-cylinder compounds; organic synthesis; ore flotations.

para-dibromobenzene (benzene dibromide) $\text{C}_6\text{H}_4\text{Br}_2$.

Properties: Colorless crystals. Soluble in alcohol and ether. M.p. 89°C; b.p. 219°C; sp. gr. 2.261; refractive index (n_{99/D}) 1.5743.

Hazard: Moderately toxic by inhalation.

Uses: Organic synthesis of dyestuffs and drugs; manufacture of intermediates; fumigant.

N,N-dibromobenzenesulfonamide $\text{C}_6\text{H}_5\text{SO}_2\text{NBr}_2$.

Properties: Solid; m.p. 109–111°C. Active bromine 50.4%.

Use: Halogenating agent.

dibromochloromethane CHBr_2Cl .

Properties: Clear, colorless heavy liquid. Sp. gr. 2.38; b.p. 116°C.

Hazard: Probably irritant and narcotic.

Use: Organic synthesis.

1,2-dibromo-3-chloropropane $\text{CH}_2\text{BrCHBrCH}_2\text{Cl}$.

Properties: Colorless (when pure) liquid; sp. gr. 2.05 (20°C); b.p. 195.5°C; f.p. 6.7°C; refractive index 1.5530 (20/D); flash point (TOC) 170°F. Combustible. Slightly soluble in water; miscible with oils.

Hazard: Strong irritant to skin, eyes, and throat. Absorbed by skin. Use may be restricted.

Use: Soil fumigant for nematodes.

dibromodiethyl sulfide $(\text{CH}_3\text{CH}_2\text{Br})_2\text{S}$. The bromine analog of mustard gas.

Properties: White crystals. Soluble in alcohol, benzene, ether; insoluble in water. Sp. gr. 2.05 (15°C); b.p. 240°C (decomposes); m.p. 31–34°C.

Derivation: Action of hydrobromic acid on an aqueous solution of thiodiglycol.

Hazard: Highly toxic by inhalation; strongly irritant poison gas.

Use: Organic synthesis.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

dibromodiethyl sulfone $(\text{BrCH}_2\text{CH}_2)_2\text{SO}_2$.

Properties: Plates. Soluble in alcohol, benzene, ether. M.p. 111–112°C.

Derivation: Interaction of dibromodiethyl sulfide, chromic anhydride, and dilute sulfuric acid.

dibromodiethyl sulfoxide $(\text{BrCH}_2\text{CH}_2)_2\text{SO}$.

Properties: Glittering crystals. Soluble in alcohol, benzene, ether. M.p. 100–101°C.

Derivation: Interaction of benzoyl peroxide and a hot solution of dibromodiethyl sulfide in chloroform.

dibromodifluoromethane CF_2Br_2 .

Properties: Colorless heavy liquid; f.p. -141°C; b.p. 24.5°C; sp. gr. 2.288 (15/4°C); refractive index 1.399 (12°C). Insoluble in water; soluble in methanol and ether. Nonflammable.

Derivation: Vapor phase bromination of difluoromethane.

Grades: Pure (95.0% min).

Containers: Cylinders.

Hazard: Moderately toxic and irritant.

Uses: Synthesis of dyes, pharmaceuticals, quaternary ammonium compounds, fire-extinguishing agent.

1,3-dibromo-5,5-dimethylhydantoin $\text{BrNCONBrCOC}(\text{CH}_3)_2$.

Properties: Free-flowing cream-colored powder with slight bromine odor. M.p. 187–191°C (decomposes); quite stable at 75°C. Soluble in benzene, chloroform, glacial acetic acid; slightly soluble in water and carbon tetrachloride; insoluble in hexane. Contains 55% active bromine, which is slowly released in aqueous solution.

Derivation: Bromination of dimethylhydantoin.

Uses: Controlled bromination and oxidation of organic compounds; water treatment; polymerization catalyst; potential germicide and sanitizer.

1,2-dibromoethane. See ethylene dibromide.

4,5'-dibromofluorescein $\text{C}_{20}\text{H}_{10}\text{Br}_2\text{O}_5$.

Properties: Yellow powder (clean shade); m.p. 265–267°C.

Grades: 99+%.

Use: Lipstick dye.

2,4-dibromofluorobenzene $\text{C}_6\text{H}_3\text{Br}_2\text{F}$.

Properties: Colorless liquid; sp. gr. (20°C) 2.047; b.p. 214°C; refractive index (n_D²⁵) 1.5790. Insoluble in water; soluble in alcohol, acetone, ether, benzene, chloroform, ethyl acetate, and glacial acetic acid.

Hazard: Irritating to skin and eyes.

Uses: Intermediate for agricultural and pharmaceutical chemicals.

dibromoformoxime CBBr_2NOH .

Properties: Crystals. M.p. 70–71°C. Distills between 75 and 85°C (3 mm).

Hazard: Evolves highly toxic fumes on heating. A military poison.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

dibromiodoethylene Br_2CCHBr .

Properties: Liquid; sp. gr. 2.952 (24°C); b.p. 91°C (15 mm).

Derivation: Reaction of iodine and dibromoacetylene.

dibromomalonic acid $\text{HOOC}\cdot\text{CBBr}_2\text{COOH}$.

Properties: Light yellow needles or prisms; m.p. 147°C (decomposes).

Use: Intermediate for drugs and fine chemicals.

dibromomalonyl chloride $\text{ClOCCBr}_2\text{COCl}$.

Properties: Yellowish oily liquid; b.p. 75–77°C (15 mm).

Use: Chemical intermediate.

dibromomethane. See methylene bromide.

dibromomethyl ether $(\text{CH}_2\text{Br})_2\text{O}$.

Properties: Colorless liquid. Decomposed by water. Soluble in acetone, benzene, ether; insoluble in water. Sp. gr. 2.2; b.p. 154–155°C; f.p. –34°C.

Derivation: (a) The reaction product of paraformaldehyde and sulfuric acid is treated with ammonium bromide. (b) Interaction of hydrobromic acid and paraformaldehyde.

Hazard: Evolves highly toxic fumes on heating, strong irritant to eyes; fire risk in contact with oxidizing materials.

Uses: Military poison (lachrymator).

Shipping regulations: (Rail, Air) Not listed.

9,10-dibromooctadecanoic acid (9,10-dibromostearic acid) $\text{CH}_3(\text{CH}_2)_7\text{CHBrCHBr}(\text{CH}_2)_7\text{CO}_2\text{H}$.

Properties: Yellow solid or liquid; sp. gr. 1.2458 (30/4°C); m.p. 29–30°C; refractive index 1.4893 (42°C). Insoluble in water; soluble in alcohols, ketones, aromatic and chlorinated hydrocarbons. Also available as methyl ester.

Grade: Technical (amber liquid).

Use: Chemical intermediate.

1,5-dibromopentane. See pentamethylene dibromide.

1,3-dibromopropane. See trimethylene bromide.

dibromopropanol (2,3-dibromo-1-propanol) $\text{CH}_2\text{BrCHBrCH}_2\text{OH}$.

Properties: Colorless liquid. Sp. gr. (20/4°C) 2.120; b.p. 219°C. Soluble in acetone, alcohol, ether and benzene.

Uses: Intermediate in preparation of flame retardants, insecticides and pharmaceuticals.

dibromoquinonechlorimide. A reagent used for spot visualizations in chromatographic systems.

Hazard: Highly sensitive to heat. Explodes at 120°C; decomposes with rapid heat evolution at 60°C.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

3,5-dibromosalicylaldehyde (3,5-dibromo-2-hydroxybenzaldehyde) $\text{Br}_2(\text{OH})\text{C}_6\text{H}_3\text{CHO}$.

Properties: Pale yellow crystals; m.p. 86°C; slightly soluble in water; soluble in ether, benzene, chloroform, alcohol and acetic acid.

Use: Medicine (external); fungicide.

4',5-dibromosalicylanilide. See dibromsalan.

9,10-dibromostearic acid. See 9,10-dibromoöctadecanoic acid.

2,5-dibromoterephthalic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{COOH})_2$. A flame-retardant monomer for production of polyester fibers, which are made by reacting this acid with dimethyl terephthalate and ethylene glycol. Permanent lowering of flammability is said to be gained by this method of incorporating bromine in molecular combination.

sym-dibromotetrafluoroethane $\text{CBBrF}_2\text{CBrF}_2$.

Properties: Liquid; b.p. 47.3°C; density 2.18 g/cc (21.1°C). Nonflammable.

Uses: Refrigerant; fire-extinguishing agent; control fluid.

dibromsalan. USAN for 4',5-dibromosalicylanilide $\text{BrC}_6\text{H}_3(\text{OH})\text{CONHC}_6\text{H}_4\text{Br}$.

Use: Disinfectant.

dibucaine $\text{C}_{20}\text{H}_{29}\text{N}_3\text{O}_2$. 2-n-Butoxy-N-(2-diethylaminoethyl)cinchoninamide.

Properties: Colorless or almost colorless powder; m.p. 62–65°C. Odorless; somewhat hygroscopic; affected by light. Soluble in alcohol and acetone; slightly soluble in water. Also available as the hydrochloride.

Grade: N.F.

Hazard: May have serious allergic side effects.

Use: Medicine (anesthetic).

dibutoline sulfate $(\text{C}_4\text{H}_9\text{N}_2\text{O}_2)_2\text{SO}_4$. Bis(dibutylcarbamate of ethyl(2-hydroxyethyl)dimethylammonium sulfate.

Properties: Hygroscopic powder; decomposes 166°C; soluble in water and benzene.

Use: Surface-active agent in medicine.

2,5-dibutoxyaniline $\text{C}_6\text{H}_3(\text{OC}_4\text{H}_9)_2\text{NH}_2$.

Properties: M.p. 18°C; insoluble in water; soluble in organic solvents.

- ethanol, isopropanol, "Cellosolve" (12°C), naphtha, benzene, methyl ethyl ketone and linseed oil; insoluble in water and 10% sodium hydroxide. Flash point (COC) 275°F. Combustible. Low toxicity.
 Grades: Technical; feed; F.C.C.
 Containers: Drums; tank cars.
 Hazard: Use in foods restricted. Consult FDA regulations for details.
 Uses: Antioxidant for petroleum products, jet fuels, rubber, plastics and food products; food packaging; animal feeds. Satisfies ASTM D910-64T for use in aviation gasoline.
- 2,6-di-tert-butyl-alpha-dimethylamino-para-cresol** ("Ethyl" Antioxidant 703)
 $(C_4H_9)_2C_6H_2OH[CH_2N(CH_3)_2]$.
 Properties: Light yellow crystalline solid; m.p. 201°F; flash point 280°F (open cup). Insoluble in water and 10% sodium hydroxide; soluble in organic solvents. Combustible.
 Use: Antioxidant in gasoline and oils, including jet-engine oils.
- di-tert-butyl diperphthalate**
 $(CH_3)_3COOCOC_6H_4COOOC(CH_3)_3$. Available as a 50% solution in dibutyl phthalate.
 Properties: Clear liquid, insoluble in water; soluble in most organic solvents. Flash point 145°F (open cup); combustible. Sp. gr. 1.056.
 Hazard: May ignite organic materials. Strong oxidizing agent. May explode when shocked or in contact with reducing materials.
 Use: High-temperature polymerization catalyst for vinyl and polyester resins.
 Shipping regulations: Peroxides, organic, liquid, n.o.s., (Rail) Yellow label. (Air) Not acceptable.
- dibutyl diphenyl tin** $(CH_3CH_2CH_2CH_2)_2Sn(C_6H_5)_2$.
 Properties: Clear, slightly greenish liquid; contains 30.7% Sn; b.p. 175°C (2 mm); refractive index 1.563 (17.5°C); sp. gr. 1.19. Combustible.
 Hazard: Toxic. Tolerance (as Sn) 0.1 mg per cubic meter of air.
- di-tert-butyl disulfide** $C(CH_3)_3SSC(CH_3)_3$.
 Properties: Liquid; sp. gr. 0.9291 (60/60°F); boiling range 375-405°F; refractive index 1.491 (20°C); flash point 170°F (approx). Combustible.
 Use: Intermediate; diesel and jet fuel additive; lubricant additive.
- n-dibutyl ether**. See butyl ether.
- dibutyl fumarate** $(C_4H_9)OOCCH:CHCOO(C_4H_9)$.
 Properties: Colorless liquid; sp. gr. (20°C) 0.9873; b.p. 285.2°C; f.p. -15.6°C; refractive index n (20°C) 1.4466; insoluble in water; flash point 300°F; combustible; nontoxic.
 Containers: Drums; tank trucks; tank cars.
 Uses: Monomeric plasticizers; copolymers; intermediate.
- dibutyl hexahydrophthalate** $C_6H_{10}(COOC_4H_9)_2$.
 Properties: Liquid; sp. gr. 1.005; b.p. 185-190°C; flash point 305°F. Combustible.
 Use: Plasticizer for nitrocellulose.
- 2,5-di-tert-butyl hydroquinone** $[C(CH_3)_3]_2C_6H_2(OH)_2$.
 Properties: White powder; soluble in acetone, alcohol, benzene; insoluble in water; aqueous alkali. M.p. 210-212°C.
 Uses: Polymerization inhibitor; antioxidant; stabilizer against ultraviolet deterioration of rubber.
- di-n-butyl itaconate** $CH_2:C(COOC_4H_9)CH_2(COOC_4H_9)$.
 Properties: Clear, colorless liquid with slight odor. B.p. 145°C (10 mm); sp. gr. 0.9833 (22°C); refractive index (n 25/D) 1.442. Insoluble in water. Combustible.
 Uses: Resins; lube oil additives; plasticizers.
- N,N-di-n-butyl lauramide** $C_{11}H_{23}CON(C_4H_9)_2$.
 Properties: Straw-colored liquid. Sp. gr. 0.861 (20°C); boiling range 200-230°C (3 mm); odor lauric acid. Flash point 375°F. Combustible.
- dibutyl maleate (DBM)** $C_4H_9OOCCH:CHCOOC_4H_9$.
 Properties: Colorless oily liquid. B.p. 280.6°C; sets to a glass below -85°C; sp. gr. 0.9964 (20/20°C); wt/gal 8.3 lb (20°C); flash point (open cup) 285°F. Insoluble in water. Combustible. Low toxicity.
 Containers: Drums; tank cars.
 Uses: Copolymers; plasticizers; intermediate.
- 2,6-di-tert-butyl-4-methylphenol**. See 2,6-di-tert-butyl-para-cresol.
- 4,6-di-tert-butyl-3-methylphenol**. See 4,6-di-tert-butyl-meta-cresol.
- dibutyl oxalate** $(COOC_4H_9)_2$.
 Properties: Water-white, high-boiling liquid. Mild odor. B.p. 240-250°C; refractive index 1.425; f.p. -30°C; wt/gal 8.24 lb (approx) (20°C); flash point 220°F (closed cup). Miscible with most alcohols, ketones, esters, oils, hydrocarbons. Combustible.
 Derivation: By the standard esterification process using normal butyl alcohol and oxalic acid.
 Grades: According to ester content 90%; 95%; 99-100%.
 Containers: Drums; tank cars.
 Hazard: Toxic by ingestion and inhalation; strong skin irritant.
 Uses: Organic synthesis; solvent.
- di-tert-butyl peroxide** (tert-butyl peroxide; DTBP)
 $(CH_3)_3COOC(CH_3)_3$.
 Properties: Clear, water-white liquid. Sp. gr. 0.791 (25/25°C); f.p. -40°C; b.p. 111°C; refractive index 1.389 (20°C); flash point 65°F (closed cup). Soluble in styrene, ketones, most aliphatic and aromatic hydrocarbons; insoluble in water.
 Hazard: Moderately toxic. Flammable, dangerous fire hazard. Strong oxidizing agent; may ignite organic materials or explode when shocked or in contact with reducing materials.
 Uses: Polymerization catalyst for resins, including olefins, styrene, styrenated alkyds, and silicones; ignition accelerator for diesel fuel; organic synthesis; intermediate.
 Shipping regulations: Peroxides, organic, liquid, n.o.s. (Rail) Yellow label. (Air) Not acceptable.
- 2,4-di-tert-butylphenol** $[(CH_3)_3C]_2C_6H_3OH$.
 Properties: Tan crystalline solid; m.p. 52°C; b.p. 152-157°C (25 mm); sp. gr. 0.907 (60/4°C); lb/gal 7.57 (60°C); flash point 265°F. Soluble in methanol, ether, very slightly soluble in water. Combustible.
 Hazard: May be toxic. See phenol.
 Uses: Intermediate; antioxidant; stabilizer; germicide.
- 2,6-di-tert-butylphenol** $[(CH_3)_3C]_2C_6H_3OH$.
 Properties: Light straw crystalline solid; m.p. 37°C; sp. gr. 0.914 (20°C); b.p. 253°C; flash point 245°F. Combustible. Soluble in alcohol and benzene; insoluble in water.
 Hazard: May be toxic. See phenol.
 Uses: Intermediate; antioxidant; satisfies ASTM D910-64T for use as antioxidant in aviation gasoline.
- N,N'-di-sec-butyl-para-phenylenediamine**
 $CH_3CH_2CH(CH_3)NHC_6H_4NHCH(CH_3)CH_2CH_3$.
 Properties: Amber to red liquid (normally super-cooled below 18°C). Sp. gr. 0.94 (15.5/15.5°C); f.p.

20°C; flash point 290°F (COC). Soluble in gasoline, absolute alcohol, and benzene; insoluble in water or caustic solutions. Combustible.

Hazard: Toxic by ingestion, inhalation, and skin absorption. Strong irritant to tissue; causes skin burns. **Uses:** Oxidation inhibitor and stabilizer in gasoline (satisfies ASTM D910-64T as antioxidant in aviation gasoline); prevents decomposition of tetraethyl lead in gasoline.

dibutyl phosphite (C_4H_9O)₂PHO.

Properties: Water-white liquid; b.p. 95°C (1 mm); sp. gr. 0.9860 (25°C); refractive index 1.4228 (n_D 25/D); flash point 120°F; soluble in common organic solvents. Combustible.

Hazard: Moderate fire risk.

Uses: Solvent; antioxidant; intermediate.

dibutyl phthalate (DBP) $C_6H_4(COOC_4H_9)_2$.

Properties: Colorless, odorless, stable, oily liquid. Sp. gr. 1.0484 (20/20°C); f.p. -35°C; viscosity 0.203 poise (20°C); distillation range 227-235°C (37 mm); flash point (COC) 340°F; wt/gal 8.72 lb (68°F); refractive index 1.4915 (25°C); b.p. 340.0°C; vapor pressure 1.1 mm (150°C). Miscible with common organic solvents; insoluble in water. Combustible. Autoignition temp., about 750°F.

Derivation: By treating n-butyl alcohol with phthalic anhydride followed by purification, which results in a product unusually free from odor and color.

Grades: Technical; 99-100% dibutyl phthalate.

Containers: Drums; tank cars and trucks.

Hazard: Toxic. Tolerance, 5 mg per cubic meter of air.

Uses: Plasticizer in nitrocellulose lacquers, elastomers, explosives, nail polish and solid rocket propellants; solvent for perfume oils; perfume fixative; textile lubricating agent; safety glass; insecticides; printing inks; resin solvent; paper coatings; adhesives.

2,5-di-tert-butylquinone $[C(CH_3)_3]_2C_6H_2O_2$. Yellow powder; m.p. 149-151°C; insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzene.

Hazard: Fire risk in contact with organic materials.

Use: Oxidizing agent.

dibutyl sebacate (DBS) $C_4H_9OCO(CH_2)_8OCOC_4H_9$.

Properties: Clear, colorless, odorless liquid. B.p. 349°C (760 mm), 180°C (3 mm); f.p. -11°C; sp. gr. 0.936 (20/20°C); wt/gal 7.81 lb (20°C); refractive index 1.4395 (25°C); flash point 350°F. Insoluble in water. Combustible. Low toxicity.

Grade: Technical.

Containers: Drums; tank cars.

Uses: Plasticizer; rubber softener; dielectric liquid; cosmetics and perfumes; sealing food containers; flavoring.

N,N-dibutylstearamide $C_{17}H_{35}CON(C_4H_9)_2$.

Properties: Yellow liquid; sp. gr. 0.860 (20/20°C); boiling range 173-175°C (0.4 mm); flash point 420°F; fatty-acid odor. Combustible. Low toxicity.

di-tert-butyl sulfide (butyl sulfide) $[(CH_3)_3C]_2S$.

Properties: Liquid; f.p. 12.3°F; boiling range 297-303°F; sp. gr. 0.8316 (60/60°F); wt/gal 6.93 lb; refractive index 1.451 (20°C); flash point 125°F. Combustible.

Hazard: Moderate fire risk.

Uses: Intermediate; flavoring.

dibutyl tartrate $C_4H_9OOCCHOHCHOHCOOC_4H_9$.

Properties: Light tan liquid. M.p. 21°C; b.p. approx. 204°C (26 mm); refractive index 1.4463 (20°C); flash

point 195°F (closed cup); combustible; low toxicity; autoignition temp. 544°F; wt/gal 9.07 lb (68°F). Miscible with the common organic solvents, oils, hydrocarbons.

Uses: Solvent and plasticizer for cellulose esters and ethers, elastomers; lubricant; rubberized fabrics; lacquers; dopes; transfer inks.

dibutylthiourea $C_4H_9NHCSNHC_4H_9$.

Properties: White to light tan powder; m.p. 59-69°C; slightly soluble in water; soluble in methanol, ether, acetone, benzene, ethyl acetate; insoluble in gasoline; low toxicity.

Uses: Corrosion inhibitor; for pickling cast iron or carbon steel; reducing corrosion of ferrous metals and aluminum alloys in brine; intermediate.

dibutyltin bis(lauryl) mercaptide $(C_4H_9)_2Sn(SC_{12}H_{25})_2$.

Yellow liquid; tin content 18.5%; soluble in toluene and heptane.

Hazard: Toxic; tolerance, 0.1 mg per cubic meter of air.

Uses: Antioxidant and metal cleaning (or protective) agent.

dibutyltin diacetate $(C_4H_9)_2Sn(C_2H_3O_2)_2$.

Properties: Clear yellow liquid. B.p. 130°C (2 mm); f.p. below 12°C. Soluble in water and most organic solvents. Flash point 290°F. Combustible.

Derivation: Reaction of acetic acid with dibutyltin oxide.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Stabilizer for chlorinated organics; catalyst for condensation reactions.

dibutyltin dichloride $(C_4H_9)_2SnCl_2$.

Properties: White crystalline solid; m.p. 43°C; b.p. 135°C (10 mm); sp. gr. 1.36 (24/4°C); refractive index 1.4991 (51°C). Insoluble in cold water; hydrolyzed by hot water. Soluble in many organic solvents. Flash point 335°F; combustible.

Derivation: Reaction of butylmagnesium chloride with tin tetrachloride.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Use: Organotin intermediate.

dibutyltin di-2-ethylhexoate $(C_4H_9)_2Sn(O_2CC_7H_{15})_2$.

Properties: Waxy white solid. M.p. 52-54°C. Insoluble in water; soluble in most organic solvents.

Derivation: Reaction of dibutyltin oxide with 2-ethylhexoic acid.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Catalyst for silicone curing; polyether foams.

dibutyltin dilaurate $(C_4H_9)_2Sn(OCOC_{10}H_{20}CH_3)_2$.

Properties: Clear, pale yellow liquid. Sp. gr. 1.066 (20/20°C); f.p. 8.0°C; lb/gal 8.84 (20°C); flash point 440°F; soluble in acetone and benzene; insoluble in water. Combustible.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Stabilizer for vinyl resins, lacquers, elastomers; catalyst for urethane.

dibutyltin maleate $[(C_4H_9)_2Sn(OOCCH)_2]_x$.

Properties: White amorphous powder; m.p. 110°C. Insoluble in water; soluble in benzene and organic esters. Flash point 400°F; combustible.

Derivation: Reaction of maleic acid with di-butyltin oxide.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Stabilizer for polyvinyl chloride resins; condensation catalyst.

dibutyltin oxide $[(C_4H_9)_2SnO]_x$.

Properties: White powder; m.p. (decomposes). Insoluble in water. Combustible.

Derivation: Hydrolysis of dibutyltin dichloride with caustic.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Condensation catalysts; intermediate for other organotin.

dibutyltin sulfide $[(C_4H_9)_2SnS]_3$.

Properties: Colorless oily liquid. Combustible.

Derivation: Reaction of dibutyltin oxide with hydrogen sulfide.

Hazard: Toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Vinyl stabilizer; antioxidant; lubricating additive.

2,6-di-tert-butyl-para-tolyl N-methylcarbamate

$[(CH_3)_3C]_2CH_3C_6H_4OOCNHCH_3$. White solid; m.p. 200°C; insoluble in water; soluble in alcohol.

Use: Herbicide.

1,1-dibutylurea (N,N-dibutylurea) $NH_2CON(C_4H_9)_2$.

Liquid. M.p. 22–25°C; boiling range 118–119°C (2–3 mm); soluble in alcohol and ether. Flash point 279°F. Combustible.

Use: Thermoplastic resins, by copolymerization with simple urea with formaldehyde catalyst.

dibutyl xanthogen disulfide. See "C-P-B."

DIC. Abbreviation for beta-diisopropylaminoethyl chloride hydrochloride (q.v.).

dicalcium magnesium aconitate (calcium magnesium aconitate) $[C_3H_3(COO)_3]_2Ca_2Mg$.

Properties: White crystalline powder or lumps.

Derivation: Precipitation from molasses with lime.

Uses: Conversion to aconitic acid, tributyl aconitate and similar ester plasticizers.

dicalcium orthophosphate. See calcium phosphate, dibasic.

dicalcium orthophosphite. See calcium phosphite.

dicalcium phosphate dihydrate. See calcium phosphate, dibasic.

dicalcium silicate $2CaO \cdot SiO_2$. One of the components of cement. See cement, Portland. Also obtained as a by-product in electric furnace operation; used to neutralize acid soils. Noncombustible.

"Dicalite."²¹⁸ Trademark for a group of products made from either diatomite or perlite; used in filters and filteraids. See also diatomaceous earth.

dicamba. Generic name for 3,6-dichloro-ortho-anisic acid (2-methoxy-3,6-dichlorobenzoic acid) $HOOC(Cl)C_6H_2Cl(OCH_3)$.

Properties: Crystals; m.p. 114–116°C. Slightly soluble in water; moderately soluble in xylene; very soluble in alcohol.

Uses: Herbicide; pest control.

dicapryl adipate $C_8H_{17}OOC(CH_2)_4COOC_8H_{17}$. See also capryl compounds.

Properties: Almost water-white liquid; b.p. (4 mm) 213–216.5°C. Flash point 352°F; combustible. Low toxicity.

Use: Plasticizer for vinyl resins and cellulose esters.

dicapryl phthalate (DCP; di-(2-octyl) phthalate) $(C_8H_{17}OOC)_2C_6H_4$. See also capryl compounds.

Properties: Colorless, viscous liquid; b.p. (4.5 mm) 227–234°C; f.p. –60°C; refractive index (20°C) 1.480; sp. gr. (25°C) 0.965; flash point 395°F. Insoluble in water; compatible with vinyl chloride resins and some cellulosic resins. Combustible. Low toxicity.

Containers: Drums; tank cars.

Use: Monomeric plasticizer for vinyl and cellulosic resins.

dicapryl sebacate $C_8H_{17}OOC(CH_2)_8COOC_8H_{17}$. See also capryl compounds.

Properties: Light straw-colored liquid; b.p. (4 mm) 231.5–239°C; nonvolatile; gives excellent low-temperature flexibility. Flash point 445°F. Combustible. Low toxicity.

Containers: Drums; tank cars.

Use: Plasticizer for vinyl resins and acrylonitrile rubber.

dicapthion. Generic name for O-(2-chloro-4-nitrophenyl) O,O-dimethyl phosphorothioate $(CH_3O)_2P(S)OC_6H_3(Cl)NO_2$.

Properties: White solid; m.p. 51–52°C. Insoluble in water; soluble in acetone, cyclohexanone, ethyl acetate, toluene, and xylene. Cholinesterase inhibitor.

Hazard: Highly toxic. See parathion. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, dry, n.o.s., Poison label. Not accepted on passenger planes.

dicarboxylic acid. A carboxylic acid (q.v.) containing two —COOH groups, e.g., adipic, oxalic, phthalic, sebacic and maleic acids.

dicetyl. See dotriacontane.

dicetyl ether (dihexadecyl ether)

Properties: Crystals; f.p. 54°C; b.p., decomposes at 300°C; sp. gr. 0.8117 (54/4°C).

Uses: Electrical insulators; water repellents; lubricants in plastic molding and processing; antistatic substances; chemical intermediates.

dicetyl sulfide (dihexadecyl thioether; dihexadecyl sulfide) $(C_{16}H_{33})_2S$.

Properties: Solid; m.p. 57–58°C; b.p. decomposes; sp. gr. 0.8253 (60/4°C).

Uses: Organic synthesis (formation of sulfonium compounds).

dichlobenil. Generic name for 2,6-dichlorobenzonitrile $Cl(Cl)C_6H_3CN$.

Properties: White solid; m.p. 144°C. Almost insoluble in water; soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Herbicide.

dichlone. Generic name for 2,3-dichloro-1,4-naphthoquinone, $C_{10}H_4Cl_2O_2$.

Properties: Yellow needles; m.p. 193°C; soluble in xylene and ortho-dichlorobenzene; slightly soluble in ethyl alcohol, glacial acetic acid and carbon tetrachloride; almost insoluble in water.

Hazard: Toxic by ingestion and inhalation; irritating to skin and eyes.

Uses: Seed disinfectant; fungicide for foliage and textiles; insecticide; organic catalyst.

Shipping regulations: (Rail, Air) Not listed.

dichlor-. See dichloro-.

dichloramine-T (para-toluenesulfondichloramide)

$CH_3C_6H_4SO_2NCl_2$. See also chloramine-T. Properties: Pale yellow crystals, containing not less

than 28% nor more than 30% active chlorine; chlorine odor; stable when pure; decomposed slowly by air, rapidly by impurities, petrolatums, kerosine, olive oil, and alcohol. Soluble in glacial acetic acid, chlorinated paraffin hydrocarbons, eucalyptol, benzene, chloroform and carbon tetrachloride; almost insoluble in water. M.p. 80°C. Low toxicity.

Derivation: Reaction between toluene-para-sulfonamide and calcium hypochlorite solution is acidified with acetic acid and extracted with chloroform. The chloroform solution is dried chemically, filtered and evaporated.

Use: Medicine (external).

"Dichloran."⁴³⁰ Trademark for a high-alkyl dimethyl dichlorobenzyl ammonium chloride. Used as an antiseptic.

dichlorethylene. Legal label name for dichloroethylene (q.v.).

dichlorisone acetate

Properties: A chlorinated steroid. Available as liquid and cream.

Containers: Aerosol containers; bottles.

Use: Topical therapy in medicine.

dichloroacetaldehyde CHCl_2CHO .

Properties: Colorless liquid with a penetrating pungent odor; sp. gr. (25°C) 1.436; wt. per gal 12.1 lb.

Containers: 55-gal drums; tank cars. Flash point 140°F (closed cup). Combustible.

Hazard: Moderate fire hazard. Toxic by ingestion and inhalation; strong skin irritant.

Use: Manufacture of insecticides.

dichloroacetic acid CHCl_2COOH .

Properties: Colorless liquid; sp. gr. 1.5724 (13°C); f.p. -4°C; b.p. 193-194°C. Soluble in water, alcohol, and ether. Crystalline form, m.p. +9.3°C.

Derivation: Chlorination of acetic acid in presence of iodine.

Hazard: Toxic by ingestion and inhalation. Strong irritant to eyes and skin.

Uses: Intermediate; pharmaceuticals.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

sym-dichloroacetic anhydride. See chloroacetic anhydride.

2,5-dichloroacetoacetanilide

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_3\text{Cl}_2$. White, crystalline solid. M.p. 96°C.

alpha,alpha-dichloroacetophenone $\text{C}_6\text{H}_5\text{COCHCl}_2$.

Crystals; sp. gr. 1.34 (15°C); b.p. 247°C (dec); m.p. 20-21.5°C.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin.

dichloroacetyl chloride Cl_2CHCOCl .

Properties: Fuming liquid; acrid odor; sp. gr. 1.5315 (16/4°C); b.p. 107-108°C; refractive index 1.4638 (16°C). Soluble in ether; decomposes in water and alcohol.

Hazard: Toxic; strong irritant to skin and eyes.

Use: Intermediate.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label.

2,3-dichloroallyl diisopropylthiocarbamate (di-allate) $[(\text{CH}_3)_2\text{CH}]_2\text{NCOSCH}_2\text{C}(\text{Cl})\text{CHCl}$.

Properties: Brown liquid; b.p. 159°C (9 mm). Almost

insoluble in water; soluble in acetone, benzene, chloroform, kerosine, and xylene.

Hazard: Toxic. Use may be restricted. Absorbed by skin.

Use: Herbicide.

dichloroaniline, liquid. Shipping regulations: (Air) Poison label.

2,5-dichloroaniline $\text{C}_6\text{H}_3\text{NH}_2\text{Cl}_2$.

Properties: Light brown or amber-colored crystalline mass. Slightly soluble in water; soluble in alcohol, benzene, and dilute hydrochloric acid. M.p. 47-50°C; b.p. 251-252°C. Combustible.

Derivation: Nitration of para-dichlorobenzene with subsequent reduction.

Containers: Up to tank cars.

Hazard: Toxic. See aniline.

Use: Dye intermediate.

3,4-dichloroaniline $\text{C}_6\text{H}_3\text{NH}_2\text{Cl}_2$.

Properties: Crystals; m.p. 68-72°C; b.p. 272°C. Slightly soluble in water; soluble in most organic solvents. Flash point 331°F. Combustible.

Derivation: Nitration of ortho-dichlorobenzene, with subsequent reduction.

Containers: Up to tank cars.

Hazard: Toxic. See aniline.

Uses: Intermediate for manufacture of dyes and pesticides.

dichlorobenzaldehyde $\text{C}_6\text{H}_3\text{CHOCl}_2$. (2,4-, 2,5-, and 3,4-isomers).

Properties: White crystalline solid; b.p. 233°C; m.p. 65-67°C. (2,4-); 35°C (3,4-). 2,4-isomer soluble in methanol, ethanol, ether, and acetone; insoluble in water. 2,5-isomer soluble in ethanol and ether. 3,4-isomer soluble in ethanol, ether, and acetone, slightly soluble in methanol and amyl ether; insoluble in water.

Containers: Fiber drums.

Use: Intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

meta-dichlorobenzene (1,3-dichlorobenzene) $\text{C}_6\text{H}_4\text{Cl}_2$.

Properties: Colorless liquid. Sp. gr. 1.288 (20/4°C); b.p. 172°C; f.p. -24°C; refractive index (20.9°C) 1.547. Soluble in alcohol and ether; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Uses: Fumigant and insecticide.

ortho-dichlorobenzene (1,2-dichlorobenzene) $\text{C}_6\text{H}_4\text{Cl}_2$.

Properties: Colorless liquid. Pleasant odor; a mixture of isomers containing at least 85% ortho- and varying percentages of para- and meta-. Flash point 150°F; combustible. Miscible with most organic solvents; insoluble in water. Autoignition temp. 1198°F. Sp. gr. 1.284; wt. per gal 10.7 lb; b.p. 172-179°C; frz. pt. below -20°C.

Derivation: Chlorination of monochlorobenzene.

Method of purification: Rectification.

Grades: Purified; technical.

Containers: Drums; tank cars; tank trucks.

Hazard: Irritant; moderately toxic by inhalation and ingestion. Tolerance, 50 ppm in air. Safety data sheet available from Manufacturing Chemists Assn., Washington, D.C.

Uses: Mfg. of 3,4-dichloroaniline; solvent for a wide range of organic materials and for oxides of nonferrous metals; solvent carrier in production of toluene diisocyanate; dye mfg; fumigant and insecticide; de-

greasing hides and wool; metal polishes; industrial odor control.

para-dichlorobenzene (1,4-dichlorobenzene; PDB)
 $C_6H_4Cl_2$.

Properties: White crystals; volatile (sublimes readily); penetrating odor. Sp. gr. 1.458; b.p. 173.7°C; m.p. 53°C; flash point 150°F (closed cup). Soluble in alcohol, benzene, and ether; insoluble in water. Combustible.

Derivation: Chlorination of monochlorobenzene.

Grade: Technical.

Containers: Semibulk cartons; fiber drums.

Hazard: Moderately toxic; irritant to eyes. Tolerance, 75 ppm in air.

Uses: Moth repellent; general insecticide; germicide; space odorant; manufacture of 2,5-dichloroaniline; dyes; intermediates; pharmacy; agriculture (fumigating soil).

N,N-dichlorobenzenesulfonamide $C_6H_4SO_2NCl_2$.

Properties: Solid fine crystals; white color; m.p. 68–71°C.

Use: A source of positive chlorine.

3,3'-dichlorobenzidine $C_6H_3Cl_2NHNH_2$.

Properties: Gray to purple crystalline solid; insoluble in water; soluble in alcohol and ether; m.p. 133°C.

Hazard: Causes tumors in experimental animals; worker exposure should be minimized. Absorbed by skin. May be a carcinogen.

Uses: Intermediate for dyes and pigments; curing agent for isocyanate-terminated resins for urethane plastics.

2,4-dichlorobenzoic acid $Cl_2C_6H_3COOH$.

Properties: White to slightly yellowish powder; m.p. 158–162°C. Soluble in alcohol, ether, acetone, 5% caustic. Insoluble in water and heptane.

Uses: Intermediate for antimalarials, dyes, fungicides, pharmaceuticals, etc. other organic chemicals.

3,4-dichlorobenzoic acid, $Cl_2C_6H_3COOH$.

Properties: White to slightly yellowish powder; m.p. 202–204°C; soluble in alkali, alcohol, ether, and acetone; slightly soluble in diacetone; insoluble in water, ethylene dichloride, and toluene.

Uses: Intermediate for pharmaceuticals, dyes, etc.

2,6-dichlorobenzonitrile. See dichlobenil.

3,4-dichlorobenzotrichloride $Cl_2C_6H_3CCl_3$.

Properties: Water-white liquid; boiling range 276–285°C; f.p. (approx.) 24.0°C; sp. gr. 1.585–1.590 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.

Use: Intermediate for pharmaceuticals, dyes, etc.

dichlorobenzoyl chloride $Cl_2C_6H_3COCl$.

Properties: Colorless liquid; boiling range 250–260°C; f.p. 15–16°C; sp. gr. 1.500–1.510 (25/15°C). Soluble in alcohol, ether, and acetone; slightly soluble in heptane; insoluble in water. Combustible.

Use: Intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

dichlorobenzyl chloride $Cl_2C_6H_3CH_2Cl$.

Properties: Colorless liquid; boiling range 245–252°C; sp. gr. 1.415–1.420 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water. Combustible.

Hazard: Probably toxic.

Use: Intermediate for organic chemicals, pharmaceuticals, and dyes; insecticide.

1,1-dichloro-2,2-bis (para-chlorophenyl) ethane. See TDE.

1,1-dichloro-2,2-bis(para-ethylphenyl)ethane (diethylidenehydridichloroethane; "Perthane").

$CHCl_2CH(C_6H_4C_2H_5)_2$.

Properties: Crystals; m.p. 56–57°C. Soluble in acetone, kerosine, diesel fuel.

Hazard: Moderately toxic; absorbed by skin.

Use: Insecticide, formulated as emulsifiable concentrate or wettable powder. Used especially in aerosols against insects, including moths.

1,4-dichlorobutane (tetramethylene dichloride; DCB)
 $ClCH_2(CH_2)_2CH_2Cl$.

Properties: Colorless, mobile liquid; pleasant odor. Sp. gr. 1.141 (20/4°C); boiling point 155°C; flash point 104°F (TOC); refractive index (n 20/D) 1.4542. Insoluble in water; soluble in most common organic solvents. Combustible.

Containers: 9-lb (1-gal) containers; 45-, 500-lb drums; 76,000-lb tank cars.

Hazard: Moderate fire risk.

Use: Organic synthesis, including adiponitrile.

1,3-dichlorobutene-2 $ClH_2CCH=CClCH_3$.

Properties: Clear to straw-colored liquid; b.p. 125–130°C. Insoluble in water; soluble in organic solvents. Flash point 80°F (COC).

Hazard: Flammable, moderate fire risk.

1,4-dichlorobutene-2 $ClH_2CCH=CHCH_2Cl$.

Properties: Colorless liquid, distinct odor. Miscible with benzene, alcohol, carbon tetrachloride. Immiscible with ethylene glycol, glycerine, and water. B.p. 158°C, 60°C (20 mm); m.p. 3.5°C; sp. gr. 1.1858 (25/4°C); refractive index (n 25/D) 1.4863. Combustible.

Grades: Available as 95–98% trans-isomer, 2–5% cis-isomer. Above constants are for the pure trans-isomer.

Containers: Up to tank cars.

Hazard: Toxic. Irritant to skin and eyes; causes blisters. Moderate fire hazard.

Use: Intermediate.

dichlorocarbene CCl_2 . Exists only at low temperatures and pressures. F.p. –114°C; b.p. –20°C; decomposes on distillation at normal pressure to hexachloroethane and hexachlorobenzene.

Derivation: Reaction of carbon tetrachloride vapor with carbon at 1300°C and 10^{–3} mm Hg.

Hazard: Explosive reaction with carbon; forms phosphine on reaction with oxygen.

Use: Research.

1,1'-dichlorocarbonyl ferrocene (ferrocenoyl dichloride)
 $[C_5H_4(COCl)]_2Fe$.

Properties: Red crystalline solid; m.p. 93–95°C.

Use: Intermediate.

4,6-dichloro-N-(2-chlorophenyl)-1,3,5-triazin-2-amine ("Dyrene") $ClC_6H_4NHC_6H_3N_3Cl_2$.

Properties: Tan crystalline solid; m.p. 159–160°C; insoluble in water.

Hazard: Moderately toxic. See aniline.

Uses: Foliage fungicide.

dichloro(2-chlorovinyl)arsine. See chlorovinylidichloroarsine.

3,3'-dichloro-4,4'-diaminodiphenylmethane. See 4,4'-methylenebis(2-chloroaniline).

2,3-dichloro-5,6-dicyanobenzoquinone (DDQ)
 $OCC(Cl):C(Cl)COC(CN):C(CN)$.

Properties: Bright yellow-orange solid; m.p. 213–215°C.

Use: Highly selective oxidizing agent for organic compounds.

2,2'-dichlorodiethyl ether. See dichloroethyl ether.

dichlorodiethyl formal. See dichloroethyl formal.

dichlorodiethyl sulfide (mustard gas; dichloroethyl sulfide) $S(CH_2CH_2Cl)_2$.

Hazard: Highly toxic. Vesicant war gas; causes conjunctivitis and blindness! Can be decontaminated by chloroamines or bleaching powder. Vapor is extremely poisonous and can be absorbed through skin. Derivation: Bubbling ethylene through sulfur chloride; also from thiodiglycol and hydrogen chloride.

Grades: Pure; technical (containing excess sulfur as a polysulfide).

Uses: Organic synthesis; poison gas; medicine.

Shipping regulations: (Rail) Poison gas label. Not accepted by express. Legal label name mustard gas. (Air) Not acceptable.

dichlorodiethyl sulfone $(ClCH_2CH_2)_2SO_2$.

Properties: Colorless crystals. B.p. 179–181°C (14–15 mm); m.p. 52°C. Soluble in alcohol, chloroform, and ether; slightly soluble in water.

Hazard: Toxic; strong irritant to eyes and skin.

2,2-dichloro-1,1-difluoroethyl methyl ether (methoxyfluorane) $HCCl_2CF_2OCH_3$.

Properties: Clear, colorless liquid; fruity odor; b.p. 104.65°C; f.p. –35°C; sp. gr. 1.4223 (25°C); completely stable in the presence of alkali, air, light, or moisture. Slightly soluble in water. Combustible.

Grade: N.D.

Use: Anesthetic.

dichlorodifluoromethane (difluorodichloromethane; fluorocarbon-12). CCl_2F_2 .

Properties: Colorless, odorless, noncorrosive gas. B.p. –29.8°C; f.p. –158°C; sp. gr. 1.486 (–30); critical pressure 43.2 atm. Soluble in water; soluble in most organic solvents. Nonflammable.

Derivation: (a) Reaction of carbon tetrachloride and anhydrous hydrogen fluoride, in the presence of an antimony halide catalyst; (b) high temperature chlorination of vinylidene fluoride (vinylidene fluorides made by addition of hydrogen fluoride to acetylene).

Grade: 99.9% min. purity.

Containers: Cylinders.

Hazard: Narcotic in high concentrations. Tolerance, 1000 ppm in air.

Uses: Refrigerant and air conditioner; aerosol propellant (?); plastics; blowing agent; low-temperature solvent; leak-detecting agent; freezing of foods by direct contact; chilling cocktail glasses.

Shipping regulations: (Rail) Green label. (Air) Nonflammable Gas label.

See also chlorofluorocarbon.

1,3-dichloro-5,5-dimethylhydantoin (DDH) $CINCONClOC(CH_3)_2$.

Properties: White powder with mild chlorine odor. M.p. approximately 130°C; sublimes about 100°C without decomposition. Contains approximately 36% active chlorine. Slightly soluble in water with gradual liberation of hypochlorous acid; soluble in benzene, chloroform, ethylene dichloride, alcohol. Combustible, with evolution of chlorine at 210°C.

Derivation: Chlorination of dimethylhydantoin.

Grades: Technical.

Hazard: Highly toxic by inhalation. Tolerance, 0.2 mg per cubic meter of air. Skin irritant.

Uses: Household laundry bleach; water treatment; mild chlorinating agent.

dichlorodimethylsilane. See dimethyldichlorosilane.

dichlorodiphenyldichloroethane. See TDE.

dichlorodiphenyldichloroethylene. See DDE.

dichlorodiphenyltrichloroethane. See DDT.

1,1-dichloroethane. See ethylidene chloride.

1,2-dichloroethane. See ethylene dichloride.

dichloroether. See dichloroethyl ether.

dichloroethoxymethane. See dichloroethyl formal.

1,2-dichloroethyl acetate $CH_3COOCHClCH_2Cl$.

Properties: Water-white liquid. Sp. gr. 1.296 (20°C); boiling range: 58–65°C (13 mm); f.p. < –32°C; refractive index 1.444 (20°C); b.p., dec. Flash point 307°F. Combustible. Low toxicity. Miscible with alcohol and ethyl ether. Immiscible with water.

Use: Organic synthesis.

para-di(2-chloroethyl)aminophenylamine. See melphalan.

dichloroethylarsine. See ethyldichloroarsine.

dichloroethyl carbonate $(ClH_2CCH_2O)_2CO$.

Properties: Colorless liquid. Slowly hydrolyzed by alkalis. Volatile in steam. Sp. gr. 1.3506 (20°C); b.p. 240°C (partial decomposition). Insoluble in water.

Derivation: By heating ethylene chlorohydrin and trichloromethylchloroformate together (under reflux).

sym-dichloroethylene (1,2-dichloroethylene; acetylene dichloride). $ClHC:CHCl$. Exists as cis and trans isomers.

Properties: Colorless, low-boiling liquid. Pleasant odor. It decomposes slowly on exposure to air, light and moisture. Soluble in most organic solvents; slightly soluble in water. Trans-isomer; sp. gr. 1.257; b.p. 47–49°C. Cis-isomer: sp. gr. 1.282; b.p. 58–60°C. Flash point 39°F; f.p. –80°C.

Derivation: Two stereoisomeric compounds made by the partial chlorination of acetylene.

Grades: Technical; as cis, trans, and mixture of both.

Containers: 300-, 550-lb drums.

Hazard: Toxic by ingestion, inhalation and skin contact; irritant and narcotic in high concentrations. Tolerance, 200 ppm in air. Flammable, dangerous fire hazard.

Uses: General solvent for organic materials; dye extraction; perfumes; lacquers; thermoplastics; organic synthesis; medicine.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

dichloroethyl ether (dichloroether; dichloroethyl oxide; 2,2'-dichlorodiethyl ether, bis(2-chloroethyl) ether; sym-dichloroethyl ether) $ClCH_2CH_2OCH_2CH_2Cl$.

Properties: Colorless liquid. Odor like that of ethylene dichloride. B.p. 178.5°C; sp. gr. 1.2220 (20/20°C); wt/gal 10.2 lb (20°C); refractive index 1.457 (20°C); flash point (closed cup) 131°F; f.p. –51.8°C. Auto-ignition temp. 696°F. Miscible with most organic solvents; insoluble in water. Combustible.

Derivation: Chlorination of ethyl ether.

Grades: Technical.

Containers: Glass bottles; iron drums; tank cars.

Hazard: Toxic by inhalation and ingestion; absorbed by skin; strong irritant. Tolerance, 5 ppm in air. Moderate fire hazard.

Uses: General solvent; selective solvent for produc-

tion of high-grade lubricating oils; textile scouring and cleansing; fulling compounds; wetting and penetrating compounds; organic synthesis; paints; varnishes, lacquers; finish removers; spotting and dry cleaning; soil fumigant.

sym-dichloroethyl ether. See dichloroethyl ether.

dichloroethyl formal (dichlorodiethyl formal)

Properties: Colorless liquid; b.p. 218.1°C; f.p. -32.8°C; sp. gr. 1.2339 (20/20°C); wt/gal 10.3 lb (20°C); flash point (open cup) 230°F. Slightly soluble in water; decomposed by mineral acids. Combustible. Hazard: Toxic by inhalation and ingestion; strong irritant.

Uses: Solvent; intermediate for polysulfide rubber.

dichloroethyl oxide. See dichloroethyl ether.

dichloroethyl sulfide. See dichlorodiethyl sulfide.

dichlorofluoromethane (fluorodichloromethane; fluorocarbon 21) CHCl_2F .

Properties: Colorless, nearly odorless, heavy gas. B.p. 8.9°C; f.p. -135°C; sp. gr. 1.426 (0°C); critical pressure 51.0 atm. Soluble in alcohol and ether; insoluble in water. Nonflammable.

Derivation: Reaction of chloroform and hydrogen fluoride.

Grade: Technical.

Containers: Drums; cylinders; tanks.

Hazard: Narcotic in high concentrations. Tolerance, 1000 ppm in air.

Use: Fire extinguishers; solvent; refrigerant; aerosol propellant (?).

See also chlorofluorocarbon.

dichloroformoxime CCl_2NOH .

Properties: Colorless, prismatic crystals. Disagreeable, penetrating odor. High vapor pressure. Slowly decomposes at normal temperatures, the rate depending on temperature and humidity. B.p. 53-54°C (28 mm); m.p. 39-40°C. Soluble in water, alcohol, ether, and benzene.

Derivation: (a) Action of chlorine on fulminic acid, HONC . (b) Reduction of trichloronitrosomethane with either aluminum amalgam or hydrogen sulfide. Hazard: Highly toxic. Strong irritant to skin and eyes. Use: A military poison.

alpha-dichlorohydrin (alpha-propenyldichlorohydrin; glycerol dichlorohydrin; GDCH)

Properties: Colorless, slightly viscous, unstable liquid; faint chloroform-like odor. The commercial product is a mixture of two isomers. Miscible with most organic solvents, vegetable oils; slightly soluble in water. Sp. gr. 1.36-1.39; f.p. -4°C; b.p. 174°C; refractive index 1.47-1.48; flash point 165°F; combustible. Vapor pressure 7 mm.

Derivation: Interaction of glycerol and dry hydrogen chloride gas and subsequent distillation.

Hazard: Moderately toxic by inhalation and ingestion; moderate fire risk.

Uses: General solvent; intermediate in organic synthesis; paints, varnishes, lacquers; celluloid cements; water colors' binder; photographic lacquers.

5,7-dichloro-8-hydroxyquinaldine. See chlorquinaldol.

dichloroisocyanuric acid (dichloro-s-triazine-2,4,6-trione)

Properties: White, slightly hygroscopic, crystalline powder, granules. Density: (loose bulk, approx.)

powder 34 lb/cu ft; (granular) 53 lb/cu ft. Active ingredient approximately 70% available chlorine; decomp. 225°C.

Containers: 200-lb fiber drums.

Hazard: Oxidizing material. May ignite organic materials with which it is in contact. Moderately toxic.

Uses: Household dry bleaches, dishwashing compounds, scouring powders, and detergent sanitizer. replacement for calcium hypochlorite.

Shipping regulations: Dry, containing more than 39% available chlorine, (Rail) Yellow label. (Air) Oxidize label.

sym-dichloroisopropyl alcohol. See alpha-dichlorohydrin.

dichloroisopropyl ether $[\text{ClCH}_2\text{C}(\text{CH}_3)_2\text{O}]_2$.

Properties: Colorless liquid; sp. gr. 1.1135 (20/20°C); b.p. 187.4°C (760 mm); vapor pressure 0.10 mm (20°C); flash point 185°F; wt/gal 9.3 lb (20°C); coefficient of expansion 0.00096 (20°C); viscosity 0.0230 poise (20°C). Miscible with most oils and organic solvents; immiscible with water. Combustible.

Containers: 1-gal cans; 5- and 55-gal drums.

Hazard: Strong irritant to tissue.

Uses: Solvent for fats, waxes, greases; extractant; paint and varnish removers; spotting agents and cleaning solutions.

Shipping regulations: (Air) Corrosive label.

dichloromethane. Legal label name for methylene chloride (q.v.).

3',4'-dichloro-2-methylacrylanilide. See dicryl.

dichloromethylchloroformate ClCOOCHCl_2 .

Properties: Colorless liquid. Decomposed by water and alkalis. Soluble in alcohol, benzene, and ether. Sp. gr. 1.56 (15°C); b.p. 110-111°C; vapor density 5.7 (air = 1).

Derivation: (a) By chlorinating methyl formate; (b) by chlorinating methylchloroformate. In both methods the mixture of chloro-derivatives is then separated by fractionation.

Hazard: Toxic; strong irritant to eyes and skin.

sym-dichloromethyl ether $\text{O}(\text{CH}_2\text{Cl})_2$.

Properties: Colorless, volatile liquid; suffocating odor. Decomposed by heat and water; soluble in acetone, benzene, ethyl alcohol, and methyl alcohol; insoluble in water. Sp. gr. 1.315 (20°C); b.p. 105°C.

Derivation: (a) Action of chlorine on methyl ether; (b) interaction of hydrochloric acid and formaldehyde, with subsequent dehydration of the chloromethyl alcohol formed.

Hazard: Strong irritant to eyes and mucous membranes.

5,7-dichloro-2-methyl-8-quinolinol. See chlorquinaldol.

dichloromethylsilane $\text{CH}_3\text{SiHCl}_2$. Colorless liquid; b.p.

41°C; sp. gr. 1.113 (25/25°C); refractive index (n_D 20/D) 1.3983. Combustible.

Hazard: Corrosive to tissue.

Use: Intermediate.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

dichloromethyl sulfate $(\text{ClCH}_2\text{O})_2\text{SO}_2$.

Properties: Colorless, odorless liquid; soluble in alcohol, benzene, and ether. Sp. gr. 1.60 (20°C); b.p. 96-97°C (14 mm). Combustible.

Derivation: (a) By bubbling sulfur trioxide through (cooled) dichloromethyl ether; (b) by heating chlorosulfonic acid with formaldehyde.

dichloronaphthalene. See chlorinated naphthalenes.

2,3-dichloro-1,4-naphthoquinone. See dichlone.

1,2-dichloro-4-nitrobenzene $\text{Cl}_2\text{C}_6\text{H}_3\text{NO}_2$. Solid; m.p. 43°C ; b.p. $255\text{--}256^\circ\text{C}$; sp. gr. 1.4266 ($100/4^\circ\text{C}$). Insoluble in water; soluble in hot alcohol, ether.

Hazard: Probably toxic. Fire risk by spontaneous reaction.

Use: Intermediate.

2,5-dichloronitrobenzene $\text{Cl}_2\text{C}_6\text{H}_3\text{NO}_2$.

Properties: Pale yellow crystals; sp. gr. 1.669 (22°C); m.p. 55°C ; b.p. 266°C . Insoluble in water; soluble in chloroform and hot alcohol.

Hazard: Probably toxic; fire risk by spontaneous reaction.

Use: Intermediate.

1,1-dichloro-1-nitroethane $\text{H}_3\text{CC}(\text{Cl})_2\text{NO}_2$.

Properties: B.p. 124°C ; sp. gr. 1.4153 ($20/20^\circ\text{C}$); flash point 168°F (open cup); combustible.

Hazard: Toxic, strong irritant. Tolerance, 10 ppm in air.

Uses: Grain fumigant; solvent.

dichloropentane $\text{C}_5\text{H}_{10}\text{Cl}_2$. A mixture of the dichloro-derivatives of both normal and isopentane. About 40% are amylene dichlorides having two chlorine atoms attached to adjacent carbon atoms.

Properties: Light-yellow liquid; sp. gr. 1.06–1.08 (20°C); acidity as HCl not over 0.025%; distillation 95% between $130\text{--}200^\circ\text{C}$; flash point $97\text{--}105^\circ\text{F}$; combustible; wt/gal 8.94 lb. Water solubility negligible; water azeotrope at $80\text{--}97^\circ\text{C}$, 66% $\text{C}_5\text{H}_{10}\text{Cl}_2$ (approx.).

Containers: Cans; drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic by inhalation.

Uses: Solvent for oils, greases, rubber, resins and bituminous materials; removal of tar; reclaiming rubber; paint and varnish removers; degreasing of metals; insecticide; soil fumigant; removal of wax deposits on oil-well equipment.

dichlorophenarsine hydrochloride (3-amino-4-hydroxy-phenyldichloroarsine hydrochloride)

$\text{C}_6\text{H}_3(\text{AsCl}_2)(\text{OH})\text{NH}_2 \cdot \text{HCl}$.

Properties: White, odorless powder; m.p. 200°C ; soluble in water, solutions of alkali hydroxides and carbonates, and in dilute mineral acids.

Hazard: Toxic by ingestion.

Use: Medicine (syphilis treatment).

Shipping regulations: (Rail, Air) Arsenical compounds, Poison label.

dichlorophene (2,2'-dihydroxy-5,5'-dichlorodiphenyl-methane; DDDM) $(\text{C}_6\text{H}_3\text{ClOH})_2\text{CH}_2$.

Properties: Light tan, free-flowing powder; weakly phenolic odor; m.p. 177°C ; vapor pressure 10^{-4} mm (100°C) and about 10^{-10} mm (25°C) (extrapolated value). Soluble in acetone and alcohols; slightly soluble in benzene, toluene, carbon tetrachloride; insoluble in water.

Derivation: Condensation of para-chlorophenol with formaldehyde in the presence of sulfuric acid.

Grades: Pure and technical.

Hazard: Moderately toxic.

Uses: Fungicide and bactericide; textile preservative; some dermatological and cosmetic applications; veterinary medicine.

2,4-dichlorophenol $\text{Cl}_2\text{C}_6\text{H}_3\text{OH}$.

Properties: White, low melting solid; b.p. 210°C ; m.p. 45°C ; flash point 237°F ; combustible. Soluble

in alcohol and carbon tetrachloride; slightly soluble in water.

Derivation: By chlorination of phenol.

Hazard: Strong irritant to tissue; toxic by ingestion.

Use: Organic synthesis.

2,4-dichlorophenoxyacetic acid. See 2,4-D.

2,4-dichlorophenoxybutyric acid (2,4-DB)

$\text{Cl}_2\text{C}_6\text{H}_3\text{O}(\text{CH}_2)_3\text{COOH}$. M.p. $118\text{--}120^\circ\text{C}$. Used as an herbicide.

Hazard: May be toxic.

di-(4-chlorophenoxy)methane $(\text{ClC}_6\text{H}_4\text{O})_2\text{CH}_2$.

Properties: Solid; m.p. 65°C ; insoluble in water and oils; soluble in ether and acetone.

Hazard: May be toxic.

Use: Acaricide.

2-(2,4-dichlorophenoxy)propionic acid (dichloroprop)

$\text{Cl}_2\text{C}_6\text{H}_3\text{OCH}(\text{CH}_3)\text{COOH}$.

Properties: Solid; m.p. $117\text{--}118^\circ\text{C}$. Soluble in acetone, alcohol, and ether; insoluble in water.

Hazard: Moderately toxic.

Use: Herbicide.

2,4-dichlorophenylbenzenesulfonate

$\text{Cl}_2\text{C}_6\text{H}_3\text{OSO}_2\text{C}_6\text{H}_5$.

Properties: Waxy solid; vapor pressure 2.7×10^{-4} mm at 30°C . Insoluble in water; soluble in most organic solvents. Low toxicity.

Use: Acaricide; insecticide.

O-(2,4-dichlorophenyl)-O,O-diethyl phosphorothioate

$\text{Cl}_2\text{C}_6\text{H}_3\text{OP}(\text{S})(\text{OC}_2\text{H}_5)_2$.

Properties (pure compound): Liquid; b.p. $120\text{--}123^\circ\text{C}$ (0.2 mm); slightly soluble in water; miscible with most organic solvents.

Hazard: Highly toxic; absorbed by skin. Cholinesterase inhibitor. Use may be restricted.

Use: Nematocide; insecticide.

Shipping regulations: Organic phosphorus compound, liquid, n.o.s., (Rail, Air) Poison label. Not accepted on passenger planes.

3-(3,4-dichlorophenyl)-1,1-dimethylurea. See diuron.

di(para-chlorophenyl)ethanol (1,1-bis(para-chlorophenyl)ethanol; di(para-chlorophenyl)methyl carbinol; DMC; DCPC) $\text{CH}_3\text{C}(\text{C}_6\text{H}_4\text{Cl})_2\text{OH}$.

Properties: Colorless crystals; m.p. 70°C ; insoluble in water; soluble in common organic solvents.

Derivation: Reaction of 4,4'-dichlorobenzophenone with methyl magnesium bromide, followed by treatment with water.

Hazard: Moderately toxic.

Use: Insecticide.

3,4-dichlorophenyl isocyanate $\text{Cl}_2\text{C}_6\text{H}_3\text{NCO}$. White to yellow crystalline solid.

Hazard: Strong irritant to tissue, especially eyes and mucous membranes.

Uses: Chemical intermediate; organic synthesis.

3-(3,4-dichlorophenyl)-1-methoxy-1-methylurea. See linuron.

di(para-chlorophenyl)methyl carbinol. See di(para-chlorophenyl)ethanol.

O-(2,4-dichlorophenyl) O-methyl isopropylphosphor-amidothioate (DMPA)

$\text{Cl}_2\text{C}_6\text{H}_3\text{OP}(\text{S})(\text{OCH}_3)\text{NHCH}(\text{CH}_3)_2$.

Properties: Solid; m.p. 51.4°C . Vapor pressure 2 mm at 150°C . Slightly soluble in water (5 ppm); freely soluble in acetone, benzene, and carbon tetrachloride.

Hazard: Highly toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Herbicide; insecticide.

Shipping regulations: (Rail) Poison label. (Air) Poison label. Not acceptable on passenger planes.

2,4-dichlorophenyl 4-nitrophenyl ether

$\text{Cl}_2\text{C}_6\text{H}_3\text{OC}_6\text{H}_4\text{NO}_2$.

Properties: Dark brown solid; setting point 62.5°C . Soluble in acetone, methanol, and xylene.

Use: Herbicide.

dichlorophenyltrichlorosilane $\text{Cl}_2\text{C}_6\text{H}_3\text{SiCl}_3$. A mixture of isomers.

Properties: Straw-colored liquid; sp. gr. 1.562; b.p. 260°C . Refractive index (n 20/D) 1.5638; flash point (COC) 286°F . Readily hydrolyzed, with liberation of hydrochloric acid. Soluble in benzene, perchloroethylene. Combustible.

Derivation: Chlorination of phenyltrichlorosilane.

Grades: Technical.

Hazard: Strong irritant to skin and eyes.

Use: Intermediate for silicones.

Shipping regulations: (Rail) Corrosive liquid, n.o.s., White label. (Air) Corrosive label. Not acceptable on passenger planes.

3,6-dichlorophthalic acid $\text{C}_6\text{H}_2\text{Cl}_2(\text{COOH})_2$.

Properties: Colorless, thick crystals; soluble in hot water.

Derivation: By oxidizing dichloronaphthalene tetrachloride (see chloronaphthalene) with nitric acid.

dichloroprop. See 2-(2,4-dichlorophenoxy)-propionic acid.

1,2-dichloropropane. See propylene dichloride.

1,2-dichloro-3-propanol. See alpha-dichlorohydrin.

1,3-dichloro-2-propanol. See alpha-dichlorohydrin.

1,3-dichloropropene (1,3-dichloropropylene).

$\text{CHCl:CHCH}_2\text{Cl}$.

Properties: Exists in cis and trans isomeric forms, both colorless liquids. Sp. gr. 1.225 ($20/4^\circ\text{C}$); flash point (open cup) 95°F ; insoluble in water; soluble in acetone, toluene, octane. Cis isomer b.p. 104°C , trans 112°C ; refractive index (n 20/D) cis 1.469, trans 1.475.

Derivation: Chlorination of propylene.

Hazard: Strong irritant; flammable, moderate fire risk.

Uses: Organic synthesis; soil fumigants.

dichloropropene-dichloropropane mixture.

Hazard: Highly toxic. May be fatal if swallowed, inhaled, or absorbed through skin. Corrosive to tissue, skin and eyes.

Uses: Pesticide; insecticide.

Shipping regulations: (Air) Corrosive label.

3,4-dichloropropionanilide. See propanil.

2,2-dichloropropionic acid. See dalapon.

2,6-dichlorostyrene $\text{C}_6\text{H}_3(\text{CH:CH}_2)\text{Cl}_2$.

Properties: Colorless liquid. B.p. $92\text{--}94^\circ\text{C}$ (5 mm). Flash point 225°F (O.C.) insoluble in water; soluble in most organic solvents. Polymerizes slowly on standing, unless inhibited. Combustible.

Uses: Monomer and co-monomer in plastic research.

para-N,N-dichlorosulfamylbenzoic acid. See halazone.

dichlorosulfonphthalein. See chlorphenol red.

2,6-dichloroquinonechlorimide. Reagent used for spot visualizations in chromatographic systems.

Hazard: Explodes readily on slight heating.

dichlorotetrafluoroacetone $\text{CClF}_2\text{COCF}_2$.

Properties: Colorless liquid; b.p. 45.2°C ; f.p. $< -100^\circ\text{C}$. Soluble in water and most organic solvents. Stable to acids but not alkalis.

Uses: Solvent in acidic media; complexing agent for active hydrogen compound separation.

sym-dichlorotetrafluoroethane (fluorocarbon-114; tetrafluorodichloroethane); $\text{CClF}_2\text{CClF}_2$.

Properties: Colorless, nearly odorless, nonflammable gas. B.p. 3.55°C ; f.p. -94°C ; critical pressure 32.3 atm. Insoluble in water.

Derivation: By treating perchloroethylene with hydrogen fluoride.

Grades: Technical 95%.

Containers: Cylinders up to 1 ton.

Hazard: Moderately toxic by inhalation. Tolerance, 1000 ppm in air.

Uses: Solvent; fire extinguishers; refrigerant and air conditioner; aerosol propellants (?); blowing agent, dielectric fluid.

See also chlorofluorocarbon.

2,5-dichlorothiophene $\text{C}_4\text{H}_2\text{Cl}_2\text{S}$ (cyclic).

Properties: Colorless to light-yellow liquid; b.p. 161°C . Combustible.

Use: Intermediate.

alpha, alpha-dichlorotoluene. See benzyl dichloride.

dichlorotoluene (chlorobenzyl chloride) $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}_2$.

Properties: Colorless liquid; boiling range $200\text{--}200^\circ\text{C}$; f.p. (approx.) -13°C ; sp. gr. 1.245–1.247 ($25/15^\circ\text{C}$); refractive index 1.5480 (22°C). Soluble in alcohol, ether, and acetone; insoluble in water. Exists as ortho and para isomers. Combustible.

Containers: Glass carboys or drums.

Hazard: May be toxic and irritant. See benzyl chloride.

Uses: High-boiling solvent; intermediate for organic synthesis.

dichloro-sym-triazine-2,4,6-trione. See dichloroisocyanuric acid.

beta,beta'-dichlorovinylchloroarsine $(\text{ClCH:CH})_2\text{AsCl}$.

Properties: Yellowish liquid; b.p. 230°C (decomp.); sp. gr. 1.70.

Hazard: Highly toxic by inhalation and ingestion. Strong irritant to skin and mucous membranes.

Use: Poison gas.

Shipping regulations: (Rail) Arsenical compounds, n.o.s., Poison label. (Air) Not acceptable.

2,2-dichlorovinyl dimethyl phosphate. See dichlorovos.

beta,beta'-dichlorovinylmethylarsine

$(\text{ClCH:CH})_2\text{AsCH}_3$.

Properties: Liquid. B.p. $140\text{--}145^\circ\text{C}$ (10 mm).

Derivation: Interaction of acetylene and methylchloroarsine in the presence of aluminum chloride.

Hazard: Highly toxic by inhalation and ingestion. Strong irritant to skin and mucous membranes.

Use: Poison gas.

Shipping regulations: Poisonous liquid or gas, n.o.s., (Rail) Poison Gas label; not accepted by express. (Air) Not acceptable.

dichlorovos. Generic name for 2,2-dichlorovinyl dimethyl phosphate (DDVP) $(\text{CH}_3\text{O})_2\text{P(O)OCH:CCl}_2$.

Properties: Liquid; b.p. 120°C (14 mm). Slightly soluble in water and glycerine; miscible with aromatic and chlorinated hydrocarbon solvents and alcohols.

Hazard: Toxic. Tolerance, 1 mg per cubic meter of air.

Uses: Insecticide; fumigant.

Shipping regulations: (Rail) Not listed. (Air) Poison label.

dichroic. A term used in crystallography to denote crystals which refract incident light in two directions, thus displaying two colors when observed from different angles, for example, calcite. See also anisotropic; birefringent.

dichromatic. Characterizing certain dyes and indicators for which different colors may be seen depending on the thickness of the solution viewed.

"Di-Clad."²⁸¹ Trademark for a series of copper-clad laminated plastics consisting of either electrolytic or rolled copper laminated on either one or both sides of a supporting medium made from various base materials and resins. Available in sheets for use primarily in printed circuit applications.

dicobalt octacarbonyl. See cobalt tetracarbonyl.

"Dicodid."⁹ Trademark for dihydrocodeinone; used in medicine as bitartrate and hydrochloride salts.

dicofol. Generic name for 4,4'-dichloro- α -trichloromethylbenzhydrol. See 1,1'-bis(chlorophenyl)-2,2,2-trichloroethanol.

"Dicom."⁷⁹ Trademark for commercial steam-distilled dipentene (q.v.).

dicoumarol. See bishydroxycoumarin.

dicresyl glyceryl ether (glyceryl ditolyl ether). This may be a mixture of ortho-, meta-, and para-isomers. $\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_2\text{CHOHCH}_2\text{OC}_6\text{H}_4\text{CH}_3$.

Properties: Similar to cresyl glyceryl ether (see methyphenesin) in properties. Sp. gr. 1.136; refractive index 1.549; boiling range 328–340°C.

dicresyl glyceryl ether acetate

$\text{CH}_3\text{C}_6\text{H}_4\text{OCH}_2\text{CHOOCH}_3\text{CH}_2\text{OC}_6\text{H}_4\text{CH}_3$.
Properties: Fairly stable liquid. Sp. gr. 1.115; b.p. 360°C; refractive index 1.53. Combustible.

dicryl. Generic name for 3',4'-dichloro-2-methylacrylanilide $\text{Cl}_2\text{C}_6\text{H}_3\text{NHCOC}(\text{CH}_3)\text{CH}_2$.

Properties: Solid; m.p. 128°C. Insoluble in water; soluble in acetone, alcohol, isophorone, and dimethyl sulfoxide. Probably low toxicity.

Uses: Herbicide; pest control.

"Dicrylan."⁴⁴³ Trademark for acrylic resin coating and bonding agent.

"Dicumarol."³⁵⁵ Trademark for bishydroxycoumarin (q.v.).

dicumyl peroxide $[\text{C}_6\text{H}_5\text{C}(\text{CH}_3)_2\text{O}]_2$.

Hazard: Strong oxidizing material; may ignite organic materials on contact.

Use: Polymerization catalyst and vulcanizing agent.
Shipping regulations: (Rail) (solid and 50% solution), Yellow label. (Air) (solid and solution) Organic Peroxide label.

"Di-cup."²⁶⁶ Trademark for a series of vulcanizing, and polymerization agents containing dicumyl peroxide (q.v.).

dicyan. See cyanogen.

dicyandiamide (cyanoguanidine) $\text{NH}_2\text{C}(\text{NH})(\text{NHCN})$.

Properties: Pure white crystals; sp. gr. 1.400 (25°C). Stable when dry. Melting range 207–209°C. Soluble in water and alcohol; sparingly soluble in ether. Non-flammable.

Derivation: Polymerization of cyanamide in the presence of bases.

Grades: 99% pure; technical.

Containers: 100-lb multiwall paper bags.

Uses: Fertilizers; nitrocellulose stabilizer; organic synthesis, especially of melamine, barbituric acid and guanidine salts; pharmaceutical products; dye-stuffs; explosives; retarding rancidity in fats and oils; fire-proofing compounds; case-hardening preparations; cleaning compounds; soldering compounds; accelerator; thinner for oil-well drilling muds; stabilizer in detergent compositions; modifier for starch products; catalyst for epoxy resins.

dicyanine. See cyanine dye.

ortho-dicyanobenzene. See phthalonitrile.

1,4-dicyanobutane. See adiponitrile.

2,4-dicyanobutene-1. See methylene glutaronitrile.

dicyclohexyl. See bicyclohexyl.

dicyclohexyl adipate $(-\text{CH}_2\text{CH}_2\text{COOC}_6\text{H}_{11})_2$.

Properties: White, crystalline solid. Odorless. Compatible with most natural and synthetic resins. Soluble in most organic solvents; insoluble in water. Sp. gr. 0.913–0.919 (15/15°C); b.p. 256°C; f.p. –0.1°C; density 45 lb/cu ft; acidity (as adipic acid) less than 0.05%.

Use: Plasticizer.

dicyclohexylamine $(\text{C}_6\text{H}_{11})_2\text{NH}$.

Properties: Colorless liquid with faint amine odor; sp. gr. 0.913–0.919 (15/15°C); b.p. 256°C; f.p. –0.1°C; refractive index 1.4823 ($n_{25/D}$); flash point 210°F. Combustible. Slightly soluble in water; miscible with organic solvents. Strongly basic.

Containers: Drums; tank cars.

Hazard: Strong irritant to skin and mucous membranes.

Uses: Intermediate; insecticides; plasticizer; corrosion inhibitors; antioxidants in rubber, lubricating oils, fuels; catalysts for paint, varnishes and inks; detergents; extractant.

dicyclohexyl carbodiimide $\text{C}_6\text{H}_{11}\text{NCNC}_6\text{H}_{11}$.

Properties: White crystalline solid with a heavy, sweet odor. Set point 29–30°C; b.p. 138–140°C (2 mm); soluble in organic solvents.

Hazard: Vapor may be toxic.

Use: Chemical intermediate.

dicyclohexyl phthalate (DCHP). $\text{C}_6\text{H}_4(\text{COOC}_6\text{H}_{11})_2$.

Properties: White, granular solid; nonvolatile; mildly aromatic odor; sp. gr. (25/25°C) 1.20; m.p. 62–65°C. Soluble in most organic solvents; insoluble in water; compatible with a large number of polymers. Flash point 405°F. Combustible.

Uses: Plasticizer for nitrocellulose, ethyl cellulose, chlorinated rubber, polyvinyl acetate, polyvinyl chloride, and other polymers.

dicyclomine hydrochloride

$(\text{C}_6\text{H}_{11})(\text{C}_6\text{H}_{10})\text{CO}_2(\text{CH}_2)_2\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$. 2-Diethylaminoethyl bicyclohexyl-1-carboxylate hydrochloride.

Properties: Crystals; m.p. 164–166°C. Soluble in water.

Use: Medicine.

dicyclopentadiene $\text{C}_{10}\text{H}_{12}$.

Properties: Liquid; sp. gr. 0.979 (20/20°C); b.p. 172°C; m.p. 33.6°C; 8.2 lb/gal (60°F); refractive index 1.5073 ($n_{31/D}$); flash point 90°F. Soluble in alcohol; insoluble in water.

Containers: Drums; tank cars.

Derivation: Olefin manufacture.

Hazard: Flammable, moderate fire risk. Toxic by ingestion.

Uses: Chemical intermediate for insecticides; EPDM elastomers; metalocenes; paints and varnishes; flame retardants for plastics.

dicyclopentadiene dioxide $C_{10}H_{12}O_2$.

Properties: White crystalline powder; m.p. 180–184°C; sp. gr. 1.331 (25°C); slightly soluble in water; soluble in acetone and benzene.

Containers: Up to tank car lots.

Use: Intermediate for epoxy resins, plasticizers, protective coatings.

dicyclopentadienylcobalt. See cobaltocene.

dicyclopentadienyliron (bis-cyclopentadienyliron). The first organometallic "sandwich" compound (synthesized in 1951), which served as a prototype for metalocenes (q.v.). Such compounds are based on cyclic unsaturates combined with a transition metal or its halide. See also ferrocene.

dicyclopentadienylnickel. See nickelocene.

dicyclopentadienyl osmium. See osmocene.

dicyclopentadienyltitanium dichloride. See titanocene dichloride.

dicyclopentadienylzirconium dichloride. See zirconocene dichloride.

DIDA. See diisodecyl adipate.

didecyl adipate ($-\text{CH}_2\text{CH}_2\text{COOC}_{10}\text{H}_{21}$)₂.

Properties: Light-colored liquid; sp. gr. 0.9181 (20°C); 7.7 lb/gal (20°C); b.p. 245°C (5 mm); vapor pressure 0.58 mm (200°C); insoluble in water; viscosity 26.3 cp (20°C). Flash point 425°F. Combustible. Low toxicity.

Use: Plasticizer.

didecylamine $[\text{CH}_3(\text{CH}_2)_9]_2\text{NH}$.

Properties: Light straw-colored liquid; faint amine odor; boiling range 195–215°C (12 mm); sp. gr. 0.840 (20/20°C) (solid). Combustible.

didecyl ether $(\text{C}_{10}\text{H}_{21})_2\text{O}$.

Properties: Liquid; m.p. 16°C; b.p. 170–180°C (6 mm); sp. gr. 0.819 (20/4°C); refractive index 1.4418 (n_D 20/D). Combustible.

Grades: 95% (min) purity.

Uses: Electrical insulators; water repellent; lubricant in plastic molding and processing; antistatic agent; intermediate.

didecyl phthalate (DDP) $\text{C}_6\text{H}_4(\text{COOC}_{10}\text{H}_{21})_2$.

Properties: Light-colored liquid; sp. gr. 0.9675 (20°C); 8.05 lb/gal (20°C); b.p. 261°C (5 mm); insoluble in water; vapor pressure 0.3 mm Hg (200°C); viscosity 113.2 cp (20°C); flash point 445°F. Combustible. Low toxicity.

Containers: Drums, tank cars; tank trucks.

Use: Plasticizer, especially for vinyl resins.

didecyl sulfide (didecyl thioether) $(\text{C}_{10}\text{H}_{21})_2\text{S}$.

Properties: Liquid; solidifies at 72°F; b.p. 205–206°C (4 mm); sp. gr. 0.831 (20/4°C); refractive index 1.4569 (n_D 33.5°C/D). Combustible.

Grades: 95% (min.) purity.

Use: Organic synthesis (formation of sulfonium compounds).

didecyl thioether. See didecyl sulfide.

didodecylamine. See dilaurylamine.

didodecyl ether. See dilauryl ether.

didodecyl 3,3'-thiodipropionate. See dilauryl thiodipropionate.

didodecyl thioether. See dilauryl sulfide.

DIDP. See diisodecyl phthalate.

didymium Di

Commercial mixture of rare earth elements obtained from monazite sand by extraction followed by the elimination of cerium and thorium. The name is used like that of an element in naming mixed oxides and salts. The approximate composition of didymium from monazite, expressed as rare earth oxides is 46% lanthana, La_2O_3 ; 10% praseodymia, Pr_6O_{11} ; 32% neodymia, Nd_2O_3 ; 5% samaria, Sm_2O_3 ; 0.4% yttrium earth oxides; 1% ceria, CeO_2 ; 3% gadolinia Gd_2O_3 ; 2% others. Commercially used didymium salts are acetate, carbonate, chloride, fluoride, nitrate, etc. Didymium oxide; Di_2O_3 ; brown powder; insoluble in water; soluble in acids.

Containers: Glass bottles; fiber and steel drums.

Uses (as salts): Coloring and decolorizing glass; in temperature-compensating capacitors for radio, television, and radar; in carbon arc cores (fluoride); in stainless steel (oxide); metallurgical research; textile treatment.

Shipping regulations: (didymium nitrate) (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

die casting. Shaping of metal products by forcing a molten metal or alloy under high pressure into a negative die cavity by means of a plunger or ram. The die is usually made of an alloy steel. Metals commonly used for die casting are zinc, aluminum, copper, lead and their alloys, some of which also include silicon. Die castings can be held to tolerances as low as 0.001 to 0.0015 in., and sizes from 75 to 100 lb (aluminum) are possible. The largest end-use area for die castings is automobile and airplane parts; they are also used in washing and drying machines, electrical equipment and appliances, and for various military applications.

dieldrin (HEOD) $\text{C}_{12}\text{H}_{10}\text{OCl}_6$. Generic name for an insecticidal product containing not less than 85% of 1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8a-octahydro-1,4-endo,exo-5,8-dimethanonaphthalene, and not less than 15% active related compounds. See also endrin, a stereoisomer of dieldrin.

Properties: Light-tan, flaked solid, m.p. 175°C. Insoluble in water, methanol, aliphatic hydrocarbons; soluble in acetone, benzene. Compatible with most fertilizers, herbicides, fungicides and insecticides.

Derivation: By oxidation of aldrin (q.v.) with peracids.

Containers: Fiber drums.

Hazard: Highly toxic by ingestion, inhalation and skin absorption. Penetrates intact skin. Tolerance, 0.25 milligram per cubic meter of air. Use restricted to nonagricultural applications. Said to be carcinogenic.

Use: Insecticide.

dielectric. A substance that has very low electrical conductivity, i.e., an insulator. Such substances have electrical conductivity of less than 1,000,000th mho per cm. Those with a somewhat higher conductivity (10^{-6} to 10^{-3} mho per cm) are called semiconductors (q.v.). Among the more common solid dielectrics are glass, rubber and similar elastomers, wood and other cellulose. Liquid dielectrics are hydrocarbon oils, askarel (q.v.) and silicone oils. See also transformer oil.

dielectric constant. A value that serves as an index of the ability of a substance to resist the transmission

of an electrostatic force from one charged body to another, as in a condenser. The lower the value, the greater the resistance. The standard apparatus utilizes a vacuum, whose dielectric constant is 1; in reference to this various materials interposed between the charged terminals have the following values at 20°C: air, 1.00058; glass, 3; benzene, 2.3; acetic acid, 6.2; ammonia, 15.5; ethyl alcohol, 25; glycerol, 56; and water, 81. The exceptionally high value for water accounts for its unique behavior as a solvent and in electrolytic solutions. Most hydrocarbons have high resistance (low conductivity). Dielectric constant values decrease as the temperature rises.

dielectric strength. The maximum electric field that an insulator or dielectric can withstand without breakdown, usually measured in kilovolts per centimeter. At breakdown a considerable current passes as an arc, usually with more or less decomposition of the material along the path of the current.

Diels-Alder reaction. An important organic reaction for the synthesis of six-membered rings, discovered in 1928. It involves the addition of an ethylenic double bond to a conjugated diene, i.e., a compound containing two double bonds separated by one single bond, as in 1,3-butadiene ($\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$) or cyclopentadiene. The ease of addition of the ethylenic compound is greatly enhanced by adjacent carbonyl groups; hence, maleic anhydride reacts quantitatively with hexachlorocyclopentadiene to form chlorendic anhydride.

dien. Abbreviation for diethylenetriamine, as used in formulas for coordination compounds. See also en; pn; py.

diene. See diolefin.

"Diene."⁷¹⁸ Trademark for a commercial stereospecific polybutadiene rubber.

Properties: Unvulcanized: Narrow molecular weight distribution; soluble in aliphatic or aromatic hydrocarbons; free from gel; low "tackiness"; no elastic memory ("nerve").

Vulcanized: High resilience; excellent hysteretic properties; excellent resistance to abrasion and cold (brittle point < -125°F).

Containers: Boxes (75 lb in polyethylene bags).

Uses: To enhance the low temperature and hysteretic properties of other elastomers.

diestrol $\text{HOC}_6\text{H}_4\text{C}(\text{CHCH}_3)\text{C}(\text{CHCH}_3)\text{C}_6\text{H}_4\text{OH}$. 3,4-Bis(para-hydroxyphenyl)-2,4-hexadiene; a synthetic with estrogenic activity.

Properties: Colorless, odorless needles or powder; m.p. 227°C. Soluble in alcohol; practically insoluble in water. Sensitive to light.

Grade: N.F.

Use: Medicine.

diesel ignition improver. A substance such as amyl nitrate, which is added to diesel fuels to improve fuel ignition and to raise the cetane number.

diesel oil (Fuel oil No. 2). Fuel for diesel engines obtained from distillation of petroleum. Its efficiency is measured by the cetane number (q.v.). It is composed chiefly of unbranched paraffins. Its volatility is similar to that of gas oil. Flash point 110–190°F; sp. gr. less than 1. Combustible.

Containers: Tank trucks; tank cars; pipeline.

Hazard: Moderate fire risk. Environmental hazard.

Uses: Fuel for trucks, ships, and other heavy automot-

ive equipment; drilling muds; mosquito control (coating on breeding waters).

See also fuel oil.

"Diesel-Treat."¹⁰⁸ Trademark for dry, granular, orange sodium dichromate, used as a corrosion inhibitor. Sold in 50-lb drums.

Uses: Closed cooling systems, particularly diesel engines; cooling tower systems.

dietary food supplement. Any food product to which enough vitamins and minerals have been added to furnish more than 50% of the recommended daily allowance in a single serving (FDA). Such foods must have added ingredients identified on labels.

diethanolamine (DEA; di(2-hydroxyethyl)-amine) $(\text{HOCH}_2\text{CH}_2)_2\text{NH}$.

Properties: Colorless crystals or liquid; active base; m.p. 28.0°C; b.p. 217°C (150 mm); sp. gr. 1.092 (30/20°C); flash point 306°F (o.c.); very soluble in water and alcohol; insoluble in ether, benzene. Combustible. Low toxicity.

Derivation: Ethylene oxide and ammonia.

Containers: Drums; tank cars.

Uses: Liquid detergents for emulsion paints, cutting oils, shampoos, cleaners and polishes; textile specialties; absorbent for acid gases; chemical intermediate for resins, plasticizers, etc.; solubilizing 2,4-D.

N,N-diethanolglycine (DEG)

$(\text{HOCH}_2\text{CH}_2)_2\text{NCH}_2\text{COOH}$. Used as a chelating agent. Also available as the sodium salt, $(\text{HOCH}_2\text{CH}_2)_2\text{NCH}_2\text{COONa}$.

2,5-diethoxyaniline $\text{NH}_2\text{C}_6\text{H}_3(\text{OC}_2\text{H}_5)_2$.

Properties: White to gray powder; m.p. 83–85°C; insoluble in water; soluble in organic solvents.

Hazard: May be toxic. See aniline.

Use: Intermediate.

1,4-diethoxybenzene. See hydroquinone diethyl ether.

1,1-diethoxyethane. See acetal.

diethoxyethyl phthalate. See diethyl glycol phthalate.

diethylacetal. See acetal.

diethyl acetaldehyde. See 2-ethylbutyraldehyde.

N,N-diethylacetamide $\text{CH}_3\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Colorless liquid. Sp. gr. 0.920 (20°C); boiling range 182–186°C; faint odor. Flash point 170°F. Combustible.

diethylacetic acid. See 2-ethylbutyric acid.

N,N-diethylacetoacetamide $\text{CH}_3\text{COCH}_2\text{CON}(\text{C}_2\text{H}_5)_2$.

Properties: Liquid; sp. gr. 0.9950 (20/20°C); b.p., decomposes; f.p. -70°C (sets to glass below this temperature). Completely soluble in water; flash point 250°F. Combustible.

Use: Intermediate for pigments.

diethyl adipate $\text{C}_2\text{H}_5\text{OCO}(\text{CH}_2)_4\text{OCOC}_2\text{H}_5$.

Properties: Colorless liquid. Sp. gr. (25°C) 1.002; refractive index (25°C) 1.426; b.p. 245°C; f.p. -21°C. Insoluble in water. Combustible.

Use: Plasticizer.

diethylaluminum chloride (aluminum diethyl monochloride; DEAC) $(\text{C}_2\text{H}_5)_2\text{AlCl}$.

Properties: Colorless pyrophoric liquid. B.p. 208°C; f.p. -50°C.

Derivation: Reaction of triethylaluminum with ethylaluminum sesquichloride.

Hazard: Highly flammable in contact with air; reacts violently on contact with water. Dangerous fire and explosion hazard.

Uses: Polyolefin catalyst; intermediate in production of organometallics.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (Air) Not acceptable.

diethylaluminum hydride $(C_2H_5)_2AlH$. A pyrophoric mixture with triethylaluminum.

Derivation: Action of ethylene and hydrogen on aluminum.

Hazard: Highly flammable in contact with air; reacts violently on contact with water. Dangerous fire and explosion hazard.

Use: Catalyst reducing agent.

Shipping regulations: Pyrophoric liquid, n.o.s., (Rail) Red label. (Air) Not acceptable.

diethylamine $(C_2H_5)_2NH$.

Properties: Colorless liquid; ammoniacal odor; alkaline reaction. B.p. $55.5^\circ C$; freezing point $-49.8^\circ C$; sp. gr. $(20/20^\circ C)$ 0.7062; wt/gal $(20^\circ C)$ 5.91 lb; autoignition temp. $594^\circ F$; flash point less than $-15^\circ F$. Miscible with water, alcohol, most organic solvents.

Derivation: From ethyl chloride and ammonia under heat and pressure.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Highly flammable, dangerous fire risk. Moderately toxic by ingestion; strong irritant. Tolerance, 25 ppm in air. Flammable limits in air 1.8–10.1%. Safety Data Sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Rubber chemicals; textile specialties; selective solvent; dyes; flotation agents; resins; pesticides; polymerization inhibitors; pharmaceuticals; petroleum chemicals; electroplating; corrosion inhibitors.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

alpha-diethylaminoaceto-2,6-xylidide. See lidocaine.

1-diethylamino-4-aminopentane. See 5-diethylamino-2-aminopentane.

5-diethylamino-2-aminopentane (1-diethylamino-4-aminopentane) $CH_3CH(NH_2)(CH_2)_2CH_2N(C_2H_5)_2$.

Properties: Liquid with an amine odor; sp. gr. 0.82; b.p. $142\text{--}144^\circ C$; soluble in water, alcohol and ether. Combustible.

Use: Pharmaceuticals.

diethylaminopentane. See para-aminodiethylaniline.

diethylaminocellulose (DEAE cotton). A cellulose derivative containing a tertiary amine group which acts as a catalyst for epoxide reactions. It is also used in ion-exchange fractionations. It is made by adding beta-chloroethyldiethylamine hydrochloride to cellulose in sodium hydroxide. Repeated treatments increase the nitrogen content of the cotton (cellulose) to over 1 per cent with beneficial effect on crease resistance. Combustible. See also epoxide.

2-diethylaminoethanethiol hydrochloride

$(C_2H_5)_2NCH_2CH_2SH \cdot HCl$. Solid; m.p. $170^\circ C$; soluble in water and alcohol; insoluble in benzene. Used as a thio intermediate.

diethylaminoethanol (N,N-diethylethanamine) $(C_2H_5)_2NCH_2CH_2OH$.

Properties: Colorless, hygroscopic liquid base combining the properties of amines and alcohols; b.p. $161^\circ C$; sp. gr. 0.88–0.89 $(20/20^\circ C)$; vapor pressure 21 mm $(20^\circ C)$; flash point $140^\circ F$ (open cup); wt/gal

7.14 lb $(20^\circ C)$; hygroscopic; freezing point $-70^\circ C$; combustible; soluble in water, alcohol, benzene. Low toxicity.

Grade: Technical.

Containers: Cans; drums; tank cars.

Hazard: Moderate fire risk.

Uses: Water-soluble salts; fatty acid derivatives; textile softeners; pharmaceuticals; antirust compositions; emulsifying agents in acid media; derivatives containing tertiary amine groups; curing agent for resins.

diethylaminoethoxyethanol $(C_2H_5)_2NC_2H_4OC_2H_4OH$.

Properties: Colorless liquid. Sp. gr. 0.930–0.950 $(20/20^\circ C)$; boiling range 95% distills between $215.0\text{--}228.0^\circ C$. Combustible.

Use: Intermediate.

beta-diethylaminoethyl chloride hydrochloride (DEC) $(C_2H_5)_2NCH_2CH_2Cl \cdot HCl$. Intermediate in the manufacture of pharmaceuticals, and as an organic intermediate for attaching the diethylaminoethyl radical.

N,N'-diethyl-3-amino-4-methoxy-benzene-sulfonamide $NH_2(C_6H_3O)C_6H_3SO_2N(C_2H_5)_2$. White to pink crystals; m.p. $100\text{--}103^\circ C$; insoluble in water and ether, partially soluble in alcohol.

Use: Intermediate.

1-diethylamino-2-methylbenzene. See N,N-diethylortho-toluidine.

7-diethylamino-4-methylcoumarin (MDAC; 4-methyl-7-(diethylamino)coumarin) $CH_3C_9H_4O(O)N(C_2H_5)_2$.

Properties: Granular; light-tan color; m.p. $68\text{--}72^\circ C$; gives a bright blue-white fluorescence in very dilute solutions; soluble in aqueous acid solutions, resins, varnishes, vinyls and nearly all common organic solvents; slightly soluble in aliphatic hydrocarbons.

Uses: Optical bleach in textile industry; in coatings for paper, labels, book covers, etc.; to lighten plastics, resins, varnishes and lacquers; invisible marking agent.

1-diethylamino-4-pentanone. See 5-diethylamino-2-pentanone.

5-diethylamino-2-pentanone (1-diethylamino-4-pentanone) $CH_3CO(CH_2)_2N(C_2H_5)_2$. Liquid with an amine odor. Combustible.

Use: Pharmaceuticals.

meta-diethylaminophenol $C_6H_4OHN(C_2H_5)_2$.

Properties: White, crystalline solid. M.p. $78^\circ C$; b.p. $276\text{--}280^\circ C$. Soluble in alcohol, caustic soda, ether.

Derivation: Diethylaniline is sulfonated with oleum, and resulting diethylaniline-meta-sulfonic acid fused with caustic soda.

Hazard: May be toxic; see phenol.

Use: Dyes.

3-diethylaminopropylamine $(C_2H_5)_2NCH_2CH_2CH_2NH_2$.

Properties: Water-white liquid; amine odor; b.p. $169^\circ C$; f.p. $-100^\circ C$ (sets to a glass); sp. gr. 0.82 $(20/20^\circ C)$; refractive index 1.442 $(10^\circ C)$; flash point $138^\circ F$ (O.C.). Combustible.

Hazard: Moderate fire risk. Irritant to skin.

Uses: Curing agent for epoxy resins; intermediate.

Shipping regulations: (Air) Corrosive label.

gamma-diethylaminopropyl chloride hydrochloride (DEPC) $(C_2H_5)_2NCH_2CH_2CH_2Cl \cdot HCl$. Used in manufacture of pharmaceuticals; intermediate for attaching the diethylaminopropyl radical.

N,N-diethylaniline $(C_2H_5)_2NC_6H_5$.

Properties: Colorless to yellow liquid. Sp. gr. 0.9351; f.p. -38 to $-39^\circ C$; b.p. $215\text{--}216^\circ C$; flash point

- 185°F. Soluble in alcohol and ether; slightly soluble in water. Combustible.
 Derivation: By heating aniline hydrochloride with alcohol at 180°C under pressure.
 Grade: Technical.
 Containers: Drums; tank cars.
 Hazard: May be toxic. See aniline.
 Uses: Organic synthesis; dyestuff intermediate.
- diethylbarbituric acid.** See barbitol.
- diethylbenzene** $C_6H_4(C_2H_5)_2$. The commercial product is either a mixture of isomers or the para isomer, the latter being available in both pure and technical grades.
 Properties: Colorless liquid. Boiling range 179.8–184.8°C; sp. gr. 0.865 (25/25°C); flash point 132°F; soluble in alcohol, benzene, carbon tetrachloride, ether; insoluble in water; wt/gal 7.22 lb; refractive index 1.49. Autoignition temp. 806°F. Combustible.
 Containers: 55-gal drums; tank cars.
 Hazard: Moderate fire risk. Moderately toxic.
 Uses: Intermediate; solvent.
- diethylbromoacetamide** $C(C_2H_5)_2BrCONH_2$.
 Properties: Crystalline powder; bitter, cooling taste; camphor-like odor. Decomposed by hot water.
 Constants: M.p. 66–67°C. Slightly soluble in cold water; soluble in alcohol, benzene, ether, oils.
 Use: Medicine.
- di(2-ethylbutyl) azelate** $C_6H_{13}OOC(CH_2)_7COOC_6H_{13}$. (2-Ethylbutyl is $(C_2H_5)_2CHCH_2-$ or $C_6H_{13}-$.)
 Properties: Pale-yellow to water-white liquid; sp. gr. 0.9340 (20/20°C); viscosity 56 sec Saybolt (100°F); flash point 385°F; freezing point below -40°C; acid number below 1.0; faint odor; stable to heat, light, and hydrolysis. Combustible.
 Uses: As plasticizer for polyvinyl chloride and its copolymers and for cellulose esters.
- di(2-ethylbutyl) phthalate** (dihexyl phthalate) $C_6H_4(COOC_6H_{13})_2$.
 Properties: Oily, slightly aromatic liquid; sp. gr. 1.010–1.016 (20/20°C); b.p. 350°C (735 mm); acidity (as phthalic acid) 0.01% max; f.p. -50°C; ester content 98% max. flash point 381°F; combustible. Low toxicity.
 Grade: Technical.
 Containers: Steel drums.
 Use: Plasticizer for cellulose ester and vinyl plastics.
- diethyl cadmium** $(C_2H_5)_2Cd$.
 Properties: Colorless pyrophoric oily liquid; b.p. 64°C (19 mm); f.p. -21°C.
 Derivation: Reaction of cadmium acetate with triethyl aluminum.
 Hazard: Ignites spontaneously in air; dangerous fire hazard. Toxic. See cadmium.
 Uses: TEL production; synthesis of ketones from acid chlorides.
 Shipping regulations: Pyrophoric liquid, n.o.s., (Rail) Red label. (Air) Not acceptable.
- diethylcarbamazine citrate** $C_{10}H_{21}N_3O \cdot C_6H_8O_7$. 1-Diethylcarbamyl-4-methylpiperazine dihydrogen citrate.
 Properties: White, crystalline powder. Odorless or has slight odor; slightly hygroscopic. Very soluble in water; sparingly soluble in alcohol; practically insoluble in acetone, chloroform, and ether. M.p. 135–138°C.
 Grade: U.S.P.
 Use: Medicine.

- N,N'-diethylcarbanilide.** See sym-diethyldiphenylurea.
- diethyl carbinol.** See 3-pentanol.
- diethyl "Carbitol."**²¹⁴ Trademark for diethylene glycol diethyl ether (q.v.).
- 1,1'-diethyl-4,4'-carbocyanine iodide.** See cryptocyanine.
- diethyl carbonate** (ethyl carbonate) $(C_2H_5)_2CO_3$.
 Properties: Colorless liquid. Mild odor; stable. Sp. gr. 0.975 (20/4°C); b.p. 126°C; f.p. -43°C; flash point (open cup) 115°F. Miscible with alcohols, ketones, esters, aromatic hydrocarbons, some aliphatic solvents; insoluble in water. Combustible.
 Derivation: The steps in its manufacture are: (a) reacting chlorine and carbon monoxide to produce phosgene ($COCl_2$); (b) reacting phosgene with ethyl alcohol to make ethyl chlorocarbonate ($ClCO_2C_2H_5$); (c) reacting ethyl chlorocarbonate with anhydrous ethyl alcohol to produce diethyl carbonate.
 Grade: Technical.
 Containers: Steel drums; tank cars.
 Hazard: Moderate fire risk. Moderately toxic by ingestion and inhalation; strong irritant.
 Uses: Solvent for nitrocellulose, cellulose ethers, many synthetic and natural resins; organic synthesis.
- diethyl chlorophosphate** $(C_2H_5O)_2P(O)Cl$.
 Properties: Water-white liquid; b.p. 60°C (2 mm); sp. gr. 1.1915 (25°C); refractive index 1.4153 (n 25/D). Soluble in alcohols. Combustible.
 Grade: Technical.
 Hazard: Vapor is strong irritant to eyes and lungs; liquid is corrosive to skin and tissue. Reacts violently with water; absorbed by skin.
 Use: Intermediate for organic synthesis.
- diethylcyclohexane** $(C_2H_5)_2C_6H_{10}$.
 Properties: Liquid; sp. gr. 0.8037 (20/20°C); b.p. 174°C; f.p. -100°C; insoluble in water; flash point 125°F (open cup). Autoignition temp. 465°F. Combustible.
 Hazard: Moderate fire risk.
- N,N-diethylcyclohexylamine** $C_6H_{11}N(C_2H_5)_2$.
 Properties: Colorless liquid; b.p. 194.5°C. Soluble in ether and benzene; slightly soluble in water. Low toxicity. Combustible.
 Grade: Technical.
 Uses: Solvent; intermediate.
- diethyl-1-(2,4-dichlorophenyl)2-chlorovinyl phosphate** $(C_2H_5O)_2PO \cdot OC(C_6H_3Cl_2):CHCl$.
 Properties: Liquid; b.p. 167–170°C (5 mm); insoluble in water. Miscible with acetone, ethanol, kerosene, and xylene.
 Hazard: Highly toxic; cholinesterase inhibitor.
 Use: Insecticide.
 Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail, Air) Poison label. Not accepted on passenger planes.
- diethyldichlorosilane** $(C_2H_5)_2SiCl_2$.
 Properties: Colorless liquid; b.p. 130.4°C; sp. gr. 1.053 (25/25°C); refractive index (n 25/D) 1.4309; flash point (COC) 77°F. Readily hydrolyzed, with liberation of HCl.
 Derivation: Reaction of powdered silicon and ethyl chloride at 300°C, in presence of copper powder.
 Grade: Technical.
 Containers: Bottles; 85-lb drums.

Hazard: Flammable and corrosive to tissue; dangerous fire risk.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

O,O-diethyl S-2-diethylaminoethyl phosphorothioate hydrogen oxalate. See tetram.

diethyl diethylmalonate (C_2H_5)₂C(COOC₂H₅)₂. Colorless liquid; sweet odor; sp. gr. 0.984 (25/25°C). Used as an intermediate.

3,3-diethyl-2,4-dioxopiperidine. See dihyprylone.

diethyldiphenyldichloroethane. See 1,1-dichloro-2,2-bis(para-ethylphenyl)ethane.

sym-diethyldiphenylurea (N,N'-diethylcarbanilide; ethyl centralite; carbamate)
 $C_2H_5(C_6H_5)NCON(C_2H_5)C_6H_5$.

Properties: White crystalline solid; peppery odor; m.p. 79°C; b.p. 325–330°C; sp. gr. 1.12 (20°C); insoluble in water; soluble in organic solvents. Flash point 302°F.

Hazard: Severe explosion hazard when shocked or heated.

Uses: Stabilizer for nitrocellulose-based smokeless powder and in solid rocket propellants.

Shipping regulations: Not listed. Consult authorities.

diethylenediamine. See piperazine.

1,4-diethylene dioxide. See 1,4-dioxane.

diethylene disulfide. See 1,4-dithiane.

diethylene ether. See 1,4-dioxane.

diethylene glycol (dihydroxydiethyl ether; diglycol, DEG) $CH_2OHCH_2OCH_2CH_2OH$.

Properties: Colorless, practically odorless, syrupy liquid; sweetish taste; extremely hygroscopic; non-corrosive; lowers freezing point of water. Miscible with water, ethyl alcohol, acetone, ether, ethylene glycol; immiscible with benzene, toluene, carbon tetrachloride. B.p. 245.0°C; freezing point -8.0°C; sp. gr. 1.1184 (20/20°C); wt/gal 9.35 (15°C); refractive index 1.446 (25°C); surface tension 48.5 dynes/cm (25°C); viscosity 0.30 poise (25°C); vapor pressure 0.01 mm (30°C); flash point 255°F. Combustible. Autoignition temp. 444°F.

Derivation: By-product of manufacture of ethylene glycol.

Grade: Technical.

Containers: Drums, tank cars.

Hazard: Toxic by ingestion. FDA regards it as hazardous for household use in concentrations of 10% or more.

Uses: Polyurethane and unsaturated polyester resins; triethylene glycol; textile softener; petroleum solvent extraction; dehydration of natural gas; plasticizers and surfactants; solvent for nitrocellulose, and many dyes and oils; humectant for tobacco, casein, synthetic sponges, paper products; cork compositions; book-binding adhesives; dyeing assistant; cosmetics.

diethylene glycol acetate. See diethylene glycol monoacetate.

diethylene glycol bis(allyl carbonate) (allyl diglycol carbonate) $O[CH_2CH_2OOCO(C_3H_5)]_2$. Liquid; f.p. -4°C; b.p. 160°C (4 mm); sp. gr. (20°C) 1.143; viscosity in optically clear castings.

diethylene glycol bis(n-butylcarbonate). See butyl diglycol carbonate.

diethylene glycol bis(chloroformate). See diglycol chloroformate.

diethylene glycol bis(cresyl carbonate). See cresyl diglycol carbonate.

diethylene glycol bis(2,2-dichloropropionate). An herbicide; see "Garlon."

diethylene glycol bis(phenyl carbonate). See phenyl diglycol carbonate.

diethylene glycol diacetate (diglycol acetate) $(CH_3COOCH_2CH_2)_2O$.

Properties: Colorless liquid. Miscible with water. Sp. gr. 1.1159; b.p. 250°C; m.p. 19.1°C; flash point 275°F; vapor pressure 0.02 mm. Combustible. Nontoxic.

Grades: Technical.

Uses: Solvent for cellulose esters, printing inks, lacquers.

diethylene glycol dibenzoate.

$C_6H_5COO(CH_2)_2O(CH_2)_2OOCOC_6H_5$.

Properties: Liquid; b.p. 225–227°C (3 mm). Flash point 450°F. Combustible. Nontoxic.

Use: Plasticizer.

diethylene glycol dibutyl ether (dibutyl "Carbitol"). $C_4H_9O(C_2H_4O)_2C_4H_9$.

Properties: Practically colorless liquid. Slightly soluble in water; sp. gr. 0.8853 (20/20°C); 7.36 lb/gal (20°C); b.p. 256°C; vapor pressure 0.02 mm (20°C); freezing point -60.2°C; viscosity 2.39 cp (20°C); flash point 245°F. Combustible. Low toxicity.

Containers: Drums.

Uses: High-boiling, inert solvent with application in extraction processes and in coatings and inks; diluent in vinyl chloride dispersions; extractant for uranium ores.

diethyleneglycol dicarbamate. See diglycol carbamate.

diethylene glycol diethyl ether (diethyl "Carbitol"). $C_2H_5O(C_2H_4O)_2C_2H_5$.

Properties: Colorless liquid; extremely stable; sp. gr. 0.9082 (20/20°C); b.p. 189°C; flash point 180°F; wt/gal 7.56 lb (20°C); freezing point -44.3°C. Soluble in hydrocarbons and water. Combustible. Nontoxic.

Containers: Cans; drums.

Uses: Solvent for nitrocellulose, resins, lacquers; high-boiling medium and solvent for organic synthesis.

diethylene glycol dimethyl ether. ("diglyme"; diglycol methyl ether) $CH_3(OCH_2CH_2)_2OCH_3$.

Properties: Colorless liquid with mild odor. B.p. 162.0°C; f.p. -68.0°C; sp. gr. 0.9451 (20/20°C); flash point 153°F; viscosity 1.089 cp (20°C). Miscible with water and hydrocarbons. Combustible. Nontoxic.

Grade: Technical.

Uses: Solvent; anhydrous reaction medium for organometallic syntheses.

diethylene glycol dinitrate (DEGN; diglycol nitrate; dinitroglycol) $(O_2NOCH_2CH_2)_2O$.

Properties: Liquid; sp. gr. 1.377 (25/4°C); f.p. -11.3°C; b.p. 161°C; slightly soluble in water and alcohol; soluble in ether.

Hazard: Moderately toxic by ingestion. Severe explosion hazard when shocked or heated.

Uses: Rocket propellant; plasticizer in solid rocket propellants.

Shipping regulations: (Rail) Consult regulations. (Air) Not accepted.

diethylene glycol dipelargonate

$(C_8H_{17}COOCH_2CH_2)_2O$. A simple ester of pelargonic acid. Acid number 2.0; b.p. 229°C (5 mm); pour point 10°F, viscosity (S.U.V. at 110°C) 36 seconds; flash point 410°F. Combustible. Low toxicity. Use: Secondary plasticizer for vinyl resins.

diethylene glycol distearate. See diglycol stearate.**diethylene glycol monoacetate** (diethylene glycol acetate) $HO(CH_2)_2O(CH_2)_2OOCCH_3$. Miscible with water and aromatic hydrocarbons. Solvent for nitrocellulose, cellulose acetate, camphor and rosin.**diethylene glycol monobutyl ether** (butyl "Carbitol").

$C_4H_9OCH_2CH_2OCH_2CH_2OH$.

Properties: Colorless liquid; faint, butyl odor; b.p. 230.6°C; sp. gr. 0.9536 (20/20°C); wt/gal 7.94 lb (20°C); refractive index 1.4316 (20°C); viscosity 0.0649 poise (20°C); vapor pressure 0.01 mm (20°C); specific heat 0.546 cal/g (20–25°C); flash point 172°F; autoignition temp. 442°F. Coefficient of expansion 0.00088 (per °C) to 20°C; f.p. -68.1°C. Soluble in oils and water. Combustible. Nontoxic.

Grade: Technical.

Containers: Cans; drums; tank cars; tank trucks.

Uses: Solvent for nitrocellulose, oils, dyes, gums, soaps, polymers; plasticizer intermediate.

diethylene glycol monobutyl ether acetate (butyl "Carbitol" acetate). $CH_3CO(OC_2H_4)_2OC_4H_9$.

Properties: Colorless liquid, miscible with most organic liquids. Sp. gr. 0.9810 (20/20°C) b.p. 246.7°C; vapor pressure <0.01 mm (20°C); flash point 240°F; wt/gal 8.16 lb (20°C); nitrocellulose-xylene dilution ratio 1.8; coefficient of expansion 0.0010 (20°C); f.p. -32.3°C; viscosity 0.0356 poise (20°C). Autoignition temp. 570°F. Combustible; nontoxic.

Grade: Technical.

Containers: Cans; drums; tank cars; tank trucks.

Uses: Solvent for oils, resins, gums, also for cellulose nitrate and polymeric coatings; plasticizer in lacquers and coatings.

diethylene glycol monoethyl ether ("Carbitol" solvent). $CH_2OHCH_2OCH_2CH_2OC_2H_5$.

Properties: Colorless, hygroscopic liquid; mild, pleasant odor; slightly viscous; stable; b.p. 195–202°C; sp. gr. 1.0273 (20/20°C); refractive index 1.425 (n 25/D); flash point 205°F; wt/gal 8.55 lb (20°C); miscible with water and the common organic solvents. Combustible.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars.

Uses: Solvent for dyes, nitrocellulose, and resins; mutual solvent for mineral oil-soap and mineral oil-sulfonated oil mixtures; nonaqueous stains for wood; for setting the twist and conditioning yarns and cloth; textile printing; textile soaps; lacquers; organic synthesis; brake fluid diluent.

diethylene glycol monoethyl ether acetate ("Carbitol" acetate) $CH_3COOCH_2CH_2OCH_2CH_2OC_2H_5$.

Properties: Colorless liquid; sp. gr. 1.0114 (20/20°C); b.p. 217.4°C; vapor pressure 0.05 mm (20°C); flash point 230°F; wt/gal 8.4 lb (20°C); coefficient of expansion 0.00105 (20°C); f.p. -25°C; refractive index (30/D) 1.418; viscosity 0.0279 poise (20°C). Soluble in water; miscible with most organic solvents. Combustible. Nontoxic.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Solvent for cellulose esters, gums, resins; coatings and lacquers; printing inks.

diethylene glycol monohexyl ether (n-hexyl "Carbitol") $C_6H_{13}OC_2H_4OC_2H_4OH$.

Properties: Water-white liquid; sp. gr. 0.9346 (20/20°C); 7.8 lb/gal (20°C); b.p. 259.1°C; vapor pressure <0.01 mm (20°C); f.p. -33°C; viscosity 8.6 cp (20°C). Flash point 285°F; combustible; low toxicity. Containers: 1-gal cans; 5-, 55-gal drums.

Use: High-boiling solvent.

diethylene glycol monolaurate. See diglycol laurate.**diethylene glycol monomethyl ether** (2-beta-methyl "Carbitol"); methoxyethoxy ethanol $CH_3OCH_2CH_2OCH_2CH_2OH$.

Properties: Colorless liquid; refractive index (n 27/D) 1.4264; sp. gr. 1.0211 (20/4°C); b.p. 194°C; soluble in water; flash point 200°F; wt/gal 8.51 lb (20°C). Combustible.

Containers: Drums; tank cars.

Uses: Solvent; brake fluid component; intermediate.

diethylene glycol monomethyl ether acetate (methyl "Carbitol" acetate).

$CH_3COOC_2H_4OC_2H_4OCH_3$.

Properties: Colorless liquid; b.p. 209.1°C; flash point 180°F (open cup); sp. gr. 1.04 (20/20°C); vapor pressure 0.12 mm (20°C). Combustible.

Use: Solvent.

diethylene glycol monooleate. See diglycol oleate.**diethylene glycol monoricinoleate**. See diglycol ricinoleate.**diethylene glycol monostearate**. See diglycol monostearate.**diethylene glycol phthalate**. See diglycol phthalate.**diethylene glycol stearate**. See diglycol stearate.**diethylene oxide**. See 1,4-dioxane.**diethylenetriamine** $NH_2C_2H_4NHC_2H_4NH_2$.

Properties: Yellow liquid; ammoniacal odor. Strongly alkaline, hygroscopic, somewhat viscous liquid. Soluble in water, hydrocarbons. Corrosive to copper and its alloys. B.p. 206.7°C; f.p. -39°C; sp. gr. 0.9542 (20/20°C); vapor pressure 0.37 mm (20°C); flash point 215°F; wt/gal 7.9 lb (20°C); viscosity 0.0714 poise (20°C); coefficient of expansion 0.00088.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Toxic by ingestion and inhalation; strong irritant to eyes and skin. Safety Data Sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Solvent for sulfur, acid gases, various resins, dyes; saponification agent for acidic materials; fuel component (see hydrene).

Shipping regulations: (Air) Corrosive label.

diethylenetriamine pentaacetic acid

$HOOCCH_2N[CH_2CH_2N(CH_2COOH)_2]_2$.

Properties: White, crystalline solid; m.p. 230°C (dec); slightly soluble in cold water; soluble in hot water.

Grade: Technical.

Hazard: May be toxic.

Use: Chelating agent.

N,N-diethylethanolamine. See diethylaminoethanol.**diethyl ether**. See ethyl ether.

diethyl ethoxymethylenemalonate

Properties: Liquid; sp. gr. 1.0855 (15/15°C); refractive index (n 20/D) 1.4625; b.p. 279–281°C with decomposition; flash point 190°F; insoluble in water. Grade: 98% min (purity). Combustible. Containers: 55-gal drums. Use: Synthesis.

uns-diethylethylene. See 2-ethyl-1-butene.

N,N-diethylethylenediamine $(\text{C}_2\text{H}_5)_2\text{NC}_2\text{H}_4\text{NH}_2$

Properties: Colorless liquid; b.p. 145.2°C; sets to a glass below –100°C; sp. gr. 0.8211 (20/20°C); wt/gal 6.8 lb (20°C); flash point (open cup) 115°F. Miscible with water. Combustible. Hazard: Moderate fire risk. Use: Intermediate.

para, para'-(1,2-diethylethylene)diphenol. See hexestrol.

diethyl ethylmalonate $\text{C}_2\text{H}_5\text{CH}(\text{COOC}_2\text{H}_5)_2$

Properties: Colorless liquid; ester odor; sp. gr. 0.9994 (25/25°C). Combustible. Use: Intermediate.

diethyl ethylphosphonate $\text{C}_2\text{H}_5\text{P}(\text{O})(\text{OC}_2\text{H}_5)_2$

Properties: Colorless liquid with mild odor. Stable. Miscible with most common organic solvents. Slightly soluble in water; soluble in alcohol. Sp. gr. 1.025 (20/4°C); b.p. 82–83°C (11 mm); flash point 220°F (COC). Combustible. Containers: Steel drums. Uses: Heavy metal extraction and solvent separation; gasoline additives; antifoam agent; plasticizer; textile conditioner and antistatic agent.

1,1'-diethyl ferrocenoate (1,1'-ferrocene dicarboxylic acid diethyl ester) $(\text{C}_2\text{H}_5\text{OOC})_2\text{C}_6\text{H}_4\text{Fe}$. Orange crystalline solid; m.p. 38–40°C.

Uses: Intermediate; high-temperature plasticizer.

diethylgermanium dichloride $(\text{C}_2\text{H}_5)_2\text{GeCl}_2$

Properties: Colorless liquid; f.p. –38°C; b.p. 175°C. Decomposed by water. Uses: Biocide; intermediate.

diethylglycol phthalate (diethoxyethyl phthalate) $(\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OOC})_2\text{C}_6\text{H}_4$

Properties: Water-white to pale straw liquid; sp. gr. 1.115–1.120 (20/20°C); wt/gal 9.31 lb. Flash point 343°F. Combustible. Uses: Plasticizer.

di(2-ethylhexyl) adipate (DOA; dioctyl adipate) $[\text{CH}_2\text{CH}_2\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_5]_2$

Properties: Light-colored oily liquid; sp. gr. 0.9268 (20/20°C); refractive index 1.4472; flash point 385°F; pour point –75°C; b.p. 417°C; 214°C (5 mm); vapor pressure 2.60 mm (200°C); insoluble in water; viscosity 13.7 cps (20°C); 7.7 lb/gal (20°C). Combustible. Low toxicity. Assay: 99% min.

Containers: 55-gal drums; tank cars; tank trucks. Uses: Plasticizer, commonly blended with general purpose plasticizers, such as DOP and DIOP in processing polyvinyl and other polymers; solvent; aircraft lubes.

di(2-ethylhexyl)amine (dioctylamine) $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)_2\text{CH}_2]_2\text{NH}$

Properties: Water-white liquid with slightly ammoniacal odor; sp. gr. 0.8062 (20/20°C); 6.7 lb/gal (20°C); b.p. 281.1°C; vapor pressure 0.01 mm (20°C); viscosity 3.70 cp (20°C); flash point 270°F; high solubility in hydrocarbons and low solubility in water;

solubility of water in, 0.17% by wt; refractive index (n 20/D) 1.4420. Combustible; low toxicity. Uses: Synthesis of dyestuffs, insecticides, emulsifying agents, etc.

di(2-ethylhexyl)aminoethanol. See di(2-ethylhexyl)ethanolamine.

di(2-ethylhexyl) azelate (DOZ; dioctyl azelate) $(\text{CH}_2)_7[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)_2\text{C}_4\text{H}_9]_2$

Properties: Colorless, odorless liquid; sp. gr. 0.919 (20/20°C); refractive index 1.4472; b.p. 376°C; flash point 430°F. Combustible. Grade: 99% pure.

Uses: Plasticizer for vinyls; especially used as low-temperature plasticizer; base for synthetic lubricants.

di(2-ethylhexyl)ethanolamine (di(2-ethylhexyl)aminoethanol; dioctylaminoethanol) $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)_2\text{CH}_2]_2\text{N}(\text{CH}_2)_2\text{OH}$

Properties: Colorless liquid; insoluble in water; wt/gal 7.2 lb. Flash point 280°F. Combustible. Uses: Emulsifier; acid-stable wetting agent.

di(2-ethylhexyl) ether $[\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)_2\text{CH}_2]_2\text{O}$

Properties: Colorless, stable liquid; mild odor. Almost insoluble in water; sp. gr. 0.8121 (20/20°C); 6.6 lb/gal (20°C); b.p. 269.4°C; vapor pressure < 0.01 mm (20°C); sets to glass below –95°C; viscosity 2.89 cp (20°C); refractive index (n 20/D) 1.4525. Combustible.

Uses: High-boiling, inert reaction medium; component of certain foam breakers.

di(2-ethylhexyl) 2-ethylhexylphosphonate (bis(2-ethylhexyl) 2-ethylhexylphosphonate) $\text{C}_8\text{H}_{17}\text{PO}(\text{OC}_8\text{H}_{17})_2$

Properties: Colorless liquid with a mild odor. Sp. gr. 0.908 (20/4°C); b.p. 160–161°C (0.26 mm); flash point 420°F. Insoluble in water; miscible with most common organic solvents. Combustible. Probably low toxicity.

Containers: 5-, 55-gal drums.

Uses: Heavy-metal extraction; solvent separation; gasoline additive; anti-foam agent; plasticizer; stabilizer; textile conditioner and antistatic agent.

di(2-ethylhexyl) fumarate (dioctyl fumarate; DOF) $\text{C}_8\text{H}_{17}\text{OOCCH}:\text{CHCOOC}_8\text{H}_{17}$

Properties: Clear, mobile liquid; sp. gr. 0.937–0.940 (25/25°C); b.p. 211–220°C; flash point 365°F; combustible; low toxicity.

Uses: Monomer for polymerization and co-polymerization.

di(2-ethylhexyl) hexahydrophthalate (dioctyl hexahydrophthalate) $\text{C}_6\text{H}_{10}[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)_2\text{C}_4\text{H}_9]_2$

Properties: Light-colored liquid; sp. gr. 0.9586 (20/20°C); 8.0 lb/gal (20°C); b.p. 216°C (5 mm); vapor pressure 2.2 mm (200°C); insoluble in water; viscosity 42.1 cp (20°C); flash point 425°F; combustible. Low toxicity.

Use: Plasticizer.

di(2-ethylhexyl) hydrogen phosphate (bis(2-ethylhexyl) hydrogen phosphate) $(\text{C}_8\text{H}_{17})_2\text{HPO}_4$

Properties: Solid; sp. gr. 0.972 (20/4°C); flash point (COC) 340°F. Insoluble in water. Combustible.

Use: Heavy-metal extraction.

di(2-ethylhexyl) isophthalate (dioctyl isophthalate) $\text{C}_6\text{H}_4[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)_2\text{C}_4\text{H}_9]_2$

Properties: Colorless liquid. B.p. 258°C at 10 mm; sp. gr. 0.984 (20/20°C); 8.2 lb/gal; pour point +46°C; insoluble in water; viscosity 86.5 cp (20°C). Combustible.

Use: Plasticizer.

di(2-ethylhexyl) maleate (dioctyl maleate; DOM)
 $C_8H_{17}OOCCH:CHCOOC_8H_{17}$.
 Properties: Liquid; b.p. 209°C (10 mm); f.p. sets to glass below -60°C; sp. gr. 0.9436 (20/20°C); wt/gal 7.9 lb (20°C); flash point (open cup) 365°F. Insoluble in water. Combustible. Low toxicity.
 Containers: 1-gal cans; 5-, 55-gal drums.
 Uses: Copolymers; intermediate.

di(2-ethylhexyl) phosphite (bis(2-ethylhexyl) phosphite ($C_8H_{17}O)_2PHO$).
 Properties: Mobile, colorless liquid with mild odor and a high degree of thermal stability. Insoluble in water (hydrolyzes very slowly); miscible with most common organic solvents. Sp. gr. 0.937 (20/4°C); b.p. 163–164°C (3 mm); refractive index $n_{25/D}$ 1.444; flash point 330°F. Combustible.
 Containers: 5-gal, 55-gal drums.
 Uses: Lubricant additive; intermediate; adhesive.

di(2-ethylhexyl)phosphoric acid (dioctyl phosphoric acid) $[C_8H_5CH(C_2H_5)CH_2]_2HPO_4$.
 Properties: Liquid having strong acid properties; sp. gr. 0.973 (25/25°C); f.p. -60°C; refractive index 1.4420 ($n_{25/D}$); flash point 385°F; wt/gal 8.2 lb. Insoluble in water; soluble in organic solvents. Combustible.
 Hazard: Toxic and irritant.
 Uses: Metal extraction and separation; intermediate for wetting agents and detergents.
 Shipping regulations: (Air) Corrosive label.

di(2-ethylhexyl) phthalate (dioctyl phthalate; DOP)
 $C_8H_4[COOCH_2CH(C_2H_5)C_4H_9]_2$.
 Properties: Light-colored odorless liquid; sp. gr. 0.9861 (20/20°C); pour point -46°C; refractive index 1.4836; flash point 425°F; 8.20 lb/gal (20°C); b.p. 231°C (5 mm); vapor pressure 1.32 mm Hg (200°C); viscosity 81.4 cp (20°C); insoluble in water; miscible with mineral oil. Combustible.
 Derivation: Reaction of 2-ethylhexyl alcohol and phthalic anhydride.
 Containers: Drums; tank cars; tank trucks.
 Uses: Plasticizer for many resins and elastomers.

di(2-ethylhexyl) sebacate (dioctyl sebacate) ($-C_8H_5COOC_8H_{17}$)₂.
 Properties: Pale straw-colored liquid; sp. gr. 0.91 (25°C); refractive index 1.447 (28°C); b.p. 248°C (4 mm); f.p. -55°C; flash point 410°F (COC); insoluble in water; partially compatible with cellulose acetate and cellulose acetate butyrate; compatible with ethyl cellulose, polystyrene, polyethylene, vinyl chloride, and vinyl chloride acetate. Combustible. Low toxicity.
 Containers: Drums; tank cars.
 Use: Plasticizer.

di(2-ethylhexyl) sodium sulfosuccinate. See dioctyl sodium sulfosuccinate.

di(2-ethylhexyl) succinate (dioctyl succinate)
 $C_8H_{17}OCOCH_2CH_2COOC_8H_{17}$.
 Properties: Liquid; b.p. 257°C (50 mm); f.p., sets to glass below -60°C; sp. gr. 0.9346 (20/20°C); wt/gal 7.8 lb (20°C); flash point (open cup) 315°F; vapor pressure < 0.01 mm (20°C); solubility in water < 0.01% by wt (20°C). Combustible. Low toxicity.
 Containers: 1-gal cans; 5-, 55-gal drums.
 Uses: Plasticizer; intermediate.

diethylhydroxylamine $(C_2H_5)_2NOH$.
 Properties: Liquid; refractive index ($n_{20/D}$) 1.4238. Combustible.

Grade: 85%.

Uses: Photographic developer; antioxidant; corrosion inhibitor.

diethyl isoamylethylmalonate
 $(C_2H_5)(C_5H_{11})C(COOC_2H_5)_2$. Colorless liquid; sweet odor; sp. gr. 0.950 (25/25°C). Combustible. Used as an intermediate.

diethylketone (metacetone; propione; 3-pentanone; ethyl propionyl) $C_2H_5COC_2H_5$.
 Properties: Colorless, mobile liquid; acetone-like odor; soluble in alcohol and ether; slightly soluble in water. Autoignition temp. 846°F. B.p. 101°C; sp. gr. 0.816; f.p. -42°C; flash point (open cup) 55°F. Low toxicity.

Derivation: By distilling sugar with an excess of lime. Method of purification: Rectification.

Grade: Technical.

Containers: Iron drums; glass bottles.

Hazard: Flammable, dangerous fire hazard.

Uses: Medicine; organic synthesis.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

diethyl maleate $C_2H_5OOCCH:CHCOOC_2H_5$.
 Properties: Water-white liquid; sp. gr. 1.0687; 8.92 lb/gal (20°C); refractive index ($n_{20/D}$) 1.4400; b.p. 225°C; f.p. -11.5°C (approx.); viscosity 3.567 cp (20°C); flash point 200°F (COC); dielectric constant 2.18 (calc) (25°C); surface tension 37.0 dynes/cm (20°C). Readily soluble in alcohol, diethyl ether, paraffinic hydrocarbons and common organic solvents; soluble in water; readily hydrolyzed by alkaline solutions. Combustible.

Derivation: Reaction of maleic anhydride with ethyl alcohol in the presence of a catalyst.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Irritant to eyes and skin.

Uses: Organic synthesis; flavoring.

diethyl malonate. See ethyl malonate.

diethylmalonylurea. See barbital.

diethyl (1-methylbutyl)malonate
 $[C_3H_7CH(CH_3)]CH(COOC_2H_5)_2$. Colorless liquid; ester odor; sp. gr. 0.969 (25/25°C).
 Uses: Intermediate; organic synthesis.

diethylmethylethane. See 3-methylpentane.

O,O-diethyl O-para-nitrophenyl phosphorothioate. See parathion.

diethyl oxalate. See ethyl oxalate.

diethyl oxide. See ether.

di(para-ethylphenyl)dichloroethane. See 1,1-dichloro-2,2-bis(para-ethylphenyl)ethane.

N,N-diethyl-para-phenylenediamine. See para-amino-diethylaniline.

diethyl phosphite $(C_2H_5O)_2HPO$.
 Properties: Water-white liquid; b.p. 138°C; sp. gr. 1.069 (25°C); refractive index 1.4061 ($n_{25/D}$); flash point 195°F (COC). Soluble in water, common organic solvents. Combustible.
 Uses: Paint solvent; lubricant additive; antioxidant; reducing agent; intermediate for flame retardants and insecticides; phosphorylating agent.

O,O-diethyl phosphorochloridothioate (ethyl PCT) $(C_2H_5O)_2P(S)Cl$.
 Properties: Colorless to light amber liquid; sp. gr.

1.196 (25/25°C); f.p. below -75°C; b.p. 49°C (< 1 mm) refractive index 1.4705 (n_D 25/D); insoluble in water; soluble in most organic solvents. Stable at room temperature; slowly isomerizes at 100°C.

Hazard: Probable cholinesterase inhibitor. May be highly toxic; irritant to eyes and lungs.

Uses: Intermediate for pesticides; oil and gasoline additives; flame retardants; flotation agents.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail) Poison label, (Air) Poison label. Not acceptable on passenger planes.

diethyl phthalate (ethyl phthalate; DEP)

$C_6H_4(CO_2C_2H_5)_2$.

Properties: Water-white, stable, odorless, liquid; bitter taste; f.p. -40.5°C; refractive index 1.5002 (25°C); surface tension 37.5 dynes/cm (20°C); viscosity 31.3 centistokes (0°C); vapor pressure 14 mm (163°C), 30 mm (182°C), 734 mm (295°C); b.p. 298°C; flash point 325°F (O.C.); wt/gal 9.31 lb (approx.) (20°C); sp. gr. 1.120 (25/25°C). Miscible with alcohols, ketones, esters, aromatic hydrocarbons; partly miscible with aliphatic solvents; insoluble in water. Combustible.

Derivation: By reacting phthalic anhydride with ethyl alcohol, followed by careful purification.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion and inhalation; strong irritant to eyes and mucous membranes. Narcotic in high concentrations.

Uses: Solvent for nitrocellulose, cellulose acetate; plasticizer; wetting agent; insecticidal sprays; camphor substitute; plastics; perfumery as fixative and solvent; alcohol denaturant; mosquito repellents; plasticizer in solid rocket propellants.

2,2-diethyl-1,3-propanediol $HOCH_2C(C_2H_5)_2CH_2OH$.
Properties: Colorless liquid; m.p. 61.3°C; b.p. 160°C (50 mm); sp. gr. (at m.p.) 0.949; wt/gal 8.2 lb (60°C); flash point (open cup) 215°F. Soluble in water. Combustible. Low toxicity.

Grades: Technical; pharmaceutical.

Uses: Emulsifying agent; intermediate; medicine.

O,O-diethyl-O-2-pyrazinyl phosphorothioate. See thio-nazin.

diethylpyrocarbonate (DEPC)

$C_2H_5OC(O)OC(O)OC_2H_5$.

Properties: Colorless liquid; sweet, ester-like odor. Miscible with ethanol and methanol. Refractive index 1.395-1.398 (25°C).

Grade: F.C.C.

Hazard: Use in food products prohibited (FDA). Irritant to eyes and skin.

Use: Fermentation inhibitor.

diethylstilbestrol (stilbestrol; DES)

$HOC_6H_4C(C_2H_5):C(C_2H_5)C_6H_4OH$. 3,4-Bis(parahydroxyphenyl)-3-hexene. A non-steroid, synthetic estrogen, always in the trans form. It is the most active of the commonly used stilbene compounds.

Properties: White, odorless crystalline powder; m.p. 169-172°C; almost insoluble in water; soluble in alcohol, chloroform, ether, fatty oils, and dilute alkali hydroxide.

Derivation: From anethole hydrobromide; from anisole; from anisoin.

Grade: U.S.P.

Hazard: Probable carcinogen. Under USDA regulations, no residues are permitted in tissues of slaughtered animals. Not permitted in cattle feeds (FDA).

Uses: Biochemical research; emergency contraceptive.

diethyl succinate ($-CH_2COOC_2H_5$)₂

Properties: Colorless liquid with faint pleasant odor.

B.p. 216.2°C; f.p. -21°C; sp. gr. 1.0418 (20/20°C); wt/gal 8.7 lb (20°C); refractive index (n_D 20/D) 1.4201; flash point (open cup) 230°F. Miscible with alcohol and ether; slightly soluble in water. Combustible.

Low toxicity.

Uses: Plasticizer; intermediate; flavoring.

diethyl sulfate (ethyl sulfate) $(C_2H_5)_2SO_4$

Properties: Colorless liquid; faint, ethereal odor; irritating after-effect. Noncorrosive; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.1803; b.p. 208°C (dec); vapor pressure 0.19 mm (20°C); flash point 220°F; autoignition temp. 817°F; wt/gal 9.8 lb (20°C) f.p. -24.4°C; viscosity 1.79 cp (20°C). Combustible.

Derivation: Action of fuming sulfuric acid on ethyl alcohol.

Method of purification: Rectification in vacuo.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Highly toxic by ingestion and inhalation; strong irritant.

Use: Ethylating agent in organic synthesis.

Shipping regulations: (Air) Poison label.

diethyl sulfide. See ethyl sulfide.

diethyl tartrate $C_4H_4O_6(C_2H_5)_2$

Properties: Colorless thick, oily liquid; b.p. 280°C; m.p. 17°C; soluble in water and alcohol; sp. gr. 1.204 (20/4°C). Combustible.

Uses: Plasticizer for automobile lacquers; solvent for nitrocellulose, gums, and resins.

diethylthioglycol $(C_2H_5OCH_2CH_2)_2S$

Properties: Liquid; volatile in steam. Soluble in alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 0.9672 (20°C); b.p. 225°C (746 mm). Combustible.

1,3-diethylthiourea $C_2H_5NHCSNHC_2H_5$

Properties: Buff solid; m.p. 68-71°C; slightly soluble in water; soluble in methanol, ether, acetone, benzene, and ethyl acetate; insoluble in gasoline.

Uses: Inhibitor of corrosion in metal pickling solutions; accelerator activator in elastomers.

N,N-diethyl-meta-toluamide (deet)

$CH_3C_6H_4CON(C_2H_5)_2$.

Properties: Colorless liquid; mild bland odor; b.p. 160°C (19 mm); sp. gr. 0.996-1.002 (25/25°C); refractive index 1.5200-1.5235 (25°C); slightly soluble in water; soluble in alcohol, ether and benzene. Combustible.

Grade: U.S.P.

Hazard: Irritant to eyes and mucous membranes. Uses: Insect repellents; resin solvent; film formers.

N,N-diethyl-meta-toluidine $CH_3C_6H_4N(C_2H_5)_2$

Properties: Light amber oil; b.p. 231°C; refractive index (n_D 20/D) 1.5361.

Hazard: Probably toxic. See toluidine.

Use: Dye intermediate.

N,N-diethyl-ortho-toluidine (1-diethylamino-2-methylbenzene) $CH_3C_6H_4N(C_2H_5)_2$

Properties: Prisms from water; m.p. 72.3°C; b.p. 209°C; soluble in water, alcohol, and ether.

Derivation: From ortho-toluidine.

Hazard: Probably toxic. See toluidine.

Use: Dye intermediate.

O,O-diethyl O-3,5,6-trichloro-2-pyridyl phosphorothioate $Cl_3C_5NHOP(S)(OC_2H_5)_2$

Properties: Solid; m.p. 41.5-43°C; soluble in acetone, benzene, ether; almost insoluble in water.

Hazard: Toxic. Cholinesterase inhibitor.

Use: Insecticide.

Shipping regulations: (Rail, Air) Poison label. Not accepted on passenger planes.

3,9-diethyl-6-tridecanol (heptadecanol)

$C_4H_9CH(C_2H_5)C_2H_4CH(OH)C_2H_4CH(C_2H_5)_2$.

Properties: White solid; sp. gr. 0.8475; b.p. 309°C; flash point 310°F (open cup); refractive index 1.4531 (20°C). Insoluble in water. Combustible.

Uses: Intermediate for synthetic lubricants, defoamers and surfactants.

1,1-diethylurea $NH_2CON(C_2H_5)_2$. White solid; m.p. 75°C; soluble in water, alcohol and benzene. When copolymerized with simple urea by the use of formaldehyde, it yields modified resins that differ in nature from those made from monosubstituted ureas. These resins tend to be permanently thermoplastic.

diethylzinc (ethylzinc; zinc ethyl; inc diethyl)

$Zn(C_2H_5)_2$. The first known organometallic compound.

Properties: Colorless, pyrophoric liquid; sp. gr. 1.207 (20°C); f.p. -28°C; b.p. 118°C. Soluble in most saturated hydrocarbons.

Derivation: Action of ethyl iodide on zinc and sodium-zinc; or by interaction of zinc chloride with triethyl aluminum.

Grade: Technical.

Containers: Sealed tubes; steel cylinders.

Hazard: Ignites spontaneously on contact with air. Dangerous fire hazard. Decomposes violently in water.

Uses: Organic synthesis; catalyst for polymerization of olefins; high energy aircraft and missile fuel; production of ethyl mercuric chloride.

Shipping regulations: (Rail) Pyrophoric liquids, n.o.s., Red label. (Air) Not acceptable.

differential gravimetric analysis (DGA). A variation of differential thermal analysis in which additional information is obtained by determining the rate of change in weight during the heating process.

differential thermal analysis (DTA). The method of precisely measuring the temperature, and the rate of temperature change as heat is added to or abstracted from a sample of material that is in a controlled constant environment. The method determines whether the sample is a pure substance or a mixture, and yields information about its composition and thermal properties.

diffraction, x-ray. A method of spectroscopic analysis involving the reflection or scattering of x-radiation by the atoms of a substance (lattice) as the rays pass through it. The rays are reflected by the atoms at an angle that is characteristic of the substance, yielding a spectrum that indicates its atomic or molecular structure. The spectra thus obtained are well-defined and specific; from them the properties of elements, and the structure of both crystalline and amorphous materials can be obtained. For example, unvulcanized rubber gives an amorphous pattern, while vulcanized rubber is crystalline; the cellulose macromolecule has been found to have alternating crystalline and amorphous areas. X-ray diffraction was one of the earliest and most successful methods of instrumental analysis; developed by Bragg and von Laue early in this century, it was used with dramatic

effect by Moseley (1912) in establishing the location of several elements in the Periodic System.

See also lattice; crystal; x-radiation.

diffusion. The spontaneous mixing of one substance with another when in contact or separated by a permeable membrane or microporous barrier. The rate of diffusion is proportional to the concentrations of the substances and increases with temperature. Diffusion occurs most readily in gases, less so in liquids, and least in solids. The theoretical principles are stated in Fick's laws. In gases, diffusion takes place counter to gravity, and the rate at which different gases diffuse into a particular gas (e.g. air) is inversely proportional to the square roots of the densities. Carbon dioxide and chlorine vapor will diffuse in air until a uniform mixture results. Diffusion occurs in the cell walls of plants and animals (see osmosis). Many substances diffuse through a parchment membrane. See also dialysis.

diffusion, gaseous. A technique used for separating the light isotope of uranium (U-235) from the heavy isotope (U-238). The uranium is allowed to diffuse through a series of microporous barriers, whose apertures are of molecular dimensions, in the form of the gas uranium hexafluoride; this is a mixture of $U^{238}F_6$ and $U^{235}F_6$ in a ratio of 140 to 1. Because of the vastly greater number of the heavier molecules and the extremely small difference in their masses, the mixture must pass through the barrier a great many times to obtain a high concentration of the 235 isotope. Assuming that the diffusion rate of two gases through a porous barrier is inversely proportional to the square root of their molecular weights, the ideal separation factor is $\sqrt{M_1/M_2}$, where M_2 is the molecular weight of $U^{238}F_6$ and M_1 that of $U^{235}F_6$. This method is still in use for uranium enrichment for nuclear power plant fuel.

diffusion length. A property of materials used in reactors for moderators or reflectors. It is a measure of the distance a thermal neutron diffuses after it is thermalized until it is captured. It is related to the density of the material and to the scattering and absorption cross sections.

difluorophosphoric acid. See difluorophosphoric acid.

1,1,1-difluoroethane. See 1,1,1-chlorodifluoroethane.

difluoroethane. See chlorodifluoromethane.

difluorodiazine FN:NF.

Properties: Gas; can exist as cis and trans isomers.

Grade: All trans isomer; 95-99.8%.

Hazard: May be toxic. See fluorine.

Use: Trans form—preparation of ionic fluorine compounds; cis form—polymerization initiator.

difluorodichloromethane. See dichlorodifluoromethane.

4,4'-difluorodiphenyl $FC_6H_4C_6H_4F$.

Properties: White, crystalline powder; aromatic odor.

Soluble in alcohol, ether, chloroform, and oils; insoluble in water. Sp. gr. 1.04; m.p. 92-95°C; b.p. 254-255°C.

Use: Medicine.

difluorodiphenyltrichloroethane. See DFDT.

1,1-difluoroethane (ethylidene fluoride) CH_3CHF_2 .

Properties: Colorless, odorless gas. B.p. -24.7°C;

f.p. -117°C ; sp. gr. 1.004 (-25°C); index of refraction 1.255 (20°C). Insoluble in water.

Derivation: By adding hydrogen fluoride to acetylene.

Grades: Technical, 98%.

Containers: Cylinders.

Hazard: Flammable, dangerous fire risk. Moderately toxic by inhalation. Narcotic in high concentrations; lung irritant. Flammable limits in air, 3.7–18%.

Uses: Intermediate.

Shipping regulations: (Rail) Red Gas label. (Air)

Flammable Gas label. Not acceptable on passenger planes.

1,1-difluoroethylene. (Air) legal label name for vinylidene fluoride (q.v.).

difluoromethane CH_2F_2 .

Properties: Gas; b.p. -51.6°C . Soluble in alcohol; insoluble in water. High thermal stability.

Uses: Refrigeration; organic synthesis.

difluoromonochloroethane. Legal label name (Rail) for 1,1,1-chlorodifluoroethane (q.v.).

difluoromonochloromethane. See chlorodifluoromethane.

difluorophosphoric acid (difluorophosphoric acid)

HPO_2F_2 .

Properties: Mobile, strongly fuming, colorless liquid; sp. gr. 1.583 ($25/4^{\circ}\text{C}$); f.p. -75°C ; b.p. 116°C . Corrosive to glass and fabric. Noncombustible.

Hazard: Highly toxic when heated; corrosive to tissue. Uses: Chemical polishing agent; protective coatings for metal surfaces; catalyst.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

"Difolatan."²⁵³ Trademark for cis-N-[(1,1,2,2-tetrachloroethyl)thio]4-cyclohexene-1,2-dicarboximide (q.v.).

"Digesta."¹ Trademark for a series of fine calcium phosphates with varying proportions of calcium and phosphate.

Grade: F.C.C.

Use: Feed supplement for livestock and poultry.

digester. A cylindrical metal vessel used chiefly in the preparation of wood pulp for papermaking, in which lignin is separated from cellulose by chemical means. It operates at about 150 psi and 170°C . The wood is fed to the digester in the form of chips, to which the cooking liquor is added. Standard digesters are 12 ft in diameter and 45 ft high, with a wall thickness of 2 inches. These hold about 20 cords of wood, and some are even larger. The cooking cycle varies from 2.5 hr for board stock to 5 hr for bleached paper. Heat supply is by circulating steam and heat exchanger, though some types have direct steam injection. Digesters are designed for both batch and continuous operation. They are also used in reclaiming fabricated rubber products (tires, boot and shoe, etc.). See also pulp, paper; digestion (2).

digestion. (1) The physiological processes involved in the assimilation of nutrients from ingested foods by the animal organism. Hydrochloric acid in the gastric juice plays a prominent part, aided by the saliva, which initiates carbohydrate breakdown, and by bile and pancreatic secretions in the intestine. Numerous types of enzymes catalyze these processes. See also metabolism; nutrition.

(2) In chemical engineering the term refers to several processes: (a) the preferential dissolution of certain mineral constituents in some ore concentrations; (b) the liquefaction of organic waste materials

by microbiological action, as in activated sludge; (c) removal of lignin from wood by hot chemical solutions in the manufacture of chemical cellulose and paper pulp; (d) separation of fabric from scrap tires by hot sodium hydroxide solution in the reclaiming of rubber. The equipment for (c) and (d) is called a digester (q.v.).

digitalis. A drug obtained from dried leaves of the purple foxglove; native to southern Europe but grown in the U.S. Used in treatment of cardiac diseases, both human and animal. Allergic reactions are infrequent. Contains both digitonin and digitoxin. Toxic symptoms result from overdose.

digitonin $\text{C}_{56}\text{H}_{92}\text{O}_{29}$. A saponin derived from digitalis seeds; used for the determination of cholesterol (an insoluble addition compound is formed). Also used as an analytical reagent.

digitoxin $\text{C}_{41}\text{H}_{64}\text{O}_{13}$. Most active glycoside of Digitalis purpurea.

Properties: White, odorless, bitter leaflets or powder; m.p. $255\text{--}256^{\circ}\text{C}$; slightly soluble in water or ether; soluble in alcohol.

Derivation: From digitalis leaves, usually digitalis purpurea (foxglove).

Grade: U.S.P.

Hazard: Highly toxic by ingestion. Overdose can be fatal.

Use: Medicine (cardiac treatment).

diglycerol. See polyglycerols.

1,3-diglycidylloxybenzene. See resorcinol diglycidyl ether.

diglycol. See diethylene glycol.

diglycol acetate. See diethylene glycol diacetate.

"Diglycolamine."¹³⁷ Trademark for 2-(2-aminoethoxy)-ethanol.

diglycol carbamate (diethylene glycol dicarbamate)

$\text{O}(\text{CH}_2\text{CH}_2\text{OCONH}_2)_2$.

Properties: White crystalline solid; relatively stable to acid hydrolysis, but less stable to basic conditions. Use: Manufacture of resins.

diglycol chloroformate [diethylene glycol bis(chloroformate)] $\text{O}(\text{CH}_2\text{CH}_2\text{OCOCl})_2$.

Properties: Liquid; b.p. $125\text{--}127^{\circ}\text{C}$ (5 mm); flash point 295°F ; combustible; nontoxic; soluble in acetone, alcohol, ether, chloroform, and benzene.

Uses: Preparation of nonvolatile plasticizers or modifying agent.

diglycol chlorohydrin. $\text{ClCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; miscible with water; sp. gr. 1.1698; b.p. 196.8°C ; flash point 225°F ; combustible; vapor pressure 0.17 mm.

Hazard: Moderately toxic by ingestion and inhalation; an irritant.

diglycolic acid $\text{O}(\text{CH}_2\text{COOH})_2$.

Properties: White crystalline solid; m.p. 148°C ; soluble in water and alcohol; pH of 10% aqueous solution 1.4. Forms a nonhygroscopic monohydrate at relative humidities above 72% at 25°C . Low toxicity. Containers: Multiwall paper bags.

Uses: Manufacture of resins and plasticizers; organic synthesis; sequestering agent; emulsion breaker in petroleum.

diglycol laurate (diethylene glycol monolaurate)

$\text{C}_{11}\text{H}_{23}\text{COOC}_2\text{H}_4\text{OC}_2\text{H}_4\text{OH}$.

Properties: Light straw-colored, oily liquid practically odorless, nontoxic, and edible. Sp. gr. 0.96. Dis-

persible in water; soluble in methanol, ethanol, toluene, naphtha, and mineral oil. Miscible in certain proportions in cottonseed oil, acetone, and ethyl acetate. Flash point 290°F; low toxicity; combustible.

Derivation: Lauric acid ester of diethylene glycol.

Uses: Emulsifying agent for oils and hydrocarbon solvents; emulsions for lubrication, sizing, finishing, of textiles, paper, and leather; fluid emulsions of oils for hand lotions, hair dressings, etc.; cutting and spraying oils; dry-cleaning soap base; antifoaming agent.

diglycol methyl ether. See diethylene glycol dimethyl ether.

diglycol monostearate (diethylene glycol monostearate)
 $C_{17}H_{35}COOC_2H_4OC_2H_4OH$.

Properties: Small white flakes, available in regular or water-dispersible types. Nontoxic.

Uses: Emulsifier and thickener in cosmetics; mold release lubricant for die casting; temporary binder for ceramics and grinding wheels.

diglycol nitrate. See diethylene glycol dinitrate.

diglycol oleate (diethylene glycol monooleate)

$C_{17}H_{33}COOC_2H_4OC_2H_4OH$.

Properties: Light red, oily liquid; fatty odor. Soluble in ethanol, naphtha, ethyl acetate, methanol; partly soluble in cottonseed oil; insoluble in water. Sp. gr. 0.93; iodine value 65–75; titer below 0°C; pH (25°C) 7.7–8.2 (5% aqueous dispersion). Combustible; nontoxic.

Derivation: Oleic acid ester of diethylene glycol.

Uses: Emulsifying agent for fluid water-in-oil emulsions for the manufacture of furniture and automobile polish; water-emulsion paints; agricultural sprays.

diglycol phthalate (diethylene glycol phthalate)

$C_6H_4(COOC_2H_4OH)_2$.

Properties: Pale yellow, liquid resin. Soluble in methanol, ethanol, acetone, ethyl acetate; partly soluble in toluene, naphtha, mineral oil, cottonseed oil; insoluble in water. Sp. gr. 1.29; saponification value 430–450; acid value 170–175. Combustible; nontoxic.

Use: Plasticizer; emulsifier.

diglycol ricinoleate (diethylene glycol monoricinoleate)

$C_{17}H_{32}(OH)COOC_2H_4OC_2H_4OH$.

Properties: Light yellow liquid; f.p. below –60°C; sp. gr. 0.980 (25°C). Soluble in alcohol, acetone, and ethyl acetate; insoluble in water. Combustible; nontoxic.

Use: Plasticizer for high polymers and elastomers.

diglycol stearate (diethylene glycol distearate)

$(C_{17}H_{35}COOC_2H_4)_2O$.

Properties: White, wax-like solid; faint fatty odor. Disperses in hot water; soluble (hot) in alcohol, oils, and hydrocarbons. M.p. 54–55°C; sp. gr. 0.9333 (20/4°C). Combustible; nontoxic.

Derivation: Stearic acid ester of diethylene glycol.

Grades: Technical; cosmetic.

Containers: Drums.

Uses: Emulsifying agent for oils, solvents, and waxes; lubricating agent for paper and cardboard; suspending medium for powders in the manufacture of polishes, cleaners, and textile delusterants; temporary binder for abrasive powders and clays for ceramic insulation; protective coating for hygroscopic powders; thickening agent; pharmaceuticals.

diglyme. Abbreviation for diglycol methyl ether. See diethylene glycol dimethyl ether.

digoxin. A cardiotonic digitalis glycoside, $C_{41}H_{64}O_{14}$. **Properties:** Colorless to white crystals or white crystalline powder; odorless. Melts at about 235°C (dec). Insoluble in water, chloroform, and ether; soluble in pyridine and dilute alcohol.

Derivation: From the leaves of *Digitalis lanata*.

Grade: U.S.P.

Use: Medicine (cardiac diseases).

"Di-Halo."²²⁵ Trademark for bromochlorodimethylhydantoin (q.v.).

diheptyl-para-phenylenediamine. See N,N'-bis(1,4-dimethylpentyl)-para-phenylenediamine.

dihexadecylamine. See dipalmitylamine.

dihexadecyl ether. See dicetyl ether.

dihexadecyl sulfide. See dicetyl sulfide.

dihexadecyl thioether. See dicetyl sulfide.

dihexyl. See n-dodecane.

di-n-hexyl adipate ($-CH_2CH_2COOC_6H_{13}$)₂.

Properties: Liquid; color, water-white to maximum 100 Pt-Co; sp. gr. (20°C) 0.939; refractive index (25°C) 1.438; surface tension (20°C) 32.7 dynes/cm; viscosity (20°C) 8.8 cp; b.p. (4 mm) 183–192°C (midpoint 191°C); water solubility (25°C) 0.1%; gasoline and oil solubility, complete. Flash point 325°F; combustible; low toxicity.

Use: Low-temperature plasticizer for SBR elastomers.

di-n-hexylamine $[CH_3(CH_2)_5]_2NH$.

Properties: Water-white liquid; b.p. 233–243°C; sp. gr. 0.788 (20/20°C); refractive index 1.434 (20°C); flash point 220°F. Combustible; low toxicity.

di-n-hexyl maleate $C_6H_{13}OOCCH:CHCOOC_6H_{13}$.

Properties: Liquid; sp. gr. 0.9602 (20/20°C); b.p. 179°C (10 mm); refractive index 1.449 (20°C); vapor pressure, less than 0.01 mm (20°C); f.p. –70°C; viscosity 10.2 cp (20°C); solubility in water, less than 0.01% by wt (20°C). Combustible. Low toxicity.

Use: Preparation of resins.

dihexyl phthalate. See di(2-ethylbutyl) phthalate.

dihexyl sebacate ($-CH_2CH_2CH_2CH_2COOC_6H_{13}$)₂.

Properties: Light straw-colored liquid; b.p. (4 mm) 203°C. Flash point 415°F; combustible; low toxicity.

Derivation: By reacting dodecyl alcohol with sebacic acid.

Containers: Drums; tank cars.

Use: Plasticizer for vinyl resins.

dihydrazine sulfate $(N_2H_4)_2 \cdot H_2SO_4$.

Properties: White, crystalline flakes; m.p. approx. 104°C; decomposes at about 180°C; soluble in water; insoluble in most organic solvents.

Grades: 95% grade is available commercially.

Containers: Drums.

Hazard: Moderately toxic and irritant.

Use: Reducing agent.

dihydric. Containing two hydroxyl groups connected to different carbon atoms, e.g., a dihydric alcohol. Dihydric alcohols are collectively called glycols (diols). See also ethylene glycol.

dihydroabietyl alcohol (hydroabietyl alcohol) $C_{19}H_{31}CH_2OH$.

Properties: Solid; sp. gr. 1.007–1.008; refractive index 1.5280; vapor pressure 1.5×10^{-5} mm (25°C); m.p. 32–33°C; flash point 190°C; insoluble in water. Combustible.

Containers: Drums.

Use: Plasticizer.

1,8-dihydroacenaphthylene. See acenaphthene.

dihydrochalcone. Any of a group of disaccharide sugars having a sweet taste; they are derived from such flavanones as naringin and hesperidin. Basic research on the conversion of these compounds into acceptable synthetic sweeteners has been in progress for some years; may be introduced in certain pharmaceuticals, toothpastes, etc., with the possibility of future use in beverages and foods. See also flavanone.

dihydrocholesterol (beta-cholestanol; 3-beta-hydroxycholestone) $C_{27}H_{47}OH$. A sterol found in the feces. Unlike cholesterol, it has no double bond.

Properties: White crystals; m.p. (monohydrate) 142°C; optical rotation α (25/D) +23°. Soluble in fat solvents; insoluble in water.

Derivation: By a series of oxidation and reduction reactions from cholesterol.

Use: Biochemical research; pharmaceutical preparations.

dihydrocodeinone bitartrate $C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$.

Properties: White, odorless, crystalline powder. An alkaloid derivative. Fairly soluble in water; slightly soluble in alcohol; insoluble in ether or chloroform. Affected by light.

Grade: N.F.

Hazard: May cause addiction.

Use: Medicine (narcotic)

dihydrocoumarin. See benzodihydropyrone.

"Dihydrocyclo."¹⁹ Brand name for norbornane-2-methanol (q.v.).

6,7-dihydrodipyrido(1,2-a:2',1'-c)pyrazidinium salt. See diquat.

dihydrofolic reductase. An enzyme acting as an essential catalyst of DNA synthesis.

dihydrogen ferrous EDTA. See ethylenediaminetetraacetic acid (note).

dihydro-2(3)-imidazolone. See ethylene urea.**2,3-dihydroindene.** See indan.**9,20-dihydro-9-oxoanthracene.** See anthrone.**2,3-dihydropyran** C_5H_8O .

Properties: Colorless, mobile liquid; ether-like odor; b.p. 84.3°C; freezing point -70°C; sp. gr. 0.927 (20/4°C); refractive index 1.4180 (25/D); flash point: 0°F. Soluble in water and alcohol.

Hazard: Highly flammable; dangerous fire risk. Moderately toxic by ingestion and inhalation.

Uses: Intermediate.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

1,2-dihydro-3,6-pyridazinedione. See maleic hydrazide.

dihydrostreptomycin (DHS) $C_{21}H_{41}N_7O_{12}$. A derivative of streptomycin (q.v.) in which the carbonyl group of the streptose (q.v.) portion has been reduced by the addition of two hydrogen atoms. It has antibiotic properties similar to streptomycin and is mainly used in the treatment of tuberculosis.

Derivation: By hydrogenation of streptomycin.
Uses: Medicine (usually as sulfate salt).

dihydrotachysterol $C_{28}H_{45}OH$.

Properties: Colorless or white crystals. Odorless. Practically insoluble in water. Soluble in alcohol, ether, chloroform; sparingly soluble in vegetable oils; m. p. 123.5–129°C.

Grade: U.S.P.

Use: Medicine.

2,5-dihydrothiophene-1,1-dioxide (sulfolene) $O_2SCH_2CH:CHCH_2$.

Properties: Solid; b.p. decomposes; sp. gr. 1.314 (70°C); flash point 235°F. Partially soluble in water, acetone and toluene. Combustible.

1,2-dihydro-2,2,4-trimethylquinoline ("Agerite" Resin D). $C_{12}H_{15}N$.

Properties: Brown pellets or flakes; sp. gr. 1.03 (25°C); melting range, initial melt 75–100°C.

Use: Rubber antioxidant.

dihydroxyacetone (DHA; dihydroxypropanone) $HOCH_2COCH_2OH$.

Properties: Colorless, crystalline solid; m.p. 80°C; hygroscopic; soluble in water and alcohol; nearly insoluble in ether; insoluble in naphtha, characteristic odor; sweet cooling taste.

Derivation: Action of sorbose bacterium on glycerol.

Uses: Medicine; intermediate; emulsifier; humectant; plasticizers; fungicides; cosmetics (creates synthetic suntan).

2,4-dihydroxyacetophenone. See 4-acetylresorcinol.**dihydroxyaluminum sodium carbonate** $Al(OH)_2OOCNa$. White powder.

Derivation: Reaction of aluminum isopropoxide and an aqueous solution of sodium bicarbonate.

Use: Medicine (antacid).

1,3-dihydroxy-2-amino-4-octadecene. See sphingosine.**1,8-dihydroxyanthranol.** See anthralin.**1,2-dihydroxyanthraquinone.** See alizarin.**1,4-dihydroxyanthraquinone.** See quinizarin.**1,5-dihydroxyanthraquinone** (anthrarufin) $C_{14}H_6O_2(OH)_2$.

Properties: Yellow crystals; soluble in alcohol; sparingly soluble in water. M.p. 280°C.

Derivation: By heating anthraquinone with boric acid and sulfuric anhydride.

Use: Dyes.

1,8-dihydroxyanthraquinone (chrysazin; danthron) $C_{14}H_6O_2(OH)_2$.

Properties: Orange-colored powder or reddish-brown needles; m.p. 191°C; soluble in alcohol; sparingly soluble in water.

Derivation: From 1,8-anthraquinone potassium disulfonate.

Grades: Technical; N.F.

Uses: Dyes; medicine.

meta-dihydroxybenzene. See resorcinol.**ortho-dihydroxybenzene.** See pyrocatechol.**para-dihydroxybenzene.** See hydroquinone.**2,4-dihydroxybenzenecarboxylic acid.** See beta-resorcylic acid.**2,4-dihydroxybenzoic acid.** See beta-resorcylic acid.**2,5-dihydroxybenzoic acid.** See gentisic acid.

3,5-dihydroxybenzoic acid. See alpha-resorcylic acid.

2,4-dihydroxybenzophenone $C_6H_5COC_6H_3(OH)_2$.
Properties: Light-yellow, crystalline solid; m.p. 142°C; b.p. 194°C (1 mm); density 5.8 lb/gal (20°C). Insoluble in water; soluble in ethyl alcohol, methyl alcohol, methyl ethyl ketone, and ethyl acetate.
Use: Ultraviolet absorber in polymers.

2,5-dihydroxybenzoquinone $C_6H_2(OH)_2O_2$.
Properties: Yellow-orange solid, m.p. 216°C (dec.); soluble in concentrated sulfuric acid; slightly soluble in ethyl alcohol, acetone, water, benzene. Insoluble in naphtha.

Derivation: From hydroquinone.

Hazard: Irritant to eyes and skin.

Uses: Metal chelating; insecticides; polymerization inhibitor; tanning agent; dyestuff manufacture.

2,3-dihydroxybutane. See 2,3-butylene glycol.

2,5-dihydroxychlorobenzene. See chlorohydroquinone.

3-(3,4-dihydroxycinnamoyl) quinic acid. See chlorogenic acid.

dihydroxydiaminomercurobenzene
 $OHNH_2C_6H_3HgC_6H_3OHNH_2$. A mercury compound analogous to arsenamine, used in medicine as a source of mercury.
Hazard: Highly toxic. See mercury.
Shipping regulations: (Rail, Air) Mercury compounds, n.o.s. Poison label.

2,2'-dihydroxy-5,5'-dichlorodiphenylmethane. See dichlorophene.

dihydroxydiethyl ether. See diethylene glycol.

2,2'-dihydroxy-5,5'-difluorodiphenyl sulfide

$FC_6H_3(OH)S(OH)C_6H_3F$.

Properties: White amorphous solid; m.p. 119–121°C. Soluble in acetone, ether, chloroform, ethanol, ethyl acetate and glacial acetic acid; moderately soluble in benzene; insoluble in water.

Hazard: May be toxic.

Uses: Fungicide (textile); agricultural chemical.

2,4-dihydroxy-3,3-dimethylbutyric acid, gamma lactone.
See pantolactone.

N-(2,4-dihydroxy-3,3-dimethylbutyryl)-beta-alanine.
See pantothenic acid.

5,7-dihydroxydimethylcoumarin $C_{11}H_{10}O_4$. Properties and uses closely resemble those of 5,7-dihydroxy-4-methylcoumarin (q.v.)

dihydroxydiphenyl sulfone (sulfonol bisphenol)
 $(C_6H_4OH)_2SO_2$. The commercial product is a mixture of isomers.

Properties: White, free-flowing, odorless crystals. M.p. 215–240°C. Soluble in alcohol and acetone; insoluble in water.

Grade: Technical.

Containers: 150-lb fiber drums.

Uses: Electroplating; phenolic resins; polyvinyl chloride; intermediate.

5,5'-dihydroxy-7,7'-disulfonic-2,2'-dinaphthylurea

(6,6'-ureylenebis-1-naphthol-3-sulfonic acid)

$HOC_{10}H_5(SO_3H)NHCONHC_{10}H_5(SO_3H)OH$.

Properties: (Crude) light gray paste. Soluble in water, very soluble in alkaline solution.

Derivation: Phosgenation of J acid.

Hazard: May be toxic.

Use: Dye intermediate.

para-di-(2-hydroxyethoxy)benzene. See hydroquinone, di(beta-hydroxyethyl)ether.

di(2-hydroxyethyl)amine. See diethanolamine.

N,N-dihydroxyethyl ethylenediamine

$(CH_2NHC_2H_4OH)_2$.

Properties: Solid crystals; m.p. 98°C; b.p. 196°C (10 mm); flash point 355°F. Combustible. Low toxicity.

Use: Manufacture of textile-finishing assistants.

dihydroxyethyl sulfide. See thiodiglycol.

N,N-dihydroxyethyl-meta-toluidine

$CH_3C_6H_4N(C_2H_4OH)_2$.

Properties: Light-gray solid; m.p. 62°C; dist. range 175–185°C (2 mm).

2,2'-dihydroxy-3,5,6,3',5',6'-hexachlorodiphenyl methane. See hexachlorophene.

1,3-dihydroxy-4-hexylbenzene. See hexyl resorcinol.

3',4'-dihydroxy-2-isopropylaminoacetophenone hydrochloride $C_6H_3(OH)_2COCH_2NH(C_3H_7) \cdot HCl$. Light-colored crystalline powder with a faint odor. Used as an intermediate.

3,4-dihydroxy-alpha-(methylaminomethyl)benzyl alcohol. See pinephrine.

1,8-dihydroxy-3-methylanthraquinone. See chrysophanic acid.

5,7-dihydroxy-4-methylcoumarin $C_{10}H_8O_4 \cdot H_2O$.

Properties: Yellow to white solid; fluoresces blue, absorbs ultraviolet light; melting range 270–285°C; insoluble in water, benzene, ether; soluble in alcohol and sodium hydroxide.

Derivation: From phloroglucinol.

Uses: In suntan oils as a sun screen; in wall paints as a whitening agent.

1,1'-dihydroxymethylferrocene $[C_5H_4(CH_2OH)]_2Fe$.

Yellow crystalline solid; m.p. 85–86°C. Used as an intermediate.

See also ferrocene.

1,3-dihydroxynaphthalene (naphthoresorcinol)

$C_{10}H_6(OH)_2$.

Properties: Transparent, crystalline plates; m.p. 124–125°C; soluble in alcohol, ether and water. Combustible.

Derivation: By heating naphthalene-1,3-disulfonic acid with alkali at 230°C under pressure.

Grades: Technical; reagent.

Uses: Dyes; pharmaceuticals; analytical reagent for sugars, oils, glucuronic acid.

Note: There are several other isomeric forms of dihydroxynaphthalene (1,5-; 1,6-; 1,7-; 1,8-; 2,3-; 2,6-; 2,7-). They are derived by heating a naphthalene disulfonic acid isomer with caustic soda; are soluble in alcohol and ether and sparingly soluble in water. M.p. ranges from 136°C (1,6-) to 260°C (2,6-). Their chief use is in organic dyes.

4,5-dihydroxy-2,7-naphthalenedisulfonic acid (chromotropic acid) $C_{10}H_4(OH)_2(SO_3H)_2$.

Properties: White needles; very soluble in water; insoluble in alcohol or ether.

Hazard: May be toxic.

Uses: Dyestuff intermediate; analytical reagent.

2,3-dihydroxynaphthalene-6-sulfonic acid, sodium salt
 $C_{10}H_5(OH)_2SO_3Na$. Coupler in diazo copying.

2,8-dihydroxy-3-naphthoic acid ($C_{10}H_5(OH)_2COOH$).

Properties: Light-green powder; slightly soluble in hot water; soluble in alcohol and acetone. M.p. 235–240°C.

Use: Intermediate.

L-dihydroxyphenylalanine (L-dopa). An amino acid used in treating Parkinson's disease, manganese poisoning and muscular dystonia. Derived from several types of beans, including vanilla; also made synthetically. Classified by FDA as experimental drug.

1,2-dihydroxypropane. See 1,2-propylene glycol.

dihydroxypropanone. See dihydroxyacetone.

8,9-dihydroxystearic acid $C_{17}H_{33}(OH)_2COOH$.

Properties: White crystals, odorless, tasteless. Soluble in alcohol and ether; insoluble in water. M.p. 135°C. Derivation: By heating dibromide of isooleic acid with silver oxide.

dihydroxysuccinic acid. See tartaric acid.

3,5-dihydroxytoluene. See orcin.

DII. Abbreviation for diesel ignition improver.

diiodoacetylene (diiodoethyne) ICl_2 .

Properties: White crystals. Unpleasant odor. Light acts upon it, causing a gradual change in color to red and a separation of iodine. Highly volatile! Soluble in alcohol, ether, benzene; insoluble in water. M.p. 78.5°C (decomp.).

Derivation: By dissolving iodine in liquid ammonia and passing acetylene into the solution.

Hazard: Highly toxic by inhalation. Vapors irritating to eyes and mucous membranes.

Use: Organic synthesis; military poison.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

diiodoaniline $C_6H_4I_2NH_2$.

Properties: Shining, brown crystals. Soluble in alcohol, ether, chloroform, ethyl acetate, and carbon disulfide; insoluble in water. M.p. 96°C; sp. gr. 2.75.

Derivation: By the action of iodine chloride on acetanilide, followed by saponification and distillation with steam.

Hazard: May be toxic. See aniline.

Use: Medicine.

diiodobrassicinic acid ethyl ester. See ethyl diiodobrassicinate.

sym-diiododibromoethylene $BrICl_2CIBr$.

Properties: Crystals; m.p. 95–96°C.

Derivation: Reaction of iodine and dibromoacetylene.

Use: Organic synthesis.

diiododiethyl sulfide $(ICH_2CH_2)_2S$.

Properties: Bright-yellow prisms. Slowly decomposes, the rate being accelerated by light and by heat. Hydrolyzed by alkali solutions. Soluble in alcohol, benzene, ether; insoluble in water. M.p. 62°C.

Derivation: Interaction of dichlorodiethyl sulfide with an acetic acid solution of sodium iodide.

Hazard: Highly toxic by ingestion and inhalation. Strong irritant.

Shipping regulations: (Rail, Air) Not listed. Consult authorities.

diiodomethane. See methylene iodide.

3,5-diiodosalicylic acid $I_2C_6H_2(OH)COOH$.

Properties: White to pale pink crystalline powder; slightly soluble in water.

Uses: Source of iodine for animal nutrition.

diiodothyronine $HOC_6H_4OC_6H_2I_2CH_2CH(NH_2)COOH$. 3,5-Diiodothyronine. A thyronine derivative which is an intermediate obtained in the manufacture of synthetic thyroxine; also, probably an intermediate in the synthesis of thyroxine by the thyroid gland.

diisobutyl adipate (DIBA) $[C_2H_4COOCH_2CH(CH_3)_2]_2$.

Properties: Colorless liquid. Odorless. Compatible with most natural and synthetic polymers. Soluble in most organic solvents; insoluble in water. Sp. gr. 0.950 (25°C); b.p. 278–280°C; f.p. –20°C; wt/gal 7.95 lb; acidity (as adipic acid) less than 0.05%. Combustible.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Use: Plasticizer.

diisobutyl aluminum chloride (DIBAC)

$[(CH_3)_2CHCH_2]_2AlCl$.

Properties: Colorless liquid; density 0.905 g/ml, f.p. –39.5°C.

Derivation: Reaction of isobutylene and hydrogen on aluminum.

Hazard: May be irritant to tissue.

Use: Polyolefin catalyst.

diisobutyl aluminum hydride (DIBAL-H)

$[(CH_3)_2CHCH_2]_2AlH$.

Properties: Colorless pyrophoric liquid; f.p. –80°C; density 0.798 g/ml; b.p. 105°C (0.2 mm); miscible in hydrocarbon solvents; dilute solutions nonpyrophoric.

Derivation: Reaction of isobutylene and hydrogen with aluminum.

Hazard: Ignites spontaneously in air; dangerous fire risk.

Use: Reducing agent in pharmaceuticals.

Shipping regulations: (Rail) Pyrophoric liquid, n.o.s., Red label. (ATA) Not acceptable.

diisobutylamine $[(CH_3)_2CHCH_2]_2NH$.

Properties: Water-white liquid; sp. gr. 0.745 (20°C); boiling range 136–140°C; amine odor. Flash point 85°F. Low toxicity.

Hazard: Flammable, moderate fire risk.

Use: Intermediate.

diisobutylcarbinol. See 2,6-dimethyl-4-heptanol.

diisobutyl carbonyl acetate. See nonyl acetate.

diisobutylene. A group of isomers of the formula C_4H_8 , of which 2,4,4-trimethylpentene-1 and 2,4,4-trimethylpentene-2 are the most important since they are formed in appreciable amounts when isobutene (isobutylene) is polymerized.

Properties: Colorless liquids. Sp. gr. 0.7227 (60°F); boiling range 214–220°F.

Hazard: Fire risk. Narcotic in high concentrations.

Uses: Alkylation; intermediates; antioxidants; surfactants; lube additives; plasticizers; rubber chemicals.

alpha-diisobutylene. See 2,4,4-trimethylpentene-1.

beta-diisobutylene. See 2,4,4-trimethylpentene-2.

diisobutyl ketone (2,6-dimethyl-4-heptanone)

$(CH_3)_2CHCH_2COCH_2CH(CH_3)_2$.

Properties: Colorless liquid. Stable; mild odor. Miscible with most organic liquids; immiscible with water. Sp. gr. 0.8089 (20/20°C); b.p. 168.1°C; vapor pressure 1.7 mm (20°C); flash point 140°F; wt/gal 6.7 lb (20°C); freezing point –41.5°C; coefficient of expansion 0.00101 (20°C). Combustible.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Hazard: Toxic. Tolerance 25 ppm in air.

Uses: Solvent for nitrocellulose, rubber, synthetic

resins; lacquers; coating compositions; organic synthesis; roll-coating inks; stains.

diisobutyl phenol. See octyl phenol.

diisobutyl phthalate $C_6H_4[COOCH_2CH(CH_3)_2]_2$.

Properties: Liquid; refractive index 1.4900 (n 25/D); sp. gr. 1.040 (20/20°C); flash point 385°F; b.p. 327°C. Combustible. Low toxicity.

Containers: 55-gal drums, tank trucks, tank cars.

Use: Plasticizer.

diisocyanate. An organic compound with two isocyanate groups ($-NCO$), formed by treating diamines (e.g., toluene-2,4-diamine, hexa-methylenediamine, para, para'-diaminodiphenylmethane) with phosphoric acid. Combustible.

Uses: Production of polyurethane foams, and elastomers; in phenol-formaldehyde resins to improve water and alkali resistance; bonding rubber to rayon or nylon.

See also polyurethane.

diisodecyl adipate (DIDA)

$C_{10}H_{21}OOC(CH_2)_4COOC_{10}H_{21}$.

Properties: Light-colored, oily liquid; mild odor. Sp. gr. 0.918 (20/20°C); f.p. -71°C; boiling range 239–246°C (4 mm); refractive index 1.450 (25°C); wt/gal 7.5 lb. Flash point 225°F. Combustible. Low toxicity. Insoluble in glycerol, glycols and some amines. Soluble in most other organics.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars; tank trucks.

Uses: Primary plasticizer for polymers.

diisodecyl-4,5-epoxytetrahydrophthalate ("Flexol" PEP)

$OC_6H_4(COOC_{10}H_{21})_2$.

Properties: Liquid; sp. gr. 0.9867 (20/20°C); 8.2 lb/gal; pour point 38°C; oxirane oxygen 3%; combustible.

Use: Plasticizer-stabilizer resistant to fungi; in vinyl plastics for outdoor use.

diisodecyl phthalate (DIDP) $C_6H_4(COOC_{10}H_{21})_2$.

Properties: Clear liquid with a mild odor; sp. gr. 0.966 (20/20°C); f.p. -50°C; b.p. 250–257°C (4 mm); refractive index (n 25°C) 1.483; viscosity 108 cp (20°C); wt/gal 8 lb. Flash point 450°F; combustible. Insoluble in glycerol, glycols and some amines; soluble in most other organics.

Grade: Technical.

Containers: 55-gal drums; tank cars; tank trucks.

Hazard: Moderately toxic and irritant.

Use: Plasticizer.

diisononyl adipate $[C_9H_{19}OOC(CH_2)_4COOC_9H_{19}]$. A low-volatility plasticizer based on isononyl alcohol. Combustible.

diisooctyl acid phosphate $(C_8H_{17})_2HPO_4$.

Hazard: Strong irritant to skin and eyes. Toxic.

Shipping regulations: (Rail) White label. (Air) Corrosive label.

diisooctyl adipate (DIOA)

$C_8H_{17}OOC(CH_2)_4COOC_8H_{17}$.

Properties: A light straw-colored liquid; mild odor; sp. gr. 0.924 (25°C); b.p. 214–226° (4 mm); f.p. $\geq 75^\circ C$. Flash point 370°F; combustible. Low toxicity.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Use: Plasticizer, especially at low temperatures.

diisooctyl azelate (DIOZ)

$C_8H_{17}OOC(CH_2)_7COOC_8H_{17}$. Liquid diester of azelaic acid. B.p. 237°C (5 mm); pour point -85°F.

acid number 1.0; viscosity (min) 3.2 cs (210°F). Sp. gr. 0.92 at 20°C. Flash point 415°F; combustible. Low toxicity.

Containers: Drums; tanks.

Use: Plasticizer for vinyl resins; base for synthetic lubricants.

See also di-2-ethylhexyl azelate.

diisooctyl phthalate (DIOP) $(C_8H_{17}COO)_2C_6H_4$. Isomeric esters obtained from phthalic anhydride and the mixed octyl alcohols made by the Oxo process (see isooctyl alcohol).

Properties: Nearly colorless, viscous liquid; mild odor; b.p. 370°C; sp. gr. (20/20°C) 0.980–0.983; wt/gal (20°C) 8.20 lb; flash point 450°F. Combustible. Low toxicity. Insoluble in water; compatible with vinyl chloride resins and some cellulosic resins.

Grade: Technical.

Containers: Drums; tank cars; tank trucks.

Use: Plasticizer for vinyl, cellulosic, and acrylate resins and synthetic rubber.

diisooctyl sebacate (DIOS)

$C_8H_{17}OOC(CH_2)_8COOC_8H_{17}$.

Properties: Liquid; sp. gr. 0.915 (25/25°C); flash point 440°F; pour point -40°C; viscosity 24 cp (20°C); 7.65 lb/gal. Combustible. Low toxicity.

Containers: Drums; tank cars.

Use: Plasticizer.

diisopropanolamine (DIPA) $(CH_3CHOHCH_2)_2NH$.

Properties: White crystalline solid; sp. gr. 0.9890 (45/20°C); b.p. 248.7°C; 8.2 lb/gal (45°C); vapor pressure 0.02 mm (42°C); melting point 42°C; viscosity 1.98 poise (45°C); miscible with water. Flash point 260°F; combustible; low toxicity.

Containers: Drums; tank cars.

Uses: Emulsifying agents for polishes, textile specialties, leather compounds, insecticides, cutting oils, and water paints.

diisopropyl. See 2,3-dimethylbutane.

diisopropylamine $[(CH_3)_2CH]_2NH$.

Properties: Colorless, volatile liquid with amine odor. B.p. 84.1°C; freezing point -96.3°C; sp. gr. (20/20°C) 0.7178; wt/gal (20°C) 6.0 lb; refractive index 1.3924 (n 20/D); flash point (open cup) 30°F. Slightly soluble in water; soluble in most organic solvents.

Derivation: From isopropyl chloride and ammonia.

Grade: Technical.

Containers: 5-, 55-gal drums; tank cars.

Hazard: Flammable; dangerous fire risk. Toxic by inhalation and ingestion; strong irritant.

Uses: Intermediate; catalyst.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label.

diisopropylaminoethanol. See N,N-diisopropylethanolamine.

beta-diisopropylaminoethyl chloride hydrochloride

(DIC) $[(CH_3)_2CH]_2NCH_2CH_2Cl \cdot HCl$.

Use: Organic synthesis, especially for introduction of the beta-diisopropylaminoethyl radical.

meta-diisopropylbenzene $C_6H_4(C_3H_7)_2$.

Properties: Colorless liquid; sp. gr. 0.8559 (20/4°C); f.p. -63°C; b.p. 203°C; refractive index 1.4883 (20°C); flash point 170°F. Insoluble in water; miscible with alcohol, ether, acetone, benzene, and carbon tetrachloride. Combustible. Autoignition temp. 840°F.

Uses: Solvent; intermediate.

para-diisopropylbenzene $C_6H_4(C_3H_7)_2$.

Properties: Colorless liquid; sp. gr. 0.8568 (20/4°C); f.p. -17°C; b.p. 210°C; refractive index 1.4898 (20°C). Insoluble in water; miscible with alcohol, ether, acetone, benzene, and carbon tetrachloride. Combustible.

Uses: Solvent; intermediate.

diisopropylbenzene hydroperoxide. Available as a 52% solution in a nonvolatile solvent. Colorless to pale yellow liquid. Strong oxidizing agent.

Hazard: Dangerous fire risk in contact with organic materials.

Shipping regulations: (Rail) Yellow label. (Air) (less than 60% in nonvolatile solvent) Organic Peroxide label; (over 60%) Not acceptable.

N,N-diisopropylbenzothiazyl-2-sulfenamide

$C_6H_4NC[SN(C_3H_7)_2]$ S. Rubber accelerator.

diisopropyl carbinol (2,4-dimethylpentanol-3)

$[(CH_3)_2CH]_2CHOH$.

Properties: Colorless liquid. B.p. 140°C; f.p. below -70°C; wt/gal 6.9 lb; flash point 120°F. Low toxicity. Combustible.

Containers: 55-gal drums.

Hazard: Moderate fire risk.

Uses: Solvent; organic synthesis (intermediate); denaturant.

diisopropyl cresol. Antioxidant or stabilizer in medicine (external). See also isopropyl cresol.

N,N'-diisopropylidiamidophosphoryl fluoride (mipafos)

$(CH_3)_2CHNHPO(F)NHCH(CH_3)_2$.

Hazard: Toxic. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: Insecticide.

diisopropyl dixanthogen $(C_3H_7OCS_2)_2$.

Properties: Yellow to greenish pellets; sp. gr. 1.28; m.p. 52°C (min); purity 98% (min.). Insoluble in water; soluble in ethyl alcohol, acetone, benzene and gasoline.

Hazard: Toxic by ingestion and inhalation; strong irritant.

Uses: Modifier in polymerization reactions; additive for lubricants; flotation reagent; fungicide; weed killer.

N,N-diisopropylethanolamine (diisopropylaminoethanol) $[(CH_3)_2CH]_2NCH_2CH_2OH$.

Properties: Colorless liquid; sp. gr. 0.8742 (20°C); vapor pressure 0.08 mm (20°C); freezing point -39.3°C; b.p. 191°C, flash point 175°F; slightly soluble in water. Combustible.

Hazard: Strong irritant to tissue.

Uses: Organic synthesis.

Shipping regulations: (Air) Corrosive label.

diisopropyl ether. Legal label name for isopropyl ether (q.v.).

diisopropyl fluorophosphate (DFP; isofluorophate)

$[(CH_3)_2CHO]_2POF$. Oily liquid; in the presence of moisture forms hydrogen fluoride. One member of a series of compounds, the fluorophosphate alkyl esters, characterized by extremely high toxicity, marked mitotic effects noted even in concentrations that are chemically undetectable.

Hazard: Highly toxic. Cholinesterase inhibitor.

Uses: Medicine.

diisopropyl ketone (2,4-dimethylpentanone-3)

$[(CH_3)_2CH]_2CO$.

Properties: Colorless liquid. B.p. 123.7°C; wt/gal 6.9 lb.

Use: Solvent.

diisopropyl oxide. See isopropyl ether.

diisopropyl peroxydicarbonate (isopropyl percarbonate; isopropyl peroxydicarbonate; IPP)

$(CH_3)_2CHOC(O)OOC(O)OCH(CH_3)_2$.

Properties: Colorless, crystalline solid; sp. gr. 1.080 (15.5/4°C); m.p. 8-10°C; refractive index (n_D 20/D) 1.4034. Almost insoluble in water; miscible with aliphatic and aromatic hydrocarbons, esters, ethers, chlorinated hydrocarbons.

Derivation: By reaction of sodium peroxide with isopropyl chloroformate.

Grades: Stabilized and unstabilized.

Hazard: Spontaneous decomposition at room temperature releases flammable and corrosive products. Dangerous fire hazard. Store in open containers at low temperature, with adequate ventilation. Explodes on heating.

Use: Low temperature polymerization catalyst.

Shipping regulations: (Rail) (freight) Stabilized, White label; Unstabilized, Yellow label; (express) Not accepted. (Air) Not acceptable. Legal label name: isopropyl percarbonate.

2,6-diisopropylphenol $C_6H_3OH[CH(CH_3)_2]_2$.

Properties: Light straw-colored liquid; f.p. 18°C; sp. gr. 0.955 (20°C); b.p. 242°C; flash point 240°F. Soluble in toluene and alcohol; insoluble in water. Combustible.

Use: Intermediate for synthetic, polymers, plasticizers, surface-active agents.

diisopropyl-para-phenylenediamine

$H_2C_6H_4NHC_3H_7NHC_3H_7$.

Properties: Dark red liquid; sp. gr. 0.88. Soluble in alcohol.

Uses: Gasoline antioxidant and sweetener (permissible for aviation gasoline, ASTM D910-64T).

N,N'-diisopropylthiourea

$(CH_3)_2CHNHCSNHCH(CH_3)_2$.

Properties: Grayish white solid; m.p. 138.5-142.5°C; slightly soluble in water; soluble in methanol, acetone, and ethyl acetate; insoluble in ether, benzene and gasoline.

Uses: Corrosion inhibitor; metal pickling with hydrochloric or sulfuric acid; for reducing corrosion of ferrous metals and aluminum alloys in brine; intermediate.

diketene (acetyl ketene) $CH_2=C(CH_3)C(O)O$.

Properties: Colorless, non-hygroscopic liquid; pungent odor; readily polymerizes on standing; sp. gr. 1.096 (20/20°C); f.p. -7.5°C; b.p. 127.4°C. Soluble in common organic solvents; soluble in water. Flash point (TOC) 93°F.

Derivation: By spontaneous polymerization of ketene obtained by thermal decomposition of acetone, or from bromoacetyl bromide and zinc.

Containers: Steel drums; insulated tank trucks, cooled to 40-50°F.

Hazard: Flammable, moderate fire risk. Moderately toxic and irritant.

Uses: Production of acetoarylamides; pigments and toners; pesticides; food preservatives; pharmaceutical intermediates.

diketobutane. See diacetyl.

2,5-diketohexane. See acetonylacetone.

2,5-diketopyrrolidone. See succinimide.

2,5-diketotetrahydrofuran. See succinic anhydride.

"Dilantin."³³⁰ Trademark for diphenylhydantoin and diphenylhydantoin sodium.

dilatancy. A system is said to be dilatant if its rate of increase of strain decreases with increased shear. Among the better known systems exhibiting dilatant behavior are pastry doughs, highly pigmented paints and many other industrially important materials. Dilatancy is usually associated with suspensions, especially those containing high concentrations of suspended matter, which is often of colloidal dimensions.

"Dilaudid."⁹ Trademark for dihydromorphinone; used in medicine as the sulfate and hydrochloride.

dilaurylamine (didodecylamine) $(C_{12}H_{25})_2NH$.

Properties: Liquid. M.p. $45^{\circ}C$; sp. gr. 0.89; almost insoluble in water.

Use: Chemical intermediate.

dilauryl ether (didodecyl ether) $(C_{12}H_{25})_2O$.

Properties: Liquid. M.p. $33^{\circ}C$; b.p. $190-195^{\circ}C$ (1 mm); sp. gr. 0.8147 ($33/4^{\circ}C$). Combustible.

Grade: 95% (min.) purity.

Uses: Electrical insulators; water repellents; lubricants for plastic molding and processing; antistatic substances; chemical intermediates.

dilauryl phosphite $(C_{12}H_{25}O)_2PHO$. Water-white liquid. Combustible.

Uses: Synthesis of organophosphorus compounds for extreme pressure lubricants, adhesives, textile finishing agents, pesticides; catalyst in polymerization of unsaturated compounds.

dilauryl sulfide (didodecyl thioether) $(C_{12}H_{25})_2S$.

Properties: Liquid. M.p. $40-40.5^{\circ}C$; b.p. $260-263^{\circ}C$ (4 mm); sp. gr. 0.8275 ($40/4^{\circ}C$). Combustible.

Grade: 95% (min.) purity.

Use: Organic synthesis (formation of sulfonium compounds).

dilauryl thiodipropionate (didodecyl 3,3'-thiodipropionate; thiodipropionic acid, dilauryl ester)

$(C_{12}H_{25}OOCCH_2CH_2)_2S$.

Properties: White flakes having sweetish odor; m.p. $40^{\circ}C$; sp. gr. (solid, $25^{\circ}C$) 0.975. Insoluble in water; soluble in most organic solvents. Extremely resistant to heat and hydrolysis. Nontoxic. Combustible.

Grade: F.C.C.

Containers: Drums; trucks.

Uses: Antioxidant; additive for high-pressure lubricants and greases; plasticizer and softening agent; antioxidant for edible fats and oils (up to 0.02% of oil content).

"Dilecto."²⁸¹ Trademark for a series of laminated plastics consisting of a variety of base materials and resins, available in sheets, tubes, or rods, of numerous grades for a variety of special mechanical and electrical insulation applications.

dilinoleic acid $C_{34}H_{62}(COOH)_2$.

Properties: Light yellow viscous liquid with slight odor; sp. gr. 0.921 ($100^{\circ}C$); refractive index 1.4851 ($40^{\circ}C$); iodine value 80; combustible.

Uses: Modifier in alkyd and polyamide resins; polyester or metallic soap for petroleum additive; emulsifying agent; adhesives; shellac substitute; to up-grade drying oils.

dilithium sodium phosphate Li_2NaPO_4 . A commercial source of lithium found in Searles Lake brine.

dilituric acid. See 5-nitrobarbituric acid.

"Dillydap."⁴⁵⁸ Trademark for dilauryl thiodipropionate (q.v.).

"Diloderm" Acetate.³²¹ Trademark for dichlorisone acetate (q.v.).

diluent. (1) An ingredient used to reduce the concentration of an active material to achieve a desirable and beneficial effect. Examples are combination of diatomaceous earth with nitroglycerine to form the much less shock-sensitive dynamite; addition of sand to cement mixes to improve workability with no serious loss of strength; addition of an organic liquid having no solvent power to a paint or lacquer to reduce viscosity and achieve suitable application properties (see also thinner). (2) Low-gravity materials used primarily to reduce cost, i.e., blown asphalt, wood flock, whiting, etc. in rubber and plastic mixes. In this sense there is no clear distinction between a diluent and an extender (q.v.). (3) An ingredient of rocket fuels such as helium, hydrazine, or hydrogen.

"Diluex."⁹⁸ Trademark for a fine-mesh attapulgite clay. "Diluex" A is employed under conditions that require higher sorptivity and fineness.

Use: Granular pesticide carrier.

dilution ratio (hydrocarbon tolerance). The maximum number of unit volumes of hydrocarbon that can be added per unit volume of active solvent to cause the first trace of gelation to occur when the concentration of nitrocellulose in the solution is 8 grams per 100 milliliters. This may be used to evaluate the solvent power of active solvents by comparing them with a standard hydrocarbon, or to evaluate hydrocarbon solvents by comparing them with an active solvent. See solvent; lacquer.

dimagnesium orthophosphate. See magnesium phosphate, dibasic.

dimagnesium phosphate. See magnesium phosphate, dibasic.

"Dimazine."⁵⁵ Trademark for uns-dimethylhydrazine (q.v.).

dimedone (1,1-dimethyl-3,5-diketocyclohexane)

$(CH_3)_2C_6H_6O_2$.

Properties: Greenish-yellow needles, or prisms; m.p. $148-149^{\circ}C$; slightly soluble in cold water and naphtha; soluble in alcohol, chloroform, benzene.

Use: Reagent for the detection of ethyl alcohol and the identification of aldehydes.

dimefox. Generic name for bis(dimethylamino)fluorophosphate; tetramethyldiamidophosphoric fluoride (BFPO). $[(CH_3)_2N]_2POF$.

Properties: Liquid; fishy odor; sp. gr. 1.1151 ($20/4^{\circ}C$); b.p. $67^{\circ}C$ (4.0 mm), $86^{\circ}C$ (15 mm); refractive index 1.4267 (n $20/D$). Soluble in water, ether, benzene; aqueous solutions are stable.

Hazard: Highly toxic; use may be restricted. Tolerance (as F), 2.5 mg per cubic meter of air.

Use: A systemic pesticide, primarily for ornamental and non-food plants.

Shipping regulations: (Rail) Not listed. (Air) Poison label. Not accepted on passenger planes.

dimenhydrinate $C_{17}H_{22}NO \cdot C_7H_6ClN_4O_2$. 2-(Benzohydroxy)-N,N-dimethylethylamine-8-chlorotheophyllinate.

Properties: Crystalline, white, odorless powder. Freely soluble in alcohol and chloroform; soluble in benzene; sparingly soluble in ether; slightly soluble in water. M.p. $102-107^{\circ}$; pH (saturated solution) 6.8-7.3.

Grade: U.S.P.

Use: Medicine (antihistamine; antiemetic).

dimer. An oligomer whose molecule is composed of two molecules of the same chemical composition. For example, 1,4-dioxane is a dimer of ethylene oxide. See also polymer.

A dimer acid is a high molecular weight dibasic acid, which is liquid (viscous), stable, resistant to high temperatures, and which polymerizes with alcohols and polyols to yield a variety of products, such as plasticizers, lube oils, hydraulic fluids. It is produced by dimerization of unsaturated fatty acids at mid-molecule and usually contains 36 carbons. Trimer acid, which contains three carboxyl groups and 54 carbons, is similar.

dimercaprol. U.S.P. name for 2,3-dimercaptopropanol (q.v.).

2,3-dimercaptopropanol (BAL; British Anti-Lewisite; dimercaprol; 1,2-dithioglycerol)
 $\text{CH}_2(\text{SH})\text{CH}(\text{SH})\text{CH}_2\text{OH}$.

Properties: Colorless, oily, viscous liquid with strong, offensive odor of mercaptans. B.p. 80°C (1.9 mm), 140°C (40 mm); m.p. 77°C ; sp. gr. 1.2385 (25/ 4°C); refractive index (n 25/D) 1.5720. Soluble in vegetable oils; moderately soluble in water with decomposition; soluble in alcohol.

Derivation: Bromination of allyl alcohol followed by reaction with sodium hydrosulfide.

Grade: U.S.P., as dimercaprol.

Hazard: Intensely irritating to eyes and mucous membranes.

Uses: Medicine; antidote to Lewisite, organic arsenicals and heavy metals.

dimetan ($\text{C}_{11}\text{H}_{17}\text{NO}_3$). Generic name for 5,5-dimethylhydroresorcinol dimethylcarbamate.

Properties: Yellow crystals; m.p. $43\text{--}45^\circ\text{C}$; slightly soluble in water and oils but readily soluble in organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide.

dimethallyl. See 2,5-dimethylhexadiene-1,5.

dimethicone $\text{CH}_3[\text{Si}(\text{CH}_3)_2\text{O}]\text{Si}(\text{CH}_3)_3$.

Properties: Colorless silicone oil consisting of dimethylsiloxane polymers (range in viscosities from 0.65 to 1,000,000 centistokes at room temperature). Viscosity grades above 50 centistokes are immiscible in water. Miscible with chloroform, ether. Low toxicity.

Uses: Ointments and topical drug ingredient; skin protectant.

dimethisoquin hydrochloride

$\text{CH}_3(\text{CH}_2)_3\text{CH}_2\text{C}_6\text{H}_5\text{NOCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$. 3-Butyl-1-(2-dimethylaminoethoxy)isoquinoline hydrochloride.

Properties: White powder, odorless, with bitter, numbing taste. M.p. $144\text{--}147^\circ\text{C}$. Freely soluble in alcohol; very slightly soluble in ether; soluble in water; pH (1% solution) 3.5–5.0.

Grade: N.F.

Use: Medicine.

dimethoate. Generic name for O,O-dimethyl S-(N-methylcarbamoylmethyl) phosphorodithioate.
 $(\text{CH}_3\text{O})_2\text{PSSCH}_2\text{CONHCH}_3$.

Properties: White solid; m.p. $51\text{--}52^\circ\text{C}$. Moderately soluble in water; soluble in most organic solvents except hydrocarbons.

Hazard: Highly toxic. A cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: (Rail, Air) Organic phosphate, dry, Poison label. Not accepted on passenger planes.

dimethoxane (6-acetoxy-2,4-dimethyl-meta-dioxane)
 $\text{CH}_3\text{COOC}_6\text{H}_3\text{O}_2(\text{CH}_3)_2$.

Properties: Clear yellow to light-amber liquid; sp. gr. 1.069–1.076 (25/ 25°C); refractive index 1.431–1.438 (20°C); b.p. $66\text{--}68^\circ\text{C}$ (3 mm); f.p. less than -25°C . Soluble in or miscible with water and organic solvents. Combustible.

Use: Antimicrobial agent.

1,2-dimethoxy-4-allylbenzene. See methyl eugenol.

2,5-dimethoxyaniline $\text{NH}_2\text{C}_6\text{H}_3(\text{OCH}_3)_2$.

Properties: Gray flakes; m.p. $69\text{--}73^\circ\text{C}$. Insoluble in cold water; soluble in organic solvents and hot water. Hazard: May be toxic. See aniline.

Uses: Intermediate for dyes, pharmaceuticals and insecticides; antioxidant.

2,5-dimethoxybenzaldehyde $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CHO}$.

Properties: Flaked solid; m.p. $46\text{--}49^\circ\text{C}$; soluble in organic solvents; insoluble in water. Combustible.

Use: Organic synthesis.

1,2-dimethoxybenzene. See veratrole.

1,3-dimethoxybenzene. See resorcinol dimethyl ether.

1,4-dimethoxybenzene. See hydroquinone dimethyl ether.

dimethoxybenzidine. See dianisidine.

3,3'-dimethoxybenzidine 4,4'-diisocyanate. See dianisidine diisocyanate.

3,4-dimethoxybenzyl alcohol $\text{C}_6\text{H}_3(\text{OCH}_3)_2\text{CH}_2\text{OH}$.

Properties: Viscous, brown liquid or low-melting solid. Combustible.

Use: Organic synthesis.

2,4-dimethoxy-5-chloroaniline $\text{NH}_2(\text{Cl})\text{C}_6\text{H}_2(\text{OCH}_3)_2$.

Properties: Violet-gray crystals; m.p. $70\text{--}71^\circ\text{C}$. Insoluble in water; soluble in alcohol, benzene, and other organic solvents.

Grade: 98.5%.

Hazard: Toxic. See aniline.

Use: Intermediate for dyes and other organics

para, para'-dimethoxydiphenylamine $(\text{CH}_3\text{OC}_6\text{H}_4)_2\text{NH}$.
 A rubber antioxidant.

1,2-dimethoxyethane. See ethylene glycol dimethyl ether.

(2-dimethoxyethyl) adipate

$\text{CH}_3\text{OC}_2\text{H}_4\text{OOC}(\text{CH}_2)_4\text{COOC}_2\text{H}_4\text{OCH}_3$.

Properties: Liquid; sp. gr. 1.075 (25°C); refractive index 1.439 (25°C); b.p. $185\text{--}190^\circ\text{C}$ (11 mm); f.p. -16°C ; slightly soluble in water. Combustible. Low toxicity.

Use: Plasticizer.

di(2-methoxyethyl) phthalate

$\text{C}_6\text{H}_4(\text{COOCH}_2\text{CH}_2\text{OCH}_3)_2$.

Properties: Oily liquid with mild odor; sp. gr. 1.172 ($20/20^\circ\text{C}$); b.p. 340°C ; f.p. -45°C ; flash point 381°F (open cup). Combustible. Low toxicity.

Containers: 55-gal drums; tank cars; tank trucks.

Use: Plasticizer, especially for cellulose acetate; solvent.

dimethoxymethane. See methylal.

2,5-dimethoxy-4-methylamphetamine (STP, DOM). A hallucinogenic, habit-forming drug; used in medicine; mfg. and use controlled by law in U.S. See also amphetamine.

3,4-dimethoxyphenethylamine. See homoveratrylamine.

3,4-dimethoxyphenylacetic acid. See homoveratric acid.

2,6-dimethoxyphenyllithium $(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{Li}$.

Properties: White to tan, free-flowing pyrophoric powder. Moderately soluble in toluene and benzene; slightly soluble in ethyl ether. Stable indefinitely in sealed containers.

Hazard: Ignites spontaneously in air.

Shipping regulations: Not specified. Consult authorities.

1-(3,4-dimethoxyphenyl)-2-nitro-1-propene

$(\text{CH}_3\text{O})_2\text{C}_6\text{H}_3\text{CH}:\text{C}(\text{NO}_2)\text{CH}_3$. Yellow crystals; m.p. 68–75°C.

Use: Intermediate.

3-(dimethoxyphosphinyloxy)-N,N-dimethyl-cis-crotonamide $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OC}(\text{CH}_3):\text{CHC}(\text{O})\text{N}(\text{CH}_3)_2$.

Properties: Brown liquid; b.p. 400°C (760 mm); miscible with water, ethanol, xylene; very slightly soluble in kerosene.

Hazard: Toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail) Poison label. (Air) Poison label. Not accepted on passenger planes.

dimethoxystrychnine. See brucine.

dimethoxytetraglycol (tetraethylene glycol dimethyl ether; bis(2-methoxyethoxyethyl ether)

$\text{CH}_3(\text{OCH}_2\text{CH}_2)_4\text{OCH}_3$.

Properties: Water-white, practically odorless liquid. Stable; soluble in hydrocarbons, water. Sp. gr. 1.0132 (20/20°C); b.p. 275.8°C, 189°C (100 mm); vapor pressure < 0.01 mm (20°C); flash point 285°F; wt/gal 8.4 lb (20°C); freezing point -29.7°C; viscosity 0.0405 poise (20°C); coefficient of expansion 0.00091 (20°C). Combustible. Low toxicity.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Use: Solvent.

dimethrin. Generic name for 2,4-dimethylbenzyl-2,2-dimethyl-3-(2-methylpropenyl) cyclopropane carboxylate (2,4-dimethylbenzyl chrysanthemumate)

$\text{C}_{19}\text{H}_{26}\text{O}_2$.

Properties: Amber liquid; sp. gr. 0.986 (20°C); b.p. 175°C (3.8 mm). Insoluble in water; soluble in petroleum hydrocarbons, aromatic petroleum derivatives, alcohols, and methylene chloride. Decomposed by strong alkali.

Hazard: May be toxic.

Use: Insecticide.

dimethyl. See ethane.

dimethylacetal (ethylidenedimethyl ether)

$\text{CH}_3\text{CH}(\text{OCH}_3)_2$.

Properties: Colorless liquid; strongly aromatic odor. Soluble in water, alcohol, ether, and chloroform. Sp. gr. 0.848 (25°C); b.p. 62–63°C. Flash point below 80°F.

Derivation: By heating acetaldehyde with methyl alcohol and glacial acetic acid, and distilling.

Hazard: Flammable, dangerous fire risk. Moderately toxic by ingestion and inhalation.

Uses: Medicine; organic synthesis.

Shipping regulations: (Rail, Air) Not listed.

N,N-dimethyl acetamide (DMAC) $\text{CH}_3\text{CON}(\text{CH}_3)_2$.

Properties: Colorless liquid; b.p. 166°C; sp. gr.

0.9366 (25°C); refractive index 1.4351 (25°C); miscible with water, aromatics, esters, ketones, and ethers. Flash point 171°F (T.O.C.). Combustible.

Derivation: From dimethylamine.

Grades: Technical; high purity certified.

Containers: 55-gal drums.

Hazard: Toxic by inhalation; absorbed by skin; strong irritant. Tolerance, 10 ppm in air.

Uses: Solvent for plastics, resins, gums, and electrolytes; intermediate; catalyst; paint remover; high purity solvent for crystallization and purification.

N,N-dimethylacetoacetamide $\text{CH}_3\text{COCH}_2\text{CON}(\text{CH}_3)_2$.

Properties: Liquid; b.p. 220°C; sp. gr. 1.048–1.053 (20/20°C); refractive index (n_D 20/D) 1.4379; miscible in water and organic solvents. Flash point 252°F (COC). Combustible.

Hazard: May be toxic.

Use: Chemical intermediate.

2,4-dimethyl acetophenone $\text{CH}_3\text{COC}_6\text{H}_3(\text{CH}_3)_2$.

Properties: Colorless liquid, odor suggesting mimosa; sp. gr. 0.994–0.997; refractive index 1.532–1.534; soluble in four volumes of 60% alcohol. Combustible.

Uses: Perfumery; flavoring.

dimethylacetylene. See crotonylene.

dimethylamine (DMA) $(\text{CH}_3)_2\text{NH}$.

Properties: (anhydrous). Gas with a strong ammoniacal odor; sp. gr. 0.6865 at -6°C; b.p. 6.88°C; f.p. -92.2°C. (25% water solution): flash point 0°F; wt/gal approx 7.8 lb (68°F); soluble in alcohol, ether, and water. Autoignition temp. 806°F.

Derivation: Interaction of methanol and ammonia over a catalyst at high temperatures. The mono-, di-, and trimethylamines are all produced.

Method of separation: Azeotropic or extractive distillation.

Grades: Technical (anhydrous; 25% and 40% aqueous solutions); 99%.

Containers: Solution: 1-gal bottles; 5-, 55-gal drums; tank cars and trucks. Anhydrous: 25-, 50-, 100-, 1400 lb cylinders.

Hazard: Flammable, dangerous fire risk. Explosive limits in air 2.8 to 14%. Moderately toxic and irritant. (Anhydrous) Safety Data Sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Acid gas absorbent; solvent; antioxidants; mfg. of dimethylformamide and dimethylacetamide; dyes; flotation agent; gasoline stabilizers; pharmaceuticals; textile chemicals; rubber accelerators; electroplating; dehairing agent; missile fuels; pesticide propellant; rocket propellants; surfactants.

Shipping regulations: (anhydrous) (Rail) Red Gas label; (Air) Flammable Gas label. Not acceptable on passenger planes. (aqueous solution) (Rail) Red label; (Air) Flammable Liquid label.

dimethylaminoaniline. See para-aminodimethylaniline.

dimethylaminoantipyrene. See aminopyrene.

dimethylaminoazobenzene (methyl yellow; butter yellow) $\text{C}_6\text{H}_5\text{NNC}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: Yellow crystalline leaflets; m.p. 116°C; soluble in alcohol, ether, strong mineral acids, and oils; insoluble in water.

Derivation: Action of benzenediazonium chloride on dimethyl aniline.

Hazard: Causes cancer in experimental animals; worker exposure should be minimized. May not be used in foods or beverages (FDA).

Uses: Organic research.

para-dimethylaminobenzaldehyde $C_6H_4[N(CH_3)_2]CHO$.
Properties: Colorless crystalline plates. Soluble in hot water, alcohol and ether. M.p. 73°C; b.p. 176–177°C (17 mm). Low toxicity. Combustible.

Derivation: By mixing dimethylaniline, anhydrous chloral and phenol and allowing the mixture to stand. The phenol is removed by shaking with dilute caustic soda and the residue dissolved in water and hydrochloric acid and crystallized.

Grades: Technical; reagent.

Uses: Dyes; medicine; reagent.

para-dimethylaminobenzene diazonium chloride, zinc chloride double salt. See para-diazodimethylaniline, zinc chloride double salt.

para-dimethylaminobenzenediazo sodium sulfonate ("Dexon") $(CH_3)_2NC_6H_4NNSO_3Na$.

Properties: Solid; melts with decomposition above 200°C. Soluble in water.

Hazard: Toxic by ingestion.

Use: Fungicide for protection of germinating seed and seedlings.

3-dimethylaminobenzoic acid $(CH_3)_2NC_6H_4COOH$.

Properties: Pale yellow crystals; m.p. 147–153°C.

Use: Intermediate.

dl-dimethylamino-4,4-diphenyl-3-heptanone hydrochloride. See methadone hydrochloride.

2-dimethylaminoethanol (deanol; dimethylethanolamine) $(CH_3)_2NCH_2CH_2OH$.

Properties: Colorless liquid with amine odor. B.p. 134.6°C; f.p. –59.0°C; sp. gr. (20/20°C) 0.8879; wt/gal (20°C) 7.4 lb; refractive index (20°C) 1.4300; flash point (open cup) 105°F; low toxicity. Combustible. Miscible with water, acetone, ether, and benzene.

Preparation: From ethylene oxide and dimethylamine.

Grades: Anhydrous and 70% aqueous soln.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Intermediate in the synthesis of dyestuffs, textile auxiliaries, pharmaceuticals and corrosion inhibitors; medicine; curing of epoxy, amine and polyamide resins; emulsifier.

beta-dimethylaminoethyl chloride hydrochloride (DMC) $(CH_3)_2NCH_2CH_2Cl \cdot HCl$. Used in manufacture of antihistamines and other pharmaceuticals. Organic intermediate for introduction of beta-dimethylaminoethyl radical.

dimethylaminoethyl methacrylate

$CH_2=C(CH_3)COOCH_2CH_2N(CH_3)_2$.

Properties: Liquid; sp. gr. 0.933 (25°C); b.p. 182–190°C; refractive index 1.4376 (25°C); flash point 165°F (TOC). Combustible.

Hazard: Irritant to skin, eyes, and mucous membranes. Strong lachrymator.

Uses: Binders for coatings, textile chemicals, dispersing agents for nonaqueous systems, antistatic agents, stabilizers for chlorinated polymers, ion exchange resins, emulsifying agents, cationic precipitating agents.

dimethylaminomethyl phenol $C_6H_4OHCH_2N(CH_3)_2$.

Exists as ortho-, meta- and para- isomers; the commercial material is a mixture of ortho- and para-.

Properties: Dark red liquid; odor phenolic, free of methylamine; sp. gr. 1.020 (25/25°C); refractive index 1.530 (25°C); distillation range 80–130°C (2 mm); water content (Karl Fischer) 0.5%. Soluble in organic solvents; moderately soluble in water.

Hazard: May be toxic. See phenol.

Uses: Antioxidants; stabilizers; catalysts; intermediates.

1-dimethylamino-2-propanol $(CH_3)_2NCH_2CHOHCH_3$.

Properties: Water-white liquid; amine odor; b.p. 125.6°C; sp. gr. 0.850 (20/20°C); refractive index 1.421 (20°C); flash point 90°F; soluble in water and most organic solvents.

Hazard: Flammable, moderate fire risk.

Use: Organic synthesis.

3-dimethylaminopropylamine

$(CH_3)_2NCH_2CH_2CH_2NH_2$.

Properties: Colorless liquid; b.p. 123°C; f.p. –70°C, sets to a glass below this temperature; sp. gr. 0.8100 (30°C); refractive index (n_D 25/D) 1.4328; flash point 95°F (TCC). Soluble in water and organic solvents.

Hazard: Toxic by ingestion and inhalation; strong irritant. Flammable, moderate fire risk.

Uses: Curing agent for epoxy resins; organic intermediate.

1-dimethylamino-2-propyl chloride (beta-dimethylaminoisopropyl chloride) $(CH_3)_2NCH_2CHClCH_3$.

Yellow liquid which darkens with age; distillation range 113–120°C; refractive index 1.422–1.423 (25°C). Used as an intermediate.

1-dimethylamino-3-propyl chloride hydrochloride (DMPC) $(CH_3)_2NCH_2CH_2CH_2Cl \cdot HCl$.

Use: Intermediate for pharmaceutical and organic synthesis.

4-dimethylamino-3-methylphenolmethyl carbamate (ester) $(CH_3)_2NC_6H_3(CH_3)OOCNHCH_3$.

Properties: Tan crystalline solid; m.p. 93–94°C. Slightly soluble in water; moderately soluble in aromatic solvents. Soluble in most polar organic solvents; unstable in highly alkaline media.

Hazard: Toxic by ingestion, inhalation and skin absorption.

Use: Insecticide.

4-dimethylamino-3,5-xylyl N-methylcarbamate

$(CH_3)_2N(CH_3)_2C_6H_2OOCNHCH_3$. White crystalline solid; m.p. 85°C. Almost insoluble in water; soluble in benzene, alcohol and chloroform.

Hazard: Toxic by ingestion.

Use: Systemic insecticide.

N,N-dimethylaniline (aniline N,N-dimethyl)

$C_6H_5N(CH_3)_2$.

Properties: Yellowish to brownish oily liquid. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.954; m.p. 2.5°C; b.p. 192.5–193.5°C; flash point 145°F (C.C.); refractive index 1.5582. Combustible. Autoignition temp. 700°F.

Derivation: By heating a mixture of aniline, aniline hydrochloride and methyl alcohol (free from acetone) in an autoclave and distilling.

Grades: Technical; reagent; 99.9% pure.

Containers: Drums; tank cars.

Hazard: Toxic. Tolerance, 5 ppm in air. Absorbed by skin.

Uses: Dyes; intermediates; solvent; manufacture of vanillin; stabilizer (acid acceptor).

dimethyl anthranilate (N-methyl methyl anthranilate) $CH_3OOC C_6H_4NHCH_3$.

Properties: Colorless or pale yellow liquid, grape-like odor; sp. gr. 1.132–1.138 (15°C); refractive index 1.578–1.581 (20°C); soluble in 3 volumes or more of 80% alcohol, in benzyl benzoate, diethyl phthalate, fixed oils, mineral oils and volatile oils; insoluble in glycerin; slightly soluble in propylene glycol; congealing point 18°C (4% impurity) to 10°C (20% impurity). Combustible.

Derivation: Methylation of methyl anthranilate or esterification of N-methyl anthranilic acid.

Containers: Glass; aluminum or tin-lined cans.

Uses: Perfumes; flavorings and drugs.

dimethylarsinic acid. See cacodylic acid.

1,2-dimethylbenzene. See ortho-xylene.

1,3-dimethylbenzene. See meta-xylene.

1,4-dimethylbenzene. See para-xylene.

3,3-dimethylbenzidine. See ortho-tolidine.

dimethylbenzylcarbinyl acetate. See alpha, alpha-dimethylphenethyl acetate.

2,5-dimethylbenzyl chloride (2,5-dimethyl-alpha-chloro-toluene; alpha-chloro-para-xylene)

Properties: Colorless to pale-yellow liquid; sharp, pungent odor. A lachrymator. Sp. gr. 1.035–1.045 (25/25°C); b.p. 221–226°C; refractive index (n_D²⁵) 1.5350–1.5360. Soluble in alcohols, ethers; insoluble in water. Combustible.

Hazard: Irritant to eyes and mucous membranes.

Uses: Intermediate for pharmaceuticals, dyes, perfumes, plasticizers, resins, wetting agents, germicides, etc.

2,4-dimethylbenzyl chrysanthemumate. See dimethrin.

alpha, alpha-dimethylbenzyl hydroperoxide. See cumene hydroperoxide.

dimethyl benzylphosphonate (CH₃O)₂P(O)CH₂C₆H₅. Water-white liquid; b.p. 114°C (0.75 mm). Used for extraction of mineral salts from special solutions; fire retardant; low-temperature plasticizer.

3,3'-dimethyl-4,4'-biphenylene diisocyanate (4,4'-bi-orthotolylene diisocyanate). Flaked white crystalline solid; assay 98% min; melting point 69°C min.

Uses: High-strength elastomers, coatings, rigid plastics.

1,1'-dimethyl-4,4'-bipyridinium salt. See paraquat.

dimethyl brassylate CH₃OOC(CH₂)₁₁COOCH₃. An ester of a 13-carbon saturated aliphatic dibasic acid. Waxy, low-melting solid; made by an ozone oxidation process. Used in preparation of ethylene brassylate, a synthetic musk; chemical intermediate.

2,2-dimethylbutane. See neohexane.

2,3-dimethylbutane (diisopropyl) (CH₃)₂CHCH(CH₃)₂. Properties: Colorless liquid; b.p. 57.9°C; sp. gr. 0.66164 (20°C); f.p. –128.41°C; refractive index 1.37495 (20°C); flash point –20°F. Autoignition temp. 788°F.

Derivation: Alkylation of ethylene with isobutane using aluminum chloride catalyst.

Grades: Technical 95%; 99%; 99.8 mole %.

Containers: Bottles; drums.

Hazard: Flammable, dangerous fire and explosion risk.

Uses: High-octane fuel; organic synthesis.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,2-dimethyl-1,3-butanediol

Properties: Liquid; sp. gr. 0.9700; b.p. 202.4°C; f.p. –12.8°C; wt/gal 8.1 lb; very soluble in water. Combustible.

Hazard: Moderately toxic.

2,3-dimethylbutene-1 CH₃CH(CH₃)C(CH₃):CH₂.

Properties: Liquid; f.p. –157.27°C; b.p. 55.6°C; sp. gr. 0.678 (20/4°C); weight 5.68 lb/gal (60°F); refractive index 1.390 (20°C); flash point –20°F.

Hazard: Flammable; dangerous fire and explosion risk.

Uses: Perfume synthesis; isomerization reactions.

Shipping regulations: Flammable liquid, n.o.s., (Rail) Red label. (Air) Flammable Liquid label.

2,3-dimethylbutene-2 CH₃C(CH₃):C(CH₃)CH₃.

Properties: Liquid; f.p. –74.3°C; b.p. 73.2°C; sp. gr. 0.708 (20/4°C); weight 5.94 lb/gal (60°F); refractive index 1.412 (20°C); flash point 0°F.

Hazard: Flammable, dangerous fire and explosion risk.

Use: Isomerization reactions.

Shipping regulations: Flammable liquid, n.o.s., (Rail) (Air) Flammable Liquid label.

2,4-dimethyl-6-tert-butyl phenol

Properties: A low-viscosity, straw-colored liquid, readily soluble in gasoline and oils; sp. gr. 0.961. Combustible.

Containers: 55-gal drums, tank cars, tank trucks.

Uses: Antiskinning agent; antioxidant, especially for gasoline. (ASTM D910 64T).

dimethyl carbate C₁₁H₁₄O₄. Generic name for bicyclo (2,2,1)-5-heptene-2,3-dicarboxylic acid dimethyl ester.

Properties: Clear, oily liquid or crystalline solid; sp. gr. 1.165 (35/4°C); insoluble in water. Low toxicity.

Derivation: Esterification of Diels-Alder condensation product of maleic anhydride and cyclopentadiene.

Use: Insect repellent.

dimethylcarbinol. See isopropyl alcohol.

dimethyl carbonate. Legal label name (Air) for methyl carbonate (q.v.).

dimethyl chloroacetal (chloroacetaldehyde dimethyl acetal) ClCH₂CH(OCH₃)₂.

Properties: Colorless liquid with a pleasant odor; boiling range 126–132°C; flash point 110°F; sp. gr. 1.082–1.092 (25/4°C); refractive index (n_D²⁵) 1.4110–1.4130; purity 97% (min.); wt/gal 9.07 lb. Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderate fire risk.

Uses: Organic synthesis; pharmaceuticals; solvent.

2,5-dimethyl-alpha-chlorotoluene. See 2,5-dimethylbenzyl chloride.

dimethyl cyanamide (CH₃)₂NCN.

Properties: Colorless, mobile liquid; f.p. –41°C; sp. gr. 0.876; b.p. 160°C; flash point 160°F (TCC). Combustible.

Hazard: May be toxic by ingestion.

Uses: Chemical intermediate; solvent.

dimethylcyclohexane (hexahydroxylene). Mixture of ortho-, meta-, and para-isomers. C₆H₁₀(CH₃)₂.

Properties: Water-white liquid of mild odor; sp. gr. 0.776 (15/15°C); boiling range 120 to 129°C; f.p. < –65°C; flash point about 50°F (C.C.); soluble in most common solvents; almost insoluble in water. Low toxicity.

Hazard: Flammable, dangerous fire risk.

Uses: Synthesis; special solvent.

Shipping regulations: (1,4 isomer) (Air) Flammable Liquid label.

Note: There are several isomers of dimethylcyclohexane, i.e., 1,3-; 1,4-; cis-1,2-; trans-1,2-. They have properties and uses closely similar to those given above. All are flammable, and of low toxicity.

dimethyl 1,4-cyclohexanedicarboxylate

Properties: Partially crystallized solid; sp. gr. 1.102 (35/4°C). Consists of about 60% cis and 40% trans isomers; b.p. (mixed isomer) 265°C; weight 9.18 lb/gal (20°C). Soluble in all proportions in most organic solvents.

Uses: Plasticizers; polymers.

N-dimethylcyclohexaneethylamine. See propylhexedrine.

N,N-dimethylcyclohexylamine $(\text{CH}_3)_2\text{NC}_6\text{H}_{11}$.

Properties: Water-white liquid; distilling range 157–160°C; sp. gr. 0.8490 (20/20°C); f.p. below –77°C; flash point 110°F (COC). Partly soluble in water; miscible with alcohol, benzene, acetone. Combustible.

Hazard: Moderate fire risk.

Uses: Catalyst for polyurethane foams; intermediate for rubber accelerators; treatment of textiles.

dimethylcyclohexylamine dibutyldithiocarbamate. See "RZ-50-A."

1,2-dimethylcyclopentane $\text{C}_5\text{H}_8(\text{CH}_3)_2$.

Properties: Colorless liquid. Cis: b.p. 99.5°C; sp. gr. 0.772 (20°C). Trans: b.p. 91.8°C; sp. gr. 0.751 (20°C). Combustible.

Grade: Technical.

Use: Organic synthesis.

2,2'-dimethyl-1,1'-dianthraquinone. $\text{C}_{30}\text{H}_{18}\text{O}_4$.

Properties: Yellow crystals; soluble in hot nitrobenzene, aniline and chlorobenzene. M.p. 365–367°C.

Use: Dye intermediate.

2,5-dimethyl-2,5-di(tert-butylperoxy)hexane

Properties: Stable colorless liquid; b.p. 50–52°C (0.1 mm Hg). Active oxygen 10.5% min. F.p. 8°C; flash point 185°F. Soluble in alcohol; insoluble in water. Combustible.

Hazard: Irritating to eyes and skin. Strong oxidizer. May ignite organic materials.

Uses: Catalyst in polyethylene cross-linking, styrene polymerization; polyester resins.

Shipping regulations: (Rail) Peroxides, organic liquid, Yellow label. (Air) Peroxides, organic liquid, n.o.s., oxidizing material. Not acceptable.

dimethyldichlorosilane (dichlorodimethylsilane) $(\text{CH}_3)_2\text{SiCl}_2$.

Properties: Colorless liquid; b.p. 70°C; f.p. –86°C; sp. gr. 1.062 (20°C); refractive index (n_D²⁵) 1.4023; flash point (COC) 16°F. Reacts with water to form complex mixture of dimethylsiloxanes, and liberates hydrochloric acid. Soluble in benzene and ether.

Derivation: Action of silicon on methyl chloride in presence of a copper catalyst, or by Grignard reaction from methyl chloride and silicon tetrachloride.

Grade: Technical.

Containers: Steel drums.

Hazard: Probably toxic. Flammable, dangerous fire and explosion risk.

Use: Intermediate for silicone products.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

dimethyl dichlorovinyl phosphate. See DDVP.

5,5-dimethyldihydroresorcinol dimethylcarbamate. See dimetan.

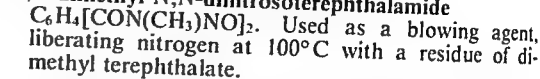

1,1-dimethyl-3,5-diketocyclohexane. See dimedone.

dimethyldiketone. See diacetyl.

N,N'-dimethyl-N,N'-di(1-methylpropyl)-para-phenylene diamine. Volatile, reddish-brown liquid. Forms a continuous protective film.

Use: Antiozonant in rubber.

N,N-dimethyl-N,N-dinitrosoterephthalamide

Used as a blowing agent, liberating nitrogen at 100°C with a residue of dimethyl terephthalate.

dimethyl dioxane $\text{OCH}(\text{CH}_3)\text{CH}_2\text{OCH}_2\text{CH}(\text{CH}_3)$.

Properties: Water-white liquid. Soluble in water. Sp. gr. 0.9268; b.p. 117.5°C; flash point 75°F; vapor pressure 15.4 mm at 20°C.

Hazard: Flammable, dangerous fire risk. Moderately toxic irritant to skin.

N,N-dimethyl-2,2-diphenylacetamide. See diphenamid.

dimethylenemethane. See allene.

dimethylethanolamine. See dimethylaminoethanol.

dimethyl ether (methyl ether; methyl oxide; wood ether) CH_3OCH_3 .

Properties: Colorless, compressed gas, or liquid; soluble in water and alcohol. Sp. gr. 0.661; b.p. –24.5°C; f.p. –141.5°C; flash point –42°F. Autoignition temp. 662°F. Soluble in water and organic solvents.

Derivation: By dehydration of methanol.

Grades: Technical; 99.5%.

Containers: 25-, 50-, 100-, and 150-lb pressure cylinders.

Hazard: Highly flammable. Dangerous fire and explosion hazard.

Uses: Refrigerant; solvent; extraction agent; propellant for sprays; chemical (reaction medium); catalyst and stabilizer in polymerization.

Shipping regulations: (Rail) Red gas label. (Air) Flammable Gas label. Not acceptable on passenger planes.

dimethyl ethyl carbinol. See tert-amyl alcohol.

dimethylethylene. See butene-2.

sym-dimethylethylene glycol. See 2,3-butylene glycol.

O,O-dimethyl S-2-(ethylsulfanyl)ethyl phosphorothioate (oxydemetonmethyl) $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{SC}_2\text{H}_5\text{SOC}_2\text{H}_5$.

Properties: Amber liquid; b.p. 106°C (0.01 mm); sp. gr. 1.28 (20/4°C); soluble in water in all proportions.

Hazard: Toxic. Cholinesterase inhibitor. Use may be restricted.

Use: Systemic insecticide.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail) Poison label. (Air) Poison label. Not accepted on passenger planes.

dimethyl ferrocenoate (1,1'-ferrocene dicarboxylic acid dimethyl ester) $(\text{C}_5\text{H}_4\text{COOCH}_3)_2\text{Fe}$.

Properties: Orange crystalline solid; m.p. 114–115°C. See also ferrocene.

N,N-dimethylformamide (DMF) $\text{HCON}(\text{CH}_3)_2$.

Properties: Water-white liquid; a dipolar aprotic solvent; b.p. 152.8°C; f.p. –61°C; refractive index (n_D²⁵) 1.4269; sp. gr. 0.953–0.954 (15.6/15.6°C). Flash point 136°F; autoignition temp. 833°F. Miscible with water and most organic solvents (except halogenated hydrocarbons). Combustible.

Derivation: Reaction of methyl formate with dimethylamine.

Containers: 55-gal drums; tank cars; tank trucks.

Hazard: Strong irritant to skin and tissue. Tolerance, 10 ppm in air. Moderate fire risk.

Uses: Solvent for vinyl resins and acetylene, butadiene, acid gases; catalyst in carboxylation reactions; organic synthesis.

dimethylfuran $\text{OC}(\text{CH}_3)\text{CHCH}(\text{CH}_3)$.

Properties: Colorless liquid; insoluble in water; sp. gr. 0.8900; b.p. 94°C; flash point 45°F; low toxicity.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: Flammable liquid, n.o.s. (Rail) Red label. (Air) Flammable Liquid label.

dimethyl glycol phthalate $\text{C}_6\text{H}_4(\text{COOCH}_2\text{CH}_2\text{OCH}_2)_2$.

Properties: Colorless liquid; sp. gr. 1.17; b.p. 230°C. Combustible.

Uses: Solvent mixtures for cellulose esters; plasticizing mixtures for cellulose esters.

dimethylglyoxal. See diacetyl.

dimethylglyoxime (butane dioxime)

$\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{NOH})\text{CH}_3$.

Properties: White crystals or powder; m.p. 204–242°C; soluble in alcohol and ether; very slightly soluble in water.

Uses: Analytical chemistry, especially as a reagent for nickel; biochemical research.

2,6-dimethyl-4-heptanol (diisobutylcarbinol)

$[(\text{CH}_3)_2\text{CHCH}_2]_2\text{CHOH}$.

Properties: Colorless liquid; refractive index 1.423 (21°C); sp. gr. 0.8121 (20°C); f.p., sets to glass below –65°C; b.p. 178°C (750 mm); insoluble in water; soluble in alcohol and ether. Flash point (TOC) 162°F. Combustible. Low toxicity.

Containers: Drums; tank cars.

Uses: Surface-active agents; lubricant additives; rubber chemicals; flotation agents; antifoam agent.

2,6-dimethyl-4-heptanone. See diisobutyl ketone.

2,6-dimethyl-5-hepten-1-ol

$(\text{CH}_3)_2\text{C}:\text{CH}(\text{CH}_2)_2\text{CH}(\text{CH}_3)\text{CHO}$.

Properties: Yellow liquid; moderately stable, but not likely to cause discoloration. Sp. gr. 0.845–0.855 (25/25°C); refractive index 1.441–1.447 (20°C); flash point (TCC) 144°F. Soluble in 2 parts of 70% alcohol. Combustible.

Use: Perfumery.

2,6-dimethylheptene-3

$(\text{CH}_3)_2\text{CHCH}:\text{CHCH}_2\text{CH}(\text{CH}_3)_2$. Mixed cis and trans isomers.

Properties: Liquid; distillation range 128 to 129°C; sp. gr. (60/60°F) 0.722; refractive index (20/D) 1.412; flash point 70°F (TOC).

Grade: 95%.

Containers: Bottles; 5-gal drums.

Hazard: Flammable, dangerous fire risk.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,5-dimethylhexadiene-1,5 (dimethallyl)

$\text{CH}_2:\text{C}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{C}(\text{CH}_3):\text{CH}_2$.

Properties: Water-white liquid with hydrocarbon odor; sp. gr. 0.740–0.760 (25/25°C); refractive index 1.426–1.429 (25°C); ASTM distillation, 90% between 114–123°C; soluble in hydrocarbons; insoluble in water. Flash point 56°F.

Hazard: Flammable, dangerous fire risk.

Use: Solvent.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

2,5-dimethylhexane 2,5-dihydroperoxide

$(\text{CH}_3)_2\text{C}(\text{OOH})\text{CH}_2\text{CH}_2\text{C}(\text{OOH})(\text{CH}_3)_2$.

Properties: Fine powder; 90% peroxide. M.p. 102–104°C; insoluble in hydrocarbons; slightly soluble in water; soluble in alcohols.

Hazard: Dangerous fire risk; strong oxidizing agent; store away from organic materials.

Use: High-temperature catalyst for polyester premix compounds and silicone resins.

Shipping regulations: (Rail) (dry) Not accepted; (wet) Yellow label. (Air) (dry or wet with less than 30% water by weight), Not acceptable; (wet with not less than 30% water by weight), Organic Peroxide label. Not acceptable on passenger planes.

dimethylhexanediol (2,5-dimethylhexane-2,5-diol)

$(\text{CH}_3)_2\text{COH}(\text{CH}_2)_2\text{COH}(\text{CH}_3)_2$.

Properties: White crystals; m.p. 88.5–89°C; b.p. 214–215°C; sp. gr. (20/20°C) 0.898. Soluble in water, acetone, and alcohol; insoluble in benzene, carbon tetrachloride, and kerosine. Combustible.

Containers: Fiber drums.

Uses: Chemical intermediate.

2,5-dimethylhexane-2,5-diperoxybenzoate

$\text{C}_6\text{H}_5\text{C}(\text{O})\text{OOC}(\text{CH}_3)_2\text{CH}_2\text{CH}_2\text{C}-$

$(\text{CH}_3)_2\text{OOC}(\text{O})\text{C}_6\text{H}_5$.

Properties: Fine white granules; m.p. 114°C; insoluble in alcohols and hydrocarbons; soluble in acetone and chlorinated hydrocarbons.

Hazard: Strong oxidant; fire risk in contact with organic materials.

Uses: Oxidizing agent; polymerization agent.

Shipping regulations: (Rail) Oxidizing material, n.o.s., Yellow label. (Air) Peroxides, organic, solid, n.o.s., Organic Peroxide label.

dimethylhexynediol (2,5-dimethyl-3-hexyne-2,5-diol)

$(\text{CH}_3)_2\text{COHC}\equiv\text{CCOH}(\text{CH}_3)_2$.

Properties: White crystals; m.p. 94–95°C; b.p. 205–206°C; sp. gr. (20/20°C) 0.949. Soluble in water; slightly soluble in benzene, carbon tetrachloride, naphtha; very soluble in acetone, alcohol, and ethyl acetate.

Uses: Wire-drawing lubricant; antifoaming agent; coupling agent in resin coatings; chemical intermediate.

dimethyl hexynol $\text{HC}:\text{CCOH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$ (3,5-dimethyl-1-hexyne-3-ol). A tertiary acetylenic alcohol.

Properties: Colorless liquid with camphor-like odor; b.p. 150–151°C; sets to a glass below –68°C; sp. gr. (20/20°C) 0.8545. Slightly soluble in water. Flash point 134°F (TOC). Combustible.

Containers: Drums.

Hazard: Moderate fire risk.

Uses: Stabilizer for chlorinated organic compounds; surface active agent; intermediate; solvent; lubricant.

5,5-dimethylhydantoin (DMH) $\text{HNCONHCOC}(\text{CH}_3)_2$.

Properties: White, crystalline solid; m.p. 178°C; soluble in water, alcohol, and ether.

Derivation: (a) From acetone, urea, and ammonium carbonate; (b) from acetone, potassium cyanate and hydrocyanic acid.

Hazard: Central nervous system depressant.

Uses: Synthesis; preparation of water-soluble polymers.

dimethylhydantoin-formaldehyde polymer.

Properties: Light-colored brittle resin containing 0.3% max. of formaldehyde; sp. gr. 1.30; softening point 59–80°C; dissolves readily in cold and hot water, methanol, ethyl acetate, methyl ethyl ketone, chloroform, methylene chloride, and hot glycerol; insoluble in benzene, xylene, diethyl ether, trichloroethylene, and carbon tetrachloride. Low toxicity.

Uses: Sizing; adhesives; blending agent; aerosol hair sprays.

1,1-dimethylhydrazine (CH₃)₂NNH₂. An unsymmetrical compound.

Properties: Colorless liquid with ammonia-like odor; f.p. –58°C; b.p. 63°C; sp. gr. 0.782 (25°C); soluble in water and alcohol. Flash point about 5°F; autoignition temp. 480°F.

Derivation: (a) Reaction of dimethylamine and chloramine; (b) catalytic oxidation of dimethylamine and ammonia.

Containers: Drums; tank cars.

Hazard: Highly toxic. Tolerance, 0.5 ppm in air. Absorbed by skin. Flammable, dangerous fire risk.

Uses: Component of jet and rocket fuels; chemical synthesis; stabilizer for organic peroxide fuel additives; absorbent for acid gases; photography; plant growth control agent.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Not acceptable on passenger planes.

dimethyl hydroquinone. See hydroquinone dimethyl ether.

dimethylhydroxybenzene. See xlenol.

dimethyl 3-hydroxyglutaconate dimethyl phosphate. See "Bomyl."

dimethylisopropanolamine (CH₃)₂NCH₂CH(OH)CH₃.

Properties: Colorless liquid. Sp. gr. 0.8645 (25/20°C); 7.4 lb/gal (20°C); b.p. 125.8°C; completely soluble in water; viscosity 1.51 cp (20°C); vapor pressure 9 mm (20°C); f.p. sets to glass below –85°C; refractive index 1.4189 (n_D 20/D); flash point 95°F (O.C.); solubility of water in compound, complete at 20°C. Low toxicity.

Hazard: Flammable, moderate fire risk.

Uses: Synthesis of methadone; other chemical syntheses. Combines the properties of tertiary amine and secondary alcohol.

dimethyl itaconate CH₂:C(COOCH₃)CH₂(COOCH₃).

Properties: White crystals with slight odor; m.p. 36°C; b.p. 91.5°C (10 mm); sp. gr. 1.27 (24°C); refractive index (n_D 20/D) 1.441. Slightly soluble in water. Combustible.

Uses: Polymers and copolymers; plasticizers; intermediate.

dimethylketol. See acetylmethylcarbinol.

dimethylketone. See acetone.

dimethyl maleate CH₃OOCCH:CHCOOCH₃.

Properties: Colorless liquid; sp. gr. 1.153; 9.62 lb/gal; b.p. 200.4°C; flash point 235°F. Combustible. Low toxicity.

dimethyl malonate CH₂(COOCH₃)₂.

Properties: Colorless liquid; b.p. 180–181°C; f.p. –62°C; refractive index 1.4140; flash point 194°F. Very slightly soluble in water; soluble in alcohol and ether. Combustible.

Containers: 55-gal steel drums.

Use: Chemical intermediate.

dimethylmethane. See propane.

2,6-dimethylmorpholine

Properties: Liquid; sp. gr. 0.99346; b.p. 146.6°C; f.p. –85°C; soluble in water; wt/gal 7.8 lb; flash point 112°F. Combustible.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Corrosion inhibitors; stabilizers for chlorinated solvents; rubless floor polishes, rubber accelerators, germicides, and textile finishing agents.

2-(2,6-dimethyl-4-morpholiniothio)benzothiazole

Properties: Cream to light-yellow powder; m.p. 88°C; sp. gr. 1.26 (25°C).

Use: Delayed-action vulcanization accelerator.

dimethyl- α -naphthylamine C₁₀H₇N(CH₃)₂.

Properties: Colorless liquid; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.045; b.p. 275°C.

Derivation: Action of methylsulfate on α -naphthylamine.

Grades: C.P.; analytical.

Containers: Glass bottles.

Use: Determination of nitrites.

dimethyl-beta-naphthylamine C₁₀H₇N(CH₃)₂.

Properties: Crystalline solid; soluble in alcohol and ether; insoluble in water; sp. gr. 1.039 (70/70°C); m.p. 46°C; b.p. 305°C.

Derivation: Interaction of dimethylamine and beta-naphthol.

dimethylnitrobenzene. See nitroxylenes.

O,O-dimethyl O-para-nitrophenyl phosphorothioate. See methyl parathion.

dimethyl nitrosamine. See N-nitrosodimethylamine.

N,N-dimethyl-para-nitrosoaniline (para-nitrosodimethylaniline) (CH₃)₂NC₆H₄NO.

Properties: Green leaflets. Soluble in alcohol and ether; insoluble in water; m.p. 93°C. Flammable.

Derivation: Nitrous acid and N-dimethylaniline.

Uses: Production of methylene blue; vulcanization accelerator.

Shipping regulations: (Rail) Flammable solid, n.o.s., Yellow label. (Air) Flammable solid label.

3,6-dimethyl-3,6-octanediol

Properties: White, waxy solid; m.p. 44°C; b.p. 241–242°C; sp. gr. (20/20°C) 0.919. Soluble in water, acetone, alcohol, benzene, carbon tetrachloride.

Uses: Non-foaming surface-active agent; chemical intermediate.

3,7-dimethyl-1,7-octanediol. See hydroxycitronellol.

dimethyloctanoic acid. See isodecanoic acid.

3,6-dimethyl-3-octanol

Properties: Colorless liquid; sweet odor; sp. gr. 0.8366 (20/20°C); refractive index 1.4370 (n_D 20/D); b.p. 202–203°C; freezing point –67.5°C. Combustible.

Uses: Perfumery (floral odors); flavoring.

3,7-dimethyl-1-octanol (tetrahydrogeraniol).

Properties: Colorless liquid, sweet odor. Soluble in mineral oil and in propylene glycol. Insoluble in glycerin. Refractive index 1.4350–1.4450 (20°C); sp. gr. 0.826–0.842 (25°C). Combustible.

Grade: F.C.C.

Uses: Flavoring agent; perfumery.

3,7-dimethyl-3-octanol. See tetrahydrolinalool.

2,6-dimethyl-1,5,7-octatriene. See ocimene.

2,6-dimethyl-2,4,6-octatriene. See alloocimene.

3,7-dimethyl-6-octenal. See citronellal.

3,7-dimethyl-6(or 7)-octen-1-ol. See citronellol.

dimethyloctynediol

$C_2H_5(CH_3)COHC \cdot CCOH(CH_3)C_2H_5$ (3,6-dimethyl-4-octyne-3,6-diol).

Properties: White crystals; m.p. 55–56°C; b.p. 222°C; sp. gr. (solid, 20°C) 0.923, (liquid, 60°C) 0.908. Moderately soluble in water; slightly soluble in kerosene; very soluble in acetone, alcohol, benzene, and carbon tetrachloride. Combustible.

Containers: Fiber drums.

Hazard: May be toxic.

Uses: Surface-active agent; intermediate.

dimethylol ethylene urea

$OCN(CH_2OH)CH_2CH_2N(CH_2OH)$. A cyclic urea, used in wrinkle-resistant textile finishes.

dimethylolethyltriazone

$OCN(CH_2OH)CH_2N(C_2H_5)CH_2N(CH_2OH)$. Used in wrinkle-resistant textile finishes.

dimethylolpropionic acid (DMPA: 2,2-bis(hydroxymethyl)-propionic acid) $CH_3C(CH_2OH)_2COOH$.

Properties: Off-white crystalline solid; m.p. 192–194°C. Soluble in water and methanol; slightly soluble in acetone and insoluble in benzene.

Uses: Water-soluble alkyd resins; textile finishing; cosmetics; plasticizers.

dimethylolurea (DMU; 1,3-bis(hydroxymethyl)urea) $CO(NHCH_2OH)_2$.

Properties: Colorless crystals; m.p. 126°C (tech. 85–90°C); sp. gr. (20°C) 1.34; slight formaldehyde odor; soluble in water and methanol; insoluble in ether; capable of polymerization.

Derivation: Combination of urea and formaldehyde in the presence of salts or alkaline catalysts.

Containers: 50-, 100-lb multiwall paper bags.

Hazard: Irritant to skin.

Uses: First stage of ureaformaldehyde resins; impregnating wood to increase hardness and fire resistance and to form self-binding laminations for plywood manufacture; permanent-press fabrics.

2,3-dimethylpentaldehyde

$CH_3CH_2CH(CH_3)CH(CH_3)CHO$. A branched-chain heptanal.

Properties: Liquid; sp. gr. 0.8293; b.p. 140.5°C (760 mm); f.p. –110°C; 6.91 lb/gal (20°C); flash point 94°F. Slightly soluble in water.

Hazard: Flammable, moderate fire risk.

Use: Intermediate.

2,4-dimethylpentane $(CH_3)_2CHCH_2CH(CH_3)_2$.

Properties: Colorless liquid; sp. gr. 0.6684 (25°C); b.p. 80.5°C; refractive index 1.382 (n_D 20); flash point 10°F; f.p. –119°C; soluble in alcohol; insoluble in water.

Grades: 95%; 99%; research, 99.7 mole %.

Hazard: Flammable, dangerous fire hazard.

Use: Organic synthesis.

Shipping regulations: Flammable liquid, n.o.s. (Rail) Red label (Air) Flammable Liquid label.

Note: Other isomers (2,2-, 2,3-, 3,3-) of closely similar properties are available.

2,4-dimethylpentanol-3. See diisopropyl carbinol.

2,4-dimethylpentanone-3. See diisopropyl ketone.

alpha, alpha-dimethylphenethyl acetate (dimethylbenzylcarbinyl acetate) $C_6H_5CH_2C(CH_3)_2OOCCH_3$.

Properties: Colorless liquid; floral, fruity odor. Solidifies at room temperature. Soluble in mineral oil; insoluble in glycerin. Refractive index 1.4910–1.4950 (20°C) in supercooled liquid form; sp. gr. 0.995–1.002 in supercooled liquid form; m.p. 29–30°C. Combustible. Nontoxic.

Grade: F.C.C.

Use: Flavoring agent.

dimethylphenol. See xlenol.

dimethyl-para-phenylenediamine. See para-aminodimethylaniline.

N,beta-dimethylphenylethylamine. See phenylpropylmethylamine.

2,3-dimethyl-1-phenyl-3-pyrazolin-5-one. See antipyrine.

dimethyl phosphite $(CH_3O)_2P(O)H$.

Properties: Mobile, colorless liquid; mild odor; sp. gr. 1.200 (20/4°C); refractive index 1.400 (25/D); b.p. 72–73°C (25 mm); flash point 205°F. Soluble in water, and miscible with most common organic solvents. Combustible.

Containers: 55-gal drums.

Uses: Lubricant additives; intermediate; adhesive.

O,O-dimethyl phosphorochloridothioate (methyl PCT) $(CH_3O)_2P(S)Cl$.

Properties: Colorless to light amber liquid; b.p. 66–67°C (16 mm); sp. gr. 1.320 (25°C); refractive index 1.4795 (n_D 25/D). Soluble in alcohol, benzene, acetone, carbon tetrachloride, chloroform, ethyl acetate; slightly soluble in hexane; insoluble in water.

Grades: 96–100% purity.

Hazard: Toxic; strong irritant to eyes, skin, and mucous membranes. Cholinesterase inhibitor. Use may be restricted.

Uses: Intermediate for insecticides, pesticides, fungicides; oil and gasoline additives; plasticizers; corrosion inhibitors; flame retardants; flotation agents.

Shipping regulations: Organic phosphate, liquid, n.o.s., (Rail, Air) Poison label. Not accepted on passenger planes.

dimethyl phthalate $C_6H_4(COOCH_3)_2$.

Properties: Colorless, odorless liquid; refractive index 1.5138 (25°C); heat of combustion 5769 cal/g; sp. gr. 1.189 (25/25°C); b.p. 282°C; flash point 300°F; wt gal 9.93 lb (68°F); vapor pressure <0.1 mm (20°C). Miscible with common organic solvents; insoluble in water. Combustible; autoignition temp. 1032°F.

Grade: Technical.

Containers: 55-gal drums; tank cars; tank trucks.

Hazard: Toxic by ingestion and inhalation; irritant. Tolerance, 5 mg per cubic meter of air.

Uses: Plasticizer for nitrocellulose and cellulose acetate, resins, rubber and in solid rocket propellants; lacquers; plastics; rubber; coating agents; safety glass; molding powders; insect repellent; perfumes.

N,N'-dimethylpiperazine (1,4-dimethylpiperazine) $(CH_3)_2C_4H_8N_2$.

Properties: Colorless, mobile liquid. Sp. gr. (20/4°C) 0.8565; b.p., 131°C; f.p. –1°C; flash point (TOC) 176°F. Combustible.

Uses: Curing agent for polyurethane foams; intermediate for cationic surface-active agents.

Note: Two other isomers are available: *cis*-2,5- and *trans*-2,5-, neither is flammable, but both are combustible. Toxicity presumed low.

2,6-dimethylpiperidine (2,6-lupetidine) $(\text{CH}_3)_2\text{C}_5\text{H}_9\text{NH}$. Properties: Liquid. B.p. 127.9°C; sp. gr. (20/20°C) 0.8199; refractive index 1.4383 (*n* 20/D); soluble in water at 20°C in all proportions. Combustible. Use: Intermediate.

dimethylpolysiloxane. A liquid defoaming agent; refractive index 1.40; viscosity 300 centistokes. Use in foods limited to 10 ppm (0 in milk).

dimethyl-POPOP. See 1,4-bis[2-(4-methyl-5-phenyl-oxazolyl)]benzene.

2,2-dimethylpropane. See neopentane.

2,2-dimethyl-1,3-propanediol See neopentyl glycol.

dimethylpyridine. See lutidine.

2,7-dimethylquinoline $(\text{CH}_3)_2\text{C}_9\text{H}_7\text{N}$.

Properties: Liquid. F.p. -40°C (approx.); distillation range 140–150°C (20 mm); soluble in benzene and diethyl ether. Combustible.

Uses: Organic synthesis; dye intermediate.

dimethyl resorcinol. See resorcinol dimethyl ether.

dimethyl sebacate $[(\text{CH}_2)_8\text{COOCH}_3]_2$.

Properties: Liquid, water-white; sp. gr. 0.9896 (25/20°C); m.p. 24.5°C; flash point 293°F; b.p. approx. 294°C; refractive index 1.4376 (20°C). Combustible.

Grade: Technical.

Containers: Cans; tank cars.

Uses: Solvent or plasticizer for nitrocellulose, vinyl resins; intermediate.

dimethyl silicone. General term for a family of silicones of composition $[(\text{CH}_3)_2\text{SiO}]_x$, the more volatile materials formed on hydrolysis of dimethyldichlorosilane. Colorless oils with b.p. ranging from 134°C (760 mm) (for *x* = 3) to 188°C (20 mm) (for *x* = 9).

dimethyl sulfate (methyl sulfate) $(\text{CH}_3)_2\text{SO}_4$.

Properties: Colorless liquid. Soluble in alcohol and ether; soluble in water. Sp. gr. 1.3516; f.p. -26.8°C; b.p. 188°C (dec). Flash point 182°F (closed cup); combustible.

Derivation: By adding fuming sulfuric acid to methyl alcohol and distilling in vacuo.

Grade: Technical.

Containers: Returnable drums; tank cars.

Hazard: Strong irritant; absorbed by skin. May be carcinogenic. Induces tumors in animals. Protective clothing required. Safety Data Sheet available from Mfg. Chemists Assn., Washington, D.C.

Use: Methylating agent for amines and phenols.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

dimethyl sulfide (methyl sulfide) $(\text{CH}_3)_2\text{S}$.

Properties: Colorless volatile liquid; disagreeable odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.845 (20°C); f.p. -83°C; b.p. 37.5°C. Evolves sulfur dioxide when heated. Autoignition temp. 403°F. Flash point 0°F.

Derivation: (a) From kraft pulping black liquor, by heating with inorganic sulfur compounds; (b) by interaction of a solution of potassium sulfide and methyl chloride in methanol.

Containers: Drums.

Hazard: Flammable. Dangerous fire risk; moderate

explosion risk. Probably highly toxic. Flammable limits in air 2.2 to 19.7%.

Uses: Gas odorant; solvent for many inorganic substances; catalyst impregnator.

Shipping regulations: (Rail) Red label. (Air) Flammable Liquid label. Legal label name, methyl sulfide.

dimethylsulfonyloxybutane. See busulfan.

dimethyl sulfoxide (methyl sulfoxide; DMSO) $(\text{CH}_3)_2\text{SO}$.

Properties: Colorless hygroscopic liquid; b.p. 189°C; m.p. 18.5°C; sp. gr. 1.01 (20/20°C); specific heat 0.7; flash point 203°F (open cup); dielectric constant 48.9 (20°C). Nearly odorless; slightly bitter taste; miscible with water. Readily penetrates skin and other tissues. Combustible. Extremely powerful aprotic solvent.

Derivation: Oxidation of dimethyl sulfide with nitrogen tetroxide under anhydrous conditions; sulfide waste liquors.

Containers: Drums; tank cars.

Hazard: Harmful if ingested; must be applied to surface of skin only. Must comply with FDA regulations.

Uses: Solvent for polymerization and cyanide reactions; analytical reagent; spinning polyacrylonitrile and other synthetic fibers; industrial cleaners, pesticides, paint stripping; hydraulic fluids; preservation of cells at low temperatures; diffusion of drugs, etc., into blood stream by topical application; medicine; plant pathology and nutrition; pharmaceutical products.

dimethyl terephthalate (DMT) $\text{C}_6\text{H}_4(\text{COOCH}_3)_2$.

Properties: Colorless crystals; m.p. 140°C; sublimes above 300°C; insoluble in water; soluble in ether and hot alcohol.

Derivation: Oxidation of para-xylene or mixed xylene isomers, followed by esterification.

Uses: Polyester resins for film and fiber production, especially polyethylene terephthalate; intermediate.

dimethyl 2,3,5,6-tetrachloroterephthalate.

$\text{C}_6\text{Cl}_4(\text{COOCH}_3)_2$.

Properties: Crystals; m.p. 156°C. Insoluble in water; slightly soluble in acetone and benzene.

Use: Herbicide.

3,5-dimethyltetrahydro-1,3,5(2H)-thiadiazine-2-thione $\text{C}_5\text{H}_{10}\text{N}_2\text{S}_2$.

Properties: Crystals; m.p. 100°C; sp. gr. 1.30 (68°F). Slightly soluble in water and alcohol; soluble in acetone.

Hazard: Toxic by ingestion and inhalation. Tolerance, 15 mg per cubic meter of air.

Uses: Herbicide; nematocide; preservative for adhesives and proteinaceous additives.

See also "Crag."

dimethyltin dichloride $(\text{CH}_3)_2\text{SnCl}_2$.

Properties: White crystals; m.p. 106–108°C; soluble in water, alcohol, hydrocarbons.

Hazard: Highly toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Electroluminescence; PVC stabilizer; catalyst.

dimethyltin oxide $(\text{CH}_3)_2\text{SnO}$.

Properties: White powder, 98.5% min. purity.

Hazard: Highly toxic. Tolerance, 0.1 mg per cubic meter of air.

Uses: Intermediate; PVC stabilizer.

N,N'-dimethylurea (DMU; sym-dimethylurea; 1,3-dimethylurea) $(\text{CH}_3\text{NH})_2\text{CO}$.

Properties: Colorless prisms; sp. gr. 1.14; m.p. 106°C;

b.p. 270°C; soluble in water and alcohol; insoluble in ether.

Use: Intermediate in synthesis of drugs.

1,3-dimethylxanthine. See theophylline.

3,7-dimethylxanthine. See theobromine.

dimetilan. Generic name for 1-dimethylcarbamoyl-5-methyl-3-pyrazolyl dimethylcarbamate.

Properties: Solid; m.p. 68–71°C. Soluble in water and most organic solvents.

Hazard: Toxic by ingestion and inhalation.

Use: Insecticide.

"Dimocillin-RT."⁴¹² Trademark for buffered sodium methicillin.

dimolybdenum trioxide. See molybdenum sesquioxide.

"Di-MōN."⁹³ Trademark for modified diammonium phosphate. Used as a low cost source of phosphorus and nitrogen as nutrients in biological waste treatment.

dimyristyl amine (ditetradecylamine) ($C_{14}H_{29}$)₂NH. Solid; m.p. 52°C; sp. gr. 0.89. Almost insoluble in water.

Use: Intermediate.

dimyristyl ether (ditetradecyl ether) ($C_{14}H_{29}$)₂O.

Properties: Liquid. M.p. 38–40°C; b.p. 238–248°C (4 mm); sp. gr. 0.8127 (45/4°C). Combustible. Low toxicity.

Grade: 95% (min.) purity.

Uses: Electrical insulators; water repellents; lubricants in plastic molding; antistatic substances; chemical intermediates.

dimyristyl sulfide (ditetradecyl sulfide; dimyristyl thioether) ($C_{14}H_{29}$)₂S.

Properties: Solid; m.p. 49–50°C; b.p. decomposes; sp. gr. 0.8258 (50/4°C).

Grade: 95% (min.) purity.

Use: Organic synthesis (formation of sulfonium compounds).

N,N'-di-beta-2-naphthyl-meta-phenylenediamine $C_{6}H_4(NHC_{10}H_7)_2$.

Properties: Colorless needles; m.p. 191°C; sparingly soluble in alcohol; insoluble in water and ether.

Derivation: By heating meta-phenylenediamine with beta-naphthol and extraction with alcohol.

Use: Organic synthesis.

N,N'-di-beta-naphthyl-para-phenylenediamine (sym-di-beta-naphthyl-para-phenylenediamine; DNPD) $C_{6}H_4(NHC_{10}H_7)_2$.

Properties: Gray powder; sp. gr. 1.25; set point 225°C (min); purity 98% (min); insoluble in water, slightly soluble in acetone and chlorobenzene.

Uses: Antioxidant; stabilizer; polymerization inhibitor; intermediate in organic synthesis.

dinitraniline orange (Permanent Orange). A pigment made from dinitroaniline and beta-naphthol. It is a reddish shade orange that has excellent light-fastness.

Hazard: Probably toxic by ingestion.

dinitroaminophenol. See picramic acid.

2,4-dinitroaniline (2,4-dinitraniline) $C_6H_3NH_2(NO_2)_2$.

Properties: Yellow crystals; slightly soluble in alcohol; insoluble in water. S. gr. 1.615; m.p. 188°C. Flash point 435°F. Combustible.

Derivation: Nitration of para-nitroaniline with hot mixed acid.

Grades: Technical; pure.

Hazard: Toxic by ingestion and inhalation; strong irritant.

Use: Intermediate for azo pigments; toner pigment in printing inks; corrosion inhibitor.

Shipping regulations: (Liquid) (Air) Poison label.

2,4-dinitroanisole (2,4-dinitrophenyl methyl ether)

$CH_3OC_6H_3(NO_2)_2$.

Properties: Colorless to yellow monoclinic needles from water or alcohol; m.p. 88°C; sp. gr. 1.341 (20/4°C), sublimes; slightly soluble in hot water; soluble in alcohol and ether.

Hazard: Probably toxic by ingestion.

Use: Ovicide, effective against moths, furniture and carpet beetles, cockroaches, and body lice.

dinitrobenzene $C_6H_4(NO_2)_2$. Meta, ortho and para isomers.

Properties: Yellow crystals; soluble in benzene; slightly soluble in water. Sp. gr.: meta 1.546, ortho 1.565, para 1.6; m.p. meta 89.9°C, ortho 117.9°C, para 172–173°C; b.p. meta 302.8°C, ortho 319°C, para 299°C.

Derivation: Nitration of nitrobenzene with hot mixed acid.

Method of purification: Crystallization.

Grades: Technical.

Hazard: Toxic by inhalation and ingestion; strong irritant. Tolerance, 1 mg per cubic meter of air. Absorbed by skin.

Uses: Organic synthesis; dyes; camphor substitute in celluloid production.

Shipping regulations: (Rail, Air) Poison label.

5,7-dinitro-1,2,3-benzoxadiazole. See diazodinitrophenol.

3,5-dinitrobenzoyl chloride $(NO_2)_2C_6H_3COCl$.

Properties: Yellow crystals; m.p. 66–68°C; b.p. 196°C (12 mm); decomposed by water and alcohol.

Hazard: May be toxic and irritant.

Use: Reagent.

2-(2,4-dinitrobenzyl)pyridine $C_5H_5NCH_2C_6H_3(NO_2)_2$. Behaves photochromically. Used to make plastics sensitive to light. See photochromism.

2,4-dinitro-6-sec-butylphenol. (2-sec-butyl-4,6-dinitrophenol; dinoseb; DNBP).

$CH_3(C_2H_5)CHC_6H_3(NO_2)_2OH$.

Properties: Reddish brown liquid, slightly soluble in water, soluble in alcohol and other organic solvents.

Forms salts with metals and organic bases.

Hazard: Highly toxic; absorbed by skin. Possible fire risk. Strong irritant.

Uses: Insecticide and ovicide, but must be used in the dormant growth season or as a salt form to reduce toxicity. Also as herbicide for preemergence treatment; increases yield of corn 5 to 10%.

Shipping regulations: (Air) Poison label. Legal label name dinoseb.

dinitrochlorobenzol. Label name for dinitrochlorobenzene.

dinitrochlorobenzene. See 1-chloro-2,4-dinitrobenzene.

4,6-dinitro-ortho-cresol (4,6-dinitro-2-methylphenol)

$CH_3C_6H_3(NO_2)_2OH$.

Properties: Yellow solid; m.p. 85.8°C; slightly soluble in water.

Hazard: Highly toxic; absorbed by skin. Tolerance, 0.2 mg per cubic meter of air. Use may be restricted.

Use: Dormant ovicidal spray for fruit trees (highly phytotoxic and cannot be used successfully on actively growing plants).

Shipping regulations: (Air) Poison label.

2,6-dinitro-para-cresol (DNPC) $(\text{NO}_2)_2\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.
Light yellow crystalline solid.

Grade: Presscake (36–43% active 2,6-DNCP)

Hazard: Probably toxic.

Uses: Parent compound for intermediates, dyes and pharmaceuticals.

dinitrocyclohexylphenol. (2-cyclohexyl-4,6-dinitrophenol; dinitro-ortho-cyclohexylphenol; DNOCHP)
 $\text{C}_6\text{H}_{11}\text{C}_6\text{H}_2(\text{NO}_2)_2\text{OH}$.

Properties: Crystalline solid.

Hazard: Probably toxic.

Use: Control of mites on citrus fruits.

3,5-dinitro-2,6-dimethyl-4-tert-butylacetophenone. See musk ketone.

2,4-dinitrofluorobenzene (1-fluoro-2,4-dinitrobenzene)
 $\text{C}_6\text{H}_3\text{F}(\text{NO}_2)_2$.

Properties: Crystals; soluble in ether, benzene, propylene glycol; m.p. 26°C; b.p. 137°C.

Use: Reagent in protein analysis.

dinitrogen tetroxide. See nitrogen dioxide.

dinitrogen trioxide. See nitrogen trioxide.

dinitroglycol. See diethylene glycol dinitrate.

2,4-dinitro-4-hydroxydiphenylamine

$(\text{NO}_2)_2\text{C}_6\text{H}_3\text{NHC}_6\text{H}_4\text{OH}$.

Properties: Yellow solid; m.p. 190°C; insoluble in water.

Derivation: Condensation of 2,4-dinitro-1-chlorobenzene and para-aminophenol.

2,6-dinitro-3-methoxy-4-tert-butyltoluene. See musk ambrette.

dinitro(1-methylheptyl)phenyl crotonate. See dinocap.

4,6-dinitro-2-methylphenol. See 4,6-dinitro-ortho-cresol.

dinitronaphthalene $\text{C}_{10}\text{H}_6(\text{NO}_2)_2$. Isomers: (a) 1,5-; (b) 1,8-.

Properties: (a) Yellowish-white needles, (b) yellowish-white, thick, crystalline tablets. M.p. (a) 217°C; (b) 172°C. (a) Sparingly soluble in pyridine; (b) soluble in pyridine. B.p. (a) sublimes; (b) decomposes.

Derivation: By dissolving alpha-nitronaphthalene in sulfuric acid and adding nitric acid.

Method of purification: Crystallization.

Hazard: Probably toxic. Moderate fire and explosion risk.

Uses: Dyes, especially sulfur colors; intermediates.

2,4-dinitro-1-naphthol-7-sulfonic acid (flavianic acid)
 $\text{C}_{10}\text{H}_6\text{O}_8\text{N}_2\text{S}$.

Properties: Yellow needles; m.p. 151°C; very soluble in water.

Hazard: Probably toxic.

Uses: Intermediate; precipitant for organic bases; reagent for amino acids.

dinitrophenol $\text{C}_6\text{H}_3\text{OH}(\text{NO}_2)_2$. Commercial product is usually mixture of 2,3-, 2,4-, and 2,6-isomers.

Properties: Yellow crystals. (2,3) sp. gr. 1.681; m.p. 144°C. (2,4) sp. gr. 1.683; m.p. 114–115°C. (2,6) m.p. 63°C. Soluble in alcohol and ether, also benzene and chloroform; slightly soluble in water.

Derivation: (a) By heating phenol with dilute sulfuric acid, cooling the product, and then nitrating, keeping the temperature below 50°C. (b) By nitration with mixed acid with careful temperature control.

Method of purification: Crystallization.

Hazard: Highly toxic; absorbed by skin. Dust inhalation may be fatal. Severe explosion hazard when dry.

Uses: Dyes, especially sulfur colors; picric acid; picramic acid; preservation of lumber; manufacture of the photographic developer diaminophenol hydrochloride; explosives manufacture.

Shipping regulations: (Solutions) (Rail, Air) Poison label. (Dry, or wet with less than 15% water) (Air) Not acceptable; (Wet with not less than 15% water) (Air) Flammable Solid label.

2,4-dinitrophenylhydrazine $(\text{NO}_2)_2\text{C}_6\text{H}_3\text{NHNH}_2$.

Properties: Red, crystalline powder; m.p. about 200°C. Slightly soluble in water and alcohol; soluble in moderately dilute inorganic acids; readily soluble in diglyme.

Hazard: Severe explosion and fire risk.

Uses: Explosive; reagent.

Shipping regulations: (Air) (dry or wet with less than 10% water), Not acceptable; (wet with not less than 10% water), Flammable Solid label. (Rail) Consult authorities.

2,4-dinitrophenyl methyl ether. See 2,4-dinitroanisole.

3,5-dinitrosalicylic acid $\text{C}_6\text{H}_2(\text{OH})(\text{NO}_2)_2\text{COOH}$.

Properties: Yellow crystals; slightly soluble in water; soluble in alcohol and benzene; m.p. 174°C.

Derivation: Nitration of salicylic acid.

Use: Determination of glucose.

dinitrosopentamethylenetetramine (DNPT)

$(\text{NO})_2\text{C}_5\text{H}_{10}\text{N}_4$. A bicyclic compound.

Properties: Light cream-colored powder; decomposes in air at 190–200°C. Soluble in dimethyl formamide; somewhat soluble in pyridine, methyl ethyl ketone, and acetonitrile. Combustible.

Hazard: Moderate fire risk.

Use: Blowing agent for rubber and plastics.

2,4-dinitrosoresorcinol $\text{C}_6\text{H}_2(\text{OH})_2(\text{NO})_2 \cdot \text{H}_2\text{O}$.

Properties: Light-brown powder; m.p. 162–163°C. Decomposes, sometimes violently. Soluble in water and most organic solvents.

Grade: Technical (13.7%N).

Hazard: Severe explosion risk when shocked or heated. Toxic and irritant.

Uses: Chelation of heavy metals; cross-linking agent; blasting caps and explosive primers.

Shipping regulations: (Rail) Consult regulations. (Air) Explosives, n.o.s., Not acceptable.

3,5-dinitro-ortho-toluamide. See zoalene.

dinitrotoluene (DNT) $\text{C}_6\text{H}_3\text{CH}_3(\text{NO}_2)_2$ (a) 2,4-; (b) 3,4-; (c) 3,5-.

Properties: Yellow crystals; soluble in alcohol and ether; very slightly soluble in water. Sp. gr. (a) 1.3208, (b) 1.32, (c) 1.277; m.p. (a) 70.5°C, (b) 61°C, (c) 92.3°C. A commercial grade consisting of a mixture of the three isomers in an oily liquid. Combustible.

Derivation: Nitration of nitrotoluene with mixed acid. Method of purification: Crystallization.

Containers: Drums; liquid, in heated tanks.

Hazard: Highly toxic; absorbed by skin. Tolerance, 1.5 mg per cubic meter of air. Moderate fire and explosion hazard. Safety Data Sheet available from Mfg. Chemists Assn., Washington, D.C.

Uses: Organic synthesis; toluidines; dyes; explosives.

Shipping regulations: (Liquid) (Air) Poison label.

dinocap. Generic name for 2-(2-methylheptyl)-4,6-dinitrophenyl crotonate.

$\text{CH}_3\text{CH}_2\text{CHCOOC}_6\text{H}_2(\text{NO}_2)_2\text{CH}(\text{CH}_3)\text{C}_6\text{H}_{13}$.

Properties: Brown liquid; b.p. 138–140°C (0.05 mm). Insoluble in water; soluble in most organic solvents.

Hazard: Probably toxic by ingestion and inhalation.
Uses: Acaricide; fungicide.

dinonyl adipate Ester of nonyl alcohol.

Properties: Colorless liquid; b.p. 201–210°C (1 mm); sp. gr. 0.926 (25°C); refractive index (n 20/D) 1.4523; viscosity 14.9 centistokes (100°F). Combustible. Low toxicity.

Use: Plasticizer where special low-temperature properties are desired.

dinonyl carbonate $(C_9H_{19})_2CO_3$. Ester of nonyl alcohol; colorless liquid; b.p. 135–140°C (0.3 mm); sp. gr. 0.894 (25°C); refractive index (n 20/D) 1.4427. Combustible. Low toxicity.

dinonyl ether $C_9H_{19}OC_9H_{19}$

Properties: Colorless liquid; b.p. 148–153°C (5 mm); sp. gr. 0.817 (25°C); refractive index (n 20/D) 1.4405. Can be made from nonyl alcohol plus nonyl halide by the Williamson synthesis. Combustible. Low toxicity.

dinonyl maleate $C_9H_{19}OOCCH:CHCOOC_9H_{19}$. Ester of nonyl alcohol; colorless liquid; b.p. 157–167°C (0.1 mm); sp. gr. 0.941 (25°C); refractive index (n 20/D) 1.4586; viscosity 6900 centistokes (–40°F), 17.47 centistokes (100°F), 3.50 centistokes (210°F). Combustible. Low toxicity.

dinonyl phenol $(C_9H_{19})_2C_6H_5OH$.

Properties: Colorless liquid; insoluble in water; soluble in common organic solvents. Combustible.

Hazard: May be toxic. See phenol.

Use: Solvent.

dinonyl phthalate (DNP) $C_6H_4(COOC_9H_{19})_2$. Ester of nonyl alcohol.

Properties: Colorless liquid. B.p. 205–220°C (1 mm); sp. gr. 0.979 (25°C); refractive index (n 20/D) 1.4871; viscosity 55.3 centistokes (100°F); flash point 420°F. Combustible. Low toxicity.

Uses: General-purpose low-volatile plasticizer for vinyl resins; pure grade as stationary liquid phase in chromatography.

dinoseb. Legal label name for 2,4-dinitro-6-sec-butylphenol (q.v.).

DIOA. Abbreviation for diisooctyl adipate.

dioctadecylamine. See distearylamine.

2,6-dioctadecyl-para-cresol. See 2,6-distearyl-para-cresol.

diotadecyl ether. See distearyl ether.

dioctadecyl sulfide. See distearyl sulfide.

3,3'-dioctadecyl thiodipropionate. See distearyl thiodipropionate.

dioctyl adipate. Now more exactly named di(2-ethylhexyl) adipate (q.v.).

dioctylamine. See di-2-ethylhexylamine.

dioctylaminoethanol. See di(2-ethylhexyl)ethanolamine.

dioctyl azelate. See di(2-ethylhexyl) azelate.

dioctyl chlorophosphate (dioctyl phosphorochloridate) $(C_8H_{17}O)_2P(O)Cl$.

Properties: Water-white liquid; sp. gr. 0.991 (25°C); refractive index 1.445 (n 25/D); decomposes on distillation; soluble in common inert organic solvents; insoluble in water. Combustible.

Hazard: Probably toxic.

Use: Intermediate; insecticide.

di(n-octyl, n-decyl)adipate (DNODA).

Properties: Clear, oily liquid; sp. gr. 0.912–0.920 (25/25°C); refractive index 1.443–1.447 (25°C). Combustible. Low toxicity.

Containers: Drums; tank cars.

Use: Low-temperature plasticizer.

di(n-octyl, n-decyl) phthalate (DNODP).

Properties: Clear, oily liquid; odor slight; acidity (as phthalic acid) 0.01% max; sp. gr. 0.968–0.977 (25/25°C); crystallizing point –30°C; b.p. 232–267°C (4 mm); flash point 426°F. Combustible. Low toxicity.

Containers: 5-, 55-gal drums; tank cars.

Uses: Plasticizer for polyvinyl chloride and other vinyls.

di-n-octyl diphenylamine $C_8H_{17}C_6H_4NHC_6H_4C_8H_{17}$.

Properties: Light tan powder; sp. gr. 0.99; m.p. 80–90°C. Soluble in benzene, gasoline, acetone, and ethylene dichloride; insoluble in water.

Use: Antioxidant for petroleum-based and synthetic lubricants and plastics.

dioctyl ether $(C_8H_{17})_2O$.

Properties: Liquid; f.p. –7°C; b.p. 291.7°C; sp. gr. 0.805 (17/4°C); refractive index 1.4329 (n 24/D). Combustible. Low toxicity.

Grades: 95% (min) purity.

Uses: Electrical insulator; water repellent; mold lubricant; antistatic agent; intermediate.

dioctyl fumarate. See di(2-ethylhexyl) fumarate.

dioctyl hexahydrophthalate. See di(2-ethylhexyl) hexahydrophthalate.

N,N'-di-n-octyl-para-phenylenediamine

$C_8H_4(NHC_8H_{17})_2$.

Properties: Colorless liquid; b.p. about 390°C; sp. gr. 0.912 (15°C); pour point –4°C; flash point (Pensky-Martin) 395°F; refractive index (n 20/D) 1.5129. Completely miscible in methanol, pentane and benzene; vapor pressure (absolute) 0.33 mm (150°C). Combustible. Low toxicity.

Containers: Steel drums, tank cars, tank trucks.

Uses: Antioxidant, antiozonant for gasoline, mercaptans, synthetic rubber.

dioctyl phosphite (dioctyl phosphonate) $(C_8H_{17}O)_2P(O)H$.

Properties: Water-white liquid; b.p. 150–155°C (2–3 mm); sp. gr. 0.929 (25°C); refractive index 1.4418 (n 25/D); soluble in common organic solvents. Combustible.

Uses: Solvent; antioxidant; intermediate.

dioctyl phosphoric acid. See di(2-ethylhexyl) phosphoric acid.

dioctyl phosphorochloridate. See dioctyl chlorophosphate.

dioctyl phthalate. See di(2-ethylhexyl) phthalate.

di(2-octyl) phthalate. See dicapryl phthalate.

dioctyl sebacate. See di(2-ethylhexyl) sebacate.

dioctyl sodium sulfosuccinate (di(2-ethylhexyl) sodium sulfosuccinate; sodium dioctyl sulfosuccinate)

$C_8H_{17}OOCCH_2CH(SO_3Na)COOC_8H_{17}$. An anionic surface-active agent.

Properties: White, wax-like solid with characteristic odor. Slowly soluble in water; freely soluble in alco-

hol and glycerin; very soluble in petroleum ether. Saponification value 240–253; stable in acid and neutral solutions; hydrolyzes in alkaline solutions. Low toxicity.

Derivation: By esterification of maleic anhydride with 2-ethylhexyl alcohol followed by addition of sodium bisulfite.

Hazard: Use in food products restricted.

Grade: N.F.; F.C.C.

Uses: Food additive (processing aid in sugar industry, stabilizer for hydrophilic colloids); wetting agent; dispersant; emulsifier.

dioctyl succinate. See di(2-ethyl hexyl) succinate.

dioctyl sulfide (dioctyl thioether) (C_8H_{17})₂S.

Properties: Liquid; m.p. 0.5°C ; b.p. 180°C (10 mm); sp. gr. 0.8419 (17/17°C); refractive index 1.4606 (n_{20/D}). Combustible.

Grades: 95% (min) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

dioctyl thioether. See dioctyl sulfide.

dioctyl thiopropionate. See 3,3'-(2-ethylhexyl) thiodi-propionate.

di(n-octyl)tin S,S' bis-isooctylmercaptoacetate. A heat stabilizer for PVC food packaging materials, especially for clear plastic bottles. Approved by FDA for all foods except malt beverages, carbonated soft drinks, milk and other dairy products.

"Diodoquin."⁷⁰ Trademark for diiodohydroquin (q.v.).

"Diodrast."¹⁶² Trademark for iodopyracet (q.v.).

"Diofan."⁴⁴⁰ Trademark for dispersions of vinylidene copolymers for paper coating.

diol. Synonym for glycol or dihydric alcohol.

diolefin. (diene; alkadiene). An aliphatic compound (olefin) containing two double bonds, e.g., butadiene.

"Dion."²⁴⁴ Trademark for a series of polyester resins. Uses: Translucent panel resins; surfacing, laminating, molding, and casting resins.

"Dionin."¹²³ Trademark for ethylmorphine hydrochloride. Hazard: Highly toxic by ingestion; narcotic and habit-forming.

"Dion" Polymercaptan Resins.²⁴⁴ Resins in which the mercaptan-terminated liquid polymers are capable of being crosslinked to form elastomers at ambient temperatures by the addition of organic or inorganic oxidizing agents. Uses: Sealants, caulking compounds, adhesives, molding compounds and coatings.

DIOP. Abbreviation for diisooctyl phthalate.

DIOS. Abbreviation for diisooctyl sebacate (q.v.).

1,4-dioxane (diethylene ether; 1,4-diethylene dioxide; diethylene oxide; dioxyethylene ether)
 $\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2$.

Properties: Colorless liquid; ethereal odor; stable; miscible with water and most organic solvents. B.p. 101.3°C ; f.p. $10\text{--}12^\circ\text{C}$; sp. gr. 1.0356 (20/20°C); wt/gal 8.61 lb (20°C); refractive index 1.4221 (20°C); flash point 65°F (ASTM open cup). Auto-ignition temp. 356°F .

Derivation: (a) Ethylene glycol by treatment with acid; (b) from beta, beta-dichloroethyl ether by treatment with alkali.

Grades: Reagent; technical; spectrophotometric; scintillation.

Containers: Drums; tank cars.

Hazard: Highly toxic by inhalation; absorbed by skin. Tolerance, 50 ppm in air. Flammable, dangerous fire risk. May form explosive peroxides (MCA).

Uses: Solvent for cellulose and wide range of organic products; lacquers; paints; varnishes; paint and varnish removers; wetting and dispersing agent in textile processing, dye baths, stain and printing compositions; cleaning and detergent preparations; cements; cosmetics; deodorants; fumigants; emulsions; polishing compositions; stabilizer for chlorinated solvents; scintillation counter.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

dioxathion. Generic name for para-dioxane-2,3-diyl ethyl phosphorodithioate $\text{C}_4\text{H}_6\text{O}_2[\text{SPS}(\text{OC}_2\text{H}_5)_2]_2$. Properties: Viscous brown liquid; f.p. -20°C ; density 1.257 g/ml (26°C); insoluble in water; soluble in organic solvents. The technical material is a mixture of cis and trans isomers.

Hazard: Toxic by inhalation and ingestion. Cholinesterase inhibitor. Use may be restricted.

Uses: Insecticide; miticide.

Shipping regulations: (Rail, Air) Organic phosphate, liquid, n.o.s. Poison label. Not accepted on passenger planes.

dioxin (2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD)). A toxic chlorinated hydrocarbon which occurs as an impurity in the herbicide 2,4,5-T. It can be removed by extraction with coconut charcoal. Its half-life in soil is about one year.

"Dioxitol."¹²⁵ Trademark for diethylene glycol monoethyl ether, b.p. 202°C ; sp. gr. 0.990 (20/20°C).

3,5-dioxo-1,2-diphenyl-4-n-butylpyrazolidine. See phenylbutazone.

dioxolane $\text{OCH}_2\text{CH}_2\text{OCH}_2$. A cyclic acetal.

Properties: Water-white liquid; soluble in water; stable under neutral or slightly alkaline conditions. Sp. gr. 1.065; b.p. 74°C ; flash point 35°F (open cup); vapor pressure 70 mm (20°C); wt/gal 8.2 lb (20°C). Derivation: Reaction of formaldehyde with ethylene glycol.

Hazard: Flammable, dangerous fire risk. Moderately toxic by inhalation and ingestion.

Use: Low-boiling solvent and extractant for oils, fats, waxes, dyes, and cellulose derivatives.

Shipping regulations: (Rail) Flammable liquid, n.o.s., Red label. (Air) Flammable Liquid label.

dioxolone-2. See ethylene carbonate.

dioxopurine. See xanthine.

dioxyanthraquinones. See dihydroxyanthraquinones.

dioxybenzenes. See dihydroxybenzenes.

dioxyethylene ether. See 1,4-dioxane.

dioxyline phosphate $\text{C}_{22}\text{H}_{25}\text{NO}_4 \cdot \text{H}_3\text{PO}_4$.

Properties: White crystalline, odorless solid with a bitter taste; soluble in water; melts (with decomposition) $197\text{--}199^\circ\text{C}$.

Use: Medicine.

dioxynaphthalenes. See dihydroxynaphthalenes.

DI OZ. Abbreviation for diisooctyl azelate.

DIPA. Abbreviation for diisopropanolamine.

"Dipac."²⁰⁴ Trademark for diisopropylbenzothiazyl-2-sulfenamide (q.v.).

dipalmitylamine (dihexadecylamine) $(C_{16}H_{33})_2NH$. Solid; m.p. $65^{\circ}C$; sp. gr. 0.83; slightly soluble in water.

Use: Intermediate.

"Dipan."⁵³⁰ Trademark for diphenylacetonitrile (q.v.).

"Di-Paralene" Hydrochloride.³ Trademark for chlorcyclizine hydrochloride.

"Dipaxin."³²⁷ Trademark for diphenadione (q.v.).

dipentaerythritol $(CH_2OH)_3CCH_2OCH_2C(CH_2OH)_3$. Occurs in technical pentaerythritol. An off-white, freeflowing powder. The molecule contains six primary hydroxyl groups, all esterifiable. M.p. $212-220^{\circ}C$; sp. gr. 1.33 ($25/4^{\circ}C$). Combustible. Low toxicity.

Use: Paints and coatings.

dipentamethylenethiuram tetrasulfide

Properties: Light gray powder; sp. gr. 1.53; m.p. $110^{\circ}C$ min. Soluble in chloroform, benzene, acetone; insoluble in water.

Use: Ultra-accelerator for rubber.

"Dipentek."¹³⁸ Trademark for dipentaerythritol, technical.

dipentene (cinene; limonene, inactive; *dl*-para-mentha-1,8-diene; cajeputene) $C_{10}H_{16}$. Commercial form is high in dipentene content, but also contains other terpenes and related compounds in varying amounts. Properties: Colorless liquid; lemon-like odor; sp. gr. ($15.5/15.5^{\circ}C$) 0.847; b.p. $175-176^{\circ}C$; refractive index 1.473 ($20^{\circ}C$); flash point $113^{\circ}F$ (closed cup); f.p. $-97^{\circ}C$; wt/gal 7.15 lb ($15.5^{\circ}C$). Autoignition temp. $458^{\circ}F$. Miscible with alcohol; insoluble in water. Combustible.

Derivation: (a) From various essential oils. (b) By close fractionation of wood turpentine. (c) By-product in making synthetic camphor. Generally low toxicity.

Grades: Steam-distilled; destructively distilled.

Containers: 30-, 55-gal drums; tank cars.

Hazard: Moderate fire risk. Moderately toxic.

Uses: Solvent for oleoresinous products, rosin, ester gum, alkyl resins, waxes, metallic soap driers, rubber, etc.; rubber compounding and reclaiming; dispersing agent for oils, resins, resin-oil combinations, pigments and driers; paints, enamels, lacquers, and varnishes; general wetting and dispersing agent; printing inks; perfumes; floor waxes and furniture polishes; synthetic resins, polyterpenes, chemicals.

"Dipentene 200."⁷⁹ Trademark for commercial steam-distilled dipentene (q.v.).

dipentene dioxide (limonene dioxide) $C_{10}H_{16}O_2$.

Properties: Liquid; sp. gr. 1.0287 ($20^{\circ}C$); b.p. $242^{\circ}C$; f.p. $-100^{\circ}C$; soluble in water.

Uses: Intermediate for plasticizers, epoxy resins; pharmaceuticals.

dipentene glycol. See terpin hydrate.

dipentene monoxide (limonene monoxide) $C_{10}H_{14}O$.

Properties: Liquid; sp. gr. 0.929 ($20^{\circ}C$); f.p. $-6^{\circ}C$; b.p. $75^{\circ}C$; flash point $152^{\circ}F$. Combustible.

Uses: Organic intermediate; epoxy resins.

"Dipentite."⁶² Trademark for diphenylpentaerythritol diphosphite (q.v.).

di-n-pentylamine. See di-n-amylamine.

2,5-di(tert-pentyl)hydroquinone. See 2,5-di(tert-amyl)-hydroquinone.

"Diphacin."⁵³⁶ Trademark for 2-diphenylacetyl-1,3-indandione. See diphenadione.

Uses: Rodenticide; anticoagulant.

diphacinone. Generic name for 2-diphenylacetyl-1,3-indandione; used as a rodenticide. See diphenadione.

Hazard: Harmful by ingestion.

diphemanil methyl sulfate (4-diphenylmethylene-1,1-dimethylpiperidinium methyl sulfate)

Properties: White bitter crystalline solid with faint characteristic odor. M.p. $189-196^{\circ}C$. Very slightly soluble in ether; slightly soluble in alcohol, chloroform, and water. Stable to heat and light; somewhat hygroscopic; pH (1% solution) 4.0-6.0.

Grade: N.F.

Use: Medicine.

diphenadione (2-diphenylacetyl-1,3-indanedione; diphacinone) $C_{23}H_{16}O_3$.

Properties: Yellow, odorless crystals or crystalline powder; m.p. $145-147^{\circ}C$. Practically insoluble in water, slightly soluble in acetone and in alcohol; soluble in benzene, ether, and in glacial acetic acid. Melting range: $144-150^{\circ}C$.

Grade: N.F.

Hazard: Harmful by ingestion. Inhibits blood clotting.

Uses: Medicine (anticoagulant); rodenticide.

diphenamid. Generic name for N,N-dimethyl-2,2-diphenylacetamide $(C_6H_5)_2CHCON(CH_3)_2$.

Properties: White solid; m.p. $134.5-135.5^{\circ}C$. Very slightly soluble in water; moderately soluble in acetone, dimethyl formamide, and phenyl "Cellosolve."

Hazard: Moderately toxic by ingestion.

Uses: Herbicide; plant growth regulator.

diphenatril. See diphenylacetonitrile.

diphenhydramine hydrochloride (2-benzhydryloxy)-N,N-dimethylethylamine hydrochloride

Properties: White, odorless, crystalline powder. Darkens slowly on exposure to light; m.p. $166-170^{\circ}C$. Solutions practically neutral to litmus paper. Freely soluble in acetone; very slightly soluble in benzene and ether.

Grades: U.S.P.

Hazard: Prescription only. Do not use with alcohol or other CNS depressants.

Use: Medicine (antihistamine).

diphenic acid (2,2'-biphenyldicarboxylic acid)

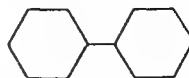

Properties: White needles; m.p. $228-229^{\circ}C$; soluble in hot water.

Uses: Synthesis of dyes, detergents, pharmaceuticals.

diphenolic acid. See 4,4-bis(4-hydroxyphenyl)pentanoic acid.

diphenyl (biphenyl) $C_6H_5-C_6H_5$. Several crystalline forms are known.

Properties: White scales; pleasant odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. approx.

l; m.p. 70°C; b.p. 256°C. Flash point 235°F; combustible.

Derivation: (a) By slowly passing benzene through a red hot iron tube. (b) By heating bromobenzene and sodium, with subsequent distillation.

Hazard: Toxic. Tolerance, 0.2 ppm in air.

Uses: Organic synthesis; heat-transfer agent; fungistat in packaging of citrus fruit; plant disease control; mfg. of benzidine; dyeing assistant for polyesters. See also chloridiphenyl.

diphenylacetic acid ($C_6H_5)_2CHCOOH$.

Properties: Colorless, odorless crystals; b.p. sublimes; m.p. 147.8–148.2°C; soluble in hot water, alcohol, ether, chloroform.

diphenylacetoneitrile (diphenatril) ($C_6H_5)_2CHCN$.

Properties: Yellow crystalline powder; m.p. 73–73.5°C; insoluble in water and very soluble in alcohol.

Uses: Preparation of diphenylacetic acid; synthesis of antispasmodics; herbicide.

diphenylacetylene. See tolan.

2-diphenylacetyl-1,3-indianedione. See diphenadione.

diphenylamine (DPA; N-phenylaniline) ($C_6H_5)_2NH$.

Properties: Colorless to grayish crystals. Soluble in carbon disulfide, benzene, alcohol, and ether; insoluble in water. Sp. gr. 1.159; m.p. 52.85°C; b.p. 302°C; flash point 307°F; autoignition temp. 1173°F; combustible.

Derivation: By heating equal formula weights of aniline and aniline hydrochloride in an autoclave. The product is boiled with dilute hydrochloric acid to remove the unaltered aniline, and the residue is distilled.

Grades: Technical; refined, flake and fused. Containers: 50-lb polyethylene-lined paper bags; fiber drums; tank trucks; tank cars.

Hazard: Toxic, absorbed by skin. Tolerance, 10 mg per cubic meter of air.

Uses: Rubber antioxidants and accelerators; solid rocket propellants; pesticides; dyes; pharmaceuticals; veterinary medicine; storage preservation of apples; stabilizer for nitrocellulose; analytical chemistry.

diphenylamine chloroarsine (adamsite; phenarsazine chloride; DM) $C_6H_5(AsCl)(NH)C_6H_5$.

Properties: Canary-yellow crystals. Sublimes readily. Sp. gr. 1.65; m.p. 195°C; b.p. 410°C (dec); insoluble in water; soluble in benzene, xylene, carbon tetrachloride.

Derivation: By heating diphenylamine with arsenic trichloride.

Hazard: Highly toxic by inhalation and ingestion; strong irritant.

Uses: Military poison gas; wood treating.

Shipping regulations: (Air) Poison label. Not accepted on passenger planes. (Rail) Tear gas label.

9,10-diphenylanthracene $C_{14}H_8(C_6H_5)_2$.

Properties: Crystals; m.p. 248–250°C; insoluble in water and alcohol; slightly soluble in toluene.

Grade: Purified.

Use: Primary fluor or wavelength shifter in solution scintillators.

1,4-diphenylbenzene. See terphenyl.

diphenylbenzidine $C_6H_5HNC_6H_4C_6H_4NHC_6H_5$.

Properties: White powder. Insoluble in water; slightly soluble in alcohol and aromatic hydrocarbons. Sensitive to light. M.p. 242°C.

Derivation: Diphenylamine and fuming sulfuric acid.

Containers: Glass bottles.

Hazard: May be carcinogenic. See benzidine.

Use: Determination of zinc and nitrites.

2,5-diphenyl-para-benzoquinone $C_6H_5C_6H_2O_2C_6H_5$.

Properties: Greenish-yellow solid; m.p. 210–214°C. Slightly soluble in styrene, benzene, acetone, and ethyl acetate.

Use: Polymerization inhibitor.

diphenylbromoarsine ($C_6H_5)_2AsBr$.

Properties: White crystals. M.p. 54–56°C.

Derivation: (a) Hydrobromic acid and diphenylarsenous oxide are heated together for about 4 hours at 115–120°C; (b) by action of arsenic tribromide on triphenyl arsine at 300–350°C.

Hazard: Highly toxic; strong irritant.

Shipping regulations: (Rail, Air) Arsenical compounds, solids, n.o.s., Poison label.

1,3-diphenyl-2-buten-1-one. See dynnone.

diphenylcarbazide (C_6H_5NHNH); CO.

Properties: White crystals or flakes. Insoluble in water; soluble in alcohol and benzene. M.p. 173°C. Decomposes in light.

Derivation: Phenylhydrazine and urea.

Use: Determination of copper and other metals.

diphenylcarbinol. See benzhydrol.

diphenyl carbonate ($C_6H_5O)_2CO$.

Properties: White, crystalline solid. Can be halogenated and nitrated in characteristic manner. Readily undergoes hydrolysis and ammonolysis. Soluble in acetone, hot alcohol, benzene, carbon tetrachloride, ether, glacial acetic acid and other organic solvents; insoluble in water. B.p. 302°C; m.p. 78°C; sp. gr. 1.1215 (87/4°C).

Grade: Technical.

Uses: Plasticizer and solvent; synthesis of polycarbonate resins.

diphenylchloroarsine ($C_6H_5)_2AsCl$.

Properties: Colorless crystals or dark-brown liquid, which slowly becomes semi-solid. Decomposed by water (slowly). Soluble in carbon tetrachloride, chloropicrin, phenyldichloroarsine; practically insoluble in water. Sp. gr. 1.363 (40°C) (solid), or 1.358 (45°C) (liquid); b.p. 333°C (in CO_2 atmosphere); m.p. 41°C.

Derivation: Benzene and arsenic trichloride are heated in presence of aluminum chloride.

Grade: Technical.

Hazard: Highly toxic by inhalation; strong irritant to tissue.

Use: Military poison gas.

Shipping regulations: (Rail) Tear Gas label. (Air) Poison label. Not accepted on passenger planes.

diphenyldecyl phosphite ($C_6H_5O)_2POC_{10}H_{21}$.

Properties: Nearly water-white liquid; sp. gr. 1.023 (25/15.5°C); m.p. 18°C; refractive index 1.5160 (n 25/D). Combustible.

Uses: Chemical intermediate; stabilizer for polyvinyl and polyolefin resins.

diphenyldichlorosilane ($C_6H_5)_2SiCl_2$.

Properties: Colorless liquid; b.p. 305°C; f.p. –22°C; sp. gr. 1.19 (20°C); refractive index (n 25/D) 1.5773; flash point (COC) 288°F. Readily hydrolyzed by moisture, with liberation of hydrochloric acid. Combustible.

Derivation: (a) Reaction of powdered silicon and chlorobenzene in the presence of copper powder as catalyst; (b) reaction of phenylmagnesium chloride with silicon tetrachloride.

Grade: Technical.

Hazard: Highly toxic; strong irritant to tissue.

Use: Intermediate for silicone lubricants.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

diphenyldi-n-dodecylsilane $(C_6H_5)_2Si(C_{12}H_{25})_2$.

Properties: Colorless oil.

Derivation: Reaction of didodecylchlorosilane with phenyl lithium.

Hazard: Probably toxic.

Use: High-temperature lubricant.

diphenyldimide. See azobenzene.

diphenyldimethoxysilane $(C_6H_5)_2Si(OCH_3)_2$.

Properties: Liquid; sp. gr. 1.080 (25°C); b.p. 191°C (53 mm); refractive index 1.5404 (25°C). Soluble in acetone, benzene, methyl alcohol; combustible.

Hazard: Probably toxic.

Uses: Treatment of powders, glass, paper, and fabrics.

diphenyleneimine. See carbazole.

alpha-diphenylenemethane. See fluorene.

diphenylene oxide (dibenzofuran) $C_{12}H_8O$ (tricyclic).

Properties: Crystalline solid; m.p. 87°C; b.p. 288°C; insoluble in water; slightly soluble in alcohol, ether and benzene.

Derived from coal-tar.

Hazard: Probably toxic.

Use: Insecticide.

1,1-diphenylethane. See uns-diphenylethane.

1,2-diphenylethane. See sym-diphenylethane.

uns-diphenylethane (1,1-diphenylethane)

$(C_6H_5)_2CHCH_3$.

Properties: Colorless liquid. Soluble in chloroform, ether, carbon disulfide. B.p. 286°C; sp. gr. 1.004 (20°C); f.p. -21.5°C. Flash point 264°F; combustible.

Derivation: Action of acetaldehyde on benzene in presence of concentrated sulfuric acid.

Uses: Solvent for nitrocellulose; organic synthesis.

sym-diphenylethane (bibenzyl; dibenzyl; 1,2-diphenylethane) $C_6H_5CH_2CH_2C_6H_5$.

Properties: White, crystalline needles or small plates. Soluble in alcohol, chloroform, ether, carbon disulfide; insoluble in water. Sp. gr. 0.9782; b.p. 284°C; m.p. 52°C.

Derivation: (a) By treating benzyl chloride with metallic sodium. (b) Action of benzyl chloride on benzylmagnesium chloride.

Use: Organic synthesis.

diphenyl ether. See diphenyl oxide.

diphenylethylene. See stilbene.

N,N-diphenylethylenediamine (ethyl diphenyldiamine) $C_6H_5NHCH_2CH_2NHC_6H_5$.

Properties: Cream-colored solid; sp. gr. 1.14; softening point 54°C; insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline.

Use: Antioxidant in rubber compounding.

diphenylglycolic acid. See benzoic acid.

diphenylguanidine (DPG; melaniline) $HN:C(NHC_6H_5)_2$.

Properties: White powder; bitter taste; slight odor; sp. gr. 1.13; m.p. 147°C; decomposes above 170°C; soluble in ethyl alcohol, carbon tetrachloride, chloroform, hot benzene and toluene; slightly soluble in water.

Derivation: Treatment of aniline with cyanogen chloride.

Uses: Basic rubber accelerator; primary standard for acids.

1,6-diphenylhexatriene (DPH)

$C_6H_5HC:CHCH:CHCCH:CHC_6H_5$.

Use: Wavelength shifter in solution scintillation counting.

diphenyl isophthalate (DPIP)

$C_6H_5OOC C_6H_4COOC C_6H_5$.

Properties: White solid; m.p. 138-139°C. Combustible.

Use: Manufacture of polybenzimidazoles, high temperature-resistant polymers.

diphenylketone. See benzophenone.

diphenylmethane (benzylbenzene) $(C_6H_5)_2CH_2$.

Properties: Long colorless needles. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0056; m.p. 26.5°C; b.p. 264.7°C. Flash point 266°F; combustible.

Derivation: Condensation of benzyl chloride and benzene in presence of aluminum chloride.

Hazard: Probably irritant and narcotic in high concentrations.

Uses: Organic synthesis; dyes; perfumery.

diphenylmethane-4,4'-diisocyanate (MDI; methylene-diparaphenylene isocyanate; methylenebis(phenyl isocyanate) $CH_2(C_6H_4NCO)_2$).

Properties: Light-yellow, fused solid; solidification point 37°C; sp. gr. (70°C) 1.197; soluble in acetone, benzene, kerosine and nitrobenzene; combustible.

Derivation: para, para'-Diaminodiphenylmethane and phosgene.

Hazard: Highly toxic by inhalation of fumes. Strong irritant. Tolerance, 0.02 ppm in air.

Uses: Preparation of polyurethane resin and spandex fibers; bonding rubber to rayon and nylon.

diphenylmethanol. See benzhydrol.

diphenylmethyl bromide (benzhydryl bromide)

$BrCH(C_6H_5)_2$.

Properties: Solid; m.p. 45°C; b.p. 193°C (26 mm). Decomposes in hot water; soluble in alcohol; very soluble in benzene.

Hazard: Strong irritant to eyes and skin.

Use: Organic synthesis.

Shipping regulations: (Air) Corrosive label. (Rail) Corrosive material, n.o.s., White label.

diphenylmethylchlorosilane $(C_6H_5)_2(CH_2)SiCl$.

Properties: Colorless liquid; sp. gr. 1.107 (25°C); b.p. 295°C; flash point 135°F. Combustible.

Derivation: Grignard reaction of diphenyldichlorosilane with methylmagnesium chloride.

Hazard: Moderate fire risk. Probably toxic.

Use: Intermediate; end stopper for silicone oils.

diphenylnaphthylethylenediamine $C_{10}H_6(NHC_6H_5)_2$.

Properties: Silvery, crystalline plates. Slightly soluble in alcohol; insoluble in water. M.p. 164°C.

Derivation: By heating 2,7-dihydroxynaphthalene with aniline and aniline hydrochloride.

Use: Organic synthesis.

diphenylnitrosamine. See N-nitrosodiphenylamine.

2,5-diphenyloxazole (DPO) $OOC_6H_4:CC_6H_5$.

Properties: White, fluffy solid; m.p. 70-72°C.

Grade: Scintillation.

Containers: Glass bottles.

Use: Primary fluor used as scintillation counter or wavelength shifter.

diphenyl oxide (phenyl ether; diphenyl ether) $(C_6H_5)_2O$.
Properties: Colorless crystals or liquid; geranium-like odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.072–1.075; m.p. 27°C; b.p. 259°C. Flash point 239°F. Combustible; low toxicity. Auto-ignition temp. 1144°F.

Derivation: Reaction of bromobenzene and sodium phenate heated under pressure.

Grades: Technical; perfume; industrial.

Containers: Glass bottles; aluminum drums.

Uses: Perfumery, particularly soaps; heat-transfer medium; resins for laminated electrical insulation; chemical intermediate for such reactions as halogenation, acylation, alkylation, etc.

diphenylpentaerythritol diphosphite
 $C_6H_5OP(OCH_2)_2C(CH_2O)_2POC_6H_5$ (spiro).

Properties: White powder; b.p. 190–200°C (0.1 mm).

Containers: 12-gal pails, 25-lb net.

Use: Stabilizer for resins.

N,N'-diphenyl-meta-phenylenediamine
 $C_6H_5(NHC_6H_5)_2$.

Properties: Crystalline needles. Soluble in hot alcohol; insoluble in water. M.p. 95°C. Combustible.

Derivation: By heating resorcinol with aniline in presence of calcium chloride and zinc chloride.

Use: Organic synthesis.

N,N'-diphenyl-para-phenylenediamine (DPPD)
 $(C_6H_5NH)_2C_6H_4$.

Properties: Gray powder; sp. gr. 1.28; m.p. 145–152°C; purity 9.2% (min). Insoluble in water; soluble in acetone, benzene, monochlorobenzene and isopropyl acetate. Combustible; low toxicity.

Uses: Flex-resistant antioxidant in rubbers; stabilizer; polymerization inhibitor; retards copper degradation; intermediate for dyes, drugs, plastics, and detergents.

diphenyl phosphite $(C_6H_5O)_2PHO$.

Properties: Clear straw-colored liquid; m.p. 12°C; refractive index (n_D²⁵) 1.557; sp. gr. 1.221 (25/15°C); flash point 350°F. Combustible; low toxicity.

Containers: Specially lined 55-gal drums.

Use: Synthesis of organophosphorus compounds.

diphenyl phthalate $C_6H_4(COOC_6H_5)_2$.

Properties: Yellow-white powder; m.p. 68–70°C; sp. gr. 1.28 (20°C); flash point 435°F; b.p. 405°C; wt/gal 10.68 lb; refractive index 1.572 (74°C). Combustible.

Hazard: Moderately toxic.

Uses: Plasticizer for ethylcellulose, nitrocellulose, and various polymers.

diphenyl-4-piperidinemethanol hydrochloride. See azacyclonol hydrochloride.

diphenyl-4-piperidylmethane $(C_6H_5)_2(C_5H_{10}H)CH$.

Properties: White solid; difficultly soluble in water but readily soluble in dilute acids; moderately soluble in organic solvents; f.p. 99.7°C min.

Use: Intermediate.

1,3-diphenyl-1,3-propanedione. See dibenzoylmethane.

N,N'-diphenylpropylenediamine
 $C_6H_5NHCH_2CH(CH_3)NHC_6H_5$.

Properties: Clear, deep reddish-brown, thick liquid; sp. gr. 1.07; stable in storage; insoluble in water; soluble in acetone, ethylene dichloride, benzene, and gasoline; readily disperses. Combustible; low toxicity.

Uses: Antioxidant for rubber latexes.

diphenyl-4-pyridylcarbinol $(C_6H_5)_2(C_5H_4N)COH$.

Properties: White solid; very weak base; slightly soluble in most organic solvents; soluble in hot glacial acetic acid; m.p. 236–241°C.

Use: Intermediate.

diphenyl-4-pyridylmethane $(C_6H_5)_2(C_5H_4N)CH$.

Properties: White to pale-yellow crystalline solid; moderately soluble in common organic solvents; b.p. 234°C (20 min); f.p. 123°C min.

Use: Intermediate.

diphenylsilanediol $(C_6H_5)_2Si(OH)_2$.

Properties: White solid; m.p. 130–150°. Derived from hydrolysis of diphenyldichlorosilane. Used as a silicone chemical.

para,para'-diphenylstilbene

$C_6H_5C_6H_4CH:CHC_6H_4C_6H_5$.

Properties: Crystals; m.p. 308–310°C.

Uses: In purified form as fluor in plastic scintillators.

N,N'-diphenylthiourea. See thiocarbamilide.

1,3-diphenyltriazene. See diazoaminobenzene.

diphenylurea (carbanilide) $(NHC_6H_5)CO(NHC_6H_5)$.

Properties: Colorless prisms. Soluble in alcohol and ether; very slightly soluble in water. Sp. gr. 1.239; m.p. 235°C; b.p. 260°C.

Use: Organic synthesis.

diphenyl-ortho-xenyl phosphate

$(C_6H_5O)_2(C_6H_5C_6H_4O)PO$.

Properties: Sp. gr. 1.20 (20°C); refractive index 1.582–1.590 (60°C); boiling range 250–285°C (5 mm); flash point 225°F; insoluble in water. Combustible.

Low toxicity.

Use: Plasticizer.

diphosgene. Legal label name (Air) for trichloromethylchloroformate (q.v.).

diphosphopyridine nucleotide. See nicotinamide adenine dinucleotide.

diphosphoric acid. See pyrophosphoric acid.

dipicrylamine. See hexanitrodiphenylamine.

dipicryl sulfide. Legal label name (Air) for hexanitrodiphenyl sulfide (q.v.).

1,3-di-4-piperidylpropane (4-di-pip)

$(HNC_5H_9)CH_2CH_2CH_2C_5H_9NH$.

Properties: Solid; f.p. 67°C; b.p. 329°C; soluble in water; a stable, high-boiling strong organic base.

Use: Intermediate.

dipole. An assemblage of atoms or subatomic particles having equal electric charges of opposite sign separated by a finite distance; for instance the nucleus and orbital electron of a hydrogen atom, or the hydrogen and chlorine atoms of an HCl molecule. See also polar.

dipole moment. Molecules in which the atoms and their electrons and nuclei are so arranged that one part of the molecule has a positive electrical charge while the other part is negatively charged. The molecule therefore becomes a small magnet or dipole. Changing electrical or magnetic fields, causes the molecule to turn or rotate in one direction or another, depending on the charge of the field. The dipole moment (μ) is the distance in centimeters between the charges multiplied by the quantity of charge in electrostatic units. See also polar.

dipotassium orthophosphate. See potassium phosphate, dibasic.

dipropargyl (bipropargyl; 1,5-hexadiyne)

Properties: Colorless liquid. Soluble in alcohol; insoluble in water; sp. gr. 0.805; b.p. 85°C; f.p. -6.0°C. Hazard: Moderate fire and explosion risk when exposed to heat.

dipropenyl. See 2,4-hexadiene.**di-2-propenylamine**. See diallylamine.**di-n-propylamine** (C₃H₇)₂NH.

Properties: Liquid; f.p. -63°C; sp. gr. 0.741 (20°C); b.p. 109°C; color water-white; odor amine; wt/gal 6.2 lb; flash point 63°F (TOC); slightly soluble in water. Low toxicity.

Containers: 5-gal cans; 55-gal drums; tank cars.

Hazard: Flammable, dangerous fire risk.

Use: Intermediate.

Shipping regulations: Flammable liquid, n.o.s. (Rail)

Red label. (Air) Flammable Liquid label.

dipropylene. See 2,4-hexadiene.**dipropylene glycol** (CH₃CHOHCH₂)₂O.

Properties: Colorless, slightly viscous liquid. Soluble in toluene, water. Sp. gr. 1.0252 (20/20°C); b.p. 233°C; vapor pressure 0.01 mm (20°C); flash point 280°F (o.c.) wt/gal 8.5 lb (20°C); coefficient of expansion 0.00073 (20°C); viscosity 1.07 poise (20°C). Combustible.

Grade: Technical.

Containers: Drums; tank cars.

Hazard: Moderately toxic by ingestion.

Uses: Polyester and alkyd resins; reinforced plastics; plasticizers; solvent.

dipropylene glycol dibenzoate

Properties: Light-colored liquid; sp. gr. 1.1271 (20/20°C); 9.4 lb/gal (20°C); b.p. 250°C (10 mm); m.p. (200°C); insoluble in water; viscosity 227 cps (20°C). Combustible.

Use: Plasticizer.

dipropylene glycol dipelargonate

A synthetic lubricant.

dipropylene glycol monomethyl ether

Properties: Colorless liquid. Sp. gr. 0.950 (25/4°C); b.p. 189°C (760 mm), 74.5°C (10 mm); f.p. -80°C; viscosity 3.5 cp (25°C); refractive index 1.419 (25°C); flash point 185°F (o.c.); completely miscible with water, VM & P naphtha, acetone, ethanol, benzene, carbon tetrachloride, ether, methanol, monochlorobenzene and petroleum ether. Combustible.

Containers: Drums; tank cars.

Hazard: Moderately toxic. Absorbed by skin. Tolerance, 100 ppm in air.

Uses: Solvent; hydraulic brake fluids.

dipropylene glycol monosalicylate (dipropylene glycol monoester) C₃H₆(OOCCH₂CH₂OH)OC₃H₆OH.

Properties: Light-colored oil; fragrant odor; sp. gr. 1.16 (40°C); refractive index, about 1.52; soluble in alcohol; insoluble in water.

Uses: Ultraviolet light-screening agents; protective coatings; plasticizers.

dipropylene triamine. See 3,3'-iminobispropylamine.**dipropyl ketone** (butyrone; 4-heptanone)

Properties: Stable, colorless liquid. Pleasant odor.

Miscible with many organic solvents. B.p. 143.7°C; f.p. -32.1°C; sp. gr. 0.8162 (20/20°C); wt/gal 6.79 lb (20°C); refractive index. 1.4068 (20°C); surface tension 25.2 dynes/cm (25°C) viscosity 0.0074 poise (20°C); vapor pressure 5.2 mm (20°C); flash point (c.c.) 120°F.

Grade: Technical.

Hazard: Moderate fire risk. Toxic by inhalation; skin irritant.

Uses: Solvent for nitrocellulose, raw and blown oils, resins and polymers; lacquers; flavoring.

dipropylmethane. See heptane.**dipropyl phthalate** C₆H₄(COOC₃H₇)₂.

Properties: Colorless liquid. Sp. gr. 1.071 (25°C); refractive index 1.494 (25°C); b.p. 129-132°C (1 mm); solubility in water 0.015% by weight. Combustible; low toxicity.

Use: Plasticizer.

"Dipterex."¹⁸¹ Trademark for trichlorfon (q.v.).**alpha, alpha-dipyridyl** (2,2'-bipyridine) (C₅H₄N)₂.

Properties: White crystals; m.p. 69-70°C; b.p. 272-273°C; slightly soluble in water; insoluble in alcohol, ether, benzene, chloroform, and petroleum ether.

Grade: Reagent.

Use: Reagent for iron determination.

2,2'-dipyridylamine (C₅H₄N)₂NH.

Properties: Solid; f.p. 92.3°C (min); b.p. 222°C (50 mm); very slightly soluble in water. Combustible.

Derivation: From 2-aminopyridine.

Use: Intermediate.

dipyridylethyl sulfide [C₅H₄N(CH₂)₂]₂S.

Properties: Liquid. Sp. gr. 1.113 (25°C); refractive index 1.5841 (n_D 20/D); m.p. 1.5°C; soluble in water and common organic solvents. Combustible.

Grade: Technical (95% purity).

Hazard: May be toxic.

Uses: Synthesis of pharmaceuticals, dyestuffs, rubber chemicals, flotation agents, insecticides, fungicides, plasticizers, textile assistants, herbicides, oil additives, rust preventives, and pickling inhibitors.

diquat. Generic name for 6,7-dihydrodipyrido(1,2-a:2',1'-c)pyrazidinium salt (1,1'-ethylene 2,2'-dipyridinium dibromide) (C₅H₄NCH₂)₂Br₂. Yellow crystals; m.p. 335°C; soluble in water.

Hazard: Tolerance, 0.5 mg per cubic meter of air.

Use: Herbicide and plant growth regulator.

direct dye. A soluble dye taken up directly by fibers, presumably due to selective adsorption. Usually applied to cotton or union goods (cotton-wool mixtures). Dyeing assistants such as sodium chloride or sodium sulfate are used to obtain a higher concentration of dye on the fibers. See also dye, synthetic.**diresorcinol** (tetrahydroxydiphenyl)

Properties: White to slight yellowish crystalline powder. Soluble in hot water and alcohol. M.p. 310°C.

Derivation: By fusing resorcinol and phenol with caustic soda.

Use: Organic synthesis.

diresorcinolphthalein. See fluorescein.**N,N'-disalicylidene-1,2-diaminopropane** (N,N'-disalicylidene propylenediamine; disalicylaminopropane; disalicylalpropylenediimine.

Properties (80% active compound): Liquid; sp. gr. 1.08 (60/60°F); density 9.0 lb/gal; pour point 0°F; flash point about 70°F (TOC); viscosity 25 cs (100°F). Insoluble in water; miscible with benzene and xylene.

Hazard: Flammable, dangerous fire risk.

Use: Metal deactivator in motor fuels.

disc (disk). A small, thin, circular section or platelet of a material, especially of a biological specimen. "Disc" is the spelling preferred by scientists.

"Discoloy."³⁰⁸ Trademark for an austenitic iron-base alloy containing nickel, chromium and relatively small proportions of molybdenum, titanium, silicon, and manganese. This alloy is precipitation-hardening and was developed primarily to meet the need for improved gas turbine discs, one of the most critical components of jet engines.

discharging agent. A substance capable of destroying a dye or mordant present within the fibers of a fabric. There are various methods of utilizing this property so that it is possible to produce a colorless figure upon a colored ground or a colored figure upon a different-colored ground. Some examples are titanous sulfate, sodium hydrosulfide, zinc formaldehyde sulfoxylate. See also stripping (2).

"Discolite."¹⁵⁹ Trademark for sodium sulfoxylate formaldehyde.

Uses: Dye discharge, vat printing, stripping of fibers; accelerator in emulsion polymerization systems.

disilanyl. See silane.

disiloxane. See siloxane.

disinfectant. A substance used on inanimate objects which destroys harmful microorganisms or inhibits their activity. Disinfectants are either complete or incomplete. Complete disinfectants destroy spores as well as vegetative forms of microorganisms; incomplete disinfectants destroy vegetative forms of the organisms, but do not injure spores.

Some representative disinfectants are: (1) mercury compounds (mercuric chloride, phenylmercuric borate); (2) halogens and halogen compounds (chlorine, iodine, fluorine, bromine, calcium and sodium hypochlorite); (3) phenols, including cresol from coal tar, ortho-phenylphenol; (4) synthetic detergents (anionic, such as sodium alkyl benzene sulfonates and cationic, such as quaternary ammonium compounds); (5) alcohols (of low molecular weight except methanol); (6) natural products (pine oil); (7) gases (sulfur dioxide, formaldehyde, ethylene oxide). Heat and electromagnetic waves are used as disinfectants.

A number of compounds (mercurous and mercuric chlorides, copper sulfate or carbonate, and a mixture of zinc oxide and zinc hydroxide) have been employed as seed disinfectants.

Effectiveness of disinfectants is rated by the phenol coefficient (q.v.). See also antiseptic.

dislocation. Any variation from perfect order and symmetry in a crystal lattice. In some cases the imperfection is due to one or more missing atoms, resulting in "holes" in the lattice; or one or more atoms of another element may be present, effecting important changes in the conductivity, hardness, and other properties of the crystal. Disordered arrangement of the constituent atoms may also occur. See also impurity; semiconductor; hole.

disodium acetarsenate (aricyl)

$\text{NaOOCCH}_2\text{As}(\text{OH})\text{O}(\text{ONa}) \cdot 2\text{H}_2\text{O}$.

Properties: White, crystalline powder. Soluble in water.

Derivation: By reacting sodium arsenite with sodium monochloracetate.

Hazard: Highly toxic.

Shipping regulations: Arsenical compounds, n.o.s. (Rail, Air) Poison label.

2,7-disodium dibromo-4-hydroxymercurifluorescein. See merbromin.

disodium dibutyl-ortho-phenylphenoldisulfonate.

Properties: Light-brown paste; soluble in alcohol, acetone, dibutyl tartrate, ethylene glycol.

Uses: Wetting, penetrating and spreading agent used in kier-boiling; scouring and dyeing textiles; industrial cleaners; deodorant preparations; insecticidal formulations; metal cleaning; stabilizer and wetting agent in latex used to treat cord or other fabrics.

disodium dihydrogen pyrophosphate. See sodium pyrophosphate acid.

disodium 1,2-dihydroxybenzene-3,5-disulfonate (4,5-dihydroxy-meta-benzenedisulfonic acid disodium salt; sodium catechol disulfonate) $\text{C}_6\text{H}_2(\text{OH})_2(\text{SO}_3\text{Na})_2$. Properties: Non-hygroscopic crystals. Freely soluble in water; produces water-soluble, colored compounds with metal salts.

Use: Colorimetric reagent for iron, manganese, titanium, molybdenum.

disodium diphosphate. See sodium pyrophosphate, acid.

disodium edetate (ethylenediaminetetraacetic acid, disodium salt; disodium EDTA) $\text{C}_{10}\text{H}_{14}\text{N}_2\text{Na}_2\text{O}_8 \cdot 2\text{H}_2\text{O}$. Properties: White, crystalline powder; freely soluble in water; 6.5 lb/gal; pH (5% solution) between 4 and 6. Low toxicity.

Grades: U.S.P., F.C.C.

Uses: Medicine; food preservative; sequestrant in vinegar.

disodium endothall. See endothall.

disodium ethylenebisdithiocarbamate. See nabam.

disodium guanylate. See sodium guanylate.

disodium hydrogen phosphate. See sodium phosphate, dibasic.

disodium inosinate. See sodium inosinate.

disodium methylarsonate (DMA; disodium methanearsonate; methanearsonic acid, disodium salt) $\text{CH}_3\text{AsO}(\text{ONa})_2$, sometimes with $6\text{H}_2\text{O}$.

Properties: Colorless crystalline solid; hygroscopic; m.p. > 355°C; (hexahydrate m.p. 132–139°C); soluble in water and methanol.

Derivation: Reaction of methyl chloride with sodium arsenate.

Grades: 55–65% powder concentrate; 31.5% blend.

Hazard: Highly toxic by ingestion and inhalation.

Uses: Pharmaceuticals; herbicide (crabgrass killer).

Shipping regulations: (Rail, Air) Arsenical compounds, n.o.s., Poison label.

disodium orthophosphate. See sodium phosphate, dibasic.

disodium phosphate. See sodium phosphate, dibasic.

disodium pyrophosphate. See sodium pyrophosphate, acid.

disodium tartrate. See sodium tartrate.

"Dispersall."¹⁵⁹ Trademark for ethylene oxide condensate. Used for after soaping of vat and naphthol colors to prevent bleeding.

"Dispersed Sulfur 70."¹ Trademark for an aqueous dispersion of sulfur in the form of a flowable paste. Sulfur particles are virtually colloidal, averaging less than 2 microns in diameter.

Uses: Manufacture of water-base paints, compounding of latexes, sulfonation reactions in aqueous media; in general, for chemical processes requiring sulfur in the presence of water.

disperse phase. See phase (2); colloid chemistry.

dispersing agent. A surface-active agent (q.v.) added to a suspending medium to promote uniform and maximum separation of extremely fine solid particles, often of colloidal size. Applications include wet-grinding of pigments and sulfur; preparation of ceramic glazes; oil well drilling muds; insecticidal mixtures; carbon black in rubber; and water-insoluble dyes. True dispersing agents are polymeric electrolytes (condensed sodium silicates, polyphosphates, lignin derivatives); in nonaqueous media sterols, lecithin, and fatty acids are effective. See also emulsion; detergent.

dispersion. (1) A two-phase system of which one phase consists of finely divided particles (often in the colloidal size range) distributed throughout a bulk substance, the particles being the disperse or internal phase and the bulk substance the continuous or external phase. Under natural conditions the distribution is seldom uniform, but under controlled conditions the uniformity can be increased by addition of wetting or dispersing agents (surfactants) such as a fatty acid. The various possible systems are: gas/liquid (foam), solid/gas (aerosol), gas/solid (foamed plastic), liquid/gas (fog), liquid/liquid (emulsions, solid/liquid paint), and solid/solid (carbon black in rubber). Some types, such as milk and rubber latex, are stabilized by a protective colloid which prevents agglomeration of the dispersed particles by an adherent coating. Solid-in-liquid colloidal dispersions (loosely called solutions) can be precipitated by adding electrolytes which neutralize the electrical charges on the particles. Larger particles will either gradually coalesce and rise to the top or settle out, depending upon their specific gravity. See also suspension; colloid chemistry.

(2) In the field of optics, dispersion denotes the retardation of a light ray, usually resulting in a change of direction, as it passes into or through a substance, the extent of this effect depending on the frequency. Dispersion is a critically important property of optical glass. See also refractive index.

"Dispersite."²⁴⁸ Trademark for water dispersions of natural, synthetic, and reclaimed rubbers and resins. Uses: Adhesives for textiles, paper, shoes, leather, tapes; coatings for metal, paper, fabrics, carpets; protective (strippable) for saturating paper, felt, book covers, tape, jute pads; for dipping tire cords. Can be applied by spraying, spreading, impregnation, saturation.

"Disperso."¹⁰⁴ Trademark for wettable grades of zinc, calcium and other metallic stearates. Used where easy dispersion in water is desired.

"Dispersol OS."²⁰⁶ Trademark for an oil-soluble emulsifying agent comprised of an 8% solution of a polyethenoxy compound in isopropanol. Designed especially for dispersion of oil spills in sea water. Claimed to be biodegradable and to have low toxicity

for fish and other marine organisms. Amount needed said to be from 20 to 25% of the oil volume.

"Dispersol" VL.³²⁵ Trademark for an ethylene oxide condensate. Nonionic dispersant and retardant for vat dyes and dispersant for acetate dyes. 20% aqueous solution.

displacement series. See activity series.

disproportionation. A chemical reaction in which a single compound serves as both oxidizing and reducing agent, and is thereby converted into a more oxidized and a more reduced derivative. Thus a hypochlorite upon appropriate heating yields a chlorate and a chloride, and an ethyl radical formed as an intermediate is converted into ethane and ethylene. See also transalkylation.

dissociation. The process by which a chemical combination breaks up into simpler constituents as a result of either (1) added energy, as in the case of gaseous molecules dissociated by heat, or (2) the effect of a solvent on a dissolved substance, e.g., water on hydrogen chloride. It may occur in the gaseous, solid, or liquid state, or in solution. All electrolytes dissociate to a greater or less extent in polar solvents. The degree of dissociation can be used to determine the equilibrium constant for dissociation, an important factor in ascertaining the extent of a chemical process. See also ionization.

dissolved oxygen (D.O.). One of the most important indicators of the condition of a water supply for biological, chemical and sanitary investigations. Adequate dissolved oxygen is necessary for the life of fish and other aquatic organisms and is an indicator of corrosivity of water, photosynthetic activity, septicity, etc. See also biochemical oxygen demand.

distearylamine (dioctadecylamine) (C₁₈H₃₇)₂NH.

Properties: Solid; sp. gr. 0.85; m.p. 69°C. Almost insoluble in water.

Use: Intermediate.

2,6-distearyl-para-cresol (2,6-dioctadecyl-para-cresol) (C₁₈H₃₇)₂CH₃C₆H₂OH. A viscous pale yellow liquid; soluble in most nonpolar solvents; refractive index 1.4825–1.4855 (25°C). Combustible.

Uses: Antioxidant; heat stabilizer for polypropylene.

distearyl ether (dioctadecyl ether) (C₁₈H₃₇)₂O.

Properties: Solid; m.p. 58–60°C; b.p.; decomposes.

Grade: 95% (min) purity.

Uses: Electrical insulators; water repellents; lubricants in plastic molding and processing; antistatic agent; intermediates.

distearyl sulfide (dioctadecyl sulfide; distearyl thioether) (C₁₈H₃₇)₂S.

Properties: Solid; m.p. 68–69°C; b.p., decomposes; sp. gr. 0.8148 (70/4°C).

Grades: 95% (min) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

distearyl thiodipropionate (3,3'-dioctadecyl thiodipropionate; thiodipropionic acid, distearyl ester) (C₁₈H₃₇-OOCCH₂CH₂)₂S.

Properties: White flakes, m.p. 58–62°C; m.p. 55°C. Insoluble in water; very soluble in benzene and olefin polymers. Resistant to heat and hydrolysis. Low toxicity.

Uses: Antioxidant; plasticizer; softening agent.

distearyl thioether. See distearyl sulfide.

"Disterdap."¹⁵⁸ Trademark for distearyl thiodipropionate.

distillate. Any product of distillation, especially of petroleum.

distillation. A separation process in which a liquid is converted to vapor and the vapor then condensed to a liquid. The latter is referred to as the distillate, while the liquid material being vaporized is the charge or distilland. Distillation is thus a combination of evaporation, or vaporization, and condensation. Simple examples are the natural cycle of evaporation and condensation that produces rain, and the vaporization and condensation of steam from a tea kettle on a cold surface.

The usual purpose of distillation is purification, or separation of the components of a mixture. This is possible because the composition of the vapor is usually different from that of the liquid mixture from which it is obtained. Alcohol has been so purified for generations to separate it from water, fusel oil, and aldehydes produced in the fermentation process. Gasoline, kerosene, fuel oil and lubricating oil are produced from petroleum by distillation. It is the key operation in removing salt from sea water. Distillation is extensively used in chemical analysis, in laboratory research, and for manufacture of many chemical products. See also destructive distillation, batch distillation, extractive distillation, rectification, dephlegmation, flash distillation, continuous distillation, simple distillation, reflux, fractional distillation, azeotropic distillation, vacuum distillation, molecular distillation, and hydrodistillation.

disulfiram. See tetraethylthiuram disulfide.

3,5-disulfobenzoic acid $C_6H_3(HSO_3)_2COOH$.

Properties: White powder. Soluble in water.

Grade: C.P.

Uses: Intermediate for detergents, dyes and pharmaceuticals.

disulfoton. Generic name for O,O-diethyl S-[2-(ethylthio)ethyl]phosphorodithioate.

$(C_2H_5O)_2P(S)SCH_2CH_2SCH_2CH_3$.

Properties: Pure compound, yellow liquid; technical compound, brown liquid; b.p. $62^\circ C$ (0.01 mm); density 1.144 ($20^\circ C$). Insoluble in most organic solvents.

Hazard: Highly toxic by ingestion and inhalation. Cholinesterase inhibitor. Absorbed by skin. Use may be restricted. Tolerance, 0.1 mg per cubic meter of air.

Uses: Systemic insecticide; acaricide.

Shipping regulations: Organic phosphate, liquid, n.o.s. (Rail) (Air) Poison label. Not accepted on passenger planes.

disulfuryl chloride. See pyrosulfuryl chloride.

"Di-Syston."¹⁸¹ Trademark for disulfoton (q.v.).

ditetradecylamine. See dimyristylamine.

ditetradecyl ether. See dimyristyl ether.

ditetradecyl sulfide. See dimyristyl sulfide.

"Dithane."²¹ Trademark for agricultural fungicides based on salts of ethylene bisdithiocarbamate. Supplied in zinc, manganese, and sodium forms as wettable powder or liquid concentrate.

1,4-dithiane (diethylene disulfide) $SCH_2CH_2SCH_2CH_2$.
Properties: White crystals. Volatile in steam. Soluble

in alcohol, ether; slightly soluble in water. B.p. $115.6^\circ C$ (60 mm); m.p. $108^\circ C$.

Derivation: Interaction of dichloroethyl sulfide with sodium or potassium sulfide.

Use: Organic synthesis.

dithiane methiodide $C_4H_8S_2 \cdot CH_3I$.

Properties: Crystals. Soluble in hot water; slightly soluble in alcohol; insoluble in ether. M.p. $174^\circ C$.

Derivation: Interaction of dichloroethyl sulfide and methyl iodide.

dithiazanine iodide $C_{23}H_{23}IN_2S_2$. 3-Ethyl-2-[5-(3-ethyl-2-benzothiazolinyldiene)-1,3-pentadienyl]benzothiazolium iodide.

Properties: Dark greenish, crystalline powder; decomposes at $248^\circ C$. Slightly soluble in methylene chloride and in dimethylformamide; insoluble in ether.

Grade: U.S.P.

Uses: Medicine; photography.

beta,beta'-dithiobisalanine. See cystine.

2,2'-dithiobisbenzothiazole (benzothiazolyl disulfide; benzothiazyl disulfide; 2-mercaptobenzothiazyl disulfide; MBTS) $(C_6H_4SCN)_2S_2$.

Properties: Pale-yellow, free-flowing, odorless powder; sp. gr. 1.54; m.p. $168^\circ C$.

Uses: Vulcanization accelerator; retarder in neoprene.

dithiocarbamic acid (aminodithioformic acid)

NH_2CS_2H .

Properties: Colorless needles, soluble in alcohol. Low toxicity.

Uses: The metal salts of the acid are important as strong (ultra) rubber accelerators, as are the thiuram disulfide derivatives. See thiuram, selenium diethyl-dithiocarbamate, zinc dibutylidithiocarbamate, zinc diethyldithiocarbamate; ziram. Also used as seed disinfectant.

2,2'-dithiodibenzoic acid $(C_6H_4COOH)_2S_2$.

Properties: Tan to gray powder; m.p. $280^\circ C$ (min).

Use: Intermediate for pharmaceuticals.

4,4'-dithiodimorpholine $C_4H_8ONSSNOC_4H_8$.

Properties: Gray to tan powder; m.p. $122^\circ C$ min; sp. gr. 1.36 ($25^\circ C$).

Hazard: Moderately toxic by ingestion, inhalation, and skin absorption.

Use: Vulcanizing agent.

1,2-dithioglycerol. See 2,3-dimercaptopropanol.

6,8-dithiooctanoic acid. See *dl*-alpha-lipoic acid.

dithiooxamide (rubeanic acid) $SC(NH_2)C(NH_2)S$.

Properties: Stable orange-red powder; decomposes at $140^\circ C$; insoluble in water; soluble in acetone and chloroform. Forms highly colored stable complexes with many metal ions; can form a series of N,N' -derivatives.

Use: Chemical intermediate.

dithiothreitol (Cleland's reagent).

Properties: Solid; m.p. $42-43.5^\circ C$. 99% pure. Available in 1-, 5-, 25-gram quantities.

Uses: Reducing agent for proteins and enzymes; biochemical research.

dithymol diiodide. See thymol iodide.

1,4-di-para-toluidinoanthraquinone (FD & C Green No. 6) $C_{14}H_6O_2(NHC_6H_4CH_3)_2$.

Properties: Solid; m.p. $213^\circ C$.

Use: Dye, approved for restricted use in drugs and cosmetics.

di-ortho-tolyl carbodiimide $(\text{CH}_3)_2\text{C}_6\text{H}_4\text{N}:\text{C}:\text{NC}_6\text{H}_4(\text{CH}_3)_2$.

Properties: Yellow to red-brown liquid with faint acrid odor. Sp. gr. 1.063 (25/4°C); b.p. 140°C (0.9 mm); refractive index (n_D 20/D) 1.6248. Soluble in organic solvents such as chloroform, carbon tetrachloride, benzene, and dioxane. Combustible.

Containers: 1-, 5-, and 55-gal.

Hazard: Toxic by inhalation and ingestion. Irritant to skin and eyes.

Uses: Surface coatings; textile processing; stabilizers of polyesters and urethanes; scavenger compounds for materials sensitive to active hydrogen.

N,N-di-ortho-tolylethylenediamine $\text{CH}_3\text{C}_6\text{H}_4\text{NHCH}_2\text{CH}_2\text{NHC}_6\text{H}_4\text{CH}_3$.

Properties: Light-brown to purple granular solid; sp. gr. 1.13; softens at about 57°C; insoluble in water; soluble in acetone, ethylene dichloride, benzene and gasoline.

Use: Antioxidant for light-colored rubber goods.

di-ortho-tolylguanidine (DOTG) $(\text{CH}_3)_2\text{C}_6\text{H}_4\text{NH})_2\text{CNH}$.

Properties: White powder; non-hygroscopic. Very slightly soluble in water; soluble in warm alcohol, from which it crystallizes on cooling. Sp. gr. 1.10; m.p. 179°C. Low toxicity.

Derivation: Desulfurization of di-ortho-tolylthiourea with a lead compound in the presence of ammonia.

Containers: Drums.

Use: Basic rubber accelerator.

2,7-di-para-tolynaphthylethylenediamine $\text{C}_{10}\text{H}_6(\text{NHC}_6\text{H}_4\text{CH}_3)_2$.

Properties: Fine needles. Sparingly soluble in alcohol; insoluble in water. M.p. 237°C.

Derivation: By heating 2,7-dihydroxynaphthalene with para-toluidine and para-toluidine hydrochloride.

1,3-di-para-tolylphenylethylenediamine $\text{C}_6\text{H}_4(\text{NHC}_6\text{H}_4\text{CH}_3)_2$.

Properties: Long needles. Soluble in alcohol and ether; insoluble in water. M.p. 137°C.

Derivation: By heating resorcinol and para-toluidine in presence of zinc chloride.

di-ortho-tolylthiourea (DOTT) $\text{SC}(\text{NHC}_6\text{H}_4\text{CH}_3)_2$.

Properties: Colorless, crystalline leaflets; pungent odor; not hygroscopic. Soluble in alcohol, ether and benzene; insoluble in water. M.p. 144–148°C. Low toxicity.

Derivation: By the interaction of ortho-toluidine and carbon disulfide.

Containers: Drums.

Use: Metal pickling inhibitor.

ditridecyl phthalate (DTDP) $\text{C}_{13}\text{H}_{27}(\text{COOC})_2$.

Properties: Colorless liquid. Sp. gr. 0.951 (20/20°C); b.p. >285°C at 5 mm Hg; pour point -37°C; viscosity 190 cps (25°C). Flash point 460°F. Combustible. Low toxicity.

Containers: Drums; tank trucks.

Use: Plasticizer.

ditridecyl thiodipropionate (3,3'-tetramethylnonyl thiodipropionate; thiodipropionic acid, ditridecyl ester) $(\text{C}_{13}\text{H}_{27}\text{OOCCH}_2\text{CH}_2)_2\text{S}$.

Properties: Colorless liquid. Sp. gr. (25°C) 0.932. Insoluble in water; soluble in most organic solvents. Combustible.

Uses: Stabilizer; plasticizer and softening agent for plastics; lubricant additive.

diuron. Generic name for 3-(3,4-dichlorophenyl)-1,1-dimethylurea, $\text{C}_6\text{H}_3\text{Cl}_2\text{NHCON}(\text{CH}_3)_2$.

Properties: White crystalline solid; m.p. 153–155°C; vapor pressure (30°C) 2×10^{-7} mm. Very low solubility in hydrocarbon solvents; approx. 42 ppm at 25°C in distilled water. Stable toward oxidation and moisture. Decomposes at 180°C.

Hazard: Irritant to skin and mucous membranes.

Use: Pre-emergence herbicide.

divanadyl tetrachloride. See vanadyl chloride.

divinyl acetylene $\text{H}_2\text{C}:\text{CHC}:\text{CCH}:\text{CH}_2$. Trimer of acetylene, formed by passing it into a hydrochloric acid solution containing metallic catalyst. Intermediate in manufacture of neoprene.

divinylbenzene (DVB; vinylstyrene) $\text{C}_6\text{H}_4(\text{CH}:\text{CH}_2)_2$, existing as ortho-, meta- and para-isomers. The commercial form contains the 3 isomeric forms together with ethylvinylbenzene and diethylbenzene.

Properties: (pure meta- isomer) Water-white liquid easily polymerized. B.p. 199.5°C; f.p. -66.90°C; sp. gr. 0.9289 (20°C); viscosity 1.09 centipoise (20°C); refractive index (n_D 20/D) 1.5772. Flash point 165°F. (Divinylbenzene, 55%) Pale straw-colored liquid; f.p. -87°C; b.p. 195°C; sp. gr. 0.918 (25/25°C); insoluble in water; soluble in methanol and ether. Combustible.

Grades: 50–60%; 20–25%.

Containers: Drums; tank cars.

Hazard: Moderately toxic by inhalation. Velocity of polymerization involves an explosion risk. If uninhibited, store at less than 90°F.

Uses: Polymerization monomer for special synthetic rubbers, drying oils, ion-exchange resins, casting resins, and polyesters.

Note: Should contain inhibitor when stored or shipped. Shipping regulations: (Rail, Air) Not listed. Consult authorities.

divinyl ether. Legal label name (Air) for vinyl ether (q.v.).

divinyl oxide. See vinyl ether.

3,9-divinylspirobi-meta-dioxane (3,9-divinyl-2,4,8,10-tetraoxaspiroundecane.) $[\text{CH}_2:\text{CHCH}(\text{OCH}_2)_2]_2\text{C}$. Bicyclic.

Properties: Liquid; m.p. 42°C; 120°C (2 mm); sp. gr. 1.251 (20/20°C); flash point 290°F (COC); slightly soluble in water. Combustible.

Uses: Intermediate and monomer.

divinyl sulfide $(\text{CH}_2:\text{CH})_2\text{S}$.

Properties: Mobile liquid. Unpleasant odor. Polymerizes readily. Sp. gr. 0.9174 (15°C); b.p. 85–86°C. Combustible.

Derivation: Interaction of dichlorodiethyl sulfide and an alcoholic solution of potassium hydroxide.

Grades: Technical.

divinyl sulfone $\text{CH}_2:\text{CHSO}_2\text{CH}:\text{CH}_2$.

Properties: Liquid; sp. gr. 1.1788 (20/20°C); b.p. 234°C; f.p. -26°C; soluble in water; flash point 255°F. Combustible.

Uses: Monomer used in manufacture of polymers with diols, urea, and malonic esters; shrinkage control agent (textiles).

di-ortho-xenyl phenyl phosphate $(\text{C}_6\text{H}_3\text{C}_6\text{H}_4\text{O})_2(\text{C}_6\text{H}_5\text{O})\text{PO}$.

Properties: Liquid. Sp. gr. 1.20 (60°C); refractive index 1.603–5 (60°C); boiling range 285–330°C (5

mm); flash point 250°C; insoluble in water. Combustible.
Use: Plasticizer.

"Dixie" Clay.⁶⁹ Trademark for a hard kaolin.
Properties: White to cream; sp. gr. $2.62 \pm .03$; fineness (through 325 mesh) 99.8%.
Use: Filler and reinforcing agent for rubber and plastics; paper coating.

"Dixsol."³¹⁹ Trademark for nitrogen solutions containing 37 to 50.6% total nitrogen by weight, used as, or in production of, soil fertilizers. Sp. gr. at 60/60°F varies from 0.984 to 1.188; lb/gal at 60°F, 8.20 to 9.89. Are composed of free ammonia, ammonium nitrate, and water (5.5–18.2% by weight).

di-para-xylylene ($-\text{CH}_2\text{C}_6\text{H}_4\text{CH}_2-$)₂. Stable, white crystals; m.p. 280°C.
Derivation: Pyrolysis of para-xylene at 750°F in presence of steam. An organic quench (benzene or toluene) gives the dimer in yields of 10–15%.
Use: Parylene resins.

DKP. Abbreviation for dipotassium phosphate. See potassium phosphate, dibasic.

DL- A prefix indicating that a compound contains equal parts of D and L stereoisomers. See also racemic; meso-.

dl- A prefix denoting a crystal that rotates the plane of polarized light equally to both left and right, resulting in optical inactivity. The symbol \pm is preferably used.

DM. See diphenylamine chloroarsine.

DMA. Abbreviation for dimethylamine or disodium methyl arsonate (q.v.).

DMAC. Abbreviation for dimethylacetamide (q.v.).

DMB. Abbreviation for dimethoxybenzene. See hydroquinone dimethyl ether.

DMC.
(1) Abbreviation for dichlorophenyl methyl carbinol. See di(para-chlorophenyl) ethanol (q.v.).
(2) Abbreviation for beta-dimethylaminoethyl chloride hydrochloride (q.v.).

DMDT. Abbreviation for dimethoxydiphenyltrichloroethane. See methoxychlor.

DMF. Abbreviation for dimethyl formamide (q.v.).

DMH. Abbreviation for dimethyl hydantoin (q.v.).

DMHF. Abbreviation for dimethylhydantoin formaldehyde. See methylol dimethylhydantoin.

"DMP."²³ Trademark for dimethylaminomethyl-substituted phenols.
Uses: Chemical intermediates, curing agents for epoxy resins, antioxidants.

DMPA.
1. See O-(2,4-dichlorophenyl) O-methyl isopropylphosphoramidothioate.
2. See dimethylol propionic acid.

DMSO. Abbreviation for dimethyl sulfoxide (q.v.).

DMT. Abbreviation for dimethyl terephthalate (q.v.).

DMU. Abbreviation for dimethylurea and dimethylolurea (q.v.).

DNA. Abbreviation for deoxyribonucleic acid (q.v.).

DNBP. Abbreviation for dinitro-ortho-sec-butylphenol (q.v.).

DNC. Abbreviation for dinitrocresol, (q.v.).

DNOC. Abbreviation for 4,6-dinitro-ortho-cresol (q.v.).

DNOCHP. Abbreviation for dinitro-ortho-cyclohexylphenol (q.v.).

DNODA. Abbreviation for di(n-octyl,n-decyl)adipate (q.v.).

DNODP. Abbreviation for di(n-octyl,n-decyl)phthalate (q.v.).

DNP. Abbreviation for dinonyl phthalate (q.v.).

DNPC. See 2,6-dinitro-para-cresol.

DNPD. Abbreviation for N,N'-di-beta-naphthyl-para-phenylenediamine (q.v.).

DNPT. See dinitrosopentamethylenetetramine (q.v.).

DNT. Abbreviation for dinitrotoluene (q.v.).

D.O. Abbreviation for dissolved oxygen (q.v.).

DOA. Abbreviation for dioctyl adipate. See the more exact name, di(2-ethylhexyl) adipate.

D.O.C. Abbreviation for dichromate oxygen consumed. See oxygen consumed.

documentation. The techniques involved in recording, coding, storing, and retrieving technical data; it is also called information processing and data processing. It can be performed mechanically by means of a punched card system, of which there are many variations; electronically by means of input to a computer; or by a combination of these methods. One of the most sophisticated techniques for storage and retrieval of chemical information has been developed by Chemical Abstracts Service (q.v.), which includes structural formulas. Pioneer development work in documentation was done in the 1950's by Dyson, Perry, Crane, and others. A journal serving this field is published by ACS.

n-docosane C₂₂H₄₆.
Properties: Solid; m.p. 45.7°C; b.p. 230°C (15 mm); sp. gr. 0.778 (45/4°C); refractive index 1.4400 (n_D 45/D). Combustible.
Grades: 95% (min) purity.
Uses: Organic synthesis; calibration; temperature-sensing devices.

docosanoic acid. See behenic acid.

1-docosanol. See behenyl alcohol.

cis-13-docosenoic acid. See erucic acid.

doctor treatment. A method of improving or "sweetening" the odor of gasoline, petroleum solvents, or kerosene. A doctor solution of sodium plumbite, Na₂PbO₂, is made by dissolving litharge in caustic soda solution; the feed to be sweetened is passed through the doctor solution. The action of the sodium plumbite and the lead sulfide formed from it, in conjunction with free sulfur (either naturally present, or added) converts the malodorous mercaptans to the pleasanter disulfides.

dodecachlorooctahydro-1,3,4-metheno-2H-cyclobuta-[c,d]pentalene. See mirex.

dodecahydrosqualane. See squalane.

dodecanal. See lauryl aldehyde.

n-dodecane (dihexyl) CH₃(CH₂)₁₀CH₃.
Properties: Colorless liquid; sp. gr. 0.749 (20/4°C); f.p. -10°C; b.p. 213°C; refractive index 1.4221 (20/D); flash point 160°F. Soluble in alcohol, acetone,

- ether; insoluble in water. Combustible. Autoignition temp. 400°F.
 Grades: 95, 99%, 99.7 mole %.
 Containers: 1-, 5-, and 10-gal cans; drums.
 Uses: Solvent; organic synthesis; distillation chaser; jet fuel research.
- 1,12-dodecanedioic acid** $\text{HOOC}_{10}\text{H}_{20}\text{COOH}$. A twelve-carbon straight-chain saturated aliphatic dibasic acid. Properties: White, crystalline powder; m.p. 130–132°C; soluble in hot toluene, alcohols, hot acetic acid; slightly soluble in hot water.
 Use: Intermediate.
- dodecanoic acid**. See lauric acid.
- n-didecanol**. See lauryl alcohol.
- dodecanoyl peroxide**. See lauryl peroxide.
- dodecene** $\text{C}_{12}\text{H}_{24}$. Many possible isomers. See 1-dodecene; tetrapropylene; sodium dodecylbenzenesulfonate.
- 1-dodecene** (alpha-dodecylene) $\text{H}_2\text{C}:\text{CH}(\text{CH}_2)_9\text{CH}_3$. Properties: Colorless liquid; sp. gr. 0.7600 (20/4°C); f.p. -33.6°C; b.p. 213°C; refractive index (n_D 20) 1.4327; soluble in alcohol, acetone, ether, petroleum, coal tar solvents; insoluble in water. Combustible.
 Containers: 1-, 5-, 10-gal cans.
 Hazard: Probably irritant and narcotic in high concentration.
 Uses: Flavors; perfumes; medicine; oils; dyes; resins.
- dodecenylsuccinic acid** $\text{HOOCCH}(\text{C}_{12}\text{H}_{23})\text{CH}_2\text{COOH}$. Properties: Extremely viscous liquid; practically insoluble in water; completely soluble in oil. Combustible.
 Uses: Synthesis; corrosion inhibitor in oils; waterproofing.
- dodecenylsuccinic anhydride** $\text{C}_{12}\text{H}_{23}\text{CHCOOOCCH}_2$. The normal and at least two branched-chain dodecenyls are used commercially. The following properties are those of a branched chain compound. Properties: Light-yellow, clear, viscous oil; b.p. 180–182°C (5 mm); sp. gr. (25°C) 1.002; flash point 352°F (COC); viscosity (20°C) 400 centipoises, (70°C) 15.5 centipoises. Combustible. Low toxicity.
 Containers: Drums.
 Uses: Alkyd, epoxy, and other resins, anticorrosion agents, plasticizers, wetting agents for bituminous compounds, and vulcanizable products.
- dodecyl acetate** (acetate C-12; lauryl acetate) $\text{C}_{12}\text{H}_{25}\text{OOCCH}_3$. Properties: Colorless liquid; fruity odor; sp. gr. 0.860–0.862; refractive index 1.430–1.433; b.p. 150.5–151.5°C; soluble in 3 volumes of 80% alcohol. Combustible.
 Use: Perfumery; flavoring.
- n-dodecyl alcohol**. See lauryl alcohol.
- dodecyl aldehyde**. See lauryl aldehyde.
- dodecylaniline** $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{NH}_2$. (Probably the para-isomer). Hazard: May be toxic. See aniline.
 Properties: Colorless liquid. Sp. gr. (25/25°C) 0.907–0.912; b.p. 340–350°C. Oil-soluble aromatic amine. Insoluble in water; soluble in most organic solvents. Combustible.
 Use: Intermediate.

- dodecylbenzene** (detergent alkylate). $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_5$. A commercial blend of isomeric, predominantly monoalkyl benzenes. The side chains are saturated, averaging twelve carbon atoms. Combustible; flash point 285°F.
 Derivation: Alkylation of benzene with isomeric dodecenes, obtained usually by polymerization of propylene. See tetrapropylene. For linear (normal) dodecylbenzene, see sodium dodecylbenzenesulfonate.
 Hazard: Moderately toxic by ingestion.
 Containers: Drums; tank cars.
 Uses: Detergents of ABS or LAS type.
- dodecylbenzenesulfonic acid** (DDBSA). See sodium dodecylbenzenesulfonate.
- dodecylbenzyl mercaptan** $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{CH}_2\text{SH}$. Offered as branched-chain isomers. Properties: Light-yellow oil; unpleasant odor; b.p. approx. 150°C (0.5 mm); soluble in acetone, benzene and heptane; insoluble in water and alcohol. Combustible.
 Hazard: Toxic and irritant.
 Uses: Polymerization modifier; intermediate; metal-cleaning and polishing compounds.
 See also thiol.
- n-dodecyl bromide**. See lauryl bromide.
- 6-dodecyl-1,2-dihydro-2,2,4-trimethylquinoline** $\text{C}_{12}\text{H}_{25}\text{C}_9\text{H}_3\text{N}(\text{CH}_3)_3$. Properties: Dark, viscous liquid; sp. gr. 0.93 (45°C). Combustible.
 Uses: Rubber antioxidant (flex-cracking).
- dodecyldimethyl(2-phenoxyethyl)ammonium bromide**. See domiphen bromide.
- N-dodecylguanidine acetate**. See dodine.
- n-dodecyl mercaptan** (DDM) $\text{C}_{12}\text{H}_{25}\text{SH}$. Many isomers of dodecyl mercaptan are possible and a variety of these occur in the technical material known as tert-dodecyl mercaptan or lauryl mercaptan or simply dodecyl mercaptan. Properties of n-isomer: Colorless liquid, boiling point 143°C; refractive index 1.4589; soluble in ether and alcohol; insoluble in water; flash point 262°F; combustible.
 See also thiol.
- 4-dodecyloxy-2-hydroxybenzophenone** $\text{C}_{12}\text{H}_{25}\text{OC}_6\text{H}_3(\text{OH})\text{C}(\text{O})\text{C}_6\text{H}_5$. Properties: Pale-yellow flakes; setting point 43°C; soluble in polar and nonpolar organic solvents.
 Use: Ultraviolet light inhibitor in plastics.
- dodecylphenol** $\text{C}_{12}\text{H}_{25}\text{C}_6\text{H}_4\text{OH}$. A mixture of isomers. Properties: Straw-colored liquid; sp. gr. 0.94 (20/20°C); flash point 325°F; boiling range 310–335°F; phenolic odor; soluble in organic solvents; insoluble in water. Combustible.
 Containers: Drums; tank cars.
 Hazard: Probably toxic. See phenol.
 Uses: Solvent; intermediate for surface-active agents; oil additives; resins; fungicides; bactericides; dyes; pharmaceuticals; adhesives; rubber chemicals.
- dodecyltrichlorosilane** $\text{C}_{12}\text{H}_{25}\text{SiCl}_3$. Properties: Colorless to yellow liquid; b.p. 288°C; sp. gr. 1.026 (25/25°C); refractive index (n_D 25, D) 1.4521. Readily hydrolyzed with liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and dodecylmagnesium chloride.

Hazard: Toxic. Strong irritant to tissue.

Use: Intermediate for silicones.

Shipping regulations: (Rail) White label. (Air) Corrosive label. Not acceptable on passenger planes.

dodecyltrimethylammonium chloride $C_{12}H_{25}N(CH_3)_3Cl$. Properties: White liquid; surface tension, 0.1% in water, 33 dynes/cm. (25°C); soluble in water and alcohol.

Uses: Germicides; moldicides; fungicides; textile fiber softeners; cationic emulsifiers; flotation reagents.

dodine. Generic name for N-dodecylguanidine acetate, $C_{12}H_{25}NHC(:NH)NH_2 \cdot CH_3COOH$.

Properties: Crystals; m.p. 136°C; soluble in hot water and alcohol.

Hazard: Strong irritant to eyes and skin over 50% concentration.

Use: Fungicide.

DOF. See di(2-ethylhexyl) fumarate.

"Dolcoseal."⁵²⁸ Trademark for spray-dried flavoring products such as essential oils, aromatic chemicals, flavor and perfume compounds.

"Dolocotone."⁵²⁸ Trademark for purified benzodihydropyrene (q.v.).

dolomite $CaMg(CO_3)_2$. A carbonate of calcium and magnesium.

Properties: Color gray, pink, white, etc.; vitreous luster; sp. gr. 2.85; Mohs hardness 3.5–4; good cleavage in three directions; similar to calcite, but less soluble in acids (reacts with acid when powdered or with hot acid). Noncombustible, nontoxic.

Uses: Refractory for furnaces; manufacture of magnesium compounds and magnesium metal; as building material; in fertilizers; stock feeds; paper making; ceramics; mineral wool; removal of sulfur dioxide from stack gases.

"Dolophine" Hydrochloride.¹⁰⁰ Trademark for methadone hydrochloride (q.v.).

"Doloxide."¹³⁹ Trademark for a calcined dolomite, powdered; 91% through 200 mesh; used in chemical processes where a high magnesium burned lime is required.

dolphin oil. See porpoise oil.

DOM. (1) See di(2-ethylhexyl) maleate. (2) A hallucinogenic drug. Use restricted by FDA.

domiphen bromide

(dodecyltrimethyl(2-phenoxyethyl)-ammonium bromide) $C_{12}H_{25}OC_2H_4N(C_{12}H_{25})(CH_3)_3Br$. A quaternary ammonium salt.

Properties: Crystals; m.p. 112°C. Soluble in water and organic solvents.

Use: Medicine.

donor. An atom which furnishes a pair of electrons to form a covalent bond or linkage with another atom, called the acceptor. See also bond, chemical; Lewis electron theory.

DOP. Abbreviation for dioctyl phthalate. See the more exact name, di(2-ethylhexyl) phthalate.

L-dopa. See L-dihydroxyphenylalanine.

dope (1) Sizing formulation consisting of solutions of nitrocellulose, cellulose acetate, or other cellulose derivations applied to crepe yarn to set the twist and assist creping, to leather to form a high-gloss finish. (2) A combustible, such as wood pulp, starch, sulfur,

etc., used in "straight" dynamites. (3) A trace impurity introduced into ultrapure crystals to obtain desired physical properties, especially electrical properties. Examples: erbium oxide doped with thulium for use as laser crystals, germanium or silicon doped with boron or arsenic for use as semiconductors.

"Doriden."³⁰⁵ Trademark for glutethimide. (2-ethyl-2-phenylglutarimide) (q.v.).

"Dorisyl."²³³ Trademark for an aromatic chemical useful as a perfume base.

"Dorlone."²³³ Trademark for fumigants and insecticides containing ethylene dibromide and 1,3-dichloropropene and related chlorinated hydrocarbons.

"Dormison."³²¹ Trademark for meparfynol (3-methyl-1-pentyn-3-ol) (q.v.).

"Dortan."⁵¹ Trademark for light-colored, sulfurized cutting oils which permit work visibility.

"Dorvon" FR.²³³ Trademark for molded polystyrene, flame-retardant foam. Used as a thermal insulation in building.

dosimetry (radiation). Measurement of the amount of radiation delivered to the body of an individual. The permissible dose is the quantity of radiation which may be received by an individual over a given period with no detectable harmful effects. For x- or gamma ray exposure the permissible dose is 0.3 roentgen per week, measured in air. All working with radioactive materials are expected to wear some device for detecting incident radiation.

DOT. Abbreviation for Department of Transportation, the agency responsible for shipping regulations for hazardous products in the U.S.

DOTG. Abbreviation for di-ortho-tolylguanidine (q.v.).

dotriacontane (dicetyl) $CH_3(CH_2)_{30}CH_3$ or $C_{32}H_{66}$.

Properties: Crystals; sp. gr. 0.823; b.p. 310°C; m.p. 70°C.

Use: Research.

DOTT. Abbreviation for di-ortho-tolylthiourea (q.v.).

double bond. See unsaturation.

double salt. A hydrated compound resulting from crystallization of a mixture of ions in aqueous solution. Common examples are the alums, made by crystallizing from solution either potassium or ammonium sulfate and aluminum sulfate; Rochelle salt (potassium sodium tartrate), made from a water solution of potassium acid tartrate treated with sodium carbonate; and Mohr's salt (ferrous ammonium sulfate), crystallized from mixed solutions of ferrous sulfate and ammonium sulfate. See also nickel ammonium sulfate.

"Dowanol."²³³ Trademark for a series of glycol monoethers; used as solvents; intermediates for plasticizers; bactericidal agents; and fixatives for soap and perfumes.

"Dowcarb."²³³ Trademark for calcium carbonate slurry for use in the paper industry.

"Dowclene."²³³ Trademark for a series of solvents for specialized cleaning.

10. A stabilized emulsion of caustic soda, a detergent, and a sequestering agent.

EC. A colorless liquid; f.p. -56.6; b.p. 77–122°C; sp. gr. 1.381.

WR. Inhibited 1,1,1-trichloroethane.

"Dow Corning."¹⁴⁹ Trademark for a wide range of sili-

- cone and polysiloxane products, including emulsions, lubricants, greases, mold-release agents, laminating polymers, electrical varnishes, and heat-resistant coatings.
- "Dowetch."**²³³ Trademark for magnesium photoengraving sheet, plate, and extruded tube. Also applies to chemicals used in the one-step engraving process.
- "Dowex."**²³³ Trademark for a series of synthetic ion-exchange resins made from styrene-divinylbenzene copolymers, having a large number of ionizable or functional groups attached to this hydrocarbon matrix. These functional groups determine the chemical behavior and type of ion-exchange resin. The strong acid cation resins are capable of exchanging cations—for example, sodium for calcium and magnesium as in softening water. The strong base anion resins are capable of exchanging anions.
- "Dowfax" 9N.**²³³ Trademark for a series of nonyl-phenolethylene oxide adducts; used as surfactants. Uses: Textile, pulp and paper, leather, latex paint.
- "Dowflake."**²³³ Trademark for calcium chloride, 77–80%, in a special flake form.
- "Dowfrost."**²³³ Trademark for a heat-transfer medium consisting of inhibited propylene glycol; used for the immersion freezing of poultry and other foods.
- "Dowfume."**²³³ Trademark for a series of proprietary products used as fumigants and pesticides.
- "Dowicil" 100.**²³³ Trademark for 1-(3-chloroallyl)-3,5,7-triaza-1-azoniaadamantane chloride. Water-soluble bactericide with fungicidal properties. Used as preservative in latexes, polishes, adhesives, inks, starches, joint cements, etc.
- "Dowmetal."**²³³ Trademark for a series of magnesium alloys containing more than 85% of magnesium.
- "Dow-Per."**²³³ Trademark for perchloroethylene of a special drycleaning grade.
- "Dowpon."**²³³ Trademark for a grass-killer, based on dalapon.
- "Dowsol."**²³³ Trademark for alkyl phosphates for use in metal extraction.
- "Dowtherm."**²³³ Trademark for a series of liquid heat-transfer media.
- "Dowzene."**²³³ Trademark for formulations of piperazines; used in veterinary medicine.
- doxorubicin.** See adriamycin.
- DOZ.** Abbreviation for dioctyl azelate. See the more exact name, di(2-ethylhexyl) azelate.
- D.P.** Abbreviation for degree of polymerization (q.v.).
- DPA.** Abbreviation for diphenylamine; also for diphenolic acid.
- DPG.** Abbreviation for diphenylguanidine (q.v.).
- DPH.** Abbreviation for 1,6-diphenylhexatriene.
- DPIP.** See diphenyl isophthalate.
- DPN.** Abbreviation for diphosphopyridine dinucleotide. See nicotinamide adenine dinucleotide.
- DPO.** Abbreviation for 2,5-diphenyloxazole (q.v.).
- DPPD.** Abbreviation for N,N'-diphenyl-para-phenylenediamine (q.v.).
- "DPS."**³⁴² Trademark for bacitracin methylene disalicylate (q.v.).
- "D.P. Solution."**⁵⁸ Trademark for dibutylamine pyrophosphate (q.v.).
- "Drakeol."**²⁵ Trademark for a series of colorless, odorless, tasteless, white mineral oils.
- "Dramamine."**⁷⁰ Trademark for dimenhydrinate (q.v.).
- "Drawcote."**²⁰⁴ Trademark for a class of compounds used as dry film lubricants in the cold working of metals.
- "Draw-ex."**⁵¹ Trademark for a group of drawing compounds suitable for hot and cold metal working. Oil- and water-soluble grades are available, some pigmented.
- "Dresinate."**²⁶⁶ Trademark for liquid, paste, and powder forms of sodium and potassium soaps of rosins and modified rosins used as emulsifiers, detergents, and dispersants in soluble oils, cleaning compounds, and other compositions.
- "Dresinol."**²⁶⁶ Trademark for 40 to 45% solids dispersions of rosins, modified rosins, or ester resins using aqueous ammonia as a dispersant plus a protective colloid stabilizing agent.
- "Drewmulse."**⁵⁵⁵ Trademark for a series of glycerol and glycol esters and sorbitan and polyoxyethylene sorbitan esters of fatty acids. Used as emulsifiers and opacifiers.
- "Driacin."**⁴¹⁶ Trademark for an ash-free organic salt of a hydrophobic, film-forming corrosion inhibitor. Uses: Sludge-dispersant additive for extending the storage life of cracked fuel oil and preventing filter or burner tip clogging; ingredient in rust-preventive formulations such as slushing oils.
- "Dri-Clor."**²⁰⁴ Trademark for a powdered laundry bleach with not less than 38% available chlorine.
- "Dricoid."**²⁰⁴ Trademark for a series of algin-emulsifier compositions.
- "Dricoid."** Sodium alginate.
K. Propylene glycol alginate-carrageenan.
KB. Propylene glycol alginate-vegetable gums.
Uses: Stabilizer-emulsifier compositions for ice cream and pressurized whipped cream.
- "Drierite."**³⁴⁵ Trademark for a special form of anhydrous calcium sulfate having a highly porous granular structure and a high affinity for water. Absorbs water vapor both by hydration and capillary action.
Grades: Regular; Indicating (turns blue to red in use); "Du-Cal" (for drying air and gases.)
Uses: Drying of solids, liquids, gases.
- drier.** A substance used to accelerate the drying of paints, varnishes, printing inks and the like by catalyzing the oxidation of drying oils or synthetic resin varnishes, such as alkyds. The usual driers are salts of metals with a valence of two or greater and unsaturated organic acids. The approximate order of effectiveness of the more common metals is cobalt, manganese, cerium, lead, chromium, iron, nickel, uranium and zinc. These are usually prepared as the linoleates, naphthenates and resinates of the metals. Paste driers are commonly the metal salts as acetates, borates, or oxalates dispersed in a dry oil. See also soap (2).

Note: The spelling "dryer" refers to equipment used for drying (of paper, textiles, food products, etc.).

"Dri-Film."²⁴⁵ Trademark for a group of silicone resins designed to impact durable moisture and weather resistance to surfaces.

Uses: Dri-Film 88 is used as a protective coating for electric motors, transformers, field coils, etc.; Dri-Film 144, a masonry water repellent; Dri-Film 1040 and 1042 imparts durable water repellency and other properties including water-borne spot and stain resistance, improved hand and drape, increased flex abrasion resistance, and improved tear strength and wrinkle recovery.

drilling fluid (drilling mud). A suspension of barytes and bentonite or attapulgite clay in either water or a petroleum oil. When circulated through oil-well drilling pipes, it acts as a coolant and lubricant and keeps the hole free from bore cuttings. To be effective it must have a specific gravity of at least 2.0 and should be thixotropic, with appreciable gel strength. Ligno-sulfonates are used as thinners in the water-based type. Oil-based muds require thickening additives such as blown asphalt and metallic soaps of tall oil and rosin acids.

"Driltreat."²³⁶ Trademark for a phosphatide liquid used as a stabilizer in oil emulsion drilling muds to offset effects of water contamination. Also effectively controls filtration.

"Drimix."²⁶⁷ Trademark for a form of dry dispersion of liquid or solid materials in a siliceous carrier. Also called dry liquid concentrates. Used to dry up liquids to convert them to free-flowing powders for easier handling in rubber and plastics industries.

"Drinalfa."⁴¹² Trademark for methamphetamine hydrochloride (q.v.).

"Drinox."⁴⁰¹ Trademark for a series of insecticides, used in seed treatment.

H-34. A liquid containing 24.5% heptachlor.

PX. A planter-box seed treatment containing 25% heptachlor.

Hazard: Highly toxic by ingestion, inhalation and skin absorption.

"Driocel."⁹⁹ Trademark for a solid, granular desiccant for drying process liquids and gases. Manufactured from a selected grade of natural bauxite, reduced to the required particle size, and thermally activated to its maximum absorbing activity. Mesh grades 4/8, 4/10, 8/14.

"Driocel" S.⁹⁹ Trademark for a drying (dehydrating) medium for light liquid hydrocarbons. Developed specifically to overcome souring of light hydrocarbon liquids, such as LPG products in the final drying stage. Mesh grades 4/8, 8/14, tamped bulk density 55-57 lb/cu ft.

"Dri-Pax."²⁴¹ Trademark for a group of silica gel products used in packaging pharmaceuticals and similar packaged products. Extends shelf life and deodorizes products having unpleasant odors.

"Drisdol."¹⁶² Trademark for crystalline vitamin D₂.

"Dri-Sol."³¹⁹ Trademark for low moisture nitrogen solutions used as, or in production of, soil fertilizers. Total nitrogen, % by wt, 46.2 to 58.5; approx. sp. gr. at 60/60°F, 0.930 to 1.162; lb/gal at 60°F, 7.75 to 9.68. Are composed of free ammonia, ammonium nitrate, and less than 0.5% by wt. of water.

"Drisoy."⁶⁴ Trademark for a group of chemically treated soybean oils, for replacement of linseed oil.

"Dritomic."⁵⁰ Trademark for a micron-fine wettable sulfur agricultural fungicide.

"Dri-Tri."¹ Trademark for sodium phosphate, tribasic, Na₃PO₄.

"Driwall."⁴⁴⁸ Trademark for transparent coatings (silicone); prevents water penetrating exterior walls of brick, stone, masonry.

dromostanolone propionate (USAN). 17beta-Hydroxy-2alpha-methylandrostan-3-one propionate; 2alpha-methylandrostan-17beta-ol-3-one propionate. C₂₃H₃₆O₃.

Properties: White crystals; m.p. 127-133°C. Soluble in alcohol, acetone, and other common organic solvents.

Grade: N.D.

Use: Medicine.

"Drucomine" 9650.⁵⁵⁵ Trademark for a cationic fatty amino amide. Used as a softener and finisher.

drug. (1) A substance that acts on the central nervous system, e.g., a narcotic, hallucinogen, barbiturate, or psychotropic drug. (2) A substance that kills or inactivates disease-causing infectious organisms. (3) A substance that affects the activity of a specific bodily organ or function. (4) According to the FDA, a drug is a substance "intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or function of the body." Under this definition, high-potency preparations of vitamins A and D are classified as drugs, though other vitamins are not; antiperspirants and suntan lotions are also considered to be drugs.

The Drug Enforcement Administration is the federal agency responsible for supervision and control of the manufacture and use of drugs, especially those in class (1). The term "ethical drug" is equivalent to "prescription drug", i.e., a drug sold only on a physician's prescription. See also pharmaceutical.

"Drupene."⁵⁵⁵ Trademark for nonionic ethoxylated fatty alcohols; available as liquid or paste. Used as detergents and penetrants.

"Drusil."⁵⁵⁵ Trademark for series of silicone emulsions used as water repellents.

"Drustat."⁵⁵⁵ Trademark for a series of cationic fatty amino amide condensates; alkyl sulfates. Used as antistatic agents.

"Drutergent E."⁵⁵⁵ Trademark for a fatty acid amine condensate.

dry cell (Lechanché cell). A primary battery having a zinc anode, a carbon or graphite cathode surrounded by manganese dioxide, and a paste containing ammonium chloride as electrolyte. Such batteries are not reversible and therefore have a limited operating life. Their chief use is in flashlights and similar devices requiring low voltage. See also battery.

dry chemical. A mixture of inorganic substances containing sodium bicarbonate (or frequently potassium bicarbonate) with small percentages of added ingredients to render it free-flowing and water repellent. Used as a fire extinguisher on fires in electric equipment, oils, greases, gasoline, paints and flammable gases.

"Dry-Flo."⁵³ Trademark for starch ester derivative containing hydrophobic groups. Especially free-flowing in dry state. Cannot be wetted with water, yet when moistened with a water-miscible solvent, it can be gelatinized and used to produce films with water-repellent properties.

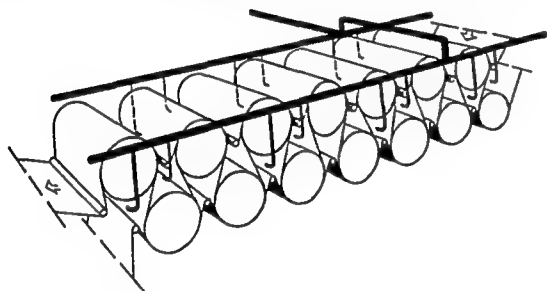

Uses: Dusting powder; no-offset spray for printing; approved by FDA for use in foods.

"Dry Gas."⁵⁸⁰ A proprietary preparation used as a gasoline line antifreeze. See antifreeze (2).

dry ice. See carbon dioxide (solid).

drying. (1) Polymerization of the glycerides of unsaturated vegetable oils induced by exposure to air or oxygen. See drying oil; drier.

(2) Removal of from 90 to 95% of the water from a material, usually by exposure to heat. Industrial drying is performed by both continuous and batch methods. The type of equipment and the temperatures used depend on the physical state of the material, i.e., whether liquid (solution or slurry), semiliquid (paste), solid units, or sheet. *Continuous drying:* the rotating-drum dryer is used for flaked or powdered products (soap flakes); a heated metal drum revolves slowly in contact with a solution of the material, the dry product being removed with a doctor knife. In paper manufacturing drying is performed by a battery

of staggered steam-heated revolving drums located at the dry end of the fourdrinier machine, the paper passing around the drums at high speed; the moisture content is thus reduced from 60% to about 5%. In spray drying, milk, egg-white and other liquid food products are passed through an atomizing device into a stream of hot air. In tunnel drying the product travels on a conveyor belt through a heated chamber of considerable length. *Batch drying:* steam-jacketed pans are used if the material is in paste or slurry form, or in removable trays placed in an oven, if in solid units (fruits, vegetables, meats, etc.). The revolving-tube dryer, used for granular solids and coarse powders, is a long, horizontal cylinder in which a current of warm air runs countercurrent to the movement of the material. Freeze-drying is a specialized technique utilizing high vacuum and low temperatures. See also dehydration; evaporation; freeze-drying.

drying oil. An organic liquid which, when applied as a thin film, readily absorbs oxygen from the air and polymerizes to form a relatively tough, elastic film. The oxidation is catalyzed by such metals as cobalt and manganese. See drier. Drying oils are usually natural products such as linseed, tung, perilla, soybean, fish, and dehydrated castor oils, but are also prepared by combination of natural oils or their fatty acids with various synthetic resins. The drying ability is due to the presence of unsaturated fatty acids, especially linoleic and linolenic, usually in the form of glycerides. The degree of unsaturation of an oil, and hence its drying ability, is expressed by its iodine number (q.v.). The drying oils have the greatest capacity for iodine and the nondrying oils the least.

For further information refer to American Oil Chemists Assn., 35 E. Wacker Drive, Chicago, Ill.

"Drymet."⁴²⁸ Trademark for sodium metasilicate, anhydrous.

"Dryolene."²⁰⁰ Trademark for a petroleum solvent prepared by straightrun overhead distillation.

Properties: Water-white; boiling range 205–287°F; sp. gr. 0.747 (60°F); flash point (Tag closed cup) 25°F; wt/gal 6.22 lb (60°F).

Hazard: Flammable; dangerous fire risk.

Use: Paint and rubber cement for fast setting and relatively slow final drying.

"Dryorth."⁴²⁸ Trademark for anhydrous sodium orthosilicate.

"Dryseq."⁴²⁸ Trademark for sodium sesquisilicate, anhydrous (q.v.).

"Dryspersion."²⁶⁷ Trademark for dry dispersion of rubber compounding chemicals in powder form. Deagglomerated and treated with non-staining oil.

"DS-207."³⁰⁴ Trademark for a mixture of dibasic lead salts of C₁₆–C₁₈ fatty acids.

Properties: Soft, white, unctuous powder; sp. gr. 2.0; refractive index, 1.6; non-melting at high temperatures; apparent lubricity of normal lead stearate.

Uses: Stabilizer-lubricants for vinyls.

DSP. Abbreviation for disodium phosphate. See sodium phosphate, dibasic.

DTA. See differential thermal analysis.

DTBP. Abbreviation for di-tert-butyl peroxide (q.v.).

DTDP. Abbreviation for dinitridecyl phthalate (q.v.).

"Duclean."²⁸ Trademark for acids containing pickling inhibitors. Used in pickling iron and steel.

No. 1. Sulfuric acid, 60° Be.; sp. gr. 1.706; f.p. below –10.8°C.

No. 2. Hydrochloric acid, technical; sp. gr. 1.142; f.p. below –40°C.

Containers: Tank cars and trucks.

Hazard: Toxic and corrosive liquids.

Dühring's rule. Relates the vapor pressures of similar substances at different temperatures. A straight or nearly straight line results if the temperature at which a liquid exerts a particular pressure is plotted on a graph against the temperature at which some similar reference liquid exerts the same vapor pressure. Water is most frequently used as a reference liquid since its vapor pressure at various temperatures is well known.

dulcin (para-phenetolecarbamide)

H₂NOCNHC₆H₄OC₂H₅. This substance should not be confused with dulcitol (q.v.) which is sometimes called dulcin.

Properties: White, needle crystals or powder with taste about two hundred times as sweet as sugar. M.p. 173–174°C; soluble in alcohol and ether; moderately soluble in hot water.

Derivation: From para-aminophenol.

Uses: Artificial sweetening agent. Prohibited by FDA for use in foods.

dulcitol (dulcite; dulcin; dulcose). C₆H₄(OH)₆. A sugar. Properties: White, crystalline powder; slightly sweet taste. Soluble in hot water; slightly soluble in cold water; very slightly soluble in alcohol. Sp. gr. 1.466; m.p. 188.5°C.

Derivation: By hydrogenation of lactose; occurs naturally in *Melampyrum nemorosum*.

Grades: Technical; reagent.

Containers: Glass bottles; fiber containers.

Uses: Bacteriology; medicine.

Dulong and Petit's law. The atomic heat capacity (atomic weight times specific heat) of elementary substances is a constant whose average value at room temperature is 6.2. A few elements, notably boron, carbon, and silicon, obey the law only at high temperatures.

dumortierite. Perhaps $8\text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2 \cdot \text{B}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A natural basic aluminum silicate. Bright, smalt-blue to greenish-blue in color. Vitreous luster. Sp. gr. 3.26–3.36; Mohs hardness 7.

Occurrence: United States (New York, Arizona, Nevada); France; Silesia; Norway.

Uses: Spark-plug porcelain; special refractories.

"Duobel."²⁸ Trademark for high-velocity permissible explosives furnished in five grades based upon velocity and cartridge count.

Hazard: Explosion risk.

Use: For mining coal where lump coal is not a factor.

"Duocarb."¹⁵⁵ Trademark for carbonized nickel from which all excess carbon has been removed and both surfaces polished.

"Duoferm."³¹⁹ Trademark for antibiotic feed supplement containing vitamin B₁₂ and bacitracin.

"Duolite."²⁴⁴ Trademark for anion and cation exchange resins, electron exchanger and resinous adsorbent.

"Duomac."¹⁵ Trademark for N-alkyl trimethylenediamine diacetate salts made from long-chain amines. Containers: 55-gal open head drums. Uses: Algicides; corrosion inhibitors; flushing agents; fungicides.

"Duomeen."¹⁵ Trademark for a series of N-alkyl trimethylenediamines. The alkyl group ranges from C₈ to C₁₈. Available in mixtures derived from coco, soya or tallow fatty acids. Containers: 55-gal drums; tank cars; tank trucks.

Uses: Anti-icers; biocides; bonding agents; chemical intermediates; corrosion inhibitors; dispersants; emulsifiers; mineral flotation and flocculation; wetting agents.

"Duo-Sol" process. A proprietary process for refining lubricating oils by extraction with a solvent consisting of liquid propane and a cresol base.

"Duponol."²⁸ Trademark for a series of surface-active agents based on lauryl sulfate. These have detergent emulsifying, dispersing, and wetting properties, and are used in the textile, paper, leather, cosmetic, electroplating industries; in dental and medical preparations, and agricultural products.

"Duracillin."¹⁰⁰ Trademark for procaine penicillin G, U.S.P.

"Duradene."²⁷⁸ Trademark for a stereoregular copolymer of butadiene and styrene with exceptional purity. Soluble in aromatics and aliphatics. Uses: Rubber products having superior abrasion resistance, good wet-skid resistance, flex-cracking resistance and good resilience. Automotive tire treads, belt conveyors, shoe soles and resilient products.

duralumin. A high-strength aluminum alloy. It contains 4% copper, 0.5% magnesium, 0.25–1.0% man-

ganese, and low percentages of iron and silicon. Resistant to corrosion by acids and sea water.

Uses: Aircraft parts, railroad cars, boats, machinery.

"Duramir."²⁴⁴ Trademark for a chromic acid formulation that has been significantly modified in many plating properties by the addition of special catalysts. Used in plating steel, copper, brass and bright nickel.

"Duran."⁵⁷³ Trademark for a series of polyvinylidene chloride packaging materials.

"Durana."¹⁹⁷ Trademark for a nitrogen fertilizer solution used in the manufacture of solid fertilizer compositions.

"Duranickel" 301.²⁸³ Trademark for an alloy of 94% nickel and 4.5% aluminum.

"Duraphos."⁵⁵ Trademark for a complex sodium-calcium-aluminum polyphosphate containing 67% phosphate. Used as a slow-dissolving glassy phosphate.

"Duraplex."²³ Trademark for drying and non-drying oil-modified alkyd resins derived from phthalic anhydride, polyhydric alcohols, and vegetable oils. Air drying, baking, and non-drying grades, in solvent solution or viscous 100% resins. Produce tough, glossy, light-colored coatings with excellent durability.

Uses: Primers, lacquers, and enamels; metal decorating; automotive coatings; furniture finishes; architectural enamels; inks.

"Duratone."²³⁶ Trademark for a synthetic organophilic colloid used to control filtration and aid in suspending drilled solid particles in oil-well muds. It is effective at high temperature, and is affected little by dissolved salts in the emulsified water phase.

"Durax."^{69,265} Trademark for N-cyclohexyl-2-benzothiazolesulfenamide.

Uses: Primary accelerator for SBR.

"Durco" D-10.⁴⁷ Trademark for a nickel-base alloy. Typical analysis: nickel, 65%; chromium, 23%; iron, 5%; copper, 3.5%; molybdenum, 2%; manganese, 1%. Properties: Wt. 0.310 lb/in.³; tensile strength, 60,000 psi; hardness (Brinell) 180; corrosion-resistant; machinable.

"Durcon" 6.⁴⁷ Trademark for an epoxy resin; corrosion resistant to a variety of materials while retaining high impact resistance and low moisture absorption.

Properties: Wt. 0.069 lb/in.³; tensile strength, 13,000 psi; hardness (Rockwell M) 114.

durene (durol; sym-1,2,4,5-tetramethylbenzene)

$\text{C}_6\text{H}_2(\text{CH}_3)_4$

Properties: Colorless crystals; camphorlike odor. Soluble in alcohol, ether, and benzene; insoluble in water. Sublimes and is volatile with steam. Sp. gr. 0.838; m.p. 77°C; b.p. 196–197°C; flash point 165°F (COC). Combustible.

Derivation: By heating ortho-xylene and methyl chloride in presence of aluminum chloride. Occurs in coal tar.

Use: Organic synthesis; plasticizers; polymers; fibers.

"Durez."⁶² Trademark for synthetic resins, plastics, molding compositions, phenolformaldehyde resins, furfuryl alcohol resins, polyester resins, and polyurethane resins.

Uses: Industrial chemicals; curing agents, rubber accelerators, plasticizers and binders.

"Durichlor"^{51.47} Trademark for a high silicon iron alloy. Typical analysis: silicon, 14.5%; chromium, 4.5; carbon 0.9%; manganese 0.65%. Properties: Wt. 0.255 lb/in.³; hardness (Brinell) 520; tensile strength, 16,000 psi; resistant to moist chlorine, ferric chloride, chlorinated solutions, and hydrochloric acid.

"Durimet 20."⁴⁷ Trademark for an austenitic stainless steel. Typical analysis: nickel, 29%; chromium, 20%; copper, 3%; molybdenum, 2%; silicon, 1%; carbon 0.07% max.

Properties: Wt., 0.287 lb/in.³; tensile strength, 62,500 psi; hardness (Brinell) 120-150; machinable; sulfuric acid-resistant; weldable.

"Duriron."⁴⁷ Trademark for a high-silicon iron alloy. Typical analysis: silicon, 14.5%; carbon, 0.9%; manganese, 0.65%.

Properties: Wt. 0.255 lb/in.³; hardness (Brinell) 520; tensile strength, 16,000 psi; resistant to abrasion, erosion, and corrosion; machined by grinding.

"Durisite."³²⁶ Trademark for a furan acid- and alkali-resistant resin cement mortar.

"Durite."⁶⁵ Trademark for a series of phenolformaldehyde resins used in the manufacture of grinding wheels, brake linings, clutch facings, lamp-basing cements.

"Duro."⁴⁴⁶ Trademark for an acid-proof brick made from materials of very low flux content. When fired stable minerals are formed which are insoluble in various acids and corrosive acidic solutions and resist alkaline solutions. Insoluble in mineral acids, except hydrofluoric.

Uses: Domes and dished bottoms of cylindrical tanks; capping tile; separators for electrolytic tanks; girders and supports for acid tower packing.

"Durobrite."²⁸ Trademark for zinc cyanide plating brightening agents. Amber liquids. Hazard: Highly toxic.

"Durol."²⁴³ Trademark for milling blacks for wool and nylon.

Durometer hardness. See hardness.

"Duron."¹¹⁶ Trademark for a malleable cast iron.

"Durpon" Compounds.³⁰⁹ Trademark for drawing lubricants and compounds for ferrous metals, steels and alloys, ultra high strength metals and refractories. Available in both oil soluble and water soluble series which include EP additives.

"Dursban."²³³ Trademark for insecticides containing O,O-diethyl O-3,5,6-trichloro-2-pyridyl phosphorothioate.

Hazard: Highly toxic. Use may be restricted.

Uses: Control of chinch bugs in Gulf Coast states; tick control on cattle and sheep (Australia).

dust, industrial. Finely divided solid particles that may have damaging effects on personnel by inhalation, or that constitute a fire hazard. They are air suspensions of particles 10 microns or less in diameter, though sizes up to 50 microns may be present. Such dusts include (1) metallic particles of all types, some being more harmful than others; (2) silica, mica, talc, quartz, graphite, clays, calcium carbonate, asbestos; (3) organic materials such as chemicals, pesticides, flour or other cereals, cellulose, coal, etc.

The size range of mineral dust most damaging to the lungs is between 0.5 and 2 microns. Silicosis is caused by chronic exposure to uncombined silica (quartz, cristobalite) in mines and quarries. Dust suspensions in enclosed industrial areas are an imminent fire hazard regardless of the chemical nature of the dust; an explosion may be initiated by static sparks or any open flame. Baghouses, dust collectors, or electrostatic precipitators can be used for dust control. TLV tolerances for industrial dusts are given by ACGIH. See threshold limit value.

dusting agent. A powdery solid used as an adherent and mold-release agent in the plastics and rubber industries. Typical materials in general use are talc (soapstone), mica, slate flour, and clay. Graphite and mica have a flat crystal structure which causes them to act as lubricants, and thus are especially effective in preventing sheets or slabs of hot solid mixtures from sticking together when stacked.

Dutch oil. See ethylene dichloride.

Dutch process. Process for making white lead. See lead carbonate, basic.

"Dutrex."¹²⁵ Trademark for a series of aromatic hydrocarbon concentrates derived from petroleum.

Properties: Colors ranging from light amber to black; viscosities from 3 cp to 10,000 cp at 210°F; sp. gr. approx. 1.0; odor slight to none; very low volatilities. Hazard: Probably flammable.

Uses: Rubber processing and extending oils; plasticizer extenders for polyvinyl chloride; resin solvents; tackifier for nitrile-butadiene rubber.

DVB. Abbreviation for divinylbenzene.

Dy Symbol for dysprosium.

"Dyal."¹⁴¹ Trademark for a series of resins and resin solutions of the alkyd type.

"Dyasist."³⁰⁰ Trademark for a series of dyeing assistants.

"Dybar."²⁸ Trademark for pellets containing 25% fenuron (q.v.).

dyclonine hydrochloride (4'-butoxy-3-piperidinopropiophenone hydrochloride) $C_{18}H_{27}NO_2 \cdot HCl$.

Properties: Crystals; m.p. 175-176°C; soluble in water, alcohol, acetone. Phenol coefficient 3.6.

Grade: N.D.

Use: Medicine.

"Dycril."²⁸ Trademark for a photosensitive plastic bonded to steel, aluminum or "Cronar" base supports. Used in printing plates. Exposure to an ultraviolet light source renders exposed areas insoluble to a subsequent mild alkaline washout solution so that a relief image of the exposed pattern remains. Depth of image is dependent on the thickness of the photosensitive plastic layer. There are eight types available.

dye, certified. See food color; FD & C colors.

dye, fiber-reactive. A synthetic dye containing reactive groups capable of forming covalent linkages with certain portions of the molecules of natural or synthetic fibers, i.e., covalently bound azo dye on cellulose. This problem was not solved till 1953, when chlorotriazinyl dyes were introduced. Since then, hundreds of fiber-reactive dyes for cellulose have been patented.

dyeing assistant. Any material added to a dye bath to promote or control dyeing. The action of assistants differs with the classes of dyes, but in most cases they aid in level deposition of the dye, either by delaying its absorption, increasing its solubility, or assisting the dye solution to penetrate the material. Examples: sodium sulfate decahydrate; pine oils; alkylaryl sulfonates.

dyeing, solvent. The use of organic solvents instead of water in dyeing synthetic fibers and fabrics. The solvents used are the chlorinated hydrocarbons: 1,1,1-trichloroethane, trichloroethylene, and perchloroethylene. They are applied most successfully to nylon, polyester and acrylic fibers; the process is especially applicable to carpet dyeing.

dye intermediate. See also *intermediate*. Specifically, most dye intermediates are ring compounds, usually containing amino, hydroxy, sulfonic acid or quinone groups or their combinations. An archaic nomenclature is still common, including proper names (Cleve's acid) and alphabetical names (J acid; 2R acid). Some are toxic and flammable.

dye, metal. An organic dye suitable for use with a metal such as aluminum or steel. Alizarin Cyanin RR, Alizarin Green S, Nigrosine 2Y and Naphthalene Blue RS are used for this purpose.

dye, natural. An organic colorant obtained from an animal or plant source. Few of these are now in major use. Among the best known are madder, cochineal, logwood, and indigo. The distinction between natural dyes and natural pigments is often arbitrary. (See *colorant*; *pigment*).

dye retarding agent. An additive to dye baths to prevent, by decreasing absorption of the dyes, the rapid exhaustion of the bath. Examples: sodium lauryl sulfate; sulfonated oils.

dye, synthetic. An organic colorant, derived from coal tar- and petroleum-based intermediates and applied by a variety of methods, to impart bright, permanent colors to textile fibers, leather, plastics, rubber, aluminum, and other industrial products. They were first synthesized by Perkin (q.v.) in England (1856) and were later developed by Hofmann (q.v.) in Germany. Some, termed "fugitive," are unstable to sunlight, heat, and acids or bases; others, called "fast," are not. Direct (or substantive) dyes can be used effectively without "assistants"; indirect dyes require either chemical reduction (vat type) or a third substance (mordant), usually a metal salt or tannic acid, to bind the dye to the fiber. A noteworthy development (1953) is the fiber-reactive group (q.v.), wherein the dye reacts chemically with cellulose. Dyes may be either acidic or basic, and their effectiveness on a given fiber depends on this factor. Some types are soluble in water; others are not, but can be made so by specific chemical treatment.

The central problem is the affinity of a dye for a fiber, and this involves both the chemical nature and the physical state of the dye, i.e., whether acidic or basic, and whether colloidal, molecular, or ionic. Neither colloidal particles nor dissociated ions are accepted by a fiber: the dye must be in molecular dispersion to be effective. Further details will be found in the following entries: acetate dye, anthraquinone dye, acid dye, azo dye, alizarin, aniline, fiber-reactive dye, cosin, intermediate, resist, stilbene dye, sulfide dye. The chemical classes of coloring matters and their arrangement according to chemical structures have been designated numeri-

cally in the "Colour Index," a British publication. See also *colorant*; *pigment*.

dye, disperse. A dye that may be in any of three clearly defined chemical classes: (a) nitroarylamines; (b) azo and (3) anthraquinone, and almost all contain amino or substituted amino groups but no solubilizing sulfonic acid groups. They are water-insoluble dyes introduced as a dispersion or colloidal suspension in water and are absorbed by the fiber after which they may remain untreated or be after-treated (diazotized) to produce the final color. Their use is primarily for cellulose acetate and nylon, polyester and other synthetic fibers and for thermoplastics.

"Dykon."⁵⁵³ Trademark for sodium diacetate (q.v.).

"Dylan."¹¹ Trademark for polyethylene made by the high pressure process.

Uses: Film packaging, flexible pipe, squeeze bottles, wire insulation, filaments, paper and cloth laminates, housewares. See "Super Dylan."

"Dylene."¹¹ Trademark for polystyrene; available in regular, medium, and high-impact grades.

"Dylex" Latexes.¹¹ Trademark for acrylic, styrene-butadiene latexes. Used in exterior and interior paints.

"Dylite."¹¹ Trademark for expandable polystyrene beads and pellets. They expand on application of heat to a foam with completely closed cell structure. Used as thermal insulator, protective packaging, flotation equipment, and containers.

"Dylopon."³⁰⁰ Trademark for a low-temperature dyeing auxiliary for wool.

"Dylox."¹⁸¹ Trademark for trichlorfon (q.v.).

"Dylux."²⁸ Trademark for a photosensitive paper, free from silver compounds, and coated with organic dyes that are activated by UV radiation. Gives good continuous tones and high resolution. Used in lithography, photoproofing, and information-handling systems. Permits instantaneous direct recording without processing.

"Dymal."¹⁴¹ Trademark for resins of the maleic anhydride or fumaric acid alkyd type.

"Dymerex" Resin.²⁶⁶ Trademark for a light-colored, hard, thermoplastic resin; dimerized resin acids; softening point 152°C; acid number 135; USDA color N. Available in solid and flake forms.

"Dymetracin."³⁴² Trademark for sodium bacitracin methylene disalicylate (q.v.).

"Dymid."⁵³⁰ Trademark for diphenamid (q.v.).

dynamite. An industrial explosive detonated by blasting caps. The principal explosive ingredient is nitroglycerin (straight dynamite) or especially sensitized ammonium nitrate (ammonia gelatin dynamite) dispersed in carbonaceous materials. Diethyleneglycol dinitrate, which is also explosive, is often added as a freezing point depressant. A dope such as wood pulp, and an antacid, as calcium carbonate, are also essential.

Hazard: Of moderate sensitivity to shock or heat, dynamite is a rather serious explosion hazard; also may ignite or explode as a result of contact with powerful oxidizing agents.

Shipping regulations: (Rail) Consult regulations. (Air) Not acceptable.

See also *explosive*.

Note: Use of dynamite is decreasing; it may be entirely replaced by safer and more efficient explosives within a few years.

"Dyne."²⁸⁴ Trademark for "Tamed Iodine" complex used as a non-foam pipeline detergent-germicide for dairy industry.

"Dynel."²¹⁴ Trademark for copolymer of vinyl chloride and acrylonitrile used as a textile fiber. A modacrylic fiber. Manufacture discontinued in 1975.

"Dyphene."¹⁴¹ Trademark for pure phenolic resins characterized by extreme hardness, excellent chemical resistance and fast-drying properties.

"Dyphenite."¹⁴¹ Trademark for rosin-modified phenolic resins.

"Dyphos."³⁰⁴ Trademark for lead phosphite, dibasic. Used as a stabilizer for vinyls and other chlorinated resins.

dyphylline [7-(2,3-dihydroxypropyl)theophylline; hyphylline] $C_{10}H_{14}N_4O_4$.

Properties: Crystals; bitter taste; m.p. 158°C; soluble in water, alcohol, and chloroform.

Use: Medicine.

dynpnone (phenyl alpha-methylstyryl ketone; 1,3-diphenyl-2-butene-1-one) $C_6H_5COCH(CH_3)C_6H_5$.

Properties: Stable, light-colored liquid with a mild fruity odor. B.p. (50 mm) 246°C; sp. gr. 1.093 (20/20°C); f.p., sets to a glass below -30°C; almost insoluble in water; flash point 350°F. Combustible. Low toxicity.

Uses: Softening agent, plasticizer, and perfume base. High absorption of ultraviolet light, low water solubility, low evaporation rate, and good solvent action make it useful in light-stable coatings.

"Dyrene."¹⁸¹ Trademark for 2,4-dichloro-6-ortho-chloroaniline-s-triazine (q.v.)

dysprosia. See dysprosium oxide.

dysprosium Dy Rare earth or lanthanide element having atomic number 66; atomic weight 162.5; valence 3. Six stable isotopes.

Properties: Non-corrosive metal; does not react with moist air to form hydroxide; m.p. 1407°C; b.p. 2330°C; sp. gr. 8.54. Reacts slowly with water and halogen gases; soluble in dilute acids. High cross-section for thermal neutrons. Low toxicity.

Derivation: Reduction of the fluoride with calcium.

Forms: High-purity lumps; ingots; sponge; powder.

Uses: Measurement of neutron flux; reactor fuels; fluorescence activator in phosphors.

See also rare earth metal.

dysprosium nitrate $Dy(NO_3)_3 \cdot 5H_2O$.

Properties: Yellow crystals; m.p. 88.6°C (in its water of crystallization). Soluble in water.

Derivation: Treatment of oxides, carbonates or hydroxide with nitric acid.

Grades: Up to 99.9% pure.

Containers: Glass bottles; fiber drums.

Hazard: Strong oxidizing agent; may ignite organic materials.

Shipping regulations: (Rail) Nitrates, n.o.s., Yellow label. (Air) Oxidizer label.

dysprosium oxide (dysprosia) Dy_2O_3 .

Properties: White powder; much more magnetic than ferric oxide; slightly hygroscopic, absorbing moisture and carbon dioxide from the air. Sp. gr. 7.81 (27/4°C); m.p. 2340 ± 10°C. Soluble in acids and alcohol.

Derivation: Ignition of hydroxides and oxyacids (carbonates, oxalates, sulfates, etc.).

Containers: Glass bottles; fiber drums.

Uses: With nickel, in cermets used as nuclear reactor control rods that do not require water-cooling.

dysprosium salts. Salts available commercially are the chloride, $DyCl_3 \cdot xH_2O$; fluoride, $DyF_3 \cdot 2H_2O$; arsenide, antimonide and phosphide. The last three are used as high-purity binary semiconductors.

dysprosium sulfate $Dy_2(SO_4)_3 \cdot 8H_2O$.

Properties: Brilliant yellow crystals; stable at 110°C and completely dehydrated at 360°C. Soluble in water.

Derivation: Dissolving the hydroxide, carbonate or oxide in dilute sulfuric acid.

Use: Atomic weight determination.

"Dyterge."³⁰⁰ Trademark for a one-bath scouring and dyeing assistant for wool and wool blends.

"Dythal."³⁰⁴ Trademark for lead phthalate, dibasic (q.v.). Used as a stabilizer for vinyl resins.

"Dytol."²³ Trademark for aliphatic primary alcohols derived from natural fats and oils. (C_{10} to C_{18}).

Uses: Additives for cosmetic creams, polymerization regulators for elastomers and plastics, detergents and viscosity index improvers for lubricating oils, finishing and softening agents for textiles, preparation of quaternary ammonium compounds, surfactants, water evaporation control and anti-foam.

E

EADC. Abbreviation for ethylaluminum dichloride, q.v.

EAK. Abbreviation for ethyl amyl ketone, q.v.

earth. (1) Any siliceous or clay-like compound or mixture, e.g., fullers earth, diatomaceous earth (q.v.).

(2) A natural metallic oxide, sometimes used as a pigment, e.g., red and yellow iron oxide, ocher, or umber. (3) A series of chemically related metals that are difficult to separate from their oxides or other combined forms; specifically, rare earths, alkaline earths. See also specific entry.

earth wax. General name for ozocerite, ceresin and montan waxes. See also wax.

EASC. Abbreviation for ethylaluminum sesquichloride (q.v.).

"Eastacryl."²⁵⁶ Trademark for dyes for acrylic fibers.

East India. A type of fossil or semirecent resin similar to dammar (q.v.). Varieties are batu, black, and pale. Used in spirit and oleoresinous varnishes.

"Eastobond."²⁵⁶ Trademark for a series of hot-melt adhesives used in the packaging industry for bonding paper, board, film, foil and glassine.

"Eastone."²⁵⁶ Trademark for disperse dyestuffs for use with acetate and nylon fibers.

"Eastozone."²⁵⁶ Trademark for rubber antiozonants based on the para-phenylenediamine.

"EB-5."²³³ Trademark for fumigant containing approximately 5% ethylene bromide (q.v.). Concentrations other than 5% are indicated by appropriate number.

Hazard: May be toxic. See ethylene dibromide.

ebonite. See rubber, hard.

"Ebonol."¹⁴² Trademark for various blackening agents for metals. Materials are supplied as powders that are added to water at various temperatures to accomplish blackening.

"Eclipse."⁴⁹² Trademark for a complete series of thin-boiling starches developed for the textile industry. They are based on corn starch which has been partially hydrolyzed by sulfuric acid, weakening the cross-linkages and breaking some of the chains.

Uses: Warp sizing, especially in the sizing of spun synthetics, particularly viscose and viscose-acetate blends. Lettered alphabetically in order of increasing fluidity.

"Ecolid" Chloride.³⁰⁵ Trademark for chlorisondamine chloride (q.v.).

"Econo-chrome."²⁴⁴ Trademark for a wide spectrum chromic acid compound containing a special catalyst. Used in both decorative and hard chromium plating.

economic poison. See pesticide.

economics, chemical. See chemical economics.

"Econo-Sour."²⁴⁴ Trademark for a product consisting chiefly of fluorine compounds. White powder; sparingly soluble in water.
Use: Laundry sour.

"Econovat."⁴⁹⁶ Trademark for a high molecular weight carbohydrate natural gum blend; used as a base for printing emulsion.

ECTEOLA-cellulose (epichlorohydrin triethanolamine cellulose). A dry powdered cellulose derivative containing tertiary amine groups which is used as an anion exchanger in chromatography. It is less basic than DEAE-cellulose (q.v.) and serves to separate viruses, nucleic acids, and nucleoproteins.

EDB. Abbreviation for ethylene dibromide (q.v.).

Edeleanu process. A solvent extraction process using liquid sulfur dioxide for the removal of undesirable aromatics from heavy lubrication oils.

edestin. A protein having a molecular weight of 310,000; source of leucine.

edible oil. As commonly used, the term refers to any fatty oil obtained from the flesh or seeds of plants that is used primarily in foodstuffs (margarine, salad dressing, shortening, etc.). Among these are olive, safflower, cottonseed, coconut, peanut, soybean and corn oils, some of which may be hydrogenated to solid form. They vary in degree of unsaturation, ranging from 78% for safflower to about 10% for coconut. Castor oil, though technically edible, is not usually considered in this classification, nor are medicinal oils derived from animal sources (cod liver, mineral oil, etc.).

"Edifas."^{206a} Trademark for methyl ethyl cellulose (q.v.).

EDTA. Abbreviation for ethylenediaminetetraacetic acid (q.v.).

EDTAN. Abbreviation for ethylenediaminetetraacetoneitrile (q.v.).

EDTA Na₄. Abbreviation for ethylenediaminetetraacetic acid tetrasodium salt. See tetrasodium EDTA.

edetate. See ethylenediaminetetraacetic acid (note).

effect. An evaporation-condensation unit. See evaporation.

efflorescence. Loss of combined water molecules by a hydrate when exposed to air, resulting in partial decomposition indicated by presence of a powdery coating on the material. This commonly occurs with washing soda ($\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$) which loses almost all its water constituent spontaneously.

effluent. Any gas or liquid emerging from a pipe or similar outlet; usually refers to waste products from chemical or industrial plants as stack gases or liquid mixtures.

egg yolk

Properties: Yellow semi-solid mass; sp. gr. 0.95; m.p. 22°C; high cholesterol content.

Grades: Technical; edible.

Uses: Baking; dairy products; mayonnaise; pharmaceuticals; soap; perfumery. See also albumin, egg.

EHEC. Abbreviation for ethyl hydroxyethyl cellulose (q.v.).

Ehrlich, Paul (1854–1915). A native of Silesia, Ehrlich is considered the founder of the science of chemotherapy, or the treatment of diseases by chemical agents. He did fundamental work on immunity which gave him the Nobel prize in medicine in 1908, and also developed the famous neoarsphenamine (salvarsan or 606) treatment for syphilis (1910) which was not improved upon until the discovery of penicillin.

eicosane $C_{20}H_{42}$. Most technical eicosane is a mixture of predominantly straight-chain hydrocarbons averaging 20 carbon atoms to the molecule.

Properties (pure n-eicosane): White crystalline solid; f.p. 36.7°C ; b.p. 205°C (15 mm); refractive index 1.4348 (n 20/D); sp. gr. 0.778 (at melting point). Insoluble in water; soluble in ether. Can be readily chlorinated. Combustible.

Grades: Pure normal (99 + %); technical.

Uses: Cosmetics; lubricants; plasticizers.

eicosanoic acid. See arachidic acid.

1-eicosanol. See arachidyl alcohol.

5,8,11,14-eicosatetraenoic acid. See arachidonic acid.

einsteinium Es A synthetic radioactive element with atomic number 99 first discovered in the debris from the 1952 hydrogen bomb explosion. Einsteinium has since been prepared in a cyclotron by bombarding uranium with accelerated nitrogen ions, in a nuclear reactor by irradiating plutonium or californium with neutrons, and by other nuclear reactions. The element is named for Albert Einstein. It has chemical properties similar to those of the rare earth holmium. Isotopes are known with mass numbers ranging from 246–253.

See also actinide element.

ekahafnium. One of the recently discovered transuranic elements with atomic number 104. It has two alpha-emitting isotopes (257 and 259) and possibly a third (258). The former, made by bombardment of californium-249 with carbon-12 nuclei, has a half-life of 5 seconds and decays into nobelium-253. The 259 isotope, made by merging a carbon-13 nucleus with californium-249, has a half-life of 3 seconds and decays to nobelium-255.

"Ekonol."²⁸⁰ Trademark for an engineering plastic composed of poly-p-oxybenzoate. Resistant to temperatures above 600°C ; self-lubricating surface. Possible uses are in pumps handling corrosive liquids, protective coating for titanium skins on supersonic transports, disk brakes, etc.

"ELA."²⁸ Brand name for elastomer lubricating agent, a mixture of phosphate esters. Light amber liquid. Used for unvulcanized rubbers.

elaboration. A term used in biochemistry to describe chemical transformations within an organism resulting in formation of specific types of substances; for example, plants elaborate proteins and fats, and poisonous snakes elaborate their venom. It also refers to formation of metabolic end products such as purines and uric acid.

elaidic acid (trans-9-octadecenoic acid)

$\text{CH}_3[\text{CH}_2]_7\text{CH}:\text{CH}[\text{CH}_2]_7\text{COOH}$. The trans form of an unsaturated fatty acid of which the cis-form is oleic acid (q.v.).

Properties: White solid; sp. gr. 0.8505 ($79/4^{\circ}\text{C}$); m.p. 43.7°C ; b.p. 288°C (100 mm); 234°C (15 mm); refractive index 1.4358 (79°C). Insoluble in water; soluble in alcohol, ether, benzene and chloroform. Combustible.

Derivation: Synthesized from oleic acid by elaidinization (q.v.).

Grade: Purified, 99 + %.

Uses: Medical research; reference standard in chromatography.

elaidinization. Originally, the reaction by which oleic acid is converted into elaidic acid but now used in a more general sense to indicate the conversion of any unsaturated fatty acid or related compound from the geometric cis to the corresponding trans form. Nitrous acid and selenium compounds are commonly used as catalysts for this reaction. The resulting trans acids are more stable to oxidation.

"Elastex."¹⁷⁵ Trademark for a series of plasticizers.

elastic modulus. See modulus of elasticity.

elasticity Recovery, partial or complete, of original shape after deforming forces are removed. One measure of deformation or strain is the Poisson ratio (the ratio of the decrease in thickness or diameter to the elongation that occurs when a deforming force is applied). In elastic bodies the deformation or strain always results in a stress, or tendency to resume the original shape. Stress is expressed as force per unit area. Young's modulus is the ratio of stress to strain in elongation or retraction. Fundamental particles of matter are perfectly elastic, i.e., atomic collisions result in no deformation or energy loss. Glass is 100% elastic, but has extremely low elongation; vulcanized rubber is over 90% elastic after extension to break, with exceedingly high elongation. See also modulus of elasticity; elastomer.

elastin. A scleroprotein which occurs in elastic tissue. Properties: Yellow fibrous mass; insoluble in water, in dilute acids, alkalies and salt solutions, and in alcohol. Is partially digested by pepsin solution and wholly by trypsin.

elastomer. A general term introduced about 1940 to embrace all high polymers having the property of extensibility and elastic recovery, i.e., the ability to be stretched to at least twice their original length and to retract very rapidly to approximately their original length when released. Before the advent of synthetic rubber-like polymers, vulcanized natural rubber was the only material that displayed this property. See also rubber; rubber, synthetic; rubber, natural; elasticity.

"Elastopar."⁵⁸ Trademark for N-methyl-N,4-dinitrosoaniline (33 1/3%) plus diluent (66 2/3%). Used for chemically modifying butyl rubber.

"Elastothane."² Trademark for urethane rubber.

Uses: Conveyor rollers and belting; hose liners and covers; seals, packings and gaskets; other molded and extruded goods.

"Elbelan."²¹² Trademark for a series of neutral-dyeing pre-metallized dyestuffs of outstanding fastness properties.

"Elchem."²⁸ Trademark for a series of addition agents used for electroplating brighteners in copper cyanide plating baths.

"Elcide."³⁰ Trademark for thimerosal (q.v.).

electric steel. Steel made in an electric furnace.

electrochemical equivalent. The number of grams of an element or group of elements liberated by the passage of one coulomb of electricity (one ampere for one second).

Electrochemical Society. Established in 1902, this society was organized to promote the advance of the science of electrochemistry and related fields. It is comprised of eleven divisions, each devoted to a special branch of electrochemistry, e.g., corrosion, batteries, rare metals, electrodeposition, etc. It publishes a journal and sponsors books relating to its major interests. Its office is at 30 E. 42nd Street, New York.

electrochemistry. A branch of chemistry which deals with the chemical changes produced by an electric current and with the production of electricity from the energy released in a chemical reaction. Applications are in battery science, electroplating, purification of copper, production of aluminum, fuel cells, and corrosion of metals. It also has certain applications in biochemistry, e.g. nerve reactions and specialized electric organs in fish.

electrocoating. A process of applying primer paint to household appliances, automobiles, etc., in which the metal piece to be coated becomes the anode in a tank of water-based paint. The coating deposited on the metal is uniform regardless of the shape of the article. Large-scale use of electrocoating is on automobile bodies. See also electrostatic coating.

electroconductive polymer. See polymer, electroconductive.

electrocratic. Descriptive of a liquid colloidal dispersion of insoluble solid particles whose stability is maintained by either positive or negative charges on the particles. As the like charges are mutually repellent, they offset the attraction of gravity and prevent the particles from sinking or coalescing. A colloidal gold suspension is a well-known example. Electrocratic dispersions can be readily precipitated by addition of an oppositely charged electrolyte, as in the purification of water with Al^{+++} ions from aluminum sulfate.

"Electrocure" Trademark for a process for hardening or curing paint films on plastics by use of low-voltage electron beams. Paints so treated cure in four seconds or less at room temperature; the finishes produced are said to be superior in resistance to abrasion and chemicals. The process can also be applied to other substrates, such as wood, glass, metals, etc.

electrode. Either of two substances having different electromotive activity, which enables an electric current to flow in the presence of an electrolyte. Electrodes are sometimes called plates or terminals. Commercial electrodes are made of a number of materials which vary widely in electrical conductivity, i.e., lead, lead dioxide, zinc, aluminum, copper, iron, manganese dioxide, nickel, cadmium, mercury, calomel (mercurous chloride), platinum, glass, or hydrogen. Electrodes are essential components of both batteries and electrolytic cells; in batteries the

negative plate is the anode and the positive plate the cathode, whereas in electrolytic cells the reverse is the case. Electrodes are also used in welding devices. See also anode; cathode; battery; electrolytic cell.

electrode, glass. A thin glass membrane which, when immersed in a suitable liquid medium, develops a measurable electrical potential that can be readily related to the activity of ionic species present in the solution. By appropriate manipulation of the glass composition, careful pretreatment of the glass surface, and reproducible experimental conditions, electrodes can be devised which not only yield information about the concentration of ions in solution but also have the ability to discriminate, in terms of a selective response, between a number of different ions of similar chemical characteristics. Because of their ability to give both qualitative and quantitative information about ions in solution, glass electrodes are widely used for purposes of chemical measurement, especially in electrochemical research.

electrode, hydrogen. A platinum surface coated with platinum black, immersed in a solution and bathed with a stream of pure hydrogen gas. The potential developed depends on the equilibrium between the hydrogen gas and the hydrogen ions in solution. Used as a standard reference electrode.

electrodeposition. The precipitation of a material at an electrode as the result of the passage of an electric current through a solution or suspension of the material, for example, alkaline-earth carbonates; rubber from latex; paint films on metal. The electrode is in the shape of the desired article. See also electrophoresis.

electrodialysis. A form of dialysis (q.v.) in which an electric current aids the separation of substances that ionize in solution. Seawater can be desalted by this method on a large scale by placing it in the center chamber of a 3-compartment container having two semipermeable membranes and a positive electrode in one end chamber and a negative electrode in the other; the ions migrate to their respective electrodes under a difference of potential, leaving the water salt-free. See also dialysis; desalination; demineralization.

electroforming. An electrolytic plating process for manufacturing metal parts. A mold of the object to be reproduced is made in a soft metal or in wax (by impression). The mold surface is made conducting by coating with graphite. Some suitable metal is then deposited electrolytically on the mold surface. This mold is then (in most cases) a negative of the object to be produced. Other industrial applications are phonograph records, plastic tile, ducting, tubing, etc.

"electroless" coating. A protective coating of copper, cobalt, nickel, gold, or palladium deposited in a bath without application of an electric current, i.e., by chemical reduction.

electroluminescence. Luminescence generated in crystals by electric fields or currents in the absence of bombardment or other means of excitation. It is a solid-state phenomenon involving p and n-type semiconductors, and is observed in many crystalline substances, especially silicon carbide, zinc sulfide, gallium arsenide, as well as in silicon, germanium and diamond. See also phosphor.

electrolysis. Dissociation of an ionizable compound by passing an electric current through it; the compound

forms positive and negative ions which are carried by the current to the oppositely charged electrodes, where they are collected (if wanted) or released (if unwanted). A simple electrolysis is the separation of water into oxygen and hydrogen; this is one method of producing hydrogen. Somewhat more complicated is electrolysis of brine to chlorine and sodium hydroxide; this is carried out in electrolytic cells of the diaphragm or mercury type, with water taking part in the reaction. In electroplating, metal salts dissociate into their constituent ions, the positively charged metal ions coating the cathode. There are a number of variations of this process (electrodeposition, electrocoating, electroforming). See also electrolytic cell.

electrolyte. A substance that will provide ionic conductivity when dissolved in water or when in contact with it; such compounds may be either solid or liquid. Familiar types are sulfuric acid and sodium chloride, which ionize in solution. A recently developed solid electrolyte, used originally in fuel cells, is a polymer of perfluorinated sulfonic acid used as the core of a water electrolysis cell for production of hydrogen and oxygen. When saturated with water it has high conductivity. The most common application of electrolytes is in electroplating of metals, in which dissolved (ionized) metal salts are the electrolytes. See also electrolysis; electroplating.

electrolytic cell. An electrochemical device in which electrolysis occurs when an electric current is passed through it. Ionizable compounds dissociate in the aqueous solution with which the electrodes are in contact. Such cells are of two types: (1) the diaphragm cell, which has two compartments separated by a porous membrane, and (2) the mercury cell, in which mercury is the cathode. The anodes of both types have long been made of graphite; because this decomposes rapidly as electrolysis progresses, they are being replaced with dimensionally stable types consisting of titanium coated with oxides of ruthenium and other rare metals, which are also much more efficient. In electrolysis of sodium chloride, the current causes chloride ion to migrate to the anode, where it is collected as chlorine gas; sodium hydroxide and hydrogen are also formed by decomposition of the water, the hydrogen being discharged. This principle is applied in the electroplating of metals, electrodeposition of colloids, and similar processes. See also diaphragm cell; mercury cell; electroplating.

electromagnetic separation. Separation of isotopes, especially those of uranium, by first accelerating them by means of an electrostatic field and then passing them through a magnetic field. The effect of this is to cause all the particles to take a curved path; the heavier ones, having higher kinetic energy, describe a wider arc than the lighter ones. Thus two isotopes of closely similar masses can be separated and collected. See also mass spectrometry.

electromagnetic spectrum. See radiation.

electromotive series. See activity series.

electron. Discovered by J. J. Thomson in 1896, the electron is a fundamental particle of matter that can exist either as a constituent of an atom or in the free state. It has a negative electric charge (4.8×10^{-10} e.s.u.) and a mass $1/1837$ th that of a proton

(q.v.), equivalent to 9.1×10^{-28} gram. The number of electrons in an atom of any element is the same as the number of protons in the nucleus, i.e., the atomic number. Thus the range is from 1 electron in hydrogen to 103 in lawrencium. As the negative charge of the electrons equals the positive charge of the protons, all atoms are electrically neutral. Electrons are arranged in from 1 to 7 shells around the nucleus; the maximum number of electrons in each shell is strictly limited by the laws of physics. The tendency of electrons to form complete outer shells accounts for the valence of an element, and they play an essential part in chemical bonding (q.v.). The outer shells are not always filled: sodium has 2 electrons in the first shell, 8 in the second, and only one in the third. A single electron in the outer shell may be attracted into an incomplete shell of another element, leaving the original atom with a net positive charge. The latter then is called an ion (q.v.). Valence electrons are those which can be captured by or shared with another atom.

Electrons can be removed from the atoms of metals and some other elements by heat, light, electric energy, or bombardment with high-energy particles (see radiation, ionizing). In such cases they are totally free from the atomic orbit, and their energy can be utilized by means of a conductor (electricity) or a vacuum tube or semiconductor. Current is generated by detaching the electrons of a metallic conductor (silver, copper) by means of an electric or magnetic field; the electrons then flow along the conductor to a positively charged terminal. The entire science of electronics is made possible by the tendency of a heated metal cathode to emit a continuous stream of electrons in a vacuum tube.

Free electrons, called beta particles are spontaneously emitted by decaying radioactive nuclei; they have comparatively low energy, but can be accelerated to velocities approaching that of light. The basic nature of the electron has been the subject of much research of the highest order of mathematical rigor. In simplest terms, the electron has the properties of both a particle and a wave, i.e., a standing wave is associated with an electron moving in its orbit. The energy state of any electron is described by four quantum numbers (q.v.).

See also shell; atom; orbital theory.

electronegativity. All atoms (except those of helium) that have fewer than 8 electrons in their highest principal quantum level have low energy orbital vacancies capable of accommodating electrons from outside the atom. The existence of these vacancies is evidence that within these regions the nuclear charge can exert a significant attraction for such electrons, even though as a whole the atom is electrically neutral. This attraction is called "electronegativity." To the extent that the initially neutral atom may be able to acquire electrons from outside, it will acquire also their negative charge. The word "electronegativity" means "tendency to become negatively charged." The concept of electronegativity is an extremely useful one in chemistry, because all chemical bonding originates with attractions of nuclei for electrons.

electron-volt (eV). An extremely small unit used in measuring the energy of electrons and other nuclear constituents. It is the energy developed by an electron in falling through a potential difference of 1 volt, equivalent to 1.6×10^{-19} joule. The rupture of

a carbon-to-carbon bond has been calculated to yield about 5 eV.

electrophile. See nucleophile; Lewis acid.

electrophoresis. Migration of suspended or colloidal particles in a liquid such as rubber latex, due to the effect of potential difference across immersed electrodes. The migration is toward electrodes of charge opposite to that of the particles. Most solids, being negatively charged, migrate to the anode, the exception being basic dyes, hydroxide sols, and colloids which have adsorbed positive ions, all of which are positively charged and migrate to the cathode. Migrating particles lose their charge at the electrode, and generally agglomerate around it. Clay suspensions can be filtered by means of forced flow electrophoresis.

Electrophoresis is important in the study of proteins because the molecules of such materials act like colloidal particles and their charge is positive or negative according to whether the surrounding solution is acidic or basic. Thus, the acidity of the solution can be used to control the direction in which a protein moves upon electrophoresis. See also electrodeposition.

electroplating. The deposition of a thin layer or coating of metal (e.g., chromium, nickel, copper, silver, etc.) on an object by passing an electric current through an aqueous solution of a salt containing ions of the element being deposited, for example Cu^{++} . The material being plated (usually a metal, but often a plastic) constitutes the cathode. The anode is often composed of the metal being deposited; ideally, it dissolves as the process proceeds. The thin layer deposited is sometimes composed of two or more metals, in which case it is an alloy. The solution, or plating bath, contains dissolved salts of all the metals being deposited. Electrolytic cells (q.v.) are used for this process.

The anode must be an electrical conductor, but may or may not be of the same chemical composition as the material being deposited, and may or may not dissolve during the process. The purpose of electroplating is usually protection of the base metal from corrosion. Silver is electroplated on copper for economy reasons; plastics may be electroplated for decorative effects.

See also electrophoresis; protective coating; electrodeless coating; throwing power; current density.

electropolishing. A nonmechanical method of polishing metal surfaces by a method that is actually the reverse of electroplating. This is achieved by making the object to be polished the anode in an electrolytic circuit, the cathode usually being carbon. The electrolytes used are phosphoric, hydrofluoric, nitric, or sulfuric acids (sometimes called polishing acids).

electrostatic coating. A metal painting technique in which electrostatically charged pigment particles are sprayed onto a substrate metal, followed by baking. The electric charge attracts the particles to the metal and holds them in place until heat treatment is applied. Maintenance of the charge is thus essential; factors affecting this are relative humidity (the lower the better) and the chemical nature of the pigment, e.g., phthalocyanine blue retains the charge much longer than titanium dioxide.

electrowinning. The technique of extracting a metal from its soluble salt by an electrolytic cell. It is used in recovery of zinc, cobalt, chromium, and manganese, and has recently been applied to copper when

in the form of a silicate ore. For any specific metal, the salt in solution is subjected to electrolysis and is electrodeposited on a cathode made of the metal being extracted.

"Electrunite."²⁵¹ Trademark for steel tubing, including both stainless and carbon steels.

element. One of the 106 presently known kinds of substance that comprise all matter at and above the atomic level. According to one theory that has gained some acceptance, the elements originated in less than half an hour from a primordial complex called ylem, a mixture of neutrons and electromagnetic radiation. The smallest unit of any element is the atom (q.v.). All the atoms of a given element are identical in nuclear charge and number of electrons and protons, but they may differ in mass, e.g., hydrogen has mass numbers of 1, 2, and 3, called hydrogen, deuterium, and tritium, respectively. These are the isotopes of hydrogen; most elements have isotopic forms, which are due to the presence of one or more extra neutrons in the nucleus. The atomic number (q.v.) of an element indicates its position in the Periodic Table (q.v.) and represents the number of protons present, which is the same as the number of electrons.

All elements above lead are unstable and radioactive. About 90% of the earth's crust is made up of elements with even numbers of protons and neutrons. No stable elements heavier than nitrogen have an odd number of both protons and neutrons. Elements of even atomic number normally have several isotopes, while those of odd atomic number never have more than two stable isotopes. All elements beyond uranium (transuranic) were nonexistent in 1940. They are artificially created by bombardment of other elements with neutrons or other heavy particles. The Lawrence Berkeley Laboratory pioneered research on new elements; it announced discovery of Element 106 in 1974. See also Periodic Table; isotope; radioactivity; abundance.

Element 104. See rutherfordium.
